Intended audience

This document is written for software developers who are using the components and tools in the Fast Models portfolio to build custom platform models and integrate them with third-party tools and models.

Inclusive language commitment

Arm values inclusive communities. Arm recognizes that we and our industry have used language that can be offensive. Arm strives to lead the industry and create change.

This document includes language that can be offensive. We will replace this language in a future issue of this document.

To report offensive language in this document, email terms@arm.com.

Feedback

Arm welcomes feedback on this product and its documentation. To provide feedback on the product, create a ticket on <https://support.developer.arm.com>.

To provide feedback on the document, fill the following survey: <https://developer.arm.com/documentation-feedback-survey>.

Contents

1. About the models.....	21
1.1 Model capabilities.....	21
1.2 Running Arm Software Test Libraries (STL) on Fast Models.....	21
1.3 Quality level definitions.....	22
1.4 Fast Models accuracy.....	22
1.4.1 Timing accuracy of Fast Models.....	23
1.4.2 Bus traffic in Fast Models.....	23
1.4.3 Instruction prefetch in Fast Models.....	25
1.4.4 Out-of-order execution and write-buffers in Fast Models.....	25
1.4.5 Caches in Fast Models.....	26
1.4.6 Global exclusive monitor in Fast Models.....	27
1.5 Processor implementation.....	27
1.5.1 Mapping PMU events to MTI trace sources.....	27
1.5.2 Caches in PV models.....	29
1.5.3 GICv3 in PV models.....	31
1.5.4 GICv4 in PV models.....	31
1.5.5 CP14 Debug coprocessor.....	32
1.5.6 TLBs in PV models.....	32
1.5.7 Memory access in PV models.....	32
1.5.8 Timing in PV models.....	33
1.5.9 CADI interactions with processor behavior.....	34
1.6 Fast Models CADI implementation.....	35
1.7 CADI sync watchpoints.....	37
1.8 Non-CADI sync watchpoints.....	37
1.8.1 syncLevel definitions.....	38
1.8.2 Controlling and observing the syncLevel.....	39
1.9 SCADI.....	41
1.9.1 Intended uses of CADI and SCADI.....	41
1.9.2 Responsibilities of the SCADI caller.....	42
1.9.3 SCADI interface access.....	42
1.9.4 SCADI semantics.....	44
1.10 User mode networking.....	45

1.11 TAP/TUN networking.....	47
1.11.1 TAP/TUN networking limitations.....	47
1.11.2 Setting up a network connection for Microsoft Windows.....	47
1.11.3 Configuring the networking environment for Microsoft Windows.....	48
1.11.4 Commands for tap_setup_32.exe or tap_setup_64.exe for Microsoft Windows.....	48
1.11.5 Uninstalling networking for Microsoft Windows.....	49
1.11.6 Setting up a network connection for Red Hat Enterprise Linux.....	49
1.11.7 Setting up a network connection for Ubuntu Linux.....	51
1.11.8 Configuring the networking environment for Linux.....	53
1.11.9 Solutions to networking issues on Linux.....	54
1.11.10 Disabling and re-enabling networking for Linux.....	54
1.11.11 Uninstalling networking for Linux.....	55
1.12 Using parameters to set port values.....	55
1.13 PVBUS C++ transaction and Tx_Result classes.....	56
1.13.1 Class pv::TransactionGenerator.....	56
1.13.2 TransactionGenerator efficiency considerations.....	57
1.13.3 Enum pv::AccessWidth.....	57
1.13.4 Class pv::Transaction.....	57
1.13.5 Class pv::ReadTransaction.....	58
1.13.6 Class pv::WriteTransaction.....	58
1.14 Visualisation library.....	59
1.14.1 LISA visualisation models.....	60
1.14.2 Visualisation library C++ classes.....	60
2. Protocols.....	65
2.1 AMBA-PV protocols.....	65
2.1.1 AMBAPV protocol.....	65
2.1.2 AMBAPVACE protocol.....	68
2.1.3 AMBAPVSignal protocol.....	71
2.1.4 AMBAPVSignalState protocol.....	71
2.1.5 AMBAPVValue protocol.....	71
2.1.6 AMBAPVValue64 protocol.....	71
2.1.7 AMBAPVValueState protocol.....	72
2.1.8 AMBAPVValueState64 protocol.....	72
2.2 Clocking protocols.....	72
2.2.1 ClockRateControl protocol.....	72

2.2.2 TimerCallback protocol.....	73
2.2.3 TimerCallback64 protocol.....	73
2.2.4 TimerControl protocol.....	73
2.2.5 TimerControl64 protocol.....	74
2.3 Debug interface protocols.....	74
2.3.1 CADIDisassemblerProtocol protocol.....	75
2.3.2 CADIProtocol protocol.....	76
2.4 Peripheral protocols.....	78
2.4.1 AudioControl protocol.....	78
2.4.2 CharacterLCD protocol.....	79
2.4.3 FlashLoaderPort protocol.....	79
2.4.4 GUIPollCallback protocol.....	79
2.4.5 ICS307Configuration protocol.....	79
2.4.6 KeyboardStatus protocol.....	80
2.4.7 LCD protocol.....	80
2.4.8 LCDLayoutInfo protocol.....	81
2.4.9 MMC_Protocol protocol.....	81
2.4.10 MouseStatus protocol.....	82
2.4.11 PL080_DMACE_DmaPortProtocol protocol.....	82
2.4.12 PS2Data protocol.....	83
2.4.13 PVBUSSlaveControl protocol.....	83
2.4.14 PVDevice protocol.....	86
2.4.15 PVTransactionMaster protocol.....	86
2.4.16 SerialData protocol.....	87
2.4.17 SMMUv3AEMIdentifyProtocol protocol.....	88
2.4.18 TZFilterControl protocol.....	88
2.4.19 VirtualEthernet protocol.....	89
2.5 Power management protocols.....	89
2.5.1 PChannel protocol.....	89
2.6 Processor protocols.....	90
2.6.1 CoprocBusProtocol protocol.....	90
2.6.2 CounterInterface protocol.....	96
2.6.3 GICv3Comms protocol.....	96
2.6.4 InstructionCount protocol.....	97
2.6.5 v8EmbeddedCrossTrigger_controlprotocol protocol.....	98
2.7 Signaling protocols.....	98

2.7.1 Signal protocol.....	98
2.7.2 StateSignal protocol.....	98
2.7.3 Value protocol.....	99
2.7.4 Value_64 protocol.....	99
2.7.5 ValueState protocol.....	99
3. Fast Models components.....	100
3.1 Component differences.....	100
3.2 Bridge components.....	102
3.2.1 AMBAPV2PVBUS.....	103

1. About the models

Programmers View (PV) models of processors and devices work at a level where functional behavior is equivalent to what a programmer would see using the hardware.

They sacrifice timing accuracy to achieve fast simulation execution speeds. You can use the PV models for confirming software functionality, but you must not rely on the accuracy of cycle counts, low-level component interactions, or other hardware-specific behavior.

1.1 Model capabilities

Fast Models attempt to accurately model the hardware, but compromises exist between speed of execution, accuracy, and other criteria. A processor model might not match the hardware under certain conditions.

Fast Models can:

- Accurately model instructions.
- Correctly execute architecturally-correct code.
- Model some unpredictable behavior.

Fast Models cannot:

- Validate the hardware.
- Model all unpredictable behavior.
- Model cycle counting.
- Model timing-sensitive behavior.
- Model SMP instruction scheduling.
- Measure software performance.
- Model bus traffic.

Related information

- [Caches in Fast Models](#)

1.2 Running Arm Software Test Libraries (STL) on Fast Models

Fast Models does not support running the entire STL.

The reasons are:

- Some micro-architectural features implemented in the RTL are not implemented in the Fast Model and therefore the model's behavior might deviate from the RTL.
- Some peripheral support must be included to enable parts of the STL. For example SBIST controller support is available in the RTL but not in the Fast Model.

Fast Models can be used for integration of the STL into your software stack, but running the STL might not perform accurate measurement and validation.

Related information

- [Arm Software Test Libraries](#)

1.3 Quality level definitions

The documentation for each model of Arm® IP includes one or more quality level statements to indicate how complete the model's implementation is for each supported revision of the IP.

Table 1-1: Quality level definitions

Quality level	Definition
Alpha support	The model implementation is at an early stage and is likely to change in future releases. There might be significant defects or limitations in the model.
Preliminary support	The model implementation is complete or almost complete. Testing is nearly to the level of a fully-supported model. However, changes might still occur and there are likely to be known defects present.
Full support	Also called Release quality. Support is complete and the model has been tested as fully as possible. The modeled IP has reached its LAC milestone.

1.4 Fast Models accuracy

Fast Models aim to be accurate from the point of view of the program running on the processors. This section describes areas where Fast Models differ from hardware.

Software is able to detect differences between hardware and the model, but these differences generally depend on behavior that is not precisely specified. For example, it is possible to detect differences in the exact timings of instructions and bus transactions, effects of speculative prefetch and cache victim selection.

Certain classes of behavior are specified as unpredictable and these cases are detectable by software. A program that relies on such behavior, even unintentionally, is not guaranteed to work reliably on any device, or on a Fast Model. Programs that exploit this behavior might execute differently between the hardware and the model.

Fast Models do not attempt to accurately model bus transactions. PVBUS provides the infrastructure to ensure that the program gets the correct results.

1.4.1 Timing accuracy of Fast Models

Fast Models do not model instruction timing accurately. The simulation as a whole has a very accurate concept of timing, but the Code Translation (CT) processors do not claim to dispatch instructions with device-like timing.

In general, a processor issues a set of instructions, called a quantum, at the same point in simulation time, and then waits for some amount of time before executing the next quantum. The timing is arranged so that on average the processor executes one instruction per clock cycle.

If timing annotation is enabled, the cycle count and instruction count can differ. For more details, see [Timing Annotation](#) in the Fast Models User Guide.

The consequences of this are:

- The perceived performance of software running on the model differs from real-world software. In particular, memory accesses and arithmetic operations all take a significant amount of time.
 - A program might be able to detect the quantized execution behavior of a processor, for example by polling a high-resolution timer.
 - All instructions in a quantum are effectively atomic.
-

This might mask some race-condition bugs in software.

1.4.2 Bus traffic in Fast Models

PVBus can simulate the behavior of individual bus transactions passing through a hierarchy of bus fabric, but it uses the following techniques to optimize this process:

- PVBus generally decodes the path between a bus master and bus slave the first time a transaction is issued. All subsequent transactions to the same address are automatically sent to the same slave, without passing through the intervening fabric.
- For accesses to normal memory, the master can cache a pointer to the host storage that holds the data contents of the memory. The master can read and write directly to this memory without generating bus transactions.
- For instruction-fetch, and for operations such as repeated DMA from framebuffer memory, PVBus provides an optimization called snooping, which informs the master if anyone else could have modified the contents of memory. If no changes have occurred, the master can avoid the need to re-read memory contents.

If a piece of bus fabric wants to intercept and log all bus transactions, it can defeat these optimizations by claiming to be a slave device. It can then log all transactions and can reissue identical transactions on its own master port. However, doing this slows all bus transactions and significantly impacts simulation performance.

If direct accesses to memory by the CT engine are intercepted by the fabric, the processor is forced to single step. Execution is much slower than normal operation with translated code.

The bus traffic generated by a processor is not representative of real traffic:

Timing differences

Reordering and buffering of memory accesses, out-of-order execution, speculative prefetch, and drain-buffers can cause timing differences. They are not modeled, since they are not visible to the programmer except in situations where a cluster program contains race conditions that violate serial-consistency expectations.

Bus contention

Fast Models do not model the time taken for a bus transaction, so they cannot model the effects of multiple transactions contending for bus availability.

Size of access

Fast Models do not attempt to generate the same types of burst transaction from the processor for accesses to multiple consecutive locations. PVBUS only supports burst transactions of type INCR.

Instruction fetch

The behavior of the instruction prefetch unit of a processor is not modeled to match the hardware implementation.

Behavioral differences

In some software, the trace of instruction execution depends on timing effects. For example, if a loop polls a device waiting for a 10ms time-out, the number of iterations of the polling loop depends on the rate of instruction execution.

Other differences

- PVBUS does not support any type of write strobes.
- PVBUS does not support Quality of Service (QoS) or region values.
- Transactions cannot cross a 4KB boundary.
- Barriers and DVM messages are not transmitted on the PVBUS.

Related information

[Instruction prefetch in Fast Models](#) on page 24

1.4.3 Instruction prefetch in Fast Models

The CT engine in the processor models relies on Fast Models PVBUS optimizations. It only performs code-translation if it has been able to prefetch and snoop the underlying memory. It then need not issue bus transactions until the snoop handling detects an external modification to memory.

If the CT engine cannot get prefetch access to memory, it drops to single-stepping. This single-stepping is very slow (~1000x slower than translated code execution).

Real processors attempt to prefetch instructions ahead of execution and predict branch destinations to keep the prefetch queue full. The instruction prefetch behavior of a processor can be observed by a program that writes into its own prefetch queue (without using explicit barriers). The architecture does not define the results.

The CT engine processes code in blocks. The effect is as if the processor filled its prefetch queue with a block of instructions, then executed the block to completion. As a result, this virtual prefetch queue is sometimes larger and sometimes smaller than the corresponding hardware. In the current implementation, the virtual prefetch queue can follow small forward branches.

With an L1 instruction cache turned on, the instruction blocksize is limited to a single cache-line. The processor ensures that a line is present in the cache at the point where it starts executing instructions from that line.

In real hardware, the effects of the instruction prefetch queue are to cause additional fetch transactions. Some of these are redundant because of incorrect branch prediction. This causes extra cache and bus pressure.

1.4.4 Out-of-order execution and write-buffers in Fast Models

Hardware memory is Weakly Ordered, but Fast Models memory is Strongly Ordered.

The CT implementation executes instructions sequentially. One instruction is retired before the next starts to execute. In a real processor, multiple memory accesses can be outstanding, and can complete in a different order from their program order. Writes can also be delayed in a write-buffer.

The programmer-visible effects of these behaviors are defined in the architecture as the Weakly Ordered memory model, which the programmer must be aware of when writing lock-free cluster code.

Within Fast Models, memory accesses happen in program order, effectively as if all memory is Strongly Ordered.

1.4.5 Caches in Fast Models

Fast Models with cache-state modeling enabled can replicate some types of failure-case, but not all types.

The effects of caches are programmer-visible because they can cause a single memory location to exist as multiple inconsistent copies. If caches are not correctly maintained, reads can observe stale copies of locations, and flushes/cleans can cause writes to be lost.

There are three ways in which incorrect cache maintenance can be programmer-visible:

From the D-side interface of a single processor

The only way of detecting the presence of caches is to create aliases in the memory map, so that the same range of physical addresses can be observed as both cached and non-cached memory.

From the D-side of a single processor to its I-side

Stale instruction data can be fetched when new instructions have been written by the D-side. This can either be because of deliberate self-modifying code, or as a consequence of incorrect OS demand paging.

Between one processor and another device

For example, another processor in a non-coherent MP system, or an external DMA device.

Fast Models with cache-state modeling enabled can replicate all of these failure cases. However, they do not attempt to reproduce the following effects of caches:

- Changes to timing behavior of a program because of cache hits/misses (because the timing of memory accesses is not modeled).
- Ordering of line-fill and eviction operations.
- Cache usage statistics (because the models do not generate accurate bus traffic).
- Device-accurate allocation of cache victim lines (which is not possible without accurate bus traffic modeling).
- Write-streaming behavior where a cache spots patterns of writes to consecutive addresses and automatically turns off the write-allocation policy.

The Cortex-A9 and Cortex-A5 models do not model device-accurate MESI behavior. The Cortex-A15 and Cortex-A7 models do simulate hardware MOESI state handling, and can handle cache-to-cache snoops. In addition, they model the AMBA 4 ACE cache-coherency protocols over their PVBUS ports, so can be connected to a model of an ACE Coherent Interconnect (such as the CCI-400 model) to simulate coherent sharing of cache contents between processors.

It is not possible to insert devices between the processor and its L1 caches. In particular, you cannot model L1 traffic, although you can tell the model not to model the state of L1 caches.

1.4.6 Global exclusive monitor in Fast Models

A monitor for cacheable nonshared and shared memory is always implemented, but the implementation differs depending on whether `cache-state-modelled` is `true` or `false`.

- When `cache-state-modelled` is `true`, caches are modeled, so exclusiveness is handled by the cache coherency protocol. Each line in a coherent cache records whether it is exclusive. When another core writes to an exclusive line, it is invalidated in other caches.
- When `cache-state-modelled` is `false`, the cache state is not modeled, so there are no cache lines or coherency. To provide the same functionality from a software perspective, an exclusive monitor is instantiated internally to maintain coherency.

The `RAMDevice` component and `PVBus` to `AMBAPV` bridges do not contain global monitors. As a result, exclusive stores that reach a `RAMDevice` fail unless they go through an exclusive monitor. Some platforms might need a global monitor outside of the cache coherency domains. These platforms must include a system-level monitor in the same place in the bus hierarchy as in the hardware. See the `FVP_VE` and `FVP_Base` example platforms for examples of how to use the `PVBusExclusiveMonitor` component.

1.5 Processor implementation

This section outlines the differences between the code translation models and the hardware.

1.5.1 Mapping PMU events to MTI trace sources

In Fast Models, many PMU events are modeled and are exposed through the standard PMU interface, although in many cases they are implemented using MTI trace sources.

Note

- Counters that are modeled can generate PMU overflow interrupts, which work the same as in hardware.
- Counters that are not modeled have the value zero and do not increment.

The following tables show which PMUv1 and PMUv2 events are modeled, and which MTI trace sources are used to model them. The associated event numbers are as listed in the Arm® Architecture Reference Manual Arm®v7-A and Arm®v7-R edition, section C12.8.2 Common event numbers.

Table 1-2: PMUv1 event mappings

PMUv1 event	MTI trace sources	Notes
Software increment (0x00)	-	Modeled, but not using MTI.
Level 1 instruction cache refill (0x01)	ALLOC_LINEFILL	-
Level 1 instruction TLB refill (0x02)	MMU_TLB_FILL	-
Level 1 data cache refill (0x03)	ALLOC_LINEFILL	-

PMUv1 event	MTI trace sources	Notes
Level 1 data cache access (0x04)	CACHE_READ_HIT, CACHE_READ_MISS, CACHE_WRITE_HIT, CACHE_WRITE_MISS	-
Level 1 data TLB refill (0x05)	MMU_TLB_FILL	-
Load (0x06)	CORE_LOADS, NV2_CORE_LOADS, MEMTAG_LOAD_INST, SVE_LD_RETIRED	-
Store (0x07)	CORE_STORES, NV2_CORE_STORES, MEMTAG_STORE_INST, SVE_ST_RETIRED	-
Instruction architecturally executed (0x08)	-	Modeled, but not using MTI.
Exception taken (0x09)	EXCEPTION	-
Exception return (0x0A)	EXCEPTION_RETURN_PREBRANCH	-
Write to CONTEXTIDR (0x0B)	CONTEXTIDR	-
Software change of the PC (0x0C)	BRA_DIR, BRA_INDIR.	-

1.5.2 Caches in PV models

Some processor models have PV-accurate caches, but others do not model Level 1 or Level 2 caches.

Cores that have PV-accurate cache implementation provide a functionally-accurate model. For more information, see the processor component descriptions.

Other PV models do not model Level 1 or Level 2 caches. The system coprocessor registers related to cache operations permit cache-aware software to work, but in most cases they only check register access permissions.

The registers affected on all code translation processor models are:

- Invalidate and/or Clean Entire ICache/DCache.
- Invalidate and/or Clean ICache/DCache by MVA.
- Invalidate and/or Clean ICache/DCache by Index.
- Invalidate and/or Clean Both Caches.
- Cache Dirty Status.
- Data Write Barrier.
- Data Memory Barrier.
- Prefetch ICache Line.
- ICache/DCache lockdown.
- ICache/DCache master valid.

1.5.2.1 Functional caches in Fast Models

Fast Models implement two types of cache model: register model and functional model.

A register model provides all the cache control registers so that cache operations succeed, but does not model the state of the cache. All accesses go to memory.

A functional model tracks cache state and its contents at each level of the memory hierarchy. Incorrect cache management might return incorrect data, as it would on real hardware.

Fast Models provide:

- System IPs that support caches.
- Register models of caches on all processors that support caches and also the PL310 cache controller (PL310_L2CC).
- Functional models of caches integrated into Cortex cores.

For a core with no L2 cache, the configuration parameters are:

icache-state-modelled

Set whether the I-cache has stateful implementation.

dcache-state-modelled

Set whether the D-cache has stateful implementation.

For Arm®v7-A cores with an L2 cache, the configuration parameters are:

l1_icache-state-modelled

Set whether L1 I-cache has stateful implementation.

l1_dcache-state-modelled

Set whether L1 D-cache has stateful implementation.

l2_cache-state-modelled

Enable unified Level 2 cache state model.

For Arm®v8-A cores with an L2 cache, the configuration parameters are:

icache-state_modelled

Set whether L1 I-cache has stateful implementation. Instructions at L2 or L3 are not cached in Fast Models.

dcache-state_modelled

Set whether D-cache has stateful implementation at L1, L2, and L3.

1.5.2.2 Performance impact of functional caches in Fast Models

Enabling functional cache modeling is likely to reduce performance.

Enable the L1 and L2 functional caches together. For consistent system operation, Arm recommends that you either disable functional behavior completely or enable it for both I and D L1 caches and the L2 cache.

Cache enablement must be system wide. If you enable cache state modeling in any component then you must enable it in all components in the system, including all cores (L1 and L2) and any external cache controller (such as the PL310_L2CC) and any interconnect that has caches.

If platform memory is being modeled outside of the Fast Models environment, for example in a SystemC environment, use of functional cache modeling might improve performance if there is no other fast route to memory.

1.5.3 GICv3 in PV models

The PV models implement the Generic Interrupt Controller architecture version 3 (GICv3).

The GICv3 architecture defines two parts:

- The core interface (integrated into the core)
- The Interrupt Redistribution Infrastructure (IRI)

You can configure all Arm®v8-A cores to include a GICv3 interface. You can integrate a separate GIC_IRI component into your platforms. Communication between the core and the IRI is over an architected packet interface. An internal communication protocol represents the packets that pass over this interface.

You can configure the GICv3 models in some platforms to act as though they were GICv2 or GICv2-M models. Even in this mode, you need a GIC_IRI component and a supported core. Configure them to comply with the same standard.

Models have the following limitations:

- Support for the GITS_CTLR.Quiescent bit is not complete.
- Support for ITS save/restore is not complete. Configuration stays within the model and it does not use allocated memory.
- GICD_CTLR.RWP does not perform adequately. This difference is only an issue if you use the distributor in systems with delaying interface between the distributor and the cores. Do not use this version of the model for simulation of the GIC in a setup where interfaces are not instantly reactive.

Set the environment variable `FASTSIM_GIC_MEMORY_MAP` to 1 to print to `stderr` the memory map of certain models that are included in the platform being run. This functionality is available for all GICv3 and later models.

1.5.4 GICv4 in PV models

GICv4 is an extension of the GICv3 architecture. It allows the direct injection of LPIs into a virtualized system through the `virtual-lpi-support` parameter of the `GIC_IRI` or `GIC_IRI_Filter` component.

In addition to requiring the presence of an ITS that is configured as shown in [GIC_IRI](#), GICv4 requires you to enable the virtual LPIs feature and to configure a virtual PE table using the parameters shown in this example:

```
"virtual-lpi-support"=true,  
"GITS_BASER4-type"=2 //Type 2 is Virtual PEs.  
                      //Such a table is needed for GICv4 functionality.
```

1.5.5 CP14 Debug coprocessor

Some models fully implement the CP14 Debug coprocessor registers. Other models only implement the DSCR register. This register reads as 0 and ignores writes.

External debugging must be used to debug systems containing PV models.

1.5.6 TLBs in PV models

The PV models implement Translation Lookaside Buffers (TLBs) and model most aspects of TLB behavior.

If the `device-accurate-tlb` parameter is set to `false`, the simulation uses a different number of TLBs if this improves simulation performance. The simulation is architecturally accurate, but not device accurate. Architectural accuracy is almost always sufficient. Set `device-accurate-tlb` to `true` if you require device accuracy.

These TLB registers do not have working implementations:

- Primary memory remap register.
- Normal memory remap register.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

The models do not implement device-accurate MicroTLBs, or system coprocessor registers related to MicroTLB state.

1.5.7 Memory access in PV models

PV models use a PVBUSMaster subcomponent to communicate with slaves in a System Canvas-generated system. This provides efficient access to memory-like slaves and relatively efficient access to device-like slaves.

Memory access in PV models differs from real hardware to enable fast modeling of the processor:

- All memory accesses are performed in programmer view order.
- Unaligned accesses, where permitted, are always performed as byte transfers.

In addition, some PV models do not use all the transaction states available in a PVBUS transaction. The Privileged and Instruction flags are set correctly for Arm®v7 processors but might not be set correctly in earlier architectures. However all memory accesses are atomic so `swp` instructions behave as expected.

1.5.7.1 I-side access in PV models

PV models cache translations of instructions fetched from memory-like slaves. The models might not perform further access to those slaves for significant periods. A slave can force the model to reread the memory by declaring that the memory has changed.

PV models do not model a prefetch queue but the code translation mechanism effectively acts as a prefetch queue of variable depth. Arm recommends that you follow the standards in the [Arm® architecture specifications](#) for dealing with prefetch issues, such as self modifying code, and use appropriate cache flushing and synchronization barriers.

Translation of instructions only occurs for memory-like slaves, which are those declared by devices as having type `PV::MEMORY`. Instructions fetched from device-like slaves are repeatedly fetched, decoded, and executed, significantly slowing down model performance.

1.5.7.2 D-side access in PV models

PV models cache references to the underlying memory of memory-like slaves, and might not perform further accesses to those slaves over the bus for significant periods.

Slaves declared as type `PV::MEMORY` provide the fastest possible memory access for PV processors.

Slaves declared as type `PV::DEVICE` are normally used for peripheral access.

1.5.8 Timing in PV models

Programmers View (PV) models are loosely timed.

- Caches and write buffers are not modeled, so all memory access timing is effectively zero wait state.
- All instructions execute, in aggregate, in one cycle of the component master clock input.
- Interrupts are not taken at every instruction boundary.
- Some sequences of instructions are executed atomically, ahead of the master clock of a component, so that system time does not advance during execution. This difference in behavior can affect sequential access of device registers, where devices are expecting time to move on between accesses.
- DMA to and from Tightly Coupled Memory (TCM) is atomic.

1.5.9 CADI interactions with processor behavior

Architecturally, M series processors have different reset behavior to that of A and R series processors.

For both hardware and model processors, a reset consists of asserting, and then deasserting the reset pin. However:

M series

The architecture documentation specifies that on asserting the reset pin, the processor stops executing instructions. On deasserting the reset pin, the VTOR is given its reset value, SP_main is read from address VTOR+0, and the PC is read from address VTOR+4. See the Reset behavior section and the Vector Table Offset Register, VTOR section in the [ARMv7-M Architecture Reference Manual](#). Also, the processor begins fetching and executing instructions.

A and R series

Asserting the reset pin causes the processor to stop executing instructions and the PC to be given its reset value, which depends on VINITHI, and the SP is UNKNOWN. See the Reset section in the [ARM Architecture Reference Manual ARMv7-A and ARMv7-R edition](#). On deasserting the reset pin, the processor begins fetching and executing instructions.

The behavior of reset on M series processors interacts differently with CADI debugging functionality than it does for A and R series processors.

On A and R series processors, after the reset pin of the processor is asserted, a new application can be loaded using the `CADIExecLoadApplication()` call in CADI. This loads an application into memory, and sets the PC if a start address is specified in the application. When reset is deasserted, the processor begins fetching and executing from the start address as expected. Similarly, if a debugger asserts reset on the processor, it can modify memory with a sequence of `CADIMemWrite()` calls, update the PC with a `CADIRegWrite()` call, and when reset is deasserted the processor begins to fetch and execute from the PC.

On M series processors, these techniques do not work because after reset is deasserted the processor updates SP_main and the PC, overwriting the settings made by the CADI calls.

For these techniques to be possible, the M series processor models differ slightly from the architectural reset behavior. When reset is asserted, the M series makes note of whether the PC or SP is modified before reset is next deasserted. If there are any CADI writes to the PC or SP registers, either directly through `CADIRegWrite` or indirectly through `CADIExecLoadApplication()`, this is tracked. When reset is deasserted, if the PC has been modified using CADI, the PC retains the value written to it, otherwise it reads it from address VTOR+4. Similarly, if the SP has been modified using CADI, SP_main retains the value written to it, otherwise it reads it from address VTOR+0.

1.6 Fast Models CADI implementation

Fast Models implement a subset of CADI functionality.

The following CADI methods are not supported by Fast Models:

CADI class:

Register API

`CADIGetCommittedPCs()`

Memory API

`CADIMemGetOverlays()`

Virtual Memory API

`PhysicalToVirtual()`

Cache API

- `CADIGetCacheInfo()`
- `CADICacheRead()`
- `CADICacheWrite()`

Execution API

- `CADIExecLoadApplication()`. Implemented by CPU components only
- `CADIExecUnloadApplication()`
- `CADIExecGetLoadedApplications()`. Implemented by CPU components only. It only returns the most recently loaded application if more than one have been loaded.
- `CADIExecAssertException()`
- `CADIExecGetPipeStages()`
- `CADIExecGetPipeStageFields()`
- `CADIGetCycleCount()`

CADICallbackObj class:

- `appliOpen()`
- `appliClose()`
- `cycleTick()`
- `killInterface()`

CADIDisassembler class:

- `GetSourceReferenceForAddress()`
- `GetAddressForSourceReference()`
- `GetInstructionType()`

CADIDisassemblerCB class:

- `ReceiveSourceReference()`

The following tables describe the implementation of other CADI functionality by processor models:

Table 1-4: CADI broker implementation

Feature	Implemented	Remarks
Factories	Yes	Model DLL provides a single factory.
Instances	Yes	Factory can only instantiate one model at a time.

Table 1-5: CADI target implementation

Feature	Implemented	Remarks
# breakpoints	Yes	No intrinsic limit.
Breakpoint disabling	Yes	You can disable global breakpoints, but not user breakpoints set through <code>CADIBptSet()</code> . Debuggers usually disable breakpoints with <code>CADIBptClear()</code> and re-enable them with <code>CADIBptSet()</code> , so this does not affect debugger GUIs, but it does affect the CADI C++ interface. Global breakpoints are built-in and permanent, so <code>CADIBptSet()/Clear()</code> cannot set or delete them. With <code>CADIBptConfigure()</code> , you can only enable/disable these global breakpoints to stop on certain processor events.
Breakpoint ignore count	No	-
Breakpoint formal conditions	No	-
Breakpoint free-form conditions	No	-
Breakpoint setting	Yes, but not permitted while target is running.	-
Breakpoint types	Yes: <code>CADI_BPT_MEMORY</code> , <code>CADI_BPT_PROGRAM</code> , <code>CADI_BPT_PROGRAM_RANGE</code>	All registers in the Vector register group have disabled register breakpoints. You cannot create new register breakpoints.
Breakpoint triggers	Yes: <code>CADI_BPT_TRIGGER_ON_MODIFY</code> , <code>CADI_BPT_TRIGGER_ON_READ</code> , <code>CADI_BPT_TRIGGER_ON_WRITE</code>	<code>CADI_BPT_TRIGGER_ON_WRITE</code> approximates <code>CADI_BPT_TRIGGER_ON_MODIFY</code> . If either is set, the simulation stops when a value is written, even when it does not change.
<code>CADIExecSingleStep()</code>	Yes	Fast Models ignores the <code>stepCycle</code> and <code>stepOver</code> arguments.
Intrusive debug	Yes	Stop/start can affect processor scheduling: single stepping and multiple stepping both change scheduling, and so are intrusive.
Memory read/write	Yes, but not permitted while target is running.	-
Reset	Yes	One reset level is supported. When calling <code>CADIExecReset()</code> , Arm recommends the simulation should use a <code>syncLevel</code> of 1 or higher for best results.
Runnable	Yes	-
Stop simulation	Yes	-

1.7 CADI sync watchpoints

The CADI/Synchronous CADI (SCADI) interfaces of processor components support watchpoints. Memory components like RAMDevice do not.

When the simulator hits a watchpoint, the CADI/SCADI interface emits a sequence, typically only one, of `modeChange (CADI_EXECMODE_Bpt, bptNumber)` callbacks, where `bptNumber` is the breakpoint ID of the watchpoint. After this sequence it sends a `modeChange (CADI_EXECMODE_stop)` callback. Only after the debugger receives this `stop` callback might it inspect the state of the model.

You can read additional information about the last of the hit watchpoints from these CADI registers declared by the processor in register group `simulation`:

memoryBptPC

The PC of the instruction that caused the watchpoint to hit.

memoryBptAccessVA

Virtual address of the access or sub-access that caused the watchpoint to hit.

memoryBptAccessSize

Size in bytes of the access or sub-access that caused the watchpoint to hit.

memoryBptAccessRW

Type of access or sub-access that caused the watchpoint to hit: 1 = read, 2 = write, 3 = both, 0 = no access.

These registers are not memory (or CPnn-) mapped anywhere and are not accessible to target programs. These registers are read-only. `memoryBptPC` and `memoryBptAccessVA` are 32 or 64 bit depending on the architecture. `memoryBptAccessSize` and `memoryBptAccessRW` are 32 bit.

When multiple accesses have hit watchpoints at the same time, for example during the same instruction, the information contained in these registers is valid and consistent only for one of these accesses.

Whenever at least one CADI watchpoint is set on a processor, the `syncLevel` on that processor is at least 2.

1.8 Non-CADI sync watchpoints

This section describes `syncLevel` enum values, semantics, and behaviors, with `syncLevel` values listed from fast to slow simulation, from fewer to more requirements.

1.8.1 syncLevel definitions

Definitions for the possible syncLevel values.

syncLevel 0: OFF

- The simulator runs as fast as possible. It does not permit inspection of the processor registers while the simulation is running, and does not stop synchronously when requested to do so.
- After enabling or disabling a trace source, it is undefined how many instructions will be executed before the change takes effect.
- Quantum end detection guarantees that a quantum is not overshoot indefinitely. Quantum end detection applies to (but is not limited to) backward branches, indirect jumps, exceptions, and atomic operation retries. In addition to temporal quantum end detection, some events may end a quantum, like executing a barrier, entering a low power state, or accessing a peripheral. Target software and simulation controllers must not rely on a specific scheduling pattern based on these quantum end check points.
- Use cases: normal fast simulation and normal CADI debugging while no CADI watchpoint is set.

When using CADI reset on a model, for best results, Arm recommends using a syncLevel of 1 or higher.

syncLevel 1: SYNC_STATE

- The simulation runs slightly slower than syncLevel 0. SCADI can read the up-to-date values of the processor registers, including PC and instruction count. You cannot stop the simulation synchronously.
- After enabling or disabling a trace source, it is undefined how many instructions will be executed before the change takes effect.
- Quantum end detection is as for syncLevel 0.
- Use cases: external breakpoints that block the simulation, inspect state of processor/memory from within a peripheral or memory access.

syncLevel 2: POST_INSN_IO

- As for syncLevel 1, except that you can stop the simulation synchronously from within all LD/ST and similar instructions. The simulation stops immediately after the current LD/ST instruction has been completely executed (post instruction).
- After enabling or disabling a trace source, it is likely, but not guaranteed, that the change will be visible sooner than with syncLevel 0 or 1.
- Quantum end detection is as for syncLevel 1, plus it includes the end of LD/ST instructions.
- Use cases: CADI watchpoints, external breakpoints, stopping from within LD/ST-related MTI callbacks.

syncLevel 3: POST_INSN_ALL

- As for syncLevel 2, except that you can stop the simulation synchronously from within any instruction. The simulation stops immediately after the current instruction has been completely executed (post instruction).
- After enabling or disabling a trace source, the change will be visible at the next instruction that is executed.
- Quantum end detection is as for syncLevel 2. This allows switching between syncLevels 2 and 3 without changing the simulation scheduling.
- Use cases: a `stop` from within arbitrary MTI callbacks such as the `INST` callback. This syncLevel is a fallback for all use cases that do not fall into syncLevels 0-2.

1.8.2 Controlling and observing the syncLevel

CADI watchpoints automatically register and unregister for their required syncLevel (`POST_INSN_IO`). All other use cases must explicitly register and unregister for the syncLevel they require.

Users of syncLevel write to a set of non-architectural processor registers in the CADI and SCADI interface to register and unregister for specific syncLevels. Processor registers are more suitable than CADI parameters for exposing an interface that has side effects on writes and where values might change spontaneously.

This is the exposed interface to control and observe the value of syncLevel. All these registers are in the CADI/SCADI register group `simulation` for each CT processor that contains non-architectural, simulator-specific registers. All are 32-bit integer registers. Users of syncLevel write to these registers to register and unregister for the syncLevel they require:

syncLevelSyncStateRegister

Users write to this register for `SYNC_STATE`. Write-only.

syncLevelSyncStateUnregister

Users write this to unregister for `SYNC_STATE`. Write-only.

syncLevelPostInsnIORegister

Users write to this register for `POST_INSN_LDST`. Write-only.

syncLevelPostInsnIOUnregister

Users write this to unregister for `POST_INSN_LDST`. Write-only.

syncLevelPostInsnAllRegister

Users write this to register for `POST_INSN_ALL`. Write-only.

syncLevelPostInsnAllUnregister

Users write this to unregister for `POST_INSN_ALL`. Write-only.

These registers are only for debugging and visibility in the debugger, and syncLevel users do not usually access them at all:

syncLevel

Current syncLevel. Read-only.

syncLevelSyncStateCount

User counter. Read/write (use as read-only).

syncLevelPostInsnIOCount

User counter. Read/write (use as read-only).

syncLevelPostInsnAllCount

User counter. Read/write (use as read-only).

minSyncLevel

Same as the `min_sync_level` parameter, described below. Read/write.

The `syncLevelxxxRegister` and `syncLevelxxxUnregister` registers are for syncLevel users to register and unregister themselves, by writing the value 0 to them. Changes to the syncLevel become effective at the next stop event checkpoint. In addition, syncLevel users can write to these registers any time before the simulation is running, for example from the `init()` simulation phase. The change takes effect immediately when the simulation is run.

The other registers are only present to make the debugging of these mechanisms and their users easier. The `syncLevel` register enables you to see what kind of performance you can expect from the model. You must treat access to these other registers as read-only. You can write to them, however, to permit debugging the syncLevel mechanisms.

These registers are not memory (or CPnn-) mapped anywhere, and are not accessible to target programs.

In addition to this debug register interface, there is a CADI parameter that can influence the syncLevel:

```
min_sync_level (default=0, type=int, runtime=true)
```

This parameter enables you to control the minimum syncLevel by the CADI parameter interface. This is not intended to be the primary interface to control the syncLevel because it does not enable multiple independent syncLevel users to indicate their requirements to the simulator. It is primarily for debugging purposes and for situations where a single global syncLevel setting is sufficient.

You can change this parameter at runtime, and changes become effective at the next stop event checkpoint. Reading this parameter value returns the `min_sync_level`, not the current syncLevel. This parameter is only an additional way of controlling the syncLevel and controls the same mechanisms as the register interface.

1.9 SCADI

A Synchronous CADI (SCADI) interface enables you to request a synchronous stop of the simulation. It offers direct synchronous, but unsynchronized, register and memory read access.

The intention is that this interface is used by code that is inherently synchronized with the simulation, in particular from code that is part of the simulation itself (simulation thread). Examples of code that could use this interface are SystemC and LISA peripheral device or bus access functions, and MTI callback functions that are always called synchronously by the simulation itself.

The SCADI interface is not a replacement for CADI. It is an additional interface with clear semantics that differ slightly from CADI.

1.9.1 Intended uses of CADI and SCADI

Component Architecture Debug Interface (CADI) and Synchronous CADI (SCADI) have separate design principles.

CADI

Used by debuggers and simulation controllers to control the simulation. Execution control functions are always asynchronous and are usually called from a non-simulation thread, usually the debugger GUI thread. You can also use CADI to read/write registers, memory and so on, but only from non-simulation threads, for example only from the debugger thread.

SCADI

Implements a specific subset of CADI functions, that is, mainly read/write registers and memory, set and clear breakpoints, and get disassembly. You can only use SCADI from the simulation thread itself and from threads that can make sure on their own that the simulation is currently blocked, for example a debugger thread while it is sure that the simulation is in a stable state. SCADI is intended to be used from within peripheral read/write accesses while the simulation is running, or from within MTI callbacks that the simulation is running.

SCADI does not implement and execute control functions except `CADIExecStop()`, because only stop makes sense from within the simulation thread. Asynchronous functions such as `CADIExecContinue()` and `CADIExecSingleStep()` are not supported by SCADI, so for these you must use CADI instead.

The `SCADI::CADIExecStop()` function is the exception, because for CADI this means “stop when it is convenient for the simulation”, which is asynchronous, but `CADIExecStop()` is synchronous and means “stop now”, which you enable with the appropriate `syncLevel >= 2`.

The guidelines are:

- Use CADI for execution control.
- Use CADI or SCADI for read/write registers and memory, depending on the situation:

- Use SCADI if the caller can make sure that the accesses are (potentially inherently) synchronized with the simulation.
- Use CADI if called from a debugger thread that does not know exactly whether the simulation is running or is in a stable state.

1.9.2 Responsibilities of the SCADI caller

Synchronous interface means that the caller of SCADI functions is always responsible for ensuring that the simulation is in a stable state.

Being in a stable state means that the simulation does not advance while the call is being made. The caller is also responsible for meeting all host thread and synchronization requirements of any external bus slaves that are directly or indirectly connected to the memory bus.

1.9.3 SCADI interface access

You can obtain the SCADI interface from the same `CAInterface` pointers that provide the CADI and MTI interfaces.

This is done using the `CAInterface::ObtainInterface()` method. The interface names for the normal CADI and MTI interfaces are `CADI::IFNAME()` and `ComponentTraceInterface::IFNAME()`, respectively.

The interface name for the SCADI interface to pass into `ObtainInterface()` is `"eslapi.SCADI2"` and the interface revision is 0. There are no `IFNAME()` and `IFREVISION()` static functions defined for SCADI, and a plain string constant and integer constant (0) are used instead.

The pointer returned by `CAInterface::ObtainInterface("eslapi.SCADI2")` must be cast into an `eslapi::CADI` class pointer, that is, the same class as for `eslapi.CADI2`, the normal CADI interface class.

1.9.3.1 Access to SCADI from within LISA components

To access the SCADI interface of the LISA component itself, use the `getSCADI()` function. This returns the SCADI interface of the LISA component itself.

To access the SCADI interfaces of other components in the system, use the `getGlobalInterface()` function. This returns a `CAInterface` pointer to a simulation-wide Component Registry.

You then have to use this registry pointer with the `obtainComponentInterfacePointer()` function to obtain the `SystemTraceInterface`. This interface provides a list of all components in the system that provide trace data. You can use this list to access the SCADI interfaces of all the components.

1.9.3.2 Access to SCADI from within SystemC

To access the SCADI interfaces from within SystemC, use the `scx_get_global_interface()` function. This returns a `CAInterface` pointer to a simulation-wide Component Registry.

You then have to use this registry pointer with the `obtainComponentInterfacePointer()` function to obtain the `SystemTraceInterface`. This interface provides a list of all components in the system that provide trace data. You can use this list to access the SCADI interfaces of all the components.

1.9.3.3 Access to SCADI from MTI plug-ins

MTI plug-ins can gain access to SCADI interfaces by using the `CAInterface` pointer, which is passed as a parameter to the `RegisterSimulation()` function.

This pointer has the same semantics as the `CAInterface` pointer returned by the `getGlobalInterface()` functions in the SystemC or LISA use cases.

1.9.3.4 Example code for retrieving a SCADI interface pointer of a component

This code demonstrates how to use `getGlobalInterface()` to retrieve a SCADI interface pointer of a specific component.

From within LISA, use `getGlobalInterface()`. From within SystemC, it is assumed that you have a pointer to the Fast Models platform called `platform`. From within an MTI plug-in, you do not have to call `getGlobalInterface()`, and you can use the `CAInterface` pointer passed to `RegisterSimulation()`.

```
#include "sg/SGComponentRegistry.h"
eslapi::CADI *Peripheral::get_SCADI_interface(const char *instanceName)
{
    // get access to MTI interface (SystemTraceInterface)
    // - this code is for a SystemC peripheral
    // - for LISA this would be just 'getGlobalInterface()'
    // - for MTI plugins this would be just using the CAInterface *caif pointer passed
    // into RegisterSimulation()
    eslapi::CAInterface *globalInterface = scx::scx_get_global_interface();
    const char *errorMessage = "(no error)";
    MTI::SystemTraceInterface *mti = 0;
    if (globalInterface)
        mti = sg::obtainComponentInterfacePointer<MTI::SystemTraceInterface>
            (globalInterface,
             "mtiRegistry",
             &errorMessage);

    if (mti == 0)
    {
        printf("ERROR:MTI interface not found! (%s)\n", errorMessage);
        return 0;
    }
    // find component with instanceName
    eslapi::CAInterface *compif = 0;
    for (MTI::SystemTraceInterface::TraceComponentIndex i = 0;
         i < mti->GetNumOfTraceComponents();
         i++)
    {
        const char *name = mti->GetComponentTracePath(i);
        if (verbose)
```

```

        printf("TEST MTI component '%s'\n", name);
        if (strcmp(name, instanceName) == 0)
            compif = mti->GetComponentTrace(i);
    }
    if (!compif)
    {
        printf("ERROR:instance '%s' not found while trying to get SCADI! \n",
               instanceName);
        return 0;
    }
    // get and return SCADI interface
    return static_cast<eslapi::CADI *>(compif->ObtainInterface("eslapi.SCADI2", 0,
0));
}

```

1.9.4 SCADI semantics

This section lists the available subset of functionality and the differences in semantics from the CADI interface.

The SCADI interface provides a subset of functionality of the CADI interface. All functions in SCADI differ from the CADI functions, that is, the caller is responsible for satisfying the constraints and requirements in terms of synchronization with the simulation.

These functions have the same semantics as in CADI:

- CADIRegGetGroups()
- CADIRegGetMap()
- CADIRegGetCompount()
- CADIMemGetSpaces()
- CADIMemGetBlocks()
- CADIMemGetOverlays()
- CADIGetParameters()
- CADIGetParameterInfo()
- CADIXfaceGetFeatures()

The following debug read access functions have the same semantics as in CADI, but the values that these read access functions return might differ from the values returned by the corresponding CADI functions because some of the accessed resource values might change during the execution of an instruction.

The values of resources that are modified by the current instruction are **UNKNOWN**, except the PC, which always reflects the address of the last instruction that was issued. Reading and writing registers and memory while the simulation is running is generally only useful for `syncLevel >= SL_SYNC_STATE`. For `SL_OFF`, all registers and all memory locations are always **UNKNOWN** while the simulation is running.

- CADIRegRead()
- CADIMemRead()

- `CADIGetParameterValues()`
- `CADIGetInstructionCount()`
- `CADIGetPC()`
- `CADIGetDisassembler()`

The following write access functions always provide write access to the register in the `simulation` register group. They also might provide limited write access semantics to certain resources. A SCADI implementation might choose not to support any write access to core registers and memory:

- `CADIRegWrite()`
- `CADIMemWrite()`
- `CADISetParameters()`

The breakpoint functions have nearly all the same semantics as in the CADI interface, except that changes to breakpoints only become effective at the next stop event checkpoint defined by the current `syncLevel`. Changes might also only become visible in `CADIBptRead()` and `CADIBptGetList()` at this next synchronization point.

- `CADIBptGetList()`
- `CADIBptRead()`
- `CADIBptSet()`
- `CADIBptClear()`
- `CADIBptConfigure()`

Execution control is limited to stopping the simulation. The simulation stops at the next synchronization point as defined by the current `syncLevel`:

- `CADIExecStop()`.

All other functions are unsupported, and return `CADI_STATUS_CmdNotSupported`.

1.10 User mode networking

User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts.

This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running. Fast Models supports the following kinds of Ethernet device models:

SMSC_91C111

This is paired with an external `HostBridge` component. The user mode networking specification is set on the external `HostBridge`.

VirtioNetMMIO

This has a built-in HostBridge sub-component. The user mode networking specification is set on the internal HostBridge.

Note

- You can use TCP and UDP over IP, but not ICMP (ping).
- User mode networking does not support forwarding UDP ports on the host to the model.
- You can only use DHCP within the private network.
- You can only make inward connections by mapping TCP ports on the host to the model. This is common to all implementations that provide host connectivity using NAT.
- Operations that require privileged source ports, for example NFS in its default configuration, do not work.
- If setup fails, or the parameter syntax is incorrect, there is no error reporting.

To enable user mode networking, run the model with the following CADI parameters to activate the components:

SMSC_91C111:

```
-C motherboard.hostbridge.userNetworking=true
-C motherboard.smc_91c111.enabled=true
```

VirtioNetMMIO:

```
-C motherboard.virtio_net.hostbridge.userNetworking=true
-C motherboard.virtio_net.enabled=true
```

To map a host TCP port to a model port, run the model with the `userNetPorts` parameter. This parameter allows services to appear to be listening on privileged ports in the model but be mapped to unprivileged ports on the host. The syntax is a comma-separated list of items in the form:

```
[host-ip:]hostport=[model-ip:]modelport
```

For example, to map port 8022 on the host to port 22 on the model, use this parameter:

SMSC_91C111:

```
-C motherboard.hostbridge.userNetPorts=8022=22
```

VirtioNetMMIO:

```
-C motherboard.virtio_net.hostbridge.userNetPorts=8022=22
```

Either or both of a host IP address and model IP address can optionally be specified on either side of the assignment to select a specific interface on which the mapping will occur. For example:

```
127.0.0.1:8022=127.0.0.1:22
```

The default is to accept connections on any interface.

Related information

- [HostBridge](#)

1.11 TAP/TUN networking

This section describes TAP/TUN networking.

1.11.1 TAP/TUN networking limitations

This section describes general limitations of TAP/TUN networking for models.

DHCP

If the host uses Dynamic DNS, it inserts records into DNS. If you manage this host with DHCP, then installing TAP networking can cause failure to register in the DNS. After the physical device attaches to the bridge device, the DHCP client reruns, but the DHCP request does not have the correct hostname.

WiFi

Most WiFi adaptors do not implement the required support for TAP networking to work.

1.11.2 Setting up a network connection for Microsoft Windows

This section describes how to set up a network connection.

Before you begin

The Fast Models networking environment needs the Third Party IP add-on for the Fast Model Portfolio.

Procedure

1. Close all non-essential applications.
2. Install the TAP driver and configure it:
 - a) Locate the Fast Models Portfolio, by default `C:\Program Files\ARM\FastModelsPortfolio_X.Y\`.
 - b) Execute the `ModelNetworking\add_adapter_64.bat` file.
3. Select **Start > Control Panel > Network Connections** and locate the newly installed TAP device.
4. Select at least one real Ethernet adapter connection. Press the **Ctrl** key to multi-select.
5. Right-click and select **Bridge Connections**.

1.11.3 Configuring the networking environment for Microsoft Windows

This section describes how to set the parameters to make a network connection.

About this task

- This procedure has not been tested with wireless network adapters.
- Firewall software might block network traffic in the network bridge, and might result in a networking failure in the model. If the model does not work after configuration, check the firewall settings.

Procedure

1. Set the appropriate parameters on the `HostBridge` and `SMSC_91C111` components, or on the `VirtioNetMMIO` component and its `HostBridge` subcomponent. For example:

SMSC_91C111:

```
hostbridge.interfaceName="ARM<x>"
smc_91c111.enabled=1
```

VirtioNetMMIO:

```
virtio_net.hostbridge.interfaceName="ARM<x>"
virtio_net.enabled=1
```

`ARM<x>` is an adapter that is built into the network bridge, and is 0 by default. Use `x+1` if `ARM<x>` exists.

2. Set another parameter on the device, if you have to enable promiscuous mode for the TAP device.
 - a. Select **Start > Run > cmd.exe**.
 - b. Enter the following commands.

```
netsh bridge show adapter
netsh bridge set adapter <N> forcecompatmode=enable
```

`<N>` is the id number of the TAP adapter that the first command lists.

1.11.4 Commands for `tap_setup_32.exe` or `tap_setup_64.exe` for Microsoft Windows

This section lists the commands for use with `tap_setup_32.exe` or `tap_setup_64.exe`. These files are located in the `ModelNetworking` directory.

help

Print help information.

set_media

Configure the TAP devices to `Always Connected`.

set_perm

Configure the TAP devices to `Non-admin Accessible`.

restart

Restart the TAP devices.

list_dev

List available TAP devices and output to a file.

rename

Rename the device to **ARMx**.

install <infile> <id>

Install a TAP Win32 or Win64 adapter.

remove <dev>

Remove TAP Win32 or Win64 adapters. Set <dev> to `All` to remove all tap devices.

setup <infile> <id>

Automated setup process.

1.11.5 Uninstalling networking for Microsoft Windows

This section describes how to uninstall TAP adapters from the base location of the Fast Models Portfolio, by default `C:\Program Files\ARM\FastModelsPortfolio_X.Y`.

Procedure

1. Run the `remove_all_adapters_32.bat` Or `remove_all_adapters_64.bat` file. These files are located in the `ModelNetworking` directory.
2. If the uninstallation does not delete the bridge, delete it manually:
 - a) Close all non-essential applications.
 - b) Select **Network Connections**.
 - c) Right-click on the bridge and select **Delete**.

1.11.6 Setting up a network connection for Red Hat Enterprise Linux

This section describes how to set up a network connection.

Before you begin

Ensure that the `brctl` utility is on your system. This utility is in the installation package, but we recommend that you use the standard Linux bridge utilities, which are in the Linux distribution.

About this task

- Perform this procedure once for each host machine.
 - The setup and configuration instructions assume that your network provides IP addresses by DHCP. Otherwise, consult your network administrator.
-

Procedure

1. In a shell, change to the `FastModelsPortfolio_<X.Y>/ModelNetworking` directory.
2. Run the following script from this directory, because it does not work correctly if run from any other location:

32-bit operating system

Run `add_adapter_32.sh` as root. For example, `sudo ./add_adapter_32.sh`.

64-bit operating system

Run `add_adapter_64.sh` as root. For example, `sudo ./add_adapter_64.sh`.

3. The prompt appears: **Specify the TAP device prefix:(ARM)**. Select **Enter** to accept the default.
 4. The prompt appears: **Specify the user list**. Enter a space-separated list of all users who are to use the model on the network, then select **Enter**. All entries in the list must be the names of existing user accounts on the host.
 5. The prompt appears: **Enter the network adapter which connects to the network:(eth0)**. Select **Enter** to accept the default, or input the name of a network adapter that connects to your network.
 6. The prompt appears: **Enter a name for the network bridge to create:(armbr0)**. Select **Enter** to accept the default, or input a name for the network bridge. You must not have an existing network interface on your system with the selected name.
 7. The prompt appears: **Enter the location to write the init script to:(/etc/init.d/FMNetwork)**. Select **Enter** to accept the default, or input another path with a new filename in an existing directory.
 8. The prompt appears: **WARNING: the script creates a bridge which includes the local network adapter and tap devices. You may suffer temporary network loss. Do you want to proceed? (Yes or No)**. Verify all values input so far, and enter **Yes** if you want to proceed. If you enter **No**, no changes are made to your system.
 9. A prompt appears to inform you of the changes that the script is to make to your system. Input **Yes** if you are happy to accept these changes, or input **No** to leave your system unchanged.
-

After entering **Yes**, you might temporarily lose network connectivity. Also, the IP address of the system might change.

Next steps

The network bridge is disabled after the host system is reset. To configure the host system to support bridged networking, you might have to create links to the `init` script (FMNetwork). The script suggests some appropriate links for Red Hat Enterprise Linux.

The default firewall configuration on Red Hat Enterprise Linux blocks packet transmission across the TAP networking bridge device. You can disable the firewall. If the context makes this unwise, then add firewall rules to allow transmission. These `iptables` commands configure the firewall to allow packets across the bridge device:

```
iptables -I FORWARD -m physdev --physdev-is-bridged -j ACCEPT
service iptables save
service iptables restart
```

1.11.7 Setting up a network connection for Ubuntu Linux

This section describes how to set up a network connection.

About this task

To use TAP networking with Fast Models on Ubuntu, set up a TAP device manually by following these steps. This guide uses a network interface `eth0` and a username `fmuser`. Replace these values as appropriate.

Typographic errors when modifying the network configuration can cause failure to connect to the network. We recommend performing these steps on a machine that you have physical access to.

Procedure

1. If it is not present, add `eth0` to the interfaces file `/etc/network/interfaces`. This step stops network-manager from managing `eth0`. It can result in network-manager indicating there is no network connection even if there is. You must have root privileges for this step.

Use one of the following ways:

- For an interface using DHCP, add:

```
auto eth0
iface eth0 inet dhcp
```

- To configure a static IP address, add the static information, for example:

```
auto eth0
iface eth0 inet static
address 192.168.0.2
netmask 255.255.255.0
gateway 192.168.0.1
```

The network notifier applet launches the GUI tool network-manager. It automatically configures network devices that `/etc/network/interfaces` does not manage, and sets up devices in a way that is incompatible with bridging. This step ensures that network-manager does not manage the network interface that you want to bridge to. If you are unsure how to configure your network interface, ask your network administrator.

2. Install the bridge-utils package:

```
sudo apt-get install bridge-utils
```

This step provides the `brctl` command for creating and managing the network bridge.

3. Create a bridge device by adding this entry to `/etc/network/interfaces`:

```
auto armbr0
iface armbr0 inet dhcp
pre-up ifconfig eth0 0.0.0.0 promisc
post-down ifconfig eth0 0.0.0.0 -promisc
```

The pre-up and post-down lines give commands to execute before bringing up `armbr0` and after bringing it down. These commands put `eth0` into promiscuous mode at pre-up and take it out of promiscuous mode at post-down. Promiscuous mode makes sure that the hardware does not filter out packets for the virtual ethernet device.

This step creates a bridge device that is called `armbr0` from Fast Models TAP devices to the physical network.

4. Create the TAP devices. TAP devices need permission for specific users, so create one for each user who is to run the model with the virtual ethernet device.
For example, to create a TAP device called `ARMfmuser` for the user `fmuser`, add the following lines to the `armbr0` section of `/etc/network/interfaces`.

```
pre-up ip tuntap add dev ARMfmuser mode tap user fmuser
pre-up ifconfig ARMfmuser 0.0.0.0 promisc
post-down ip tuntap del dev ARMfmuser mode tap
```

This step creates a TAP device for each user.

5. Create a bridge between the TAP devices and the network interface `eth0` by adding a `bridge_ports` line to the `armbr0` section of `/etc/network/interfaces`. For example, for a TAP device that is named `ARMfmuser`, add the following line:

```
bridge_ports eth0 ARMfmuser
```

6. The added `/etc/network/interfaces` code now looks like this:

```
auto armbr0
iface armbr0 inet dhcp
pre-up ifconfig eth0 0.0.0.0 promisc
post-down ifconfig eth0 0.0.0.0 -promisc
pre-up ip tuntap add dev ARMfmuser mode tap user fmuser
pre-up ifconfig ARMfmuser 0.0.0.0 promisc
post-down ip tuntap del dev ARMfmuser mode tap
bridge_ports eth0 ARMfmuser
```

- Restart network services by either restarting the computer or by running the following commands:

```
sudo ifdown eth0 && sudo ifup eth0
sudo ifup armbr0
sudo service network-manager restart
```

armbr0 must be explicitly started.

This step disconnects and reconnects all network interfaces.

1.11.8 Configuring the networking environment for Linux

This section describes how to set the parameters to make a network connection.

Before you begin

Use System Canvas or a related Fast Models tool to load a project or model, and then select a component.

About this task

Firewall software might block network traffic in the network bridge, and result in a networking failure. If the model does not work after configuration, check the firewall settings.

Procedure

Set the parameters on the `HostBridge` and `SMSC_91C111` components, or on the `virtioNetMMIO` component and its `HostBridge` subcomponent. For example:

SMSC_91C111:

```
hostbridge.interfaceName=ARM<username>
smc_91c111.enabled=1
```

VirtioNetMMIO:

```
virtio_net.hostbridge.interfaceName=ARM<username>
virtio_net.enabled=1
```

ARM<username> is an adapter that is built into the network bridge.

Related information

[Fast Models Tools User Guide](#)

1.11.9 Solutions to networking issues on Linux

This section describes how to solve networking issues.

The model networking works after initial setup, but stops working after reboot

Set the correct access permissions for the `/dev/net/tun` device, by executing `chmod 666 /dev/net/tun` as root. To preserve the change across reboots, modify the udev rules of the TAP device by opening `/etc/udev/rules.d/50-udev.rules` as root, and finding the line:

```
KERNEL=="tun", NAME="net/%k"
```

If it does not have `MODE="0666"` at the end of the line, append `MODE="0666"`:

```
KERNEL=="tun", NAME="net/%k", MODE="0666"
```

Model networking installs correctly, but when a model starts up, the model cannot receive packets

Disable the firewall on the host machine, or add the TAP device to `trusted devices`.

Refer to the vendor's documentation manual.

1.11.10 Disabling and re-enabling networking for Linux

This section describes how to disable and re-enable networking with an `init` script.

About this task

These operations remove/restore TAP devices and the network bridge. There is a temporary loss of network connectivity and your IP address might change.

Procedure

1. To disable networking without uninstalling it, invoke the installed `init` script (by default, `/etc/init.d/FMNetwork`) as root with the parameter `stop`:

```
sudo /etc/init.d/FMNetwork stop
```

2. To re-enable networking, invoke the `init` script as root with the parameter `start`:

```
sudo /etc/init.d/FMNetwork start
```

1.11.11 Uninstalling networking for Linux

This section describes the steps to uninstall a network.

Procedure

1. In a shell, change to the `/FastModelsPortfolio_X.Y/ModelNetworking/` directory.
2. Run `uninstall.sh` as root, passing the location of the `init` script (FMNetwork):

```
sudo ./uninstall.sh /etc/init.d/FMNetwork
```

You must run this script from the directory in which it is installed, because it does not work correctly if run from any other location.

There is a temporary loss of network connectivity and your IP address might change.

Next steps

The uninstall script removes everything that can be safely removed. It does not remove:

- symlinks to the `init` script. You must remove any symlinks that you have created.
- `/sbin/brcctl`. Removing this is optional.

1.12 Using parameters to set port values

Some processor and peripheral component ports are almost always static in value when used as part of a typical platform. For example, the reset vector base address register address (RVBARADDR) port in processor components.

To facilitate easy configuration of platform models, the IP models for these components can provide a shadow parameter for these ports. This parameter can be used to change the value that is used by the model. In these cases, the following rules apply:

- If a port is driven in the platform model, then the parameter value is ignored.
- If a port is not driven in the platform model, then the parameter value is sampled at both simulator reset, and at every subsequent simulation reset of the specific IP model.

Simulator reset corresponds with the LISA `reset()` behavior and the SystemC `start_of_simulation()` callback.

- All ports and parameters that are sampled at reset are sampled when the simulation reset signal concerned is deasserted.

- If a port is not driven in the platform model, and a parameter has not been set, then the default value for the parameter is used.

In some IP models, the value of some ports can only be set by using a parameter. That is, the parameter is provided instead of the port.

1.13 PVBUS C++ transaction and Tx_Result classes

This section describes the C++ transaction and `Tx_Result` classes.

1.13.1 Class `pv::TransactionGenerator`

This class provides efficient mechanisms for bus masters to generate transactions that are transmitted over the `pvbustm` port of the associated PVBUSMaster subcomponent.

You can produce `pv::TransactionGenerator` objects by invoking the `createTransactionGenerator()` method on the control port of a PVBUSMaster component.

```
class pv::TransactionGenerator
{
    // Tidy up when TransactionGenerator is deleted.
    ~TransactionGenerator()

    // Control AXI-specific signal generation for future transactions.
    // Privileged processing mode.
    void setPrivileged(bool priv = true);

    // Instruction access (vs data).
    void setInstruction(bool instr = true);

    // Normal-world access (vs secure).
    void setNonSecure(bool ns = true);

    // Locked atomic access.
    void setLocked(bool locked = true);

    // Exclusive atomic access.
    void setExclusive(bool excl = true);

    // Generate transactions.
    // Generate a read transaction.
    bool read(bus_addr_t, pv::AccessWidth width, uint32_t *data);

    // Generate a write transaction.
    bool write(bus_addr_t, pv::AccessWidth width, uint32_t const *data);

    // Generate read transactions.
    bool read8(bus_addr_t, uint8_t *data);
    bool read16(bus_addr_t, uint16_t *data);
    bool read32(bus_addr_t, uint32_t *data);
    bool read64(bus_addr_t, uint64_t *data);

    // Generate write transactions.
    bool write8(bus_addr_t, uint8_t const *data);
    bool write16(bus_addr_t, uint16_t const *data);
    bool write32(bus_addr_t, uint32_t const *data);
    bool write64(bus_addr_t, uint64_t const *data);
};
```

1.13.2 TransactionGenerator efficiency considerations

TransactionGenerators are most efficient for multiple accesses to one 4KB page.

Each TransactionGenerator caches connection information internally. This improves efficiency for multiple accesses to a single 4KB page. If a component requires repeated access data from different pages, for example when streaming from one location to another, we recommend you create a TransactionGenerator for each location.

You can dynamically create and destroy TransactionGenerators, but it is better to allocate them once at initialization and destroy them at shutdown. See the example in `$PVLIB_HOME/examples/LISA/BusComponents/DmaTransfer.lisa`.

1.13.3 Enum `pv::AccessWidth`

This enum selects the required bus width for a transaction.

Defined values are:

- `pv::ACCESS_8_BITS`
- `pv::ACCESS_16_BITS`
- `pv::ACCESS_32_BITS`
- `pv::ACCESS_64_BITS`

1.13.4 Class `pv::Transaction`

This class is a base class for read and write transactions that are visible in the PVBUSSlave subcomponent. It contains functionality common to both types of transaction.

This class provides an interface that permits bus slaves to access the details of the transaction. Do not instantiate these classes manually. The classes are generated internally by the PVBUS infrastructure.

This base class provides access methods to get the transaction address, access width, and bus signals. It also provides a method to signal that the transaction has been aborted.

```

class pv::Transaction
{
public:
    // Accessors
    bus_addr_t getAddress() const;           // Transaction address.
    pv::AccessWidth getAccessWidth() const; // Request width.
    int getAccessByteWidth() const;          // Request width in bytes.
    int getAccessBitWidth() const;           // Request width in bits.

    bool isPrivileged() const; // Privileged process mode?
    bool isInstruction() const; // Instruction request vs data?
    bool isNonSecure() const;  // Normal-world vs secure-world?
    bool isLocked() const;     // Atomic locked access?
    bool isExclusive() const;  // Atomic exclusive access?

```

```

uint32_t getMasterID() const;
bool hasSideEffect() const;

// Generate transaction returns
Tx_Result generateAbort();           // Cause the transaction to abort.
Tx_Result generateSlaveAbort();       // Cause the transaction to abort.
Tx_Result generateDecodeAbort();     // Cause the transaction to abort.
Tx_Result generateExclusiveAbort();  // Cause the transaction to abort.
Tx_Result generateIgnore();
};

```

1.13.5 Class pv::ReadTransaction

This class extends the pv::Transaction class to provide methods for returning data from a bus read request.

```

class ReadTransaction : public Transaction
{
public:
    /*! Return a 64-bit value on the bus. */
    Tx_Result setReturnData64(uint64_t);

    /*! Return a 32-bit value on the bus. */
    Tx_Result setReturnData32(uint32_t);

    /*! Return a 16-bit value on the bus. */
    Tx_Result setReturnData16(uint16_t);

    /*! Return an 8-bit value on the bus. */
    Tx_Result setReturnData8(uint8_t);

    /*! This method provides an alternative way of returning a Tx_Result
     * success value (instead of just using the value returned from
     * setReturnData<n>()).
     *
     * This method can only be called if one of the setReturnData<n>
     * methods has already been called for the current transaction.
     */
    Tx_Result readComplete();
};

```

1.13.6 Class pv::WriteTransaction

This class extends the pv::Transaction class to provide methods for returning data from a bus write request.

```

class WriteTransaction : public Transaction
{
public:
    /*! Get bottom 64-bits of data from the bus. If the transaction width
     * is less than 64-bits, the data is extended as appropriate.
     */
    uint64_t getData64() const;

    /*! Get bottom 32-bits of data from the bus. If the transaction width
     * is less than 32-bits, the data is extended as appropriate.
     */
    uint32_t getData32() const;

    /*! Get bottom 16-bits of data from the bus. If the transaction width

```

```
* is less than 16-bits, the data is extended as appropriate.
*/
uint16_t getData16() const;

/*! Get bottom 8-bits of data from the bus. If the transaction width
* is less than 8-bits, the data is extended as appropriate.
*/
uint8_t getData8() const;

/*! Signal that the slave has handled the write successfully.
*/
Tx_Result writeComplete();
};
```

1.14 Visualisation library

The Visualisation library does not model hardware directly but instead provides components, protocols, and a library. These permit a GUI display that lets you interact with the external I/O from the model platform.

The types of I/O handled include:

- LCD display, such as the output from the PL110_CLCD component display port.
- LEDs representing values from a ValueState port as either single lights, or as segmented alphanumeric displays.
- DIP switches, which can drive a ValueState port.
- Capture of keyboard and mouse input, using the KeyboardStatus and MouseStatus protocols to feed input to a PS2Keyboard or PS2Mouse component.
- Background graphics, custom rendered graphics, and clickable push buttons, permitting the UI to display a skin representing the physical appearance of the device being modeled.
- Status information such as processor instruction counters, with values taken from the InstructionCount port of a processor.

The Visualisation library provides a C++ API that enables you to write your own visualization components in LISA+. These custom components can display any combination of the supported I/O types.

You can add the prebuilt GUIPoll component to your custom component. The GUIPoll component provides a LISA visualization component with a periodic signal that keeps the display updated, even when the simulation is stopped.

The Visualisation library supports one signaling protocol, the LCD protocol.

Related information

[LCD protocol](#) on page 80

[LISA visualisation models](#) on page 59

[Visualisation library C++ classes](#) on page 60

1.14.1 LISA visualisation models

The visualisation components provide a host window to display status information in addition to a frame buffer.

Each example platform model contains its own LISA visualisation model. You can use the model as the basis for your own visualization-containing components, such as the PL110_CLCD component. To use the visualisation components in your own system, copy the component LISA files from the relevant platform model directory, because they are not in the generic model library.

1.14.2 Visualisation library C++ classes

This section describes the C++ classes and structures in the Visualisation library.

1.14.2.1 C++ classes inclusion

To use these Visualisation library classes, begin your LISA component with the correct `#include` statement.

```
includes
{
#include "components/Visualisation.h"
}
```

1.14.2.2 Class Visualisation

The `visualisation` class is the API for creating a custom LISA visualization component.

A component obtains an instance of this class by calling the global function `createVisualisation()`. The component can then use this instance to control the size and layout of the visualization window:

Visualisation *createVisualisation()

This function generates an instance of the Visualisation library. You can only call this function once, because SDL only supports opening a single display window. The Visualisation library is implemented using the Simple DirectMedia Layer (SDL) cross-platform rendering library.

The `visualisation` class has the following methods:

~Visualisation()

Destructor for the Visualisation library. You must only call this method when your simulation is shutting down, after all allocated resources (`VisRenderRegions`, `VisPushButtonRegions`, `VisBitmaps`) have been deleted.

void configureWindow(unsigned int width, unsigned int height, unsigned int bit_depth)

Sets the visualization window to the requested size and bit depth. Depending on the display capabilities, the window might actually get a different bit depth from the size you requested.

VisBitmap *loadImage(char const *filename)

Allocates a new VisBitmap object, initialized by loading a Microsoft Windows Bitmap (.BMP) from the given file.

VisBitmap *loadImageWithAlphaKey(char const *filename, unsigned int red, unsigned int green, unsigned int blue)

Allocates a VisBitmap object, as with `loadImage()`. All pixels of the color specified by `red`, `green`, `blue` are converted into a transparent alpha channel.

VisBitmap *cropImage(VisBitmap *source, int x, int y, unsigned int width, unsigned int height)

Allocates a new VisBitmap object, by cropping a region from the source bitmap.

void releaseImage(VisBitmap *)

Releases the resources held by the given VisBitmap. The underlying bitmap is only to be unloaded if it is not in use.

void setBackground(VisBitmap *background, int x, int y)

Sets the background image for the visualization window. This takes a copy of the data referenced by the VisBitmap, so it is safe for the client to call `releaseImage(background)` immediately after calling `setBackground()`. The background is not displayed until the first call to `poll()`.

VisRenderRegion *createRenderRegion()

Allocates a new VisRenderRegion object that can be used to display arbitrary graphics, including LCD contents, in a rectangular region.

VisPushButtonRegion *createPushButtonRegion()

Allocates a new VisPushButtonRegion, which can be placed at a location on the display to provide a clickable push button.

bool poll(VisEvent *event)

Permits the Visualisation library to poll for GUI events. The client passes a reference to a VisEvent structure, which receives details of a single mouse/keyboard event.

The method returns false if no events have occurred.

Your LISA visualization implementations must call this periodically by using a GUIPoll component. On each `gui_callback()` event, you must ensure that the visualization component repeatedly calls `poll()` until it returns false.

void lockMouse(VisRegion *region)

Locks the mouse to the visualization window and hides the mouse pointer.

void unlockMouse()

Unlocks and redisplay the mouse pointer.

bool hasQuit()

Returns true if the user has clicked on the close icon of the visualization window.

1.14.2.3 Class VisRegion

This class is the common base class for VisPushButtonRegion and VisRenderRegion, representing a region of the visualization display.

~VisRegion()

Permits clients to delete a VisPushButtonRegion when it is no longer required.

void setId(void *id)

Permits a client-defined identifier to be associated with the region.

void *getId()

Returns the client-defined identifier.

void setVisible(bool vis)

Specifies whether the region is to be displayed on the screen. This is currently ignored by the SDL implementation.

void setLocation(intx, int y, unsigned int width, unsigned int height)

Sets the location of this region relative to the visualization window.

1.14.2.4 Class VisPushButtonRegion : public VisRegion

This class defines a region of the visualization window that represents a clickable button.

Optionally, the button can provide different VisBitmap representations for a button-up and a button-down graphic, and a graphic to use when the mouse pointer rolls over the button.

In addition to the public method defined in VisRegion, this class defines these methods:

- `void setButtonUpImage(VisBitmap*bmpUp) : void`
- `setButtonDownImage(VisBitmap*bmpDown) : void`
- `setButtonRollOverImage(VisBitmap*bmpRollover)`

These methods set the graphics to be used for each of the button states. If any image is not specified or is set to NULL, then the corresponding area of the visualization background image is used.

The VisPushButtonRegion takes a copy of the VisBitmap, so the client can safely call `Visualisation::releaseBitmap()` on its copy.

- `void setKeyCode(intcode)`

This method sets the code for the keypress event that is generated when the button is pressed or released.

1.14.2.5 Class VisRenderRegion : public VisRegion

This class defines a region of the visualization window that can render client-drawn graphics, including a representation of the contents of an LCD.

In addition to the public method defined in VisRegion, the class defines these methods:

VisRasterLayout const *lock()

Locks the region for client rendering. While the buffer is locked, the client can modify the pixel data for the buffer. You must not call the methods `writeText()` and `renderBitmap()` while the buffer is locked.

void unlock()

Releases the lock on the render buffer, permitting the buffer to be updated on screen.

void update(int left, int top, unsigned int width, unsigned int height)

Causes the specified rectangle to be drawn to the GUI.

int writeText(const char *text, int x, int y)

Renders the given ASCII text onto an unlocked VisRenderRegion. The return value is the x co-ordinate of the end of the string. The default font is 8 pixels high, and cannot be changed.

void renderBitmap(VisBitmap *bitmap, int x, int y)

Draws a bitmap onto an unlocked VisRenderRegion.

1.14.2.6 Struct VisRasterLayout

This struct defines the layout of the pixel data in a frame-buffer.

The `lock()` method of the LCD protocol expects to be given a pointer to this structure. You can generate a suitable instance by calling `VisRasterRegion::lock()`.

The structure contains these fields:

uint8_t* buffer

This points to the buffer for the rasterized pixel data. The controller can write pixels into this buffer, but must stay within the bounds specified by the width and height.

uint32_t pitch

The number of bytes between consecutive raster lines in the pixel data. This can be greater than the number of bytes per line.

uint32_t width

The width, in pixels, of the render area. This value can be less than the width requested by the LCD controller when it called `lock()`.

uint32_t height

The height, in pixels, of the render area. This value can be less than the height requested by the LCD controller when it called `lock()`.

VisPixelFormat format

This structure defines the format of the pixel data in the raster buffer.

bool changed

This is set to true if the pixel format or buffer size has changed since the previous call to `lock()`.

Pixel data is represented as a one-dimensional array of bytes. The top-left pixel is pointed to by the `buffer` member. Each pixel takes up a number of bytes, given by `format.pbytes`.

The pixel at location (x, y) is stored in the memory bytes starting at:

```
buffer[y * pitch + x * format.pbytes]
```

1.14.2.7 Struct VisPixelFormat

This struct specifies the format of pixel data within the buffer.

The members are:

uint32_trbits, gbits, bbits

The number of bits per color channel.

uint32_t roff, goff, boff

The offset within the pixel data value for the red/green/blue channels.

uint32_t pbytes

The size of a single pixel, in bytes.

`format.pbytes` specifies the number of bytes that make up the data for a single pixel. These bytes represent a single pixel value, stored in host-endian order. The pixel value contains a number of the form:

```
(R<<format.roff) + (G<<format.goff) + (B<<format.boff)
```

where (R,G,B) represents the values of the color channels for the pixel, containing values from 0 up to $(1 \ll \text{format.rbits})$, $(1 \ll \text{format.gbits})$, $(1 \ll \text{format.bbits})$.

2. Protocols

Components communicate through connected ports. Ports have protocols that define the function calls for different connections.

2.1 AMBA-PV protocols

The AMBA-PV components and protocols permit you to model a platform that interfaces with an Arm® AMBA®-based system.

The protocols are:

AMBAPV

Models the AMBA® protocols AXI4, AXI3, AHB and APB.

AMBAPVACE

Models the AMBA® ACE and DVM protocols.

AMBAPVSignal

Models interrupts.

AMBAPVSignalState

Transfers and receives signal states.

AMBAPVValue

Models propagation of 32-bit integer values between components.

AMBAPVValue64

Models propagation of 64-bit integer values between components.

AMBAPVValueState

Permits a master to retrieve the current value from a slave, using 32-bit integer values.

AMBAPVValueState64

Permits a master to retrieve the current value from a slave, using 64-bit integer values.

There are ready-to-use components that provide you with conversions between protocols.

Related information

[AMBA-PV Extensions to TLM User Guide](#)

2.1.1 AMBAPV protocol

The AMBAPV protocol defines behaviors for single read and single write transactions. This covers Arm® AMBA® AXI5, AXI4, AXI3, AHB, and APB bus protocol families, at the PV level.

In addition, the AMBAPV protocol supports AMBA® protocol additional control information:

- Protection units.

- Exclusive access and locked access mechanisms.
- System-level caches.
- Atomic accesses, including exclusive accesses, locked accesses, and atomic transactions.

The LISA definition for the AMBAPV protocol is `$PVLIB_HOME/LISA/AMBAPVProtocol.lisa`. The behaviors of the protocol are:

read()

This optional slave behavior completes a single read transaction at the given address for the given size in bytes. Additional AMBA® protocol control information can be specified using the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context.

```
read(int socket_id, const sc_dt::uint64 &addr,
     unsigned char *data, unsigned int size,
     const amba_pv::amba_pv_control *ctrl,
     sc_core::sc_time &t):
    amba_pv::amba_pv_resp_t
```

write()

This optional slave behavior completes a single write transaction at the given address with specified data and write strobes. The size of the data is specified in bytes. Additional AMBA® protocol control information can be specified using the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context.

```
write(int socket_id, const sc_dt::uint64 &addr,
      unsigned char *data, unsigned int size,
      const amba_pv::amba_pv_control *ctrl,
      unsigned char *strb, sc_core::sc_time &t):
    amba_pv::amba_pv_resp_t
```

debug_read()

This optional slave behavior completes a debug read transaction from a given address without causing any side effects. Specify the number of bytes to read in the `length` parameter. The number of successfully read values is returned. Additional AMBA® protocol control information can be specified in the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context. This behavior is empty by default and returns 0.

```
debug_read(int socket_id, const sc_dt::uint64 &addr,
           unsigned char *data, unsigned int length,
           const amba_pv::amba_pv_control *ctrl):
    unsigned int
```

debug_write()

This optional slave behavior completes a debug write transaction to a given address without causing any side effects. Specify the number of bytes to write in the `length` parameter. The number of successfully written values is returned. Additional AMBA® protocol control information can be specified in the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context. This behavior is empty by default and returns 0.

```
debug_write(int socket_id, const sc_dt::uint64 &addr,
            unsigned char *data, unsigned int length,
```

```
const amba_pv::amba_pv_control *ctrl):
    unsigned int
```

b_transport()

This is an optional slave behavior for blocking transport. It completes a single transaction using the blocking transport interface. The `amba_pv::amba_pv_extension` must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
b_transport(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sctime
&t)
```

transport_dbg()

This optional slave behavior implements the TLM debug transport interface. An `amba_pv::amba_pv_extension` object must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
transport_dbg(int socket_id, amba_pv::amba_pv_transaction &trans,
    sc_core::sctime &t):
    unsigned int
```

get_direct_mem_ptr()

This optional slave behavior requests a DMI access to a given address. It returns a reference to a DMI descriptor that contains the bounds of the granted DMI region. Returns `true` if a DMI region is granted, `false` otherwise.

The `amba_pv::amba_pv_extension` must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
get_direct_mem_ptr(int socket_id, amba_pv::amba_pv_transaction &trans,
    tlm::tlm_dmi &dmi_data):
    bool
```

atomic_store() and atomic_load()

These optional slave behaviors complete an AtomicStore or AtomicLoad transaction with the specified data. The data is used by the atomic transaction in the specified endianness.

The only difference between the two behaviors is that AtomicStore does not return data, while AtomicLoad returns the original data.

```
atomic_store(int socket_id, const sc_dt::uint64 &addr,
    unsigned char * data, unsigned int length,
    unsigned int size, const amba_pv::amba_pv_control * ctrl,
    amba_pv::amba_pv_atomic_subop_t subop,
    amba_pv::amba_pv_atomic_endianness_t endianness, sc_core::sc_time &t) :
    amba_pv::amba_pv_resp_t

atomic_load(int socket_id, const sc_dt::uint64 &addr,
    unsigned char * data, unsigned int length, unsigned int size,
    const amba_pv::amba_pv_control * ctrl,
    amba_pv::amba_pv_atomic_subop_t subop,
    amba_pv::amba_pv_atomic_endianness_t endianness, sc_core::sc_time &t) :
    amba_pv::amba_pv_resp_t
```

atomic_swap()

This optional slave behavior completes an AtomicSwap transaction with the specified data, which is written to the specified address. The original data is returned.

```
atomic_swap(int socket_id, const sc_dt::uint64 & addr,
            unsigned char * data, unsigned int length, unsigned int size,
            const amba_pv::amba_pv_control * ctrl, sc_core::sc_time & t) :
            amba_pv::amba_pv_resp_t
```

atomic_compare()

This optional slave behavior completes an AtomicCompare transaction with the specified compare value and swap value. If the compare value equals the values at the given address, the swap value is written to the addressed location.

It always returns the original data at the target address.

```
atomic_compare(int socket_id, const sc_dt::uint64 & addr,
              unsigned char * data, unsigned int length, unsigned int size,
              const amba_pv::amba_pv_control * ctrl, sc_core::sc_time & t) :
              amba_pv::amba_pv_resp_t
```

invalidate_direct_mem_ptr()

This optional master behavior invalidates a DMI request. It invalidates DMI pointers that were previously established for the given DMI region. The `socket_id` parameter is 0 in this context.

```
invalidate_direct_mem_ptr(int socket_id, sc_dt::uint64 start_range,
                          sc_dt::uint64 end_range)
```

The generic payload data is formatted as an array of bytes in order of ascending bus address. This means that irrespective of the host machine endianness or modeled bus width:

- A little endian master must write the bytes of a word in increasing significance as the array index increases.
- A big endian master must write the bytes of a word in decreasing significance as the array index increases.

A master or slave whose endianness does not match the endianness of the host machine must endian swap any access to the payload data that is wider than one byte. The same byte ordering rule applies to memory accesses using DMI pointers.

2.1.2 AMBAPVACE protocol

This protocol defines behaviors for bus transactions. This covers Arm® AMBA® ACE and DVM bus protocol families, all at the PV level.

In addition, this protocol provides support for AMBA® protocol additional extension information:

- Secure and privileged accesses.

- Atomic accesses.
- System-level caching and buffering control.
- Cache coherency transactions (ACE-Lite).
- Bi-directional cache coherency transactions (ACE).
- Distributed virtual memory transactions (DVM).

The behaviors of the protocol are:

b_transport()

This slave behavior implements the TLM blocking transport interface. An `amba_pv::amba_pv_extension` object must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
b_transport(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sctime
&t)
```

transport_dbg()

This optional slave behavior implements the TLM debug transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
transport_dbg(int socket_id, amba_pv::amba_pv_transaction &trans,
sc_core::sctime &t): unsigned int
```

get_direct_mem_ptr()

This optional slave behavior is for requesting a DMI access to a given address. It returns a reference to a DMI descriptor that contains the bounds of the granted DMI region. Returns true if a DMI region is granted, false otherwise. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
get_direct_mem_ptr(int socket_id, amba_pv::amba_pv_transaction &trans,
tlm::tlm_dmi &dmi_data): bool
```

b_snoop()

This master behavior implements an upstream snooping TLM blocking transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
b_snoop(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sctime &t)
```

snoop_dbg()

This optional master behavior implements an upstream snooping TLM debug transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
snoop_dbg(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sctime
&t): unsigned int
```

invalidate_direct_mem_ptr()

Use this optional master behavior to invalidate a DMI request. It invalidates DMI pointers that were previously established for the given DMI region. The `socket_id` parameter is 0 in this context.

```
invalidate_direct_mem_ptr(int socket_id,  sc_dt::uint64 start_range,  
                           sc_dt::uint64 end_range)
```

The generic payload data is in the format of an array of bytes in order of ascending bus address. This means that irrespective of the host machine endianness or modeled bus width:

- A little endian master must write the bytes of a word in increasing significance as the array index increases.
- A big endian master must write the bytes of a word in decreasing significance as the array index increases.

A master or slave whose endianness does not match the endianness of the host machine must endian swap any access to the payload data that is wider than one byte. The same byte ordering rule applies to memory accesses using DMI pointers.

Special considerations for ACE and cache coherent interconnects

An ACE interconnect model must be able to cope with concurrent transactions in accordance with the hazard avoidance and prioritization rules in the ACE specification. Any external bus request, downstream transaction or upstream snoop transaction, can potentially cause a transaction to stall and the calling thread to be blocked, resulting in any number of other threads being scheduled.

To maintain memory coherency, apply these rules for debug transactions:

debug reads

The bus must return data that represents the values that the bus master expects to observe if it issues a bus read. This must not modify the state of any bus components.

debug writes

These must modify the contents of all copies of the location being accessed, so that a subsequent read from this location returns the data in the debug-write request. The debug write must not modify any other state, such as cache tags, clean/dirty/shared/unique MOESI state.

The implications for a coherent interconnect are that incoming debug transactions must be broadcast back upstream as debug snoop transactions to all ports other than the one the request came in on. Incoming debug snoops must propagate upwards. Debug reads can terminate as soon as they hit a cache. Debug writes must continue until they propagate to all possible copies of the location, including downstream to main memory.

For cases where a debug transaction hazards with non-debug transactions that are in-flight, the debug transaction must observe a weak memory-order model. Any component that can block a thread whilst responsible for the payload of an in-flight transaction must take particular care. In these cases, the debug transaction must be hazarded against the in-flight payload to ensure that debug reads do not return stale data and debug writes do not cause cache incoherency.

Only use DMI when you can guarantee that subsequent transactions do not result in any state transitions. This means, in general, do not use DMI for ACE coherent cacheable transactions.

2.1.3 AMBAPVSignal protocol

This protocol defines a single behavior to permit masters to change the state of signals such as interrupts. AMBA3 does not cover this behavior, but the AMBA-PV components do provide it.

set_state(int export_id, const bool &state): void

Transfers a signal state. The `export_id` parameter must be set to 0 in this context.

2.1.4 AMBAPVSignalState protocol

This protocol defines two behaviors that permit a master to change the state of signals such as interrupt and to retrieve the state of such signals from slaves. This behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const bool &state): void

Transfers a signal state. The `export_id` parameter must be set to 0 in this context.

get_state(int export_id, tlm::tlm_tag<bool> * t): bool

Retrieves a signal state. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

2.1.5 AMBAPVValue protocol

This protocol models propagation of 32-bit integer values between components. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const uint32_t &value): void

Transfers a value. The `export_id` parameter must be set to 0 in this context.

2.1.6 AMBAPVValue64 protocol

This protocol models propagation of 64-bit integer values between components. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const uint64_t &value): void

Transfers a value. The `export_id` parameter must be set to 0 in this context.

2.1.7 AMBAPVValueState protocol

This protocol permits propagation of 32-bit integer values between components and their retrieval from slaves. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const uint32_t &value):void

Transfers a value. The `export_id` parameter must be set to 0 in this context.

get_state(unsigned int export_id, tlm::tlm_tag<uint32_t> *t): uint32_t

Retrieves a value. The `export_id` parameter must be set to 0 and the `t` parameter must be set to `NULL`, in this context.

2.1.8 AMBAPVValueState64 protocol

This protocol permits propagation of 64-bit integer values between components and their retrieval from slaves.

Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const uint64_t &value): void

Transfers a value. The `export_id` parameter must be set to 0 in this context.

get_state(int export_id, tlm::tlm_tag<uint64_t> *t): uint64_t

Retrieves a value. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

2.2 Clocking protocols

The clocking components and protocols provide a mechanism for systems to regulate the execution rate of components.

All clocking components that communicate use an opaque `ClockSignal` protocol. `ClockSignal` protocols have no behaviors that the user can invoke.

Related information

[Clocking components](#) on page 160

2.2.1 ClockRateControl protocol

This protocol sets the ratio of this component.

- `set(uint32_t mul, uint32_t div) : void`
- `set64(uint64_t mul, uint64_t div) : void`

Set the multiplier and divider that determine the clock divider ratio:

```
clk_outfreq= clk_infreq * mul / div
```

2.2.2 TimerCallback protocol

This protocol invokes a behavior on the component that set the timer. Do not use the `timer_control` port of the timer during the invoked behavior.

signal(): uint32_t

Invoked by the timer when the timer countdown expires. The invoked behavior returns the number of ticks after which it will be called again or 0 to make the timer one-shot.

2.2.3 TimerCallback64 protocol

This protocol invokes a behavior on the component that set the timer. Do not use the `timer_control` port of the timer during the invoked behavior.

signal(): uint64_t

Invoked by the timer when the timer countdown expires. The invoked behavior returns the number of ticks after which it will be called again or 0 to make the timer one-shot.

2.2.4 TimerControl protocol

This protocol controls the actions of the component. It permits a timer to be set to schedule a callback after a given number of ticks at the rate of the clock input.

If a timer is set while it is counting, it starts counting the new number of ticks without sending the original callback. Canceling a timer when it is not active has no effect.

set(uint32_t ticks): void

Set the timer to count down the given number of ticks.

cancel()

Cancel an active timer, preventing the callback being invoked.

isSet() : bool

Check whether a timer is set to generate a callback.

remaining() : uint32_t

Return how many ticks remain before the callback is invoked.

2.2.5 TimerControl64 protocol

This protocol controls the actions of the component. It permits a timer to be set to schedule a callback after a given number of ticks at the rate of the clock input.

If a timer is set while it is counting, it starts counting the new number of ticks without sending the original callback. Canceling a timer when it is not active has no effect.

set(uint64_t ticks): void

Set the timer to count down the given number of ticks.

cancel()

Cancel an active timer, preventing the callback being invoked.

isSet() : bool

Check whether a timer is set to generate a callback.

remaining() : uint64_t

Return how many ticks remain before the callback is invoked.

2.3 Debug interface protocols

LISA components can expose aspects of their internal state so that they become visible and usable in the debugger. Some aspects are supported by the native LISA language, and some are supported by debug interface protocols.

Registers and other state variables

See the LISA+ resource REGISTER declaration, especially the `read_function` and `write_function` attributes.

Memories and other memory-like objects

See the LISA+ resource MEMORY declaration, especially the `read_function` and `write_function` attributes.

Disassembly

See `CADIProtocol` and `CADIDisassemblerProtocol`.

Instruction count

See `CADIProtocol`.

Setting, configuring, and clearing of breakpoints

For example, code breakpoints, register breakpoints, watchpoints. See `CADIProtocol`.

Single stepping and instruction stepping support

See `CADIProtocol`.

If displaying and editing memory and registers are sufficient, you need not implement `CADIProtocol` and `CADIDisassemblerProtocol`. The component must implement them to enable the other debug features.

CADIProtocol and CADIDisassemblerProtocol permit you to implement the features on a Component Architecture Debug Interface (CADI) level, where the component code takes responsibility for the implementation of these interfaces.

Related information

[Component Architecture Debug Interface User Guide](#)

[LISA+ Language for Fast Models Reference Guide](#)

2.3.1 CADIDisassemblerProtocol protocol

To support disassembly, implement all of these functions. None of them is optional.

These functions are in a different port, of type CADIDisassemblerProtocol, that can have any name and only need to be implemented when disassembly must be exposed in the debugger. The functionality of this port is then exposed by CADIProtocol::CADIGetDisassembler(). See CADIProtocol for information on how to use this port and CADIDisassemblerAdapter.

In the function slave behavior GetType(): eslapi::CADIDisassemblerType; components must always return eslapi::CADI_DISASSEMBLER_TYPE_STANDARD.

The function slave behavior GetModeCount(): uint32_t; returns the number of supported disassembler modes, and at least 1 mode must be returned.

The function slave behavior GetModeNames(eslapi::CADIDisassemblerCB *callback_); returns information about all supported modes. A component that only supports one mode calls, for example, callback_>ReceiveModeName(0, "Normal"); only once. This is similar for multiple modes with different names and ids.

The function slave behavior GetCurrentMode(): uint32_t; returns the most suitable mode of disassembly at the time, based on the current state variables of the component:

For the function:

```
slave behavior GetSourceReferenceForAddress(eslapi::CADIDisassemblerCB *callback_,
const eslapi::CADIAddr_t &address): eslapi::CADIDisassemblerStatus;
```

components must return eslapi::CADI_DISASSEMBLER_STATUS_ERROR;

For the function:

```
slave behavior GetAddressForSourceReference(const char *sourceFile, uint32_t
sourceLine, eslapi::CADIAddr_t &address): eslapi::CADIDisassemblerStatus;
```

components must return eslapi::CADI_DISASSEMBLER_STATUS_ERROR;

The following function is the main disassembler function:

```
slave behavior GetDisassembly(eslapi::CADIDisassemblerCB *callback_,
                             const eslapi::CADIAddr_t &address,
                             eslapi::CADIAddr_t &nextAddr,
                             const uint32_t mode,
                             uint32_t desiredCount):
    eslapi::CADIDisassemblerStatus;
```

The component must call `callback_` for all disassembler lines for the specified address and `desiredCount`, and it must finally set `nextAddr` to the next disassembled address at that point after the requested block.

```
// Query if an instruction is a call instruction
slave behavior GetInstructionType(const eslapi::CADIAddr_t
&address, eslapi::CADIDisassemblerInstructionType &insn_type):
    eslapi::CADIDisassemblerStatus;
```

Components must return `insn_type = eslapi::CADI_DISASSEMBLER_INSTRUCTION_TYPE_NOCALL;` and return `eslapi::CADI_DISASSEMBLER_STATUS_OK;`

[Component Architecture Debug Interface User Guide](#)

2.3.2 CADIProtocol protocol

This protocol supports debugging. To add breakpoint support, implement `CADIBpt...()` functions.

Note

All CADIProtocol protocol behaviors, that is, all sets of functionalities, are optional. A component only has to implement the set of functions for the functionality that it intends to support.

You must define an internal slave port of this type, and the name of this port must always be `cadi_port`. In this port, you can implement this functionality:

```
optional slave behavior CADIBptGetList(uint32_t, uint32_t, uint32_t *,
    eslapi::CADIBptDescription_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptRead(eslapi::CADIBptNumber_t,
    eslapi::CADIBptRequest_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptSet(eslapi::CADIBptRequest_t *,
    eslapi::CADIBptNumber_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptClear(eslapi::CADIBptNumber_t):eslapi::CADIReturn_t;
optional slave behavior CADIBptConfigure(eslapi::CADIBptNumber_t,
    eslapi::CADIBptConfigure_t):eslapi::CADIReturn_t;
optional slave behavior CADIModifyTargetFeatures(eslapi::CADITargetFeatures_t
    *):eslapi::CADIReturn_t;
```

You need to implement all of these functions to enable any kind of breakpoint for the component. The component needs to maintain and keep track of all existing breakpoints. For example:

- `CADIBptSet()` and `CADIBptClear()` add and remove breakpoints.
- `CADIBptConfigure()` enable and disable breakpoints.
- `CADIBptGetList()` and `CADIBptRead()` return the current state of the breakpoint list.

The component must also implement `CADIModifyTargetFeatures`. This function permits you to override the automatic default `CADITargetFeatures_t` that System Generator provides for this component just before it is returned to the debugger. Specifically, a component that wants to support any kind of breakpoint must override the `handledBreakpoints` and `nrBreakpointsAvailable` fields of `CADITargetFeatures_t`. For example:

```
targetFeatures->handledBreakpoints = CADI_TARGET_FEATURE_BPT_PROGRAM |
    CADI_TARGET_FEATURE_BPT_REGISTER;
    // code and register breakpoints supported
targetFeatures->nrBreakpointsAvailable = 0x7fffffff;
    // virtually infinite number of breakpoints supported.
```

By default, LISA components do not support any type of breakpoints. By implementing `CADIBpt...` functions, you can add breakpoint support. In addition to implementing the stated functions, the component must call `simBreakpointHit(bptNumber)` and then `simHalt()` when an enabled breakpoint is hit. On a breakpoint hit the component must first call `simBreakpointHit()` for each breakpoint that was hit (one or more, usually just one) and then call `simHalt()` once after all `simBreakpointHit()` calls. The `simHalt()` call must always be the last call in the sequence.

A component that wants to provide disassembly must implement the following `CADIGetDisassembler()` behavior and return a `CADIDisassembler` interface implementation. This automatically follows behind the `CADI::CADIGetDisassembler()` and the `CADI::ObtainInterface("eslapi.CADIDisassembler2")` functions.

```
optional slave behavior CADIGetDisassembler():eslapi::CADIDisassembler*;
```

To do this, instantiate a `CADIDisassemblerAdapter` object in behavior `init` and return its address in this `CADIGetDisassembler()` function. This object must point to an internal slave port that implements the `CADIDisassemblerProtocol` protocol.

Skeleton code for implementing disassembly:

```
component FOO
{
    behavior init()
    {
        disassemblerAdapter = new
        CADIDisassemblerAdapter(disassPort.getAbstractInterface());
        // ...
    }
    internal slave port <CADIProtocol> cadi_port
    {
        slave behavior CADIGetDisassembler():eslapi::CADIDisassembler*
        {
            return disassemblerAdapter;
        }
        // ...
    }
    internal slave port<CADIDisassemblerProtocol> disassPort
```

```
{
    // ...
}
```

The following function implements the instruction stepping a component. It must set up an internal state that stops the simulation when the requested number of instructions is executed completely (exactly like a breakpoint). It must call `simRun()` from within `CADIExecSingleStep()` after setting up this stepping state, and later it must call `simHalt()` when the execution of the required number of instructions finishes.

```
optional slave behavior CADIExecSingleStep(uint32_t instructionCount, int8_t
stepCycle, int8_t stepOver):eslapi::CADIReturn_t;
```

The following function is for debugging purposes only. Do not implement it. The function must not alter the state of any component in any way.

```
optional slave behavior callbackModeChange(uint32_t newMode, eslapi::CADIBptNumber_t
bptNumber);
```

By implementing any of the following functions, the component can enable the instruction and cycle count display:

```
optional slave behavior CADIGetInstructionCount(uint64_t
&instructionCount):eslapi::CADIReturn_t;
optional slave behavior CADIGetCycleCount(uint64_t &instructionCount, bool
systemCycles):eslapi::CADIReturn_t;
```

Fast Models systems are not cycle accurate, so you usually only implement an instruction counter, if at all.

2.4 Peripheral protocols

This section describes the peripheral protocols.

2.4.1 AudioControl protocol

This protocol has get and release audio buffer behaviors.

getPVAudioBuffer

Get an underlying host buffer for audio output.

releasePVAudioBuffer

Release an underlying host buffer.

2.4.2 CharacterLCD protocol

This protocol has the behaviors `setLayoutInfo` and `draw`.

setLayoutInfo

Sets the width and height of the touchscreen.

draw

Sets the character information.

2.4.3 FlashLoaderPort protocol

This protocol initializes the flash contents at model startup and saves flash contents to a file when the model terminates.

loadFlashFile(FlashLoader *) : uint32

Initiate loading of the flash contents.

saveFlashFile(FlashLoader *) : uint32

Save the flash contents to a file.

2.4.4 GUIPollCallback protocol

This protocol defines one method that signals to the visualization component the end of the update period. You can invoke this callback even when the simulation is stopped.

gui_callback(): void

This is sent by the GUIPoll component, at the configured period.

2.4.5 ICS307Configuration protocol

This protocol sets the divider ratio of an ICS307 component at runtime. The output clock rate alters accordingly and any dependent components react to the clock rate change according to their defined behavior.

setConfiguration(uint32_t vdw, uint32_t rdw, uint32_t od): void

Set the parameters for deriving the clock divider ratio.

vdw

Range: 0-255.

rdw

Range: 0-255.

od

Range: 0-7.

2.4.6 KeyboardStatus protocol

This protocol passes keyboard events to a component such as the PS2Keyboard component.

Events are only sent when the visualization window is in focus. Keyboard combinations that are filtered by the host OS such as **Ctrl+Alt+Del** are not detected by the visualization. See `$PVLIB_HOME/include/components/KeyCode.h` for a list of `ATKeyCode` values.

The protocol behaviors are:

keyDown(ATKeyCode code) : void

Sent when a key on the host keyboard is pressed.

keyUp(ATKeyCode code) : void

Sent when a key on the host keyboard is released.

Related information

[VEVisualisation ports](#) on page 4270

2.4.7 LCD protocol

This Visualisation Library signaling protocol provides the interface between an LCD controller peripheral, for example the PL110, and a visualization component. This permits the LCD controller to render the framebuffer contents into a region of the visualization GUI.

LISA visualization components can provide any number of LCD ports. The implementations of these behaviors can delegate the calls to appropriate methods on the `VisRenderRegion` class.

The behaviors are:

lock() : VisRasterLayout *

Lock the raster region of the LCD in preparation for rendering.

unlock()

Unlock the raster region, ready to be updated on the screen.

update(int x, int y, unsigned int w, unsigned int h)

Update the selected rectangular area on screen from the raster buffer.

setPreferredLayout(unsigned int width, unsigned int height, unsigned int depth)

A request from the LCD controller to set the preferred size for the raster region, to match the timing parameters used by the LCD controller.

Related information

[VEVisualisation ports](#) on page 4270

2.4.8 LCDLayoutInfo protocol

This protocol has the behavior `setLayoutInfo`.

setLayoutInfo

Sets the width and height of the touchscreen.

2.4.9 MMC_Protocol protocol

This protocol describes an abstract, untimed interface between an MMC controller and an MMC or SD card.

The protocol contains methods that must be implemented by the master (controller) and some that must be implemented by the slave (card). This protocol is used by the reference PL180 MCI and MMC models. For further information on the protocol implementation, see the source file, `$PVLIB_HOME/LISA/MMC_Protocol.lisa`.

Use of this protocol assumes knowledge of the MultiMediaCard specification, available from the MultiMediaCard Association, www.mmca.org.

The protocol has these behaviors:

cmd

Commands are sent from the controller to the card using this behavior, which is implemented by the card model. The MMC command is sent with an optional argument. The card responds as defined by the MMC specification. The controller model checks that the response type matches expectations, and updates its state appropriately. The transaction-level protocol does not model start/stop bits or CRCs on the command/response payload.

For data transfer in the card to controller direction:

Rx

After the host and controller have initiated a read through the command interface, the card calls the `Rx` behavior on the controller to provide the read data. The call provides a pointer and a length. The ARM MMC reference model simulates device read latency by waiting a number of clock cycles prior to calling this behavior. If the controller is unable to accept the data, or wants to force a protocol error, it can return false in response to this behavior.

Rx_rdy

A handshake, used by the controller to inform the card that the controller is ready to receive more data. The Arm MMC reference model does not time out, so waits indefinitely for this handshake in a multiple block data transfer.

For data transfer in the controller to card direction:

Tx

After the host and controller have initiated a write through the command interface, the card calls the `Tx` behavior on the controller. The call provides a pointer to an empty buffer to be

written, and a length. The ARM MMC reference model simulates device write latency by waiting a number of clock cycles prior to each buffer being offered.

Tx_done

The controller calls this behavior on the card when the block has been written. The card model can then commit the data to its persistent storage.

The card model must also implement:

cmd_name

This behavior returns the name of the command issued. A card must implement this behavior, but is free to return an empty string for all requests. Only call this behavior for diagnostic messages.

2.4.10 MouseStatus protocol

This protocol passes mouse movement and button events to another component such as the PS2Mouse component.

Events are only sent when the visualization window is in focus.

The protocol behaviors are:

mouseMove(int dx, int dy) : void

This is sent when the host mouse is moved. Mouse movement events are always relative.

mouseButton(uint8_t button, bool down) : void

This is sent when a button on the host mouse is pressed or released.

`button` indicates which button has been pressed or released and is typically 0, 1, or 2 but can be anything up to 7 depending on the OS and attached mouse.

`down` is true if a button is pressed and false if released.

Related information

[VEVisualisation ports](#) on page 4270

2.4.11 PL080_DMAC_DmaPortProtocol protocol

This protocol provides methods to permit handshaking between peripherals and the DMA controller.

request(uint32 request) : void

Passes requests from a peripheral to the DMA controller. The request is a bitfield with the low four bits defined. The request is level-sensitive and latched internally by the DMA controller. It is sampled and interpreted in a manner dependent on the target channel and configured flow control.

0: PL080_REQ_BURST

Burst transfer request.

1: PL080_REQ_SINGLE

Single transfer request.

2: PL080_REQ_LBURST

Last burst request.

3: PL080_REQ_LSINGLE

Last single request.

response(uint32 response): void

Passes responses from the DMA controller to peripherals. The response is a bitfield with the low two bits defined. The response is transient rather than level-sensitive.

0: PL080_RES_TC

Terminal count response.

1: PL080_RES_CLR

Clear request response.

2.4.12 PS2Data protocol

This protocol is for communication between the KMI and a PS/2-like device.

For efficiency, the interface is a parallel byte interface rather than a serial clock/data interface. The behaviors are:

setClockData(enum ps2clockdata) : void

Used by the KMI to simulate forcing the state of the data/clock lines, to indicate whether it is able to receive data, wants to send a command, or is inhibiting communication.

getData() : uint8

Used by the PS/2 device to get command data from the KMI.

putData(uint8 data): void

Used by the PS/2 device to send device data to the KMI.

2.4.13 PVBusSlaveControl protocol

The PVBusSlaveControl protocol enables you to access and modify the underlying memory that PVBusSlave controls.

- `setFillPattern(uint32_t fill1, uint32_t fill2)`

This sets a two-word alternating fill pattern to be used by uninitialized memory.

- `setAccess(pv::bus_addr_t base, pv::bus_addr_t top, pv::accessType type, pv::accessMode mode)`

This reconfigures handling for a region of memory.

`base` (inclusive value) and `top` (exclusive value) specify the address range to configure.

`type` selects what types of bus access must be reconfigured. It can be one of:

- `pv::ACCESSTYPE_READ`
- `pv::ACCESSTYPE_WRITE`
- `pv::ACCESSTYPE_RW`

`mode` controls what happens when an address is accessed. Legal values for the `pv::accessMode` enumeration are:

`pv::ACCESSMODE_MEMORY`

Act as memory. The PVBUSlave manages the underlying storage to provide memory for the selected address range, which can be ROM or RAM, depending on how you configure it to handle bus write transactions.

`pv::ACCESSMODE_DEVICE`

Act as a device. Requests to the selected address range are routed to the PVBUSlave device port, where the necessary behavior can be implemented by the component.

`pv::ACCESSMODE_ABORT`

Generate bus abort signals for any accesses to the selected address range.

`pv::ACCESSMODE_IGNORE`

Ignore accesses to the selected address range. Bus read requests return 0.

- `getReadStorage(pv::bus_addr_t address, pv::bus_addr_t *limit) : const uint8_t *`
- `getWriteStorage(pv::bus_addr_t address, pv::bus_addr_t *limit) : uint8_t *`

These two methods permit you to access the underlying storage that PVBUSlave allocates to implement a region of memory.

The return value is a pointer to the byte that represents the storage corresponding to the address of `base`.

The `limit` pointer returns the device address for the limit of the accessible memory.

The pointer value returned is not guaranteed to remain valid indefinitely. Bus activities, or other calls to the control port, might invalidate the pointer. For example, if a burst transaction straddles a 4KB boundary, PVBUSlave might reallocate the 4KB regions to be contiguous.

- `provideReadStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage)`
- `provideWriteStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage)`
- `provideReadWriteStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage)`

These methods enable you to allocate blocks of memory that the PVBUSlave can use to manage regions of RAM/ROM. Only use these methods when you require a high degree of control over memory, such as when you require a device to map specific regions of host memory into the simulation.

The memory region pointed to by `storage` must be large enough to contain `(limit - base)` bytes.

After these calls, PVBUSlave controls access to the underlying memory. The owner must call `getWriteStorage()` before modifying the memory contents and `getReadStorage()` before reading the memory contents.

- `provideReadStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage, double latency)`
- `provideWriteStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage, double latency)`
- `provideReadWriteStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage, double read_latency, double write_latency)`

These methods take additional parameters to specify average latencies (in seconds) per byte, used when Timing Annotation is enabled.

In all other aspects they behave the same as `provideReadStorage()`, `provideWriteStorage()` and `provideReadWriteStorage()`, respectively.

- `slave behavior getRegionIterHandle(): uint32_t;`
- `slave behavior getNextRegionInfo(uint32_t iter_handle, pv::PVBUSlaveRegionInfo *info) : bool;`
- `slave behavior closeRegionIterHandle(uint32_t iter_handle);`

These methods form an iterator-like API that allows a PVBUSlave providing storage to report all the regions of the address space that have backing store.

The iteration begins by calling `getRegionIterHandle()`. This allocates an iterator and if successful returns a nonzero `iter_handle` to identify it.

The caller can then repeatedly call `getNextRegionInfo()` with `iter_handle`. If it finds a region, the behavior returns `true` and writes to the `info` struct if the pointer is non-null. Access the data in the region using `getReadStorage()` OR `getWriteStorage()`.

The implementation can return regions in any order. They can be of any size or alignment, but must not overlap.

The implementation need not report allocated regions that are filled entirely with the default fill pattern, or allocated regions that contain only the data they had at simulation start.

On reaching the last region, the iterator closes automatically. If the handle is invalid or there are no further regions, the behavior returns `false`.

A caller can close an iterator opened by `getRegionIterHandle()` at any time using `closeRegionIterHandle()`. This deallocates the iterator, and further uses of the handle are invalid.

2.4.14 PVDevice protocol

The PVDevice protocol enables you to implement support for memory-mapped device registers. Call the two methods through the device port on the PVBUSlave to handle bus read/write transactions.

read(pv::ReadTransaction): pv::Tx_Result

This method permits a device to handle a bus read transaction.

write(pv::WriteTransaction): pv::Tx_Result

This method permits a device to handle a bus write transaction.

The PVDevice protocol uses two behaviors to differentiate between transactions originating from the processor (loads and stores) and transactions originating from an attached debugger:

slave behavior debugRead(pv::ReadTransactiontx) : pv::Tx_Result

This method enables the device to handle a debug read transaction.

slave behavior debugWrite(pv::WriteTransactiontx) : pv::Tx_Result

This method enables the device to handle a debug write transaction.

The `debugRead` and `debugWrite` behaviors are called for all debug transactions.

For an example component that uses this protocol see `$PVLIB_HOME/examples/LISA/BusComponents/BitLatch.lisa`.

Related information

[PVBUS C++ transaction and Tx_Result classes](#) on page 56

2.4.15 PVTransactionMaster protocol

This protocol instantiates a `pv::TransactionGenerator` object from a PVBUSMaster.

createTransactionGenerator() : pv::TransactionGenerator *

This behavior instantiates a new transaction generator to control the bus master. A caller can allocate as many TransactionGenerators as it wants. It is up to the caller to delete TransactionGenerators when they are no longer required. For example:

```
behavior init() {
    tg = master.createTransactionGenerator();
}

behavior terminate() {
    delete tg;
}
```

```
}

```

2.4.16 SerialData protocol

This protocol is implemented as a parallel interface for efficiency. All communication is driven by the master port.

This protocol has behaviors:

dataTransmit(uint16_t data) : void

Used by the master to send data to the slave.

Table 2-1: Bits for dataTransmit()

Bits	Function
15:8	Reserved
7:0	Transmit data

dataReceive(void) : uint16_t

Used by the master to receive data from the slave.

Table 2-2: Bits for dataReceive()

Bits	Function
15:13	Reserved
12	Set when no data available for reading
11	Reserved
10	Break error
9:8	Reserved
7:0	Receive data

signalsSet(uint8_t signal) : void

Used by the master to get the current signal status.

Table 2-3: Bits for signalsSet()

Bits	Function
7	Out1
6	Out2
5	RTS
4	DTR
3:0	Reserved

signalsGet() : uint8_t

Used by the master to get the current signal status.

Table 2-4: Bits for signalsGet()

Bits	Function
7:4	Reserved
3	DCD
2	DSR
1	CTS
0	RI

2.4.17 SMMUv3AEMIdentifyProtocol protocol

This protocol is used by the SMMUv3AEM model to identify the SSD, StreamID, and SubStreamID of an incoming transaction. It is only used if the parameter `howto_identify` is set to "use-identify".

```
identify(unsigned tbu_number_, const pv::TransactionAttributes* attributes_, bool*
out_ssd_ns_, unsigned* out_streamid_, unsigned* out_substreamid_) : void`
```

Architecturally, a transaction comes into the SMMUv3AEM model with the following side band signals:

- Security State Determination (SSD):
 - 0**
Transaction belongs to a device controlled by the secure world.
 - 1**
Transaction belongs to a device controlled by the non-secure world.
- StreamID.
- SubStreamID and SubStreamID valid. If you set `*out_substreamid_ = ~0u`, that is interpreted as no SubStreamID because SubStreamIDs are 20 or fewer bits.

How these are transported in the system is SoC-dependent.

The SMMUv3AEM requires that the SoC provides a way of determining this information by implementing the `identify()` function.

2.4.18 TZFilterControl protocol

This protocol controls the communication between filter units and control registers in the APB control block.

```
checkPermission(const pv::TransactionAttributes *attributes_, pv::bus_addr_t
page_base_, bool is_read_, pv::RemapRequest &req_, bool &abort_on_error_) : bool
```

Check the permission of the transactions filtered by the filter unit. Optional slave behavior.

isEnabled() : bool

Check if the filter unit is enabled or not. The APB control block controls the unit. Slave behavior.

isSecureSlave() : bool

Check if the connected slave is secure or not. Optional slave behavior.

setConfig(bool rd_spec_enable, bool wr_spec_enable, uint32_t action) : void

Pass the configurations to the filter. Optional master behavior.

2.4.19 VirtualEthernet protocol

This protocol has the `sendToSlave` and `sendToMaster` behaviors.

sendToSlave(EthernetFrame *frame)

Send an Ethernet frame to the slave port.

sendToMaster(EthernetFrame *frame)

Send an Ethernet frame to the master port.

The Ethernet frame class encapsulates an Ethernet frame in a broken-up format that is more accessible by components. For information on the class definition, see the `EthernetFrame.h` header file located in `$PVLIB_HOME/include/components/VirtualEthernet/Protocol`.

2.5 Power management protocols

This section describes the power management protocols.

2.5.1 PChannel protocol

Communicates power state changes between a power controller and a device.

The behaviors of the protocol are:

pactive (uint32_t pstate) : void

This master behavior is implemented by a power controller. A device calls this method to give a hint to the power controller that it can change to a particular power state. A power controller can then take appropriate action, typically communicating with the device by calling `device.prequest(new_power_state)`.

The power state is type `uint32_t` because it is the responsibility of the system using PChannels to enumerate the power states that it supports. For example, Armv8-A cores use the following enumeration for power states:

```
enum { OFF = 0, OFF_EMU, MEM_RET, MEM_RET_EMU, LOGIC_RET, FULL_RET, MEM_OFF,
      FUNC_RET, ON, WARM_RST, DBG_RECOV }
```

prequest (uint32_t pstate) : sg::PChannel::presp_t

This slave behavior is implemented by a device, for instance a core. A power controller typically calls this method and checks for the response from the device, which can either be ACCEPT OR DENY.

sg::PChannel::presp_t

This enumeration provides two values, ACCEPT and DENY. It is returned by the `prequest()` method, depending on the state requested and the current state of the core.

Usage

You can use PChannels to replace STANDBYWFI and STANDBYWFE signaling.

For example, using STANDBYWFI OR STANDBYWFE:

- Core drives STANDBYWFI signal HIGH.
- Power controller performs logic <x>.

Equivalent behavior using PChannels:

- Core calls `pactive(OFF)`.
- Power controller calls `prequest(OFF)` to change the core to OFF.
- Power controller performs logic <x>.
- To wake up the core, the power controller calls `prequest(ON)`.

Examples

- For a LISA+ example that uses PChannel, see `$PVLIB_HOME/examples/LISA/VP_PChannel/`.
- For a SystemC example that uses PChannel, see `$PVLIB_HOME/examples/SystemCExport/EVS_Components/EVS_PChannel/`.

2.6 Processor protocols

This section describes the processor protocols.

2.6.1 CoprocBusProtocol protocol

This protocol connects a coprocessor implementation with a CPU component, for instance ARMCortexM33CT.

A coprocessor must derive from the coprocessor callback interface, `coprocessor`. It can implement the CDP, MCR, MRC, STC, LDC, MCRR, and MRRC instructions.

A coprocessor must be registered with a specific coprocessor number, by calling the `addCoproprocessor()` method. You can only register an external coprocessor that is not already present in the CPU. If no coprocessor has been registered with the coprocessor number encoded in an instruction, the CPU raises a NOCP fault.

To register coprocessor instruction implementations with the CPU, you must initialize the function pointers. For example, the following code passes the function pointers to the `Coprocessor` constructor. This code was taken from the `$PVLIB_HOME/examples/LISA/FVP_Coproc_Demo` example.

Registering a coprocessor

```
...
class TestValCoprocessor : public Coprocessor
{
public:
    protocol_CoprocBusProtocol * coproc_bus;
    uint32_t coproc_number;
    uint32_t cp_reg[2][NUM_CP_REG] = {{0}}; // [0][NUM_CP_REG] --> Secure, [1]
[ NUM_CP_REG ] --> Non-Secure
    TestValCoprocessor()
        : Coprocessor(this, test_CDP, nullptr, test_MCR, nullptr, test_MRC, nullptr,
test_LDC, nullptr, test_STC, nullptr, test_MCRR, nullptr, test_MRRC, nullptr)
        , coproc_bus(nullptr)
        , coproc_number(0)
        {
    ...
};

PARAMETER { description("coprocessors number"), type(uint32_t), default(0x2),
min(0x0), max(16) } coprocessor_number; // CP num
TestValCoprocessor test_cp;
}

behaviour init
{
...
    if (coproc_bus.addCoprocessor.implemented())
    {
        coproc_bus.addCoprocessor(&test_cp, coprocessor_number);
    }
}
```

2.6.1.1 Coprocessor behaviors

A coprocessor can call the following master behaviors:

addCoprocessor(Coprocessor*, int num) : void

Registers the coprocessor with the CPU. `num` identifies which coprocessor to register it as.

removeCoprocessor(Coprocessor*, int num) : void

Unregisters the coprocessor from the CPU.

accessIsPriv(void) : bool

Checks whether the CPU state is privileged (true) or unprivileged (false).

accessIsNonSecure(void) : bool

Checks the security state of the CPU, either true for non-secure, or false for secure.

2.6.1.2 Coprocessor callback functions

A coprocessor can implement callback functions with these signatures.

Each function returns a `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.1 CDP()

Perform a coprocessor data processing operation.

Prototype

```
CoprocState CDP(void* context, uint32_t inst)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.2 MCR()

Perform a move to coprocessor register operation.

Prototype

```
CoprocState MCR(void* context, uint32_t inst, uint32_t data)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data

register contents.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.3 MRC()

Perform a move from coprocessor register operation.

Prototype

```
CoprocState MRC(void* context, uint32_t inst, uint32_t* data)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data

pointer to word to fill with coprocessor register contents.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.4 LDC()

Perform a load coprocessor register from memory operation.

Prototype

```
CoprocState LDC(void* context, uint32_t inst, uint32_t data, CoprocState state)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data

contents of current memory location to load into register.

state

current state in a sequence of transactions.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.5 STC()

Perform a store coprocessor register to memory operation.

Prototype

```
CoprocState STC(void* context, uint32_t inst, uint32_t data, CoprocState state)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data

pointer to word to fill with coprocessor register contents to be transferred to memory.

state

current state in a sequence of transactions.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.6 MCRR()

Perform a move to two coprocessor registers operation.

Prototype

```
CoprocState MCRR(void* context, uint32_t inst, uint32_t data1, uint32_t data2)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data1

first data word to load to a coprocessor register.

data2

second data word to load to a coprocessor register.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.7 MRRC()

Perform a move from two coprocessor registers operation.

Prototype

```
CoprocState MRRC(void* context, uint32_t inst, uint32_t* data1, uint32_t* data2)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data1

pointer to first word to fill with coprocessor register contents.

data2

pointer to second word to fill with coprocessor register contents.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.3 CoprocState values

A `CoprocState` enum value is returned by coprocessor callback functions to indicate the new transaction state of the coprocessor. It is also used as a parameter for `LDC` and `STC` callback functions.

Table 2-5: CoprocState values

Value	State label	Description
0	<code>CoprocOk</code>	Complete/Ok.
1	<code>CoprocUndef</code>	Undefined operation.
2	<code>CoprocAbort</code>	Data abort.
4	<code>CoprocFirst</code>	A parameter value for <code>LDC</code> and <code>STC</code> callback functions to indicate that this is the first data transfer in a sequence.
5	<code>CoprocNext</code>	A parameter value for <code>LDC</code> and <code>STC</code> callback functions to indicate that this is a subsequent data transfer in a sequence.
12	<code>CoprocNop</code>	Treat as a NOP .

2.6.2 CounterInterface protocol

This protocol connects the `cntvalueb` port on Generic Timer components to MemoryMappedCounterModule components.

This semi-opaque protocol is exportable across a SystemC interface using a custom bridge.

It is a LISA+ protocol.

2.6.3 GICv3Comms protocol

GICv3Comms is a protocol for communication between redistributors in the GIC and the CPU interface. It is supported by the GICv3 and GICv4 models. It is defined in `$PVLIB_HOME/LISA/GICv3Comms.lisa`.

Each GICv3Comms port in the LISA+ file is connected internally to a Comms port, which is a bi-directional communication port. Comms is derived from `sg::port`. The Comms port in the GIC is called `redistributor_m` and the one in the CPU interface is called `redistributor_s`, as shown in the following diagram:

Figure 2-1: GICv3Comms block diagram

Key:

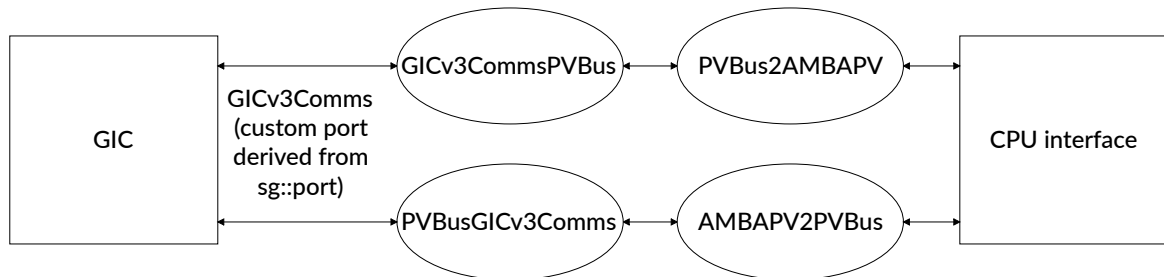

1. GIC contains a Comms port, `redistributor_m`, which the LISA+ file exposes as a GICv3Comms port, `redistributor_m`.
2. `redistributor_m` is connected to the GICv3Comms port in the CPU, `gicv3_redistributor_s`.
3. `gicv3_redistributor_s` forwards the connection to the CPU interface Comms port, `redistributor_s`.

Each redistributor in the GIC communicates through `redistributor_m` to each CPU interface. The number of redistributors in the GIC equals the number of PEs connected.

GIC commands, for example Deactivate, Activate, ActivateAcknowledge, GenerateSGI, Set or Clear interrupt, are communicated through Comms.

The PVBUSGICv3Comms and GICv3CommsPVBUS components convert between the GICv3Comms and PVBUS protocols. The following diagram shows how they can be used in distributed systems:

Figure 2-2: Conversion between GICv3Comms and PVBUS protocols

2.6.4 InstructionCount protocol

This protocol has the behaviors `getValue()` and `getRunState()`.

getValue() : uint64_t

Obtain the number of instructions executed by the processor.

getRunState() : uint32_t

Obtain the power/run status of the processor.

Table 2-6: Run state values

Value	State label	Description
0	UNKNOWN	Run status unknown, that is, simulation has not started
1	RUNNING	Processor running, is not idle and is executing instructions
2	HALTED	External halt signal asserted
3	STANDBY_WFE	Last instruction executed was WFE and standby mode has been entered
4	STANDBY_WFI	Last instruction executed was WFI and standby mode has been entered
5	IN_RESET	External reset signal asserted
6	DORMANT	Partial processor power down
7	SHUTDOWN	Complete processor power down

2.6.5 v8EmbeddedCrossTrigger_controlprotocol protocol

This protocol connects the Cross Trigger Interface (CTI) in processor components to platform-level Cross Trigger Matrix (CTM) components.

This opaque protocol is not exportable across a SystemC interface.

2.7 Signaling protocols

Many components use the signaling protocols to indicate changes in state for signals such as interrupt and reset.

Each signaling protocol has two variants:

- One permits components to signal a state change to other components.
- One permits the other components to passively query the current state of the signal.

2.7.1 Signal protocol

The Signal protocol has the `setValue` behavior.

```
setValue(enum sg::Signal::State) : void  
    Indicates a state change.
```

Valid values for `sg::Signal::State` are:

- `sg::Signal::Set`.
- `sg::Signal::Clear`.

2.7.2 StateSignal protocol

The `StateSignal` protocol has the `setValue` and `getValue` behaviors.

```
setValue(enum sg::Signal::State): void  
    indicates a value change.
```

```
getValue() : sg::Signal::State  
    reads the current value.
```

2.7.3 Value protocol

The Value protocol has the setValue behavior.

setValue(uint32_t value)
indicates a state change.

2.7.4 Value_64 protocol

This protocol provides the rules to communicate with the TrustZone® Memory Adapter (TZMA) to signal the remapped range X.

setValue(uint64_t value)
Sets a 64-bit wide address to the slave port.

2.7.5 ValueState protocol

The ValueState protocol has the setValue and getValue behaviors.

setValue(uint32_t value): void
indicates a value change.

getValue() : uint32_t
reads the current value state.

3. Fast Models components

This chapter describes all model components in Fast Models, organized by component type.

For each component, the documentation includes notes about using the model, describes any deviations in the model from the Technical Reference Manual (TRM), and describes the ports and parameters.

3.1 Component differences

This topic lists the new and changed components in this release.

Differences between 11.25.15 and 11.26.8

Table 3-1: Components added

Component	Quality level

3.2 Bridge components

This section describes the Bridge components.

These components allow conversion between the following protocols:

- PVBUS and AMBAPV.
- Signal and AMBAPVSignal.
- StateSignal and AMBAPVSignalState.
- Value(_64) and AMBAPVValue(64).
- ValueState(_64) and AMBAPVValueState(64).

LISA+ source for the bridge components is located in `$PVLIB_HOME/examples/SystemCEExport/Bridges/`.

The AMBAPV protocols and components are designed to interface with the AMBA® TLM PV library for ASI TLM 2.0. Fast Models provides this library as a standard way of mapping the AMBA protocol on top of ASI TLM 2.0.2 kit at PV level.

For more information about the AMBA TLM PV library for ASI TLM 2.0.2 kit, see the Fast Models documentation in `$MAXCORE_HOME/AMBA-PV/doc/`.

For more information about ASI TLM 2.0, see the Accellera documentation that is provided with the kit.

3.2.1 AMBAPV2PVBUS

AMBA-PV to PVBUS protocol converter. This model is written in LISA+.

Changes in 11.26.8

Parameters added:

- `report_errors`

Iris and MTI instances for AMBAPV2PVBUS

This model has the following Iris instances:

Table 3-3: AMBAPV2PVBUS Iris instances

InstanceName	ComponentName
AMBAPV2PVBUS	AMBAPV2PVBUS
AMBAPV2PVBUS.bus_master	PVBUSMaster

This model has the following MTI trace components:

Table 3-4: AMBAPV2PVBUS MTI instances

InstanceName	ComponentName
AMBAPV2PVBUS	AMBAPV2PVBUS
AMBAPV2PVBUS.bus_master	PVBUSMaster

AMBAPV2PVBUS contains the following CADI targets:

- AMBAPV2PVBUS

About AMBAPV2PVBUS

- PVBUS does not support transactions with `byte_enable` set (strobing transactions, in AXI terms). This bridge component rejects them.
- Variants of this component also exist with multiple input and output ports.

Limitations

Fast Models bridges between PVBUS and AMBA-PV can transport Memory Tagging Extension (MTE) operations (tag stores, tag loads, and tag-checked loads and stores).

These operations are transported opaquely, so the endpoint must be using PVBUS. This means you cannot handle these operations in your own TLM components.

Ports for AMBAPV2PVBUS

Table 3-5: Ports

Name	Protocol	Type	Description
amba_pv_s	AMBAPV	Slave	-
pvbush_m	PVBUS	Master	-

Parameters for AMBAPV2PVBUS

base_addr

Base address

Type

int

Default value

0x0

report_errors

Report transactions which do not comply with PVBUS protocol requirements

Type

bool

Default value

0x0

shareable

Shareable default

Type

bool

Default value

0x1

3.2.2 AMBAPVACE2PVBUS

AMBA-PV ACE to PVBUS protocol converter. This model is written in LISA+.

Changes in 11.26.8

Parameters added:

- `report_errors`

Iris and MTI instances for AMBAPVACE2PVBUS

This model has the following Iris instances:

Table 3-6: AMBAPVACE2PVBUS Iris instances

InstanceName	ComponentName
AMBAPVACE2PVBUS	AMBAPVACE2PVBUS
AMBAPVACE2PVBUS.bus_master	PVBUSMaster

This model has the following MTI trace components:

Table 3-7: AMBAPVACE2PVBUS MTI instances

InstanceName	ComponentName
AMBAPVACE2PVBUS	AMBAPVACE2PVBUS
AMBAPVACE2PVBUS.bus_master	PVBUSMaster

AMBAPVACE2PVBUS contains the following CADI targets:

- AMBAPVACE2PVBUS

About AMBAPVACE2PVBUS

- AMBAPVACE2PVBUS depends on the AMBA-PV API, which must be at least version 1.4.
- The translation of bus transactions by the bridge has some impact on performance. Bus masters that cache memory transactions avoid much of this impact. The bridge does not support DMI.
- PVBUS does not support transactions with `byte_enable` set (strobing transactions, in AXI terms). This bridge component rejects them.

Ports for AMBAPVACE2PVBUS

Table 3-8: Ports

Name	Protocol	Type	Description
amba_pv_ace_s	AMBAPVACE	Slave	-
pvbust_m	PVBUS	Master	-

Parameters for AMBAPVACE2PVBUS

report_errors

Report transactions which do not comply with PVBUS protocol requirements

Type

bool

Default value

0x0

3.2.3 AMBAPVSignal2SGSignal

AMBA-PV Signal to SystemGenerator Signal protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVSignal2SGSignal

This model has the following Iris instances:

Table 3-9: AMBAPVSignal2SGSignal Iris instances

InstanceName	ComponentName
AMBAPVSignal2SGSignal	AMBAPVSignal2SGSignal

Variants of this component also exist with multiple input and output ports.

Ports for AMBAPVSignal2SGSignal

Table 3-10: Ports

Name	Protocol	Type	Description
amba_pv_signal_s	AMBAPVSignal	Slave	Input slave port for connection from top-level AMBAPVSignal slave port.
sg_signal_m	Signal	Master	Handles outgoing signal state changes. Converted signal state changes are sent out through this port.

3.2.4 AMBAPVSignalState2SGStateSignal

AMBA-PV SignalState to SystemGenerator StateSignal protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVSignalState2SGStateSignal

This model has the following Iris instances:

Table 3-11: AMBAPVSignalState2SGStateSignal Iris instances

InstanceName	ComponentName
AMBAPVSignalState2SGStateSignal	AMBAPVSignalState2SGStateSignal

Variants of this component also exist with multiple input and output ports.

Ports for AMBAPVSignalState2SGStateSignal

Table 3-12: Ports

Name	Protocol	Type	Description
amba_pv_signal_s	AMBAPVSignalState	Slave	-
sg_signal_m	StateSignal	Master	-

3.2.5 AMBAPVValue2SGValue

AMBA-PV Value to SystemGenerator Value protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValue2SGValue

This model has the following Iris instances:

Table 3-13: AMBAPVValue2SGValue Iris instances

InstanceName	ComponentName
AMBAPVValue2SGValue	AMBAPVValue2SGValue

Variants of this component also exist with multiple input and output ports.

Ports for AMBAPVValue2SGValue

Table 3-14: Ports

Name	Protocol	Type	Description
amba_pv_value_s	AMBAPVValue	Slave	-
sg_value_m	Value	Master	-

3.2.6 AMBAPVValue2SGValue64

AMBA-PV Value64 to SystemGenerator Value_64 protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValue2SGValue64

This model has the following Iris instances:

Table 3-15: AMBAPVValue2SGValue64 Iris instances

InstanceName	ComponentName
AMBAPVValue2SGValue64	AMBAPVValue2SGValue64

Variants of this component also exist with multiple input and output ports.

Ports for AMBAPVValue2SGValue64

Table 3-16: Ports

Name	Protocol	Type	Description
amba_pv_value_s	AMBAPVValue64	Slave	-
sg_value_m	Value_64	Master	-

3.2.7 AMBAPVValue642SMMUv3AEMIdentify

AMBA-PV Value64 to SMMUv3AEMIdentify protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValue642SMMUv3AEMIdentify

This model has the following Iris instances:

Table 3-17: AMBAPVValue642SMMUv3AEMIdentify Iris instances

InstanceName	ComponentName
AMBAPVValue642SMMUv3AEMIdentify	AMBAPVValue642SMMUv3AEMIdentify

Name	Protocol	Type	Description
identify	SMMUv3AEMIdentifyProtocol	Master	-
identify_reply	AMBAPVValue64	Master	-
identify_request	AMBAPVValue64	Slave	-

3.2.8 AMBAPVValue642VECB

AMBA-PV to VECB protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValue642VECB

This model has the following Iris instances:

Table 3-19: AMBAPVValue642VECB Iris instances

InstanceName	ComponentName
AMBAPVValue642VECB	AMBAPVValue642VECB

AMBAPVValue642VECB contains the following CADI targets:

- AMBAPVValue642VECB

Ports for AMBAPVValue642VECB

Table 3-20: Ports

Name	Protocol	Type	Description
amba_pv_ctrl_s	AMBAPVValue	Slave	-
amba_pv_data_s	AMBAPVValue64	Slave	-
vecb_m	VECBProtocol	Master	-

3.2.9 AMBAPVValueState2SGValueState

AMBA-PV ValueState to SystemGenerator ValueState protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValueState2SGValueState

This model has the following Iris instances:

Table 3-21: AMBAPVValueState2SGValueState Iris instances

InstanceName	ComponentName
AMBAPVValueState2SGValueState	AMBAPVValueState2SGValueState

Note

Variants of this component also exist with multiple input and output ports.

Ports for AMBAPVValueState2SGValueState

Table 3-22: Ports

Name	Protocol	Type	Description
amba_pv_value_s	AMBAPVValueState	Slave	-
sg_value_m	ValueState	Master	-

3.2.10 AMBAPVValueState2SGValueState64

AMBA-PV ValueState64 to SystemGenerator ValueState_64 protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValueState2SGValueState64

This model has the following Iris instances:

Table 3-23: AMBAPVValueState2SGValueState64 Iris instances

InstanceName	ComponentName
AMBAPVValueState2SGValueState64	AMBAPVValueState2SGValueState64

Variants of this component also exist with multiple input and output ports.

Table 3-24: Ports

Name	Protocol	Type	Description
amba_pv_value_s	AMBAPVValueState64	Slave	-
sg_value_m	ValueState_64	Master	-

3.2.11 BroadcastSignal2AMBAPVSignal

Broadcast signal to AMBAPVSignal coverter. This model is written in LISA+.

Iris and MTI instances for BroadcastSignal2AMBAPVSignal

This model has the following Iris instances:

Table 3-25: BroadcastSignal2AMBAPVSignal Iris instances

InstanceName	ComponentName
BroadcastSignal2AMBAPVSignal	BroadcastSignal2AMBAPVSignal

BroadcastSignal2AMBAPVSignal contains the following CADI targets:

- BroadcastSignal2AMBAPVSignal

Ports for BroadcastSignal2AMBAPVSignal

Table 3-26: Ports

Name	Protocol	Type	Description
amba_pv_signal_m	AMBAPVSignal	Master	-
amba_pv_signal_s	AMBAPVSignal	Slave	-

Name	Protocol	Type	Description
b_signal	Signal	Broadcast	-

3.2.12 Clock2SystemC

Clock to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for Clock2SystemC

This model has the following Iris instances:

Table 3-27: Clock2SystemC Iris instances

InstanceName	ComponentName
Clock2SystemC	Clock2SystemC

Clock2SystemC contains the following CADI targets:

- Clock2SystemC

Ports for Clock2SystemC

Table 3-28: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
current_ticks_s	AMBAPVValueState64	Slave	-
get_clock_s	AMBAPVValueState64	Slave	-
rate_in_Hz_s	AMBAPVValueState64	Slave	-
set_clock_m	AMBAPVValue64	Master	-

3.2.13 ClockRateConversion

ClockRateControl to rate in Hz (Value_64) Converter. This model is written in LISA+.

Iris and MTI instances for ClockRateConversion

This model has the following Iris instances:

Table 3-29: ClockRateConversion Iris instances

InstanceName	ComponentName
ClockRateConversion	ClockRateConversion
ClockRateConversion.clk_div0	ClockDivider
ClockRateConversion.clk_div1	ClockDivider
ClockRateConversion.clk_div2	ClockDivider
ClockRateConversion.clk_div3	ClockDivider

This model has the following MTI trace components:

Table 3-30: ClockRateConversion MTI instances

InstanceName	ComponentName
ClockRateConversion.clk_div0	ClockDivider
ClockRateConversion.clk_div1	ClockDivider
ClockRateConversion.clk_div2	ClockDivider
ClockRateConversion.clk_div3	ClockDivider

ClockRateConversion contains the following CADI targets:

- ClockDivider
- ClockRateConversion

Ports for ClockRateConversion

Table 3-31: Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	-
rate_ctrl[4]	ClockRateControl	Slave	-
rate_hz[4]	Value_64	Master	-

Parameters for ClockRateConversion

clk_div0.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clk_div0.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clk_div1.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clk_div1.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clk_div2.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clk_div2.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clk_div3.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clk_div3.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

3.2.14 ClockSignal2SC_ClockSignal

ClockSignal to SystemC ClockSignal converter. This model is written in LISA+.

Iris and MTI instances for ClockSignal2SC_ClockSignal

This model has the following Iris instances:

Table 3-32: ClockSignal2SC_ClockSignal Iris instances

InstanceName	ComponentName
ClockSignal2SC_ClockSignal	ClockSignal2SC_ClockSignal

ClockSignal2SC_ClockSignal contains the following CADI targets:

- ClockSignal2SC_ClockSignal

Ports for ClockSignal2SC_ClockSignal

Table 3-33: Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Slave	-
sc_clk_out	SC_ClockSignal	Master	-

3.2.15 CoprocBus2SystemC

CoprocBusProtocol to SystemCCoprocBusProtocol converter. This model is written in LISA+.

Iris and MTI instances for CoprocBus2SystemC

This model has the following Iris instances:

Table 3-34: CoprocBus2SystemC Iris instances

InstanceName	ComponentName
CoprocBus2SystemC	CoprocBus2SystemC

CoprocBus2SystemC contains the following CADI targets:

- CoprocBus2SystemC

Ports for CoprocBus2SystemC

Table 3-35: Ports

Name	Protocol	Type	Description
coproc_bus_s	CoprocBusProtocol	Slave	-
sc_coproc_bus_m	SystemCCoprocBusProtocol	Master	-

3.2.16 CounterInterface2SystemC

CounterInterface to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for CounterInterface2SystemC

This model has the following Iris instances:

Table 3-36: CounterInterface2SystemC Iris instances

InstanceName	ComponentName
CounterInterface2SystemC	CounterInterface2SystemC

CounterInterface2SystemC contains the following CADI targets:

- CounterInterface2SystemC

Ports for CounterInterface2SystemC

Table 3-37: Ports

Name	Protocol	Type	Description
amba_pv_eventUpdate_m	AMBAPVValue	Master	-
amba_pv_getCounterValue_s	AMBAPVValueState64	Slave	-
amba_pv_requestEventUpdate_s	AMBAPVValue64	Slave	-
amba_pv_requestSignalUpdate_s	AMBAPVValue64	Slave	-
amba_pv_setEnabled_m	AMBAPVValue	Master	-
amba_pv_signalUpdate_m	AMBAPVValue	Master	-
cntvalueb	CounterInterface	Slave	-

3.2.17 InstructionCount2SystemC

InstructionCount to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for InstructionCount2SystemC

This model has the following Iris instances:

Table 3-38: InstructionCount2SystemC Iris instances

InstanceName	ComponentName
InstructionCount2SystemC	InstructionCount2SystemC

InstructionCount2SystemC contains the following CADI targets:

- InstructionCount2SystemC

Note

Variants of this component also exist with multiple input and output ports.

Ports for InstructionCount2SystemC

Table 3-39: Ports

Name	Protocol	Type	Description
inst_count	AMBAPVValueState64	Slave	-

Name	Protocol	Type	Description
run_state	AMBAPVValueState	Slave	-
ticks	InstructionCount	Slave	-

3.2.18 LCD2SystemC

Converts LCD protocol to SystemC. This model is written in LISA+.

Iris and MTI instances for LCD2SystemC

This model has the following Iris instances:

Table 3-40: LCD2SystemC Iris instances

InstanceName	ComponentName
LCD2SystemC	LCD2SystemC

LCD2SystemC contains the following CADI targets:

- LCD2SystemC

Ports for LCD2SystemC

Table 3-41: Ports

Name	Protocol	Type	Description
all_received_sPL	AMBAPVSignal	Master	-
all_received_u	AMBAPVSignal	Master	-
lcd_s	LCD	Slave	-
lock_m	AMBAPVValueState64	Master	-
setPreferredLayout_d	AMBAPVValue	Master	-
setPreferredLayout_h	AMBAPVValue	Master	-
setPreferredLayout_w	AMBAPVValue	Master	-
unlock_m	AMBAPVSignal	Master	-
update_h	AMBAPVValue	Master	-
update_w	AMBAPVValue	Master	-
update_x	AMBAPVValue	Master	-
update_y	AMBAPVValue	Master	-

3.2.19 PChannel2SystemC

PChannel to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for PChannel2SystemC

This model has the following Iris instances:

Table 3-42: PChannel2SystemC Iris instances

InstanceName	ComponentName
PChannel2SystemC	PChannel2SystemC

PChannel2SystemC contains the following CADI targets:

- PChannel2SystemC

Ports for PChannel2SystemC

Table 3-43: Ports

Name	Protocol	Type	Description
pchannel	PChannel	Slave	-
sc_pchannel	SystemCPChannel	Master	-

3.2.20 PVBUS2AMBAPV

PVBus to AMBA-PV protocol converter. This model is written in LISA+.

Iris and MTI instances for PVBUS2AMBAPV

This model has the following Iris instances:

Table 3-44: PVBUS2AMBAPV Iris instances

InstanceName	ComponentName
PVBus2AMBAPV	PVBus2AMBAPV
PVBus2AMBAPV.bus_bridge	PVBusBridge

This model has the following MTI trace components:

Table 3-45: PVBUS2AMBAPV MTI instances

InstanceName	ComponentName
PVBus2AMBAPV	PVBus2AMBAPV
PVBus2AMBAPV.bus_bridge	PVBusBridge

PVBus2AMBAPV contains the following CADI targets:

- PVBus2AMBAPV

About PVBUS2AMBAPV

Note

Variants of PVBus2AMBAPV also exist with multiple input and output ports.

The AMBAPV protocol definition in LISA, `AMBAPVProtocol.lisa`, specifies a 64-bit bus width, so the PVBUS2AMBAPV bridge also handles a 64-bit bus width.

If you need to connect to a component that uses a bus interface with a smaller or larger bus width, the recommended method is to insert a downsizer or upsizer respectively.

Alternatively, you could define a new bus protocol with the required bit width, for example AMBAPV32, and update the corresponding bridges to use the new protocol on AMBA-PV ports:

```
master port<AMBAPV32> amba_pv_m
```

Limitations

Fast Models bridges between PVBUS and AMBA-PV can transport Memory Tagging Extension (MTE) operations (tag stores, tag loads, and tag-checked loads and stores).

These operations are transported opaquely, so the endpoint must be using PVBUS. This means you cannot handle these operations in your own TLM components.

Dumping the DMI cache

DMI viewer provides the debugging functionality of the PVBUS2AMBAPV bridge. When activated, it dumps the content of the DMI cache in the bridge in the following CSV format:

```
Range_start, Range_end_incl, Pointer, Latency, R/W, Attributes
```

To activate this functionality, a name for the counters output file must be set, using the `counters-file-name` parameter. If the counters file name is set, when `dump-dmi-cache` is set to 1 at runtime, the DMI cache of the bridge is dumped. The runtime parameter is always reset to 0 when the dump has completed.

Ports for PVBUS2AMBAPV

Table 3-46: Ports

Name	Protocol	Type	Description
<code>amba_pv_m</code>	AMBAPV	Master	-
<code>pvbuss_s</code>	PVBUS	Slave	-

Parameters for PVBUS2AMBAPV

counters-file-name

Prefix of the file name to store counters at the end of simulation

Type

string

Default value

dmi-container-type

Type of the DMI cache. Allowed values: TZAttr and FullAttr

Type

string

Default value

FullAttr

dump-dmi-cache

Dumps the content of the DMI cache into a file

Type

bool

Default value

0x0

dump-dmi-file-name

Prefix of the file name to dump the content of the DMI when requested

Type

string

Default value**force-dmi-size**

Force DMI start and end address to be 4kB-aligned

Type

bool

Default value

0x1

min-range-to-cache

Min DMI range size to cache in the bridge

Type

int

Default value

0x10000

size

Maximum size of memory region

Type

int

Default value

0x1000000000000

3.2.21 PVBUS2AMBAPVACE

PVBus to AMBA-PV ACE protocol converter. This model is written in LISA+.

Iris and MTI instances for PVBUS2AMBAPVACE

This model has the following Iris instances:

Table 3-47: PVBUS2AMBAPVACE Iris instances

InstanceName	ComponentName
PVBus2AMBAPVACE	PVBus2AMBAPVACE
PVBus2AMBAPVACE.bus_bridge	PVBusBridge
PVBus2AMBAPVACE.pvbus_tlm_switch	PVBusMapper

This model has the following MTI trace components:

Table 3-48: PVBUS2AMBAPVACE MTI instances

InstanceName	ComponentName
PVBus2AMBAPVACE	PVBus2AMBAPVACE
PVBus2AMBAPVACE.bus_bridge	PVBusBridge
PVBus2AMBAPVACE.pvbus_tlm_switch	PVBusMapper

PVBus2AMBAPVACE contains the following CADI targets:

- PVBus2AMBAPVACE

About PVBUS2AMBAPVACE

PVBus2AMBAPVACE depends on the AMBA-PV API, which must be at least version 1.4.

The translation of bus transactions by the bridge has some impact on performance. Bus masters that cache memory transactions avoid much of this impact.

DMI viewer provides the debugging functionality of the PVBus2AMBAPV bridge. When activated, it dumps the content of the DMI cache in the bridge in the following CSV format:

Range start, Range end incl, Pointer, Latency, R/W, Attributes

To activate this functionality, set a name for the counters output file using the `counters-file-name` parameter. If the counters file name is set, when `dump-dmi-cache` is set to 1 at runtime, the DMI cache of the bridge is dumped. The runtime parameter is always reset to 0 when the dump has completed.

Ports for PVBUS2AMBAPVACE

Table 3-49: Ports

Name	Protocol	Type	Description
amba_pv_ace_m	AMBAPVACE	Master	-
pvbus_over_tlm_control	PVBusOverTLMControl	Slave	-

Name	Protocol	Type	Description
pvbuss_s	PVBus	Slave	-

Parameters for PVBus2AMBAPVACE

counters-file-name

Prefix of the file name to store counters at the end of simulation

Type

string

Default value

dmi-cache-name

DEPRECATED: This parameter will be ignored. Name of the DMI cache. Useful for multiple bridges to share the same cache

Type

string

Default value

dmi-container-type

Type of the DMI cache. Allowed values: TZAttr and FullAttr. When there are caches downstream of this bridge and cache-state-modelled=1 and route-tlm=1 use only FullAttr.

Type

string

Default value

FullAttr

dump-dmi-cache

Dumps the content of the DMI cache into a file

Type

bool

Default value

0x0

dump-dmi-file-name

Prefix of the file name to dump the content of the DMI when requested

Type

string

Default value

force-dmi-size

Force DMI start and end address to be 4kB-aligned

Type

bool

Default value

0x1

min-range-to-cache

Min DMI range size to cache in the bridge

Type

int

Default value

0x10000

route-tlm

Route all the PVBUS traffic explicitly to the TLM bus. Allows to monitor transactions on the TLM bus but slows down the emulation. The routing must always be to TLM if there is not a corresponding AMBAPVACE2PVBUS bridge downstream.

Type

bool

Default value

0x1

route-tlm-filter

Route TLM filter set a range (or multiple ranges) of addresses that will use PVBUS even if route-tlm is set to true. The route-tlm-filter is specified in JSON format. Example, [{"begin":0x2f000000, "size":0x1000}, {"begin":0x4f000000, "size":0x2000}].

Type

string

Default value**set-ace-lite**

Set bridge mode when connecting to ace-lite ports. If true, the bridge will not deal with SNOOPS.

Type

bool

Default value

0x0

size

Maximum size of memory region, i.e. the first unsupported address.

Type

int

Default value

0x10000000000000

3.2.22 PVBUSBridge

A PVBUSBridge bridges incoming transactions to a PVDevice port. This model is written in C++.

Iris and MTI instances for PVBUSBridge

This model has the following Iris instances:

Table 3-50: PVBUSBridge Iris instances

InstanceName	ComponentName
PVBUSBridge	PVBUSBridge

This model has the following MTI trace components:

Table 3-51: PVBUSBridge MTI instances

InstanceName	ComponentName
PVBUSBridge	PVBUSBridge

Ports for PVBUSBridge**Table 3-52: Ports**

Name	Protocol	Type	Description
control	PVBUSBridgeControl	Slave	Control signal.
device	PVDevice	Master	Optimised connection out to devices.
dump_dmi	Signal	Slave	On the assert of this signal the bridge will dump dmi cache content into a csv file
pvbuss	PVBUS	Slave	Connection in from bus master.
reset	Signal	Slave	On the assert of this signal, a reset of the bus slave will be latched this is used by the bus deadlock detection logic.

3.2.23 SC_ClockSignal2ClockSignal

SystemC ClockSignal to ClockSignal converter. This model is written in LISA+.

Iris and MTI instances for SC_ClockSignal2ClockSignal

This model has the following Iris instances:

Table 3-53: SC_ClockSignal2ClockSignal Iris instances

InstanceName	ComponentName
SC_ClockSignal2ClockSignal	SC_ClockSignal2ClockSignal

SC_ClockSignal2ClockSignal contains the following CADI targets:

- SC_ClockSignal2ClockSignal

Ports for SC_ClockSignal2ClockSignal

Table 3-54: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Master	-
sc_clk_in	SC_ClockSignal	Slave	-

3.2.24 SGSignal2AMBAPVSignal

SystemGenerator Signal to AMBA-PV Signal protocol converter. This model is written in LISA+.

Iris and MTI instances for SGSignal2AMBAPVSignal

This model has the following Iris instances:

Table 3-55: SGSignal2AMBAPVSignal Iris instances

InstanceName	ComponentName
SGSignal2AMBAPVSignal	SGSignal2AMBAPVSignal

Variants of this component also exist with multiple input and output ports.

Ports for SGSignal2AMBAPVSignal

Table 3-56: Ports

Name	Protocol	Type	Description
amba_pv_signal_m	AMBAPVSignal	Master	Output master port for connection to top-level AMBAPVSignal master port. Converted signal state changes are sent out through this port.
sg_signal_s	Signal	Slave	Handles incoming signal state changes.

3.2.25 SGStateSignal2AMBAPVSignalState

SystemGenerator StateSignal to AMBA-PV SignalState protocol converter. This model is written in LISA+.

Iris and MTI instances for SGStateSignal2AMBAPVSignalState

This model has the following Iris instances:

Table 3-57: SGStateSignal2AMBAPVSignalState Iris instances

InstanceName	ComponentName
SGStateSignal2AMBAPVSignalState	SGStateSignal2AMBAPVSignalState

Variants of this component also exist with multiple input and output ports.

Ports for SGStateSignal2AMBAPVSignalState

Table 3-58: Ports

Name	Protocol	Type	Description
amba_pv_signal_m	AMBAPVSignalState	Master	Output master port for connection to top-level AMBAPVValue64 master port. Converted value changes are sent out through this port.
sg_signal_s	StateSignal	Slave	Handles incoming value changes.

3.2.26 SGValue2AMBAPVValue

SystemGenerator Value to AMBA-PV Value protocol converter. This model is written in LISA+.

Iris and MTI instances for SGValue2AMBAPVValue

This model has the following Iris instances:

Table 3-59: SGValue2AMBAPVValue Iris instances

InstanceName	ComponentName
SGValue2AMBAPVValue	SGValue2AMBAPVValue

Variants of this component also exist with multiple input and output ports.

Ports for SGValue2AMBAPVValue

Table 3-60: Ports

Name	Protocol	Type	Description
amba_pv_value_m	AMBAPVValue	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	Value	Slave	Handles incoming value changes.

3.2.27 SGValue2AMBAPVValue64

SystemGenerator Value_64 to AMBA-PV Value64 protocol converter. This model is written in LISA+.

Iris and MTI instances for SGValue2AMBAPVValue64

This model has the following Iris instances:

Table 3-61: SGValue2AMBAPVValue64 Iris instances

InstanceName	ComponentName
SGValue2AMBAPVValue64	SGValue2AMBAPVValue64

Variants of this component also exist with multiple input and output ports.

Ports for SGValue2AMBAPVValue64

Table 3-62: Ports

Name	Protocol	Type	Description
amba_pv_value_m	AMBAPVValue64	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	Value_64	Slave	Handles incoming value changes.

3.2.28 SGValueState2AMBAPVValueState

SystemGenerator ValueState to AMBA-PV ValueState protocol converter. This model is written in LISA+.

Iris and MTI instances for SGValueState2AMBAPVValueState

This model has the following Iris instances:

Table 3-63: SGValueState2AMBAPVValueState Iris instances

InstanceName	ComponentName
SGValueState2AMBAPVValueState	SGValueState2AMBAPVValueState

Variants of this component also exist with multiple input and output ports.

Ports for SGValueState2AMBAPVValueState

Table 3-64: Ports

Name	Protocol	Type	Description
amba_pv_value_m	AMBAPVValueState	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	ValueState	Slave	Handles incoming value changes.

3.2.29 SGValueState2AMBAPVValueState64

SystemGenerator ValueState_64 to AMBA-PV ValueState64 protocol converter. This model is written in LISA+.

Iris and MTI instances for SGValueState2AMBAPVValueState64

This model has the following Iris instances:

Table 3-65: SGValueState2AMBAPVValueState64 Iris instances

InstanceName	ComponentName
SGValueState2AMBAPVValueState64	SGValueState2AMBAPVValueState64

Variants of this component also exist with multiple input and output ports.

Ports for SGValueState2AMBAPVValueState64

Table 3-66: Ports

Name	Protocol	Type	Description
amba_pv_value_m	AMBAPVValueState64	Master	Output master port for connection to top-level AMBAPVValue64 master port. Converted value changes are sent out through this port.
sg_value_s	ValueState_64	Slave	Handles incoming value changes.

3.2.30 SMMUv3AEMIdentify2AMBAPVValue64

SMMUv3AEMIdentify to AMBA-PV Value64 protocol converter. This model is written in LISA+.

Iris and MTI instances for SMMUv3AEMIdentify2AMBAPVValue64

This model has the following Iris instances:

Table 3-67: SMMUv3AEMIdentify2AMBAPVValue64 Iris instances

InstanceName	ComponentName
SMMUv3AEMIdentify2AMBAPVValue64	SMMUv3AEMIdentify2AMBAPVValue64

Ports for SMMUv3AEMIdentify2AMBAPVValue64

Table 3-68: Ports

Name	Protocol	Type	Description
identify	SMMUv3AEMIdentifyProtocol	Slave	SMMUv3AEMIdentifyProtocol input.
identify_reply	AMBAPVValue64	Slave	From SystemC.
identify_request	AMBAPVValue64	Master	To SystemC.

3.2.31 SystemC2Clock

Clock to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for SystemC2Clock

This model has the following Iris instances:

Table 3-69: SystemC2Clock Iris instances

InstanceName	ComponentName
SystemC2Clock	SystemC2Clock

SystemC2Clock contains the following CADI targets:

- SystemC2Clock

Ports for SystemC2Clock

Table 3-70: Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Master	ClockSignal output
current_ticks_m	AMBAPVValueState64	Master	To SystemC.
get_clock_m	AMBAPVValueState64	Master	To SystemC.
rate_in_Hz_m	AMBAPVValueState64	Master	To SystemC.
set_clock_s	AMBAPVValue64	Slave	From SystemC.

3.2.32 SystemC2CprocBus

SystemCCoprocBusProtocol to CoprocBusProtocol converter. This model is written in LISA+.

Iris and MTI instances for SystemC2CprocBus

This model has the following Iris instances:

Table 3-71: SystemC2CprocBus Iris instances

InstanceName	ComponentName
SystemC2CprocBus	SystemC2CprocBus

SystemC2CprocBus contains the following CADI targets:

- SystemC2CprocBus

Ports for SystemC2CprocBus

Table 3-72: Ports

Name	Protocol	Type	Description
coproc_bus_m	CoprocBusProtocol	Master	-
sc_coproc_bus_s	SystemCCoprocBusProtocol	Slave	-

3.2.33 SystemC2CounterInterface

SystemC to CounterInterface Converter. This model is written in LISA+.

Iris and MTI instances for SystemC2CounterInterface

This model has the following Iris instances:

Table 3-73: SystemC2CounterInterface Iris instances

InstanceName	ComponentName
SystemC2CounterInterface	SystemC2CounterInterface

SystemC2CounterInterface contains the following CADI targets:

- SystemC2CounterInterface

Ports for SystemC2CounterInterface

Table 3-74: Ports

Name	Protocol	Type	Description
amba_pv_eventUpdate_s	AMBAPVValue	Slave	From SystemC.
amba_pv_getCounterValue_m	AMBAPVValueState64	Master	To SystemC.
amba_pv_requestEventUpdate_m	AMBAPVValue64	Master	To SystemC.
amba_pv_requestSignalUpdate_m	AMBAPVValue64	Master	To SystemC.
amba_pv_setEnabled_s	AMBAPVValue	Slave	From SystemC.
amba_pv_signalUpdate_s	AMBAPVValue	Slave	From SystemC.
cntvalueb	CounterInterface	Master	-

3.2.34 SystemC2InstructionCount

SystemC to InstructionCount Converter. This model is written in LISA+.

Iris and MTI instances for SystemC2InstructionCount

This model has the following Iris instances:

Table 3-75: SystemC2InstructionCount Iris instances

InstanceName	ComponentName
SystemC2InstructionCount	SystemC2InstructionCount

SystemC2InstructionCount contains the following CADI targets:

- SystemC2InstructionCount

Variants of this component also exist with multiple input and output ports.

Ports for SystemC2InstructionCount

Table 3-76: Ports

Name	Protocol	Type	Description
inst_count	AMBAPVValueState64	Master	To SystemC to request instruction count.
run_state	AMBAPVValueState	Master	To SystemC to request run state.
ticks	InstructionCount	Master	InstructionCount input.

3.2.35 SystemC2LCD

Converts SystemC to LCD protocol. This model is written in LISA+.

Iris and MTI instances for SystemC2LCD

This model has the following Iris instances:

Table 3-77: SystemC2LCD Iris instances

InstanceName	ComponentName
SystemC2LCD	SystemC2LCD

SystemC2LCD contains the following CADI targets:

- SystemC2LCD

Ports for SystemC2LCD

Table 3-78: Ports

Name	Protocol	Type	Description
all_received_sPL	AMBAPVSignal	Slave	From SystemC.
all_received_u	AMBAPVSignal	Slave	From SystemC.
lcd_m	LCD	Master	LCD output.
lock_s	AMBAPVValueState64	Slave	From SystemC.
setPreferredLayout_d	AMBAPVValue	Slave	From SystemC.
setPreferredLayout_h	AMBAPVValue	Slave	From SystemC.
setPreferredLayout_w	AMBAPVValue	Slave	From SystemC.
unlock_s	AMBAPVSignal	Slave	From SystemC.
update_h	AMBAPVValue	Slave	From SystemC.
update_w	AMBAPVValue	Slave	From SystemC.
update_x	AMBAPVValue	Slave	From SystemC.
update_y	AMBAPVValue	Slave	From SystemC.

3.2.36 SystemC2PChannel

SystemC to PChannel Converter. This model is written in LISA+.

Iris and MTI instances for SystemC2PChannel

This model has the following Iris instances:

Table 3-79: SystemC2PChannel Iris instances

InstanceName	ComponentName
SystemC2PChannel	SystemC2PChannel

SystemC2PChannel contains the following CADI targets:

- SystemC2PChannel

Ports for SystemC2PChannel

Table 3-80: Ports

Name	Protocol	Type	Description
pchannel	PChannel	Master	-
sc_pchannel	SystemCPChannel	Slave	-

3.2.37 SystemC2VirtualEthernet

SystemC to VirtualEthernet Converter. This model is written in LISA+.

Iris and MTI instances for SystemC2VirtualEthernet

This model has the following Iris instances:

Table 3-81: SystemC2VirtualEthernet Iris instances

InstanceName	ComponentName
SystemC2VirtualEthernet	SystemC2VirtualEthernet

SystemC2VirtualEthernet contains the following CADI targets:

- SystemC2VirtualEthernet

Ports for SystemC2VirtualEthernet

Table 3-82: Ports

Name	Protocol	Type	Description
virtualethernet_m	VirtualEthernet	Master	-
virtualethernet_s	SC_VirtualEthernet	Slave	-

3.2.38 SystemC2v7VGICConfig

Converts SystemC to v7_vgic_configuration_protocol. This model is written in LISA+.

Iris and MTI instances for SystemC2v7VGICConfig

This model has the following Iris instances:

Table 3-83: SystemC2v7VGICConfig Iris instances

InstanceName	ComponentName
SystemC2v7VGICConfig	SystemC2v7VGICConfig

SystemC2v7VGICConfig contains the following CADI targets:

- SystemC2v7VGICConfig

Ports for SystemC2v7VGICConfig

Table 3-84: Ports

Name	Protocol	Type	Description
all_received_s	AMBAPVSignal	Slave	From SystemC.
cpu_interface_number_s	AMBAPVValue64	Slave	From SystemC.
inout_cluster_number_s	AMBAPVValue64	Slave	From SystemC.
inout_cpu_number_in_cluster_s	AMBAPVValue64	Slave	From SystemC.
master_id_mask_s	AMBAPVValue	Slave	From SystemC.
master_id_s	AMBAPVValue	Slave	From SystemC.

response_m	AMBAPVSignal	Master	To SystemC.
v7_vgic_config_m	v7_VGIC_Configuration_Protocol	Master	v7_VGIC_Configuration_Protocol output.

3.2.39 VECB2AMBAPVValue64

VECB protocol to AMBA-PV protocol converter. This model is written in LISA+.

Iris and MTI instances for VECB2AMBAPVValue64

This model has the following Iris instances:

Table 3-85: VECB2AMBAPVValue64 Iris instances

InstanceName	ComponentName
VECB2AMBAPVValue64	VECB2AMBAPVValue64

VECB2AMBAPVValue64 contains the following CADI targets:

- VECB2AMBAPVValue64

Ports for VECB2AMBAPVValue64

Table 3-86: Ports

Name	Protocol	Type	Description
amba_pv_ctrl_m	AMBAPVValue	Master	AMBAPV portout.
amba_pv_data_m	AMBAPVValue64	Master	AMBAPV portout.
vecb_s	VECBProtocol	Slave	VECB port in.

3.2.40 VirtualEthernet2SystemC

VirtualEthernet to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for VirtualEthernet2SystemC

This model has the following Iris instances:

Table 3-87: VirtualEthernet2SystemC Iris instances

InstanceName	ComponentName
VirtualEthernet2SystemC	VirtualEthernet2SystemC

VirtualEthernet2SystemC contains the following CADI targets:

- VirtualEthernet2SystemC

Ports for VirtualEthernet2SystemC

Table 3-88: Ports

Name	Protocol	Type	Description
virtualethernet_m	SC_VirtualEthernet	Master	-
virtualethernet_s	VirtualEthernet	Slave	-

3.2.41 v7VGICConfig2SystemC

Converts v7_vgic_configuration_protocol to SystemC. This model is written in LISA+.

Iris and MTI instances for v7VGICConfig2SystemC

This model has the following Iris instances:

Table 3-89: v7VGICConfig2SystemC Iris instances

InstanceName	ComponentName
v7VGICConfig2SystemC	v7VGICConfig2SystemC

v7VGICConfig2SystemC contains the following CADI targets:

- v7VGICConfig2SystemC

Ports for v7VGICConfig2SystemC

Table 3-90: Ports

Name	Protocol	Type	Description
all_received	AMBAPVSignal	Master	Called when all other values have been set in opposite bridge.
cpu_interface_number_m	AMBAPVValue64	Master	To SystemC.
inout_cluster_number_m	AMBAPVValue64	Master	To SystemC.
inout_cpu_number_in_cluster_m	AMBAPVValue64	Master	To SystemC.
master_id_m	AMBAPVValue	Master	To SystemC.

number_of_cores_m	AMBAPVValueState	Master	To SystemC.
response_s	AMBAPVSignal	Slave	From SystemC.
v7_vgic_config_s	v7_VGIC_Configuration_Protocol	Slave	v7_VGIC_Configuration_Protocol input.

3.3 Bus components

This section describes the Bus components.

PVBus is the bus protocol that is used to model all memory-like buses in Fast Models. PVBus is an internal protocol. The PVBus components, which abstract the internal details, are the interface to the PVBus API.

PVBus components provide functionally accurate communication between bus masters and slaves. They are not software implementations of specific hardware, but instead are abstract components that are required by the software model environment.

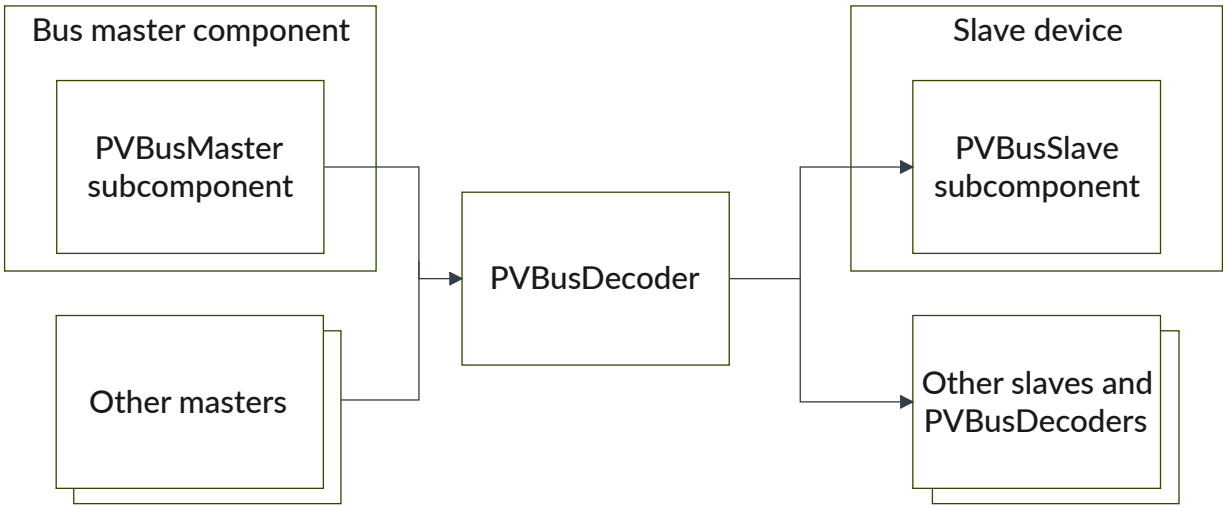

There is no modeling of handshaking or cycle counts. By removing this level of detail, and by using efficient internal communication mechanisms, PVBus components can provide very fast modeling of bus accesses. You must use these components correctly to achieve high simulation speeds.

Each bus master must contain a `PVBusMaster` subcomponent, and each bus slave must contain a `PVBusSlave` subcomponent. These subcomponents provide `PVBus` master and slave ports. Each `PVBus` master port can only connect to one slave, but any number of other masters can connect to the same slave. `PVBusDecoder`, `PVBusMaster` and `PVBusSlave` components communicate using the `PVBus` protocol.

`PVBusDecoder` components can be added to the bus system. Each of these permits its masters to connect to multiple slaves, each associated with a different bus address range.

`PVBusSlave` subcomponents provide built-in support for declaring memory-like, device-like, abort or ignore address ranges. `PVBus` has support for dealing efficiently with memory-like devices such as RAM, ROM, and Flash.

Figure 3-1: Sample bus topology

All communication over the `PVBUS` is performed using transactions that are generated by `PVBUSMaster` subcomponents and fulfilled by `PVBUSSlave` components. Transactions have a 32-bit Master ID, which is the ID of the bus master. Transactions can be routed to the slave device through its `PVBUSSlave` subcomponent. When configured, the `PVBUSSlave` can handle memory-like transactions efficiently without having to route these transactions to the slave device. Transactions are atomic unless slave devices block transactions, for example an SMMU with stall mode enabled. A slave device that can block transactions and all its upstream bus components must be re-entrant safe for bus transactions.

Fast Models provides some example `PVBUS` systems:

- `$PVLIB_HOME/examples/LISA/common/LISA/RemapDecoder.lisa`. This example dynamically modifies routing of requests based on a remap signal, using the `tzswitch` component.
- The directory `$PVLIB_HOME/examples/LISA/BusComponents/` contains a set of example components that show various ways of using the `PVBUS` interface.

3.3.1 Labeller

This model is written in LISA+.

Iris and MTI instances for Labeller

This model has the following Iris instances:

Table 3-91: Labeller Iris instances

InstanceName	ComponentName
Labeller	Labeller
Labeller.pvbusmodifier	PVBUSMapper

This model has the following MTI trace components:

Table 3-92: Labeller MTI instances

InstanceName	ComponentName
Labeller.pvbusmodifier	PVBusMapper

Labeller contains the following CADI targets:

- Labeller

About Labeller

Labeller and LabellerForDMA330 are utility components that allow the system designer to embed values into the Label field for transactions generated by a Bus Master. They are located between PVBus Master and Slave ports.

The following example creates a labeller to add an ID for an HDLCD controller that is upstream of a TZC_400. The system designer specifies a unique set of IDs for use as *Non-Secure Access IDs* (NSAIDs) in the TZC_400. The labeller can insert these IDs directly into the transaction.

```
p1370_hdlcd : PL370 HDLCD();
hdlcd_labeller : Labeller( "label" = 2 );
p1370_hdlcd.pvbus_m => hdlcd_labeller.pvbus_s;
hdlcd_labeller.pvbus_m => output_bus.pvbus_s;
```

Ports for Labeller

Table 3-93: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for Labeller

label

The label to apply to all transactions flowing through the labeller

Type

int

Default value

0x0

3.3.2 LabellerForDMA330

This model is written in LISA+.

Iris and MTI instances for LabellerForDMA330

This model has the following Iris instances:

Table 3-94: LabellerForDMA330 Iris instances

InstanceName	ComponentName
LabellerForDMA330	LabellerForDMA330
LabellerForDMA330.pvbusmapper	PVBusMapper

This model has the following MTI trace components:

Table 3-95: LabellerForDMA330 MTI instances

InstanceName	ComponentName
LabellerForDMA330.pvbusmapper	PVBusMapper

LabellerForDMA330 contains the following CADI targets:

- LabellerForDMA330

About LabellerForDMA330

Labeller and LabellerForDMA330 are utility components that allow the system designer to embed values into the Label field for transactions generated by a Bus Master. They are located between PVBus Master and Slave ports.

Ports for LabellerForDMA330

Table 3-96: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for LabellerForDMA330

dma330_data_label

The label to apply to all _data_ transactions flowing through the labeller. Used as a base value in conjunction with the channel ID if data-channel discrimination is enabled.

Type

int

Default value

0x0

dma330_discriminate_data_channels

Discriminate between DMA-330 data channels. Channel ID is added to the data label.

Type

bool

Default value

0x0

dma330_ns_instruction_label
The label to apply to all non-secure `_instructions_` transactions flowing through the labeller

Type
int

Default value
0x0

dma330_s_instruction_label
The label to apply to all secure `_instructions_` transactions flowing through the labeller

Type
int

Default value
0x0

3.3.3 LabellerForGPUProtMode

This model is written in LISA+.

Iris and MTI instances for LabellerForGPUProtMode

This model has the following Iris instances:

Table 3-97: LabellerForGPUProtMode Iris instances

InstanceName	ComponentName
LabellerForGPUProtMode	LabellerForGPUProtMode
LabellerForGPUProtMode.pvbusmodifier	PVBusMapper

This model has the following MTI trace components:

Table 3-98: LabellerForGPUProtMode MTI instances

InstanceName	ComponentName
LabellerForGPUProtMode.pvbusmodifier	PVBusMapper

LabellerForGPUProtMode contains the following CADI targets:

- LabellerForGPUProtMode

About LabellerForGPUProtMode

This component adds Non-Secure Access IDs (NSAIDs) to the transactions generated by the GPU. The NSAID is a four-bit number. It allows other components, such as a TrustZone® Controller (TZC) or a Dynamic Memory Controller (DMC) to filter transactions and control access to memory regions that are designated as protected.

Ports for LabellerForGPUProtMode

Table 3-99: Ports

Name	Protocol	Type	Description
prot_mode	Signal	Slave	Input to determine whether output is supposed to be protected or not
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for LabellerForGPUProtMode

gpu_id_normal

NSAID to apply to all transactions flowing through the labeller when prot_mode is low.

Type

int

Default value

0x0

gpu_id_protected

NSAID to apply to all transactions flowing through the labeller when prot_mode is high.

Type

int

Default value

0x0

3.3.4 MSIRewriter

Recognise writes to the GITS_TRANSLATER register and rewrite them to go to the GITS_TRANSLATE64R register. The DeviceID is expected to be in the bottom 32 bits of ExtendedID of the transaction. Debug transactions and reads are not rewritten. This component can also, optionally, apply a 16 bit 'label' to the top 16 bits of the MasterID in the same way that the Labeller component does. This model is written in LISA+.

Iris and MTI instances for MSIRewriter

This model has the following Iris instances:

Table 3-100: MSIRewriter Iris instances

InstanceName	ComponentName
MSIRewriter	MSIRewriter
MSIRewriter.mapper	PVBusMapper
MSIRewriter.pvbustmaster	PVBusMaster
MSIRewriter.pvbusslave	PVBusSlave

This model has the following MTI trace components:

Table 3-101: MSIRewriter MTI instances

InstanceName	ComponentName
MSIRewriter	MSIRewriter
MSIRewriter.mapper	PVBusMapper
MSIRewriter.pvbusmaster	PVBusMaster
MSIRewriter.pvbuslave	PVBusSlave

MSIRewriter contains the following CADI targets:

- MSIRewriter

About MSIRewriter

MSIRewriter is a component that implements the functionality of the MSI-64 Encapsulator in GIC IP, for example GIC-700. For more information about GIC-700, see [GIC-700 Technical Reference Manual](#). For the GIC architecture specification version 3 and version 4, see [GIC Architecture Specification](#).

If an MSIRewriter component is used, it converts writes to the GITS_TRANSLATER register to writes to a model-only register called GITS_TRANSLATE64R. GITS_TRANSLATE64R holds the DeviceID in the upper 32 bits and the EventID in the lower 32 bits. The lower 32 bits of GITS_TRANSLATE64R correspond to the GITS_TRANSLATER register.

MasterID, ExtendedID, and UserFlags

These tables show how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

Table 3-102: pvbus_s port

PVBus attribute	Bits used	Property encoded	Notes
MasterID	-	-	Not used.
ExtendedID	Bits[63:32]	Stream ID	-
	Bits[31:0]	Device ID	-
UserFlags	-	-	Not used.

Table 3-103: pvbus_m port

PVBus attribute	Bits used	Property encoded	Notes
MasterID	Bits[31:16]	Optional 16-bit label.	For usage, see the <code>label</code> parameter.
ExtendedID	-	-	Not used.
UserFlags	-	-	Not used.

Ports for MSIRewriter

Table 3-104: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

Parameters for MSIRewriter

GITS_TRANSLATE64R_OFFSET

It is an offset from ITS0-Base.

Type

int

Default value

0x10048

ITS0-base

Register base address for ITS0. This base address is used to recognise writes to the GITS_TRANSLATER register within the ITS0's register frame.

Type

int

Default value

0x0

enable_rewriting

Enable rewriting.

Type

bool

Default value

0x1

label

If $< 2^{*16}$ then this is a label that is put in the top 16 bits of MasterID in the same way that the component Labeller does. This labelling is not controlled by enable_rewriting and is performed on all transactions (even rewritten ones)

Type

int

Default value

0xffffffff

log

Log level, 0 is off.

Type

int

Default value

0x0

3.3.5 PASSwitch

Allow transactions from Realm Management Extension(RME) worlds (realm/root/secure/non_secure) to be routed separately. This model is written in C++.

Ports for PASSwitch

Table 3-105: Ports

Name	Protocol	Type	Description
control	PASSwitchControl	Slave	Controls routing of transactions
pvbus_m[4]	PVBus	Master	Manager ports of PASSwitch
pvbus_s	PVBus	Slave	Subordinate port of PASSwitch

Parameters for PASSwitch

non_secure_port_index

Port Index for Secure world transactions to exit or -2 for IGNORE or -1 for ABORT [Default Index of 0]

Type

int

Default value

0x1

port_map_json

A JSON value describing ports for different address regions. The begin address and size values should be aligned to 4KiB. The format is as follows:{{ "begin": 0x0, "size": 0x1000, "port": 0 },{ "begin": 0x20000, "size": 0x50000, "port": 2 }}

Type

string

Default value

realm_port_index

Port Index for Realm world transactions to exit or -2 for IGNORE or -1 for ABORT [Default Index of 0]

Type

int

Default value

0x3

root_port_index

Port Index for Root world transactions to exit or -2 for IGNORE or -1 for ABORT [Default Index of 0]

Type

int

Default value

0x2

secure_port_index

Port Index for Secure world transactions to exit or -2 for IGNORE or -1 for ABORT [Default Index of 0]

Type

int

Default value

0x0

3.3.6 PVBUS4KBTo1KBSplitter

Takes 4KB of address range input on slave port and routes each 1KB to four different master ports. This model is written in LISA+.

Iris and MTI instances for PVBUS4KBTo1KBSplitter

This model has the following Iris instances:

Table 3-106: PVBUS4KBTo1KBSplitter Iris instances

InstanceName	ComponentName
PVBUS4KBTo1KBSplitter	PVBUS4KBTo1KBSplitter
PVBUS4KBTo1KBSplitter.input_slave	PVBUSSlave
PVBUS4KBTo1KBSplitter.output_master0	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master1	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master2	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master3	PVBUSMaster

This model has the following MTI trace components:

Table 3-107: PVBUS4KBTo1KBSplitter MTI instances

InstanceName	ComponentName
PVBUS4KBTo1KBSplitter.input_slave	PVBUSSlave
PVBUS4KBTo1KBSplitter.output_master0	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master1	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master2	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master3	PVBUSMaster

PVBUS4KBTo1KBSplitter contains the following CADI targets:

- PVBUS4KBTo1KBSplitter

About PVBUS4KBTo1KBSplitter

The purpose of this component is to allow an upstream component to access four downstream components in the same 4KB address range. It splits the 4KB range from 0 to 0xfff into the following four 1KB ranges, which allows four different components to be attached to the 4KB range:

- 0x0-0x3ff
- 0x400-0x7ff
- 0x800-0xbff
- 0xc00-0xfff

This overcomes a limitation of PVBUS which only allows components to be attached to memory addresses that are a multiple of 4KB in size.

Ports for PVBUS4KBTo1KBSplitter

Table 3-108: Ports

Name	Protocol	Type	Description
pvbus_m[4]	PVBUS	Master	The four downstream ports to be connected to peripherals. Each port covers 1KiB of the address space. Output address on each port will be in the range 0x0 - 0x03FF.
pvbus_s	PVBUS	Slave	The upstream port. Accepts addresses in range 0x0 - 0x0FFF. Outside of this range transactions will abort.

3.3.7 PVBUSCache

A PVBUSCache manages cache-line data and supports forwarding of transactions. This model is written in C++.

Ports for PVBUSCache

Table 3-109: Ports

Name	Protocol	Type	Description
bus_in[4]	PVBUS	Slave	Connections in from bus master.
bus_out[4]	PVBUS	Master	Connections out to bus slaves.
control	PVBUSCacheControl	Slave	Configuration/control port.
device	PVBUSCacheDevice	Master	Connection out to cache device.

3.3.8 PVBusDecoder

A PVBusDecoder allows bus transactions to be routed to one of many slaves, based on the address given in the transaction. This model is written in C++.

About PVBusDecoder

Each slave connection is associated with a specific address range on the `pvbus_m_range` port. In LISA+, the syntax for this is:

```
decoder.pvbus_m_range[start..end] = slave.pvbus
```

The values for `start` (inclusive) and `end` (inclusive) must specify a 4KB-aligned region of a multiple of 4K bytes. You can specify an address range for the slave, where the decoder remaps addresses into the appropriate range. The default address range for a slave is $[0-(\text{sizeofMasterRange} - 1)]$.

Ports for PVBusDecoder

Table 3-110: Ports

Name	Protocol	Type	Description
<code>pvbus_m_range</code>	PVBus	Master	Specifies the address range for the bus master. The range must be 4KB aligned and a multiple of 4KB in size. If the address range is larger than the size of the slave device, the slave is aliased.
<code>pvbus_s</code>	PVBus	Slave	Accepts incoming transactions. Connect this port to a bus master, or to the output of another bus decoder.

3.3.9 PVBusExclusiveMonitor

Global exclusive monitor. This model is written in C++.

Iris and MTI instances for PVBusExclusiveMonitor

This model has the following Iris instances:

Table 3-111: PVBusExclusiveMonitor Iris instances

InstanceName	ComponentName
<code>PVBusExclusiveMonitor</code>	<code>PVBusExclusiveMonitor</code>
<code>PVBusExclusiveMonitor.bus_mapper</code>	<code>PVBusMapper</code>

This model has the following MTI trace components:

Table 3-112: PVBusExclusiveMonitor MTI instances

InstanceName	ComponentName
<code>PVBusExclusiveMonitor</code>	<code>PVBusExclusiveMonitor</code>
<code>PVBusExclusiveMonitor.bus_mapper</code>	<code>PVBusMapper</code>

PVBusExclusiveMonitor contains the following CADI targets:

- `PVBusExclusiveMonitor`

Ports for PVBusExclusiveMonitor

Table 3-113: Ports

Name	Protocol	Type	Description
excl_cleared	Signal	Master	Exclusive monitor clear signal port.
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.

Parameters for PVBusExclusiveMonitor

apply_access_width_criteria_to_non_excl_stores

Apply the given exclusive store width matching criteria to non-exclusive stores

Type

bool

Default value

0x1

clear_on_strex_address_mismatch

Whether monitor is cleared when strex fails due to address mismatch

Type

bool

Default value

0x1

enable_component

Enable component

Type

bool

Default value

0x1

exclusive_monitor_clear_on_atomic_from_same_master

Monitor atomics from the same master

Type

bool

Default value

0x1

log2_granule_size

log2 of address granule size

Type

int

Default value

0x0

match_access_width

Fail STREX if not the same access width as LDREX

Type

bool

Default value

0x0

match_secure_state

Treat the secure state like an address bit

Type

bool

Default value

0x1

monitor_access_level

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device

Type

int

Default value

0x0

monitor_non_excl_stores

Monitor non-exclusive stores from the same master

Type

bool

Default value

0x0

number_of_monitors

Number of monitors

Type

int

Default value

0x8

shareability_domain

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system)

Type

int

Default value

0x3

3.3.10 PVBusExclusiveSquasher

Squashes the exclusive attribute on bus transactions. This model is written in LISA+.

Iris and MTI instances for PVBusExclusiveSquasher

This model has the following Iris instances:

Table 3-114: PVBusExclusiveSquasher Iris instances

InstanceName	ComponentName
PVBusExclusiveSquasher	PVBusExclusiveSquasher
PVBusExclusiveSquasher.bus_modifier	PVBusMapper

This model has the following MTI trace components:

Table 3-115: PVBusExclusiveSquasher MTI instances

InstanceName	ComponentName
PVBusExclusiveSquasher.bus_modifier	PVBusMapper

PVBusExclusiveSquasher contains the following CADI targets:

- PVBusExclusiveSquasher

Ports for PVBusExclusiveSquasher

Table 3-116: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.

3.3.11 PVBusLogger

A PVBusLogger has a slave and a master port and traffic is passed straight through. All traffic is logged using an MTI trace event. This model is written in C++.

Iris and MTI instances for PVBusLogger

This model has the following Iris instances:

Table 3-117: PVBusLogger Iris instances

InstanceName	ComponentName
PVBusLogger	PVBusLogger
PVBusLogger.mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-118: PVBusLogger MTI instances

InstanceName	ComponentName
PVBusLogger	PVBusLogger
PVBusLogger.mapper	PVBusMapper

PVBusLogger contains the following CADI targets:

- PVBusLogger

Ports for PVBusLogger

Table 3-119: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.

Parameters for PVBusLogger

trace_debug

Enable tracing of debug transactions

Type

bool

Default value

0x0

trace_snoops

Enable tracing of ACE snoop requests

Type

bool

Default value

0x0

3.3.12 PVBusMapper

Allow transactions to be remapped arbitrarily. This model is written in C++.

Iris and MTI instances for PVBusMapper

This model has the following Iris instances:

Table 3-120: PVBusMapper Iris instances

InstanceName	ComponentName
PVBusMapper	PVBusMapper

This model has the following MTI trace components:

Table 3-121: PVBusMapper MTI instances

InstanceName	ComponentName
PVBusMapper	PVBusMapper

About PVBusMapper

This component performs like `PVBusModifier`, but in addition:

- It has multiple downstream ports
- It allows routing of transactions to any one of these ports
- It allows arbitrary remapping of transaction addresses and attributes

As a generic modeling component, it does not have a hardware revision code.

For an example of how to use `PVBusMapper`, SEE `$PVLIB_HOME/examples/LISAPlus/RemappingWithPVBusMapper/`.

Ports for PVBusMapper

Table 3-122: Ports

Name	Protocol	Type	Description
control	PVBusMapperControl	Master	Configuration port to determine mappings.
pdbus_m[64]	PVBus	Master	Bus master ports.
pdbus_s	PVBus	Slave	Bus slave port.
reset	Signal	Slave	Reset signal.

3.3.13 PVBusMaster

The `PVBusMaster` subcomponent allows a device to generate `PVBus` transactions. This model is written in C++.

Iris and MTI instances for PVBusMaster

This model has the following Iris instances:

Table 3-123: PVBusMaster Iris instances

InstanceName	ComponentName
PVBusMaster	PVBusMaster

This model has the following MTI trace components:

Table 3-124: PVBusMaster MTI instances

InstanceName	ComponentName
PVBusMaster	PVBusMaster

About PVBusMaster

If you want a component to act as a bus master, instantiate a `PVBusMaster` subcomponent and then use its control port to create one or more transaction generators to generate transactions on the bus. `$PVLIB_HOME/examples/LISA/BusComponents/DmaTransfer.lisa` is an example component that shows this.

See also [1.13.2 TransactionGenerator efficiency considerations](#) on page 57.

Ports for PVBusMaster

Table 3-125: Ports

Name	Protocol	Type	Description
control	PVTransactionMaster	Slave	Enables the owning component to instantiate <code>pv::TransactionGenerator</code> objects.
pvbus_m	PVBus	Master	Sends out generated transactions to the bus.
reset	Signal	Slave	On the de-assert of this signal, a reset of the bus master will be latched this is used by the bus deadlock detection logic.

3.3.14 PVBusModifier

Allow transactions to be remapped arbitrarily. This model is written in C++.

Iris and MTI instances for PVBusModifier

This model has the following Iris instances:

Table 3-126: PVBusModifier Iris instances

InstanceName	ComponentName
PVBusModifier	PVBusMapper

This model has the following MTI trace components:

Table 3-127: PVBusModifier MTI instances

InstanceName	ComponentName
PVBusModifier	PVBusMapper

PVBusModifierx2 is an identical component, except it has two downstream ports.

Ports for PVBusModifier

Table 3-128: Ports

Name	Protocol	Type	Description
control	PVBusMapperControl	Master	Configuration port to determine mappings.
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.
reset	Signal	Slave	Reset signal.

3.3.15 PVBusRouter

Allow transactions to be routed arbitrarily. This model is written in LISA+.

Iris and MTI instances for PVBusRouter

This model has the following Iris instances:

Table 3-129: PVBusRouter Iris instances

InstanceName	ComponentName
PVBusRouter	PVBusRouter
PVBusRouter.mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-130: PVBusRouter MTI instances

InstanceName	ComponentName
PVBusRouter.mapper	PVBusMapper

PVBusRouter contains the following CADI targets:

- PVBusRouter

Ports for PVBusRouter

Table 3-131: Ports

Name	Protocol	Type	Description
control	PVBusRouterControl	Master	Configuration port to determine filters.
pvbus_m[64]	PVBus	Master	Bus master ports.
pvbus_s	PVBus	Slave	Bus slave port.

3.3.16 PVBusSlave

A PVBusSlave handles incoming transactions, and handles support for mapping regions of device address space to work as RAM/ROM/device memory. This model is written in C++.

Iris and MTI instances for PVBusSlave

This model has the following Iris instances:

Table 3-132: PVBusSlave Iris instances

InstanceName	ComponentName
PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-133: PVBusSlave MTI instances

InstanceName	ComponentName
PVBusSlave	PVBusSlave

About PVBusSlave

Any component that acts as a bus slave must:

- Provide a PVBus slave port.
- Instantiate a PVBusSlave subcomponent, with the size parameter configured for the address range covered by the device.
- Connect the slave port to the `pvbus_s` port on the PVBusSlave.

By default, the PVBusSlave translates all transactions into `read()` and `write()` requests on the device port.

The control port enables you to configure the PVBusSlave for a device. This lets you define the behavior of the different regions of the address space on the device. You can configure regions separately for read and write, at a 4KB granularity. This permits you to set memory-like, device-like, abort, or ignore access address regions.

Transactions to memory-like regions are handled internally by the PVBusSlave subcomponent. Abort and ignore regions are also handled by the PVBusSlave.

Transactions to device-like regions are forwarded to the device port. Your device must implement the `read()` and `write()` methods on the device port if any regions are configured as device-like.

This component typically does not significantly affect the performance of a PV system. However, correct implementation of the PVBusSlave component is critical to the performance of the overall PV system. For example, routing a request to a PVDevice port is slower than letting the PVBusSlave component handle the request internally. Arm recommends using the internal support for memory-like regions where possible.

Ports for PVBusSlave

Table 3-134: Ports

Name	Protocol	Type	Description
control	PVBusSlaveControl	Slave	Enables the owning component to control which regions of the device memory are to be handled as RAM/ROM/Device. These settings can be changed dynamically. For example, when a Flash component is being programmed, it can switch to treating reads as Device requests instead of ROM requests.
device	PVDevice	Master	Passes on requests for peripheral register accesses to permit the owning component to handle the request.
pvbus_s	PVBus	Slave	Handles incoming requests from bus masters.
reset	Signal	Slave	On the assert of this signal, a reset of the bus slave will be latched this is used by the bus deadlock detection logic.

3.3.17 PVMemoryProtectionEngine

Encrypt memory transactions for each encryption context with an independent key to prevent mismatch access. This model is written in C++.

Iris and MTI instances for PVMemoryProtectionEngine

This model has the following Iris instances:

Table 3-135: PVMemoryProtectionEngine Iris instances

InstanceName	ComponentName
PVMemoryProtectionEngine	PVMemoryProtectionEngine
PVMemoryProtectionEngine.mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-136: PVMemoryProtectionEngine MTI instances

InstanceName	ComponentName
PVMemoryProtectionEngine	PVMemoryProtectionEngine
PVMemoryProtectionEngine.mapper	PVBusMapper

PVMemoryProtectionEngine contains the following CADI targets:

- [PVMemoryProtectionEngine](#)

About PVMemoryProtectionEngine

PVMemoryProtectionEngine is a simplified implementation of a Memory Protection Engine (MPE) component as described in [Arm Realm Management Extension \(RME\) System Architecture](#).

PVMemoryProtectionEngine supports the following features:

- Memory encryption.

- Each 4KiB page in memory is encrypted based on an encryption key. Each Physical Address Space (PAS) has a separate encryption key.
- Two or more encryption keys can be the same value.
- Configurable encryption keys for each PAS.
- Configurable encryption block size.
- Configurable corruption strategy. You can control the behavior of memory contents that are not written by the access within the encryption block.
- Encryption/decryption algorithm is a simple XOR of data with the corresponding encryption key.
- Downstream memory is always stored as plain text, allowing debuggers to view data.

For example, if a block is currently encrypted by the ns-PAS and then a byte is written by the rl-PAS, if the `block_size_in_bytes` is 4KiB, the rest of the data in the 4KiB page is corrupted such that even if you read a different byte back through the ns-PAS, you would not get the original data.

The primary use case for this component is to identify software mis-programming, where the same Physical address is accessed through more than one PAS. With PVMemoryProtectionEngine enabled, a PE sees encrypted or corrupted data when it is accessed using a different PAS to the original PAS that wrote to that page in memory.

The PVMemoryProtectionEngine component is expected to be connected in a platform at the Point of Physical Aliasing (PoPA) if storage is shared, otherwise before each specific storage for a subset of the PASEs.

PVMemoryProtectionEngine imposes a runtime cost when enabled. Normally, it is only needed when debugging and verifying the Realm Management Monitor (RMM) software. If the RMM software is correct, memory contents encrypted with the wrong key would not be visible.

The PVMemoryProtectionEngine does not encrypt or corrupt the tag data for MTE, but this feature will be supported in future.

Ports for PVMemoryProtectionEngine

Table 3-137: Ports

Name	Protocol	Type	Description
<code>pvbus_m</code>	PVBus	Master	Manager ports of the MPE
<code>pvbus_s</code>	PVBus	Slave	Subordinate port of the MPE

Parameters for PVMemoryProtectionEngine

`block_size_in_bytes`

Encryption block size, supported sizes are 1 or 4096.

Type

int

Default value

0x1000

corruption_strategy

Corruption strategy (0 - fill with constants per-old-encryption-context, 1 - fill with constants per-new-encryption-context, 2 - random data).

Type

int

Default value

0x0

enable

Enables the Memory Protection Engine.

Type

bool

Default value

0x0

ignore_mecid

Ignore MECID during encryption key calculation

Type

bool

Default value

0x0

non_secure_pas_enc_key

Non-secure PAS encryption key.

Type

int

Default value

0x22

output_attributes_parameter_of_core

Encoding of various attributes on the bus.

Type

string

Default value

ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS

realm_pas_enc_key

Realm PAS encryption key.

Type

int

Default value

0x88

root_pas_enc_key

Root PAS encryption key.

Type

int

Default value

0x44

secure_pas_enc_key

Secure PAS encryption key.

Type

int

Default value

0x11

3.3.18 PVWriteBuffer

The PVWriteBuffer subcomponent buffers PVBus transactions. This model is written in C++.

Iris and MTI instances for PVWriteBuffer

This model has the following Iris instances:

Table 3-138: PVWriteBuffer Iris instances

InstanceName	ComponentName
PVWriteBuffer	PVWriteBuffer
PVWriteBuffer.mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-139: PVWriteBuffer MTI instances

InstanceName	ComponentName
PVWriteBuffer	PVWriteBuffer
PVWriteBuffer.mapper	PVBusMapper

Ports for PVWriteBuffer

Table 3-140: Ports

Name	Protocol	Type	Description
barrier_notify_s	PVWriteBuffer_BarrierPort	Slave	Barrier notification input.
clk_in	ClockSignal	Slave	Clock input.
pvbus_m	PVBus	Master	Master connection to memory bus.
pvbus_s	PVBus	Slave	Slave connection for transactions to be buffered.
reset_in	Signal	Slave	Reset input.
serror_notify_m	PVWriteBuffer_SErrorPort	Master	SError output generation.

3.3.19 SimplePVBusMaster

Component to generate PVTransactions with configurable attributes and address. This model is written in LISA+.

Iris and MTI instances for SimplePVBusMaster

This model has the following Iris instances:

Table 3-141: SimplePVBusMaster Iris instances

InstanceName	ComponentName
SimplePVBusMaster	SimplePVBusMaster
SimplePVBusMaster.clocktimer64	ClockTimerThread64
SimplePVBusMaster.clocktimer64.thread	SchedulerThread
SimplePVBusMaster.clocktimer64.thread_event	SchedulerThreadEvent
SimplePVBusMaster.pvbusmaster	PVBusMaster
SimplePVBusMaster.pvbusslave	PVBusSlave

This model has the following MTI trace components:

Table 3-142: SimplePVBusMaster MTI instances

InstanceName	ComponentName
SimplePVBusMaster.pvbusmaster	PVBusMaster
SimplePVBusMaster.pvbusslave	PVBusSlave

SimplePVBusMaster contains the following CADI targets:

- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent
- SimplePVBusMaster

Ports for SimplePVBUSMaster

Table 3-143: Ports

Name	Protocol	Type	Description
pvbust_m	PVBus	Master	Output of generated transactions.
pvbust_s	PVBus	Slave	-

Parameters for SimplePVBUSMaster

verbose

verbose

Type

bool

Default value

0x0

3.3.20 TZSwitch

Allow TrustZone secure/normal bus signals to be routed separately. This model is written in LISA+.

Iris and MTI instances for TZSwitch

This model has the following Iris instances:

Table 3-144: TZSwitch Iris instances

InstanceName	ComponentName
TZSwitch	TZSwitch
TZSwitch.pvbust_mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-145: TZSwitch MTI instances

InstanceName	ComponentName
TZSwitch.pvbust_mapper	PVBusMapper

TZSwitch contains the following CADI targets:

- TZSwitch

About TZSwitch

The TZSwitch component allows you to control transaction routing based on the TrustZone® security state of the transaction.

The default behavior is to forward secure transactions to `pvbust_port_a`, and normal transactions to `pvbust_port_b`.

You must only use TZSwitches if the routing decisions change infrequently, for example as part of a memory remap.

The `secure` and `normal` parameters control the initial state of this component:

- 0** Ignore these transactions.
- 1** Forward the transactions to `pvbus_port_a`.
- 2** Forward the transactions to `pvbus_port_b`.
- 3** Generate an abort for these transactions.

The numbers used for initial configuration are not the same as the enumeration constants used to control routing at runtime.

Ports for TZSwitch

Table 3-146: Ports

Name	Protocol	Type	Description
<code>control</code>	<code>TZSwitchControl</code>	Slave	Controls routing of transactions.
<code>pvbus_input</code>	PVBus	Slave	Slave port for connection to PVBus master/decoder.
<code>pvbus_port_a</code>	PVBus	Master	Output port a.
<code>pvbus_port_b</code>	PVBus	Master	Output port b.

Parameters for TZSwitch

normal

Normal Port

Type

int

Default value

0x2

secure

Secure Port

Type

int

Default value

0x1

3.4 Clocking components

This section describes the Clocking components.

The clocking components and protocols provide a mechanism for systems to regulate the execution rate of components. Clocking includes the concept of clock rates, dividers to change clock rates, and timers to generate callbacks based on those clock rates.

If the MasterClock component is instantiated in a system, it provides a consistent master clock rate. Although this rate is not defined, you can consider this to be 1Hz, even for non-SystemC systems. ClockDivider components are able to convert this clock rate into a new rate using a multiplier and divider, although the clock rate cannot be divided to be less than 1Hz. You can cascade ClockDivider components to produce many different clock rates within a system. The maximum ratio of any two clocks in the system must be less than 2^{32} .

ClockTimer components can be instantiated by a component and connected to any MasterClock or ClockDivider output. ClockTimers can generate callbacks after a given number of ticks of that clock. ClockTimers can invoke a behavior on the component to permit the component to perform work. The component can then request the ClockTimer to repeat its count.

3.4.1 ClockDivider

A ClockDivider is a library component that takes a ClockSignal on its input port (which could come from the output of a MasterClock, or from another ClockDivider), and generates a new ClockSignal on its output port, representing a clock frequency that is related to the input clock by the ratio of the multiply and divide parameters. This model is written in C++.

Iris and MTI instances for ClockDivider

This model has the following Iris instances:

Table 3-147: ClockDivider Iris instances

InstanceName	ComponentName
ClockDivider	ClockDivider

This model has the following MTI trace components:

Table 3-148: ClockDivider MTI instances

InstanceName	ComponentName
ClockDivider	ClockDivider

ClockDivider contains the following CADI targets:

- ClockDivider

About ClockDivider

This component uses a configurable ratio to convert the ClockSignal rate at its input to a new ClockSignal rate at its output. Changes to the input rate or ratio take effect immediately and clocking components dependent on the output rate continue counting at the new rate.

This component does not normally incur a runtime performance cost. However, reprogramming the clock rate causes all related clocks and timers to be recalculated.

For an example of the use of ClockDividers, see the `vEMotherBoard.lisa` component in the `$PVLIB_HOME/examples/LISA/FVP_VE/LISA/` directory of your Fast Models distribution.

ClockDivider parameters

The ClockDivider parameters are not exposed by CADI. You can set them from LISA but not from SystemC:

- mul

Clock rate multiplier.
Type: `uint64_t`. Default value: 1.
- div

Clock rate divider.
Type: `uint64_t`. Default value: 1.

Ports for ClockDivider

Table 3-149: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Input clock signal, coming from a MasterClock or another ClockDivider.
clk_out	ClockSignal	Master	Clock signal generated by this ClockDivider.
rate	ClockRateControl	Slave	Permits you to dynamically change the clock divider ratio.

Parameters for ClockDivider

- div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1
- mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

3.4.2 ClockGate_cpp

Clock gate for dis/enabling the clock. This model is written in C++.

Iris and MTI instances for ClockGate_cpp

This model has the following Iris instances:

Table 3-150: ClockGate_cpp Iris instances

InstanceName	ComponentName
ClockGate_cpp	ClockGate
ClockGate_cpp.ClockDivider	ClockDivider

3.4.4 ClockTimer

A ClockTimer provides support for counting a number of ticks at the rate determined by the input clock. When the countdown reaches zero, the timer can send a signal to another component. That component can return a value that will cause the timer to start counting down again. Setting up a timer is very efficient, and no host processing time is used while a counter is counting down: when a timer is started, the scheduler precomputes the finish time. To use a ClockTimer connect the ClockTimer's 'timer_callback' port to a slave port that implements the 'signal()' behaviour and connect a clock signal to the clk_in port. Use the 'timer_control' port to start the timer counting down for a given number of ticks. This model is written in C++.

About ClockTimer

This component provides a mechanism for other components to schedule a callback after a number of ticks at a given ClockSignal rate.

An active ClockTimer component incurs no simulation overhead. For best performance, avoid frequently canceling timers or querying the number of remaining ticks in your performance-critical code.

Ports for ClockTimer

Table 3-156: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	TimerCallback	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	TimerControl	Slave	Permits the timer to be set, canceled and queried.

3.4.5 ClockTimer64

A ClockTimer64 provides support for counting a number of ticks at the rate determined by the input clock. When the countdown reaches zero, the timer can send a signal to another component. That component can return a value that will cause the timer to start counting down again. Setting up a timer is very efficient, and no host processing time is used while a counter is counting down:

when a timer is started, the scheduler precomputes the finish time. This version of the timer provides 64 bit resolution. This model is written in C++.

About ClockTimer64

This component provides a mechanism for other components to schedule a callback after a number of ticks at a given ClockSignal rate.

An active ClockTimer64 component incurs no simulation overhead. For best performance, avoid having your performance-critical code frequently cancel timers or query the number of remaining ticks.

Ports for ClockTimer64

Table 3-157: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	TimerCallback64	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	TimerControl64	Slave	Permits the timer to be set, canceled and queried.

3.4.6 ClockTimerThread

A ClockTimerThread(64) is a drop-in replacement for a ClockTimer(64) component. The main difference to the ClockTimer component is that the ClockTimerThread runs the signal() callback from a proper scheduler thread. This means that the signal() function may directly or indirectly invoke wait() functions to wait for time or events. This is not allowed for the ClockTimer component which does not use a thread. Components which issue bus transactions from within the timer signal() callback must use ClockTimerThread(64) rather than ClockTimer(64). This model is written in LISA+.

Iris and MTI instances for ClockTimerThread

This model has the following Iris instances:

Table 3-158: ClockTimerThread Iris instances

InstanceName	ComponentName
ClockTimerThread	ClockTimerThread
ClockTimerThread.timer	ClockTimerThread64
ClockTimerThread.timer.thread	SchedulerThread
ClockTimerThread.timer.thread_event	SchedulerThreadEvent

ClockTimerThread contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent

Ports for ClockTimerThread

Table 3-159: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	TimerCallback	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	TimerControl	Slave	Permits the timer to be set, canceled and queried.

3.4.7 ClockTimerThread64

A ClockTimerThread64 is a drop-in replacement for ClockTimer64. The main difference to the ClockTimer component is that the ClockTimerThread runs the signal() callback from a proper scheduler thread. This mean that the signal() function may directly or indirectly invoke wait() functions to wait for time or events. This is not allowed for the ClockTimer component which does not use a thread. Components which issue bus transactions from within the timer signal() callback must use ClockTimerThread(64) rather than ClockTimer(64). This model is written in LISA+.

Iris and MTI instances for ClockTimerThread64

This model has the following Iris instances:

Table 3-160: ClockTimerThread64 Iris instances

InstanceName	ComponentName
ClockTimerThread64	ClockTimerThread64
ClockTimerThread64.thread	SchedulerThread
ClockTimerThread64.thread_event	SchedulerThreadEvent

ClockTimerThread64 contains the following CADI targets:

- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent

Ports for ClockTimerThread64

Table 3-161: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	TimerCallback64	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	TimerControl64	Slave	Permits the timer to be set, canceled and queried.

3.4.8 MasterClock

A source of a clock signal representing the base clock rate of the simulation (nominally 1Hz). The signal from the output port can be connected to a ClockDivider, to generate clock signals

at a different clock rate. The output can also be connected to a ClockTimer in order to generate scheduled events, or to any other components that accept a ClockSignal input. See ClockSignal.lisa for more information. This model is written in C++.

About MasterClock

This component provides a single ClockSignal output that can be used to drive the ClockSignal input of ClockDividers, ClockTimers and other clocking components.

The rate of the MasterClock is not defined because all clocking is relative, but can be considered to be 1 Hz.

A system might contain more than one MasterClock, all of which generate the same ClockSignal rate.

Ports for MasterClock

Table 3-162: Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Master	Master clock rate.

3.4.9 PLLControl_cpp

Simulate PLL clock frequency control logic. This model is written in C++.

Iris and MTI instances for PLLControl_cpp

This model has the following Iris instances:

Table 3-163: PLLControl_cpp Iris instances

InstanceName	ComponentName
PLLControl_cpp	PLLControl

clkGate.divider.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkGate.divider.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv0.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv0.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv1.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv1.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv10.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv10.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv2.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv2.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv3.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv3.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv4.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

3.4.11 SwitchedClockControl_cpp

Clock control allows input selection, rate control and gating. This model is written in C++.

Iris and MTI instances for SwitchedClockControl_cpp

This model has the following Iris instances:

Table 3-169: SwitchedClockControl_cpp Iris instances

InstanceName	ComponentName
SwitchedClockControl_cpp	SwitchedClockControl
SwitchedClockControl_cpp.ClockDivider	ClockDivider
SwitchedClockControl_cpp.ClockGate	ClockGate
SwitchedClockControl_cpp.ClockGate.ClockDivider	ClockDivider

InstanceName	ComponentName
SwitchedClockControl_cpp.ClockSelector	ClockSelector
SwitchedClockControl_cpp.ClockSelector.ClockDivider	ClockDivider

This model has the following MTI trace components:

Table 3-170: SwitchedClockControl_cpp MTI instances

InstanceName	ComponentName
SwitchedClockControl_cpp.ClockDivider	ClockDivider
SwitchedClockControl_cpp.ClockGate.ClockDivider	ClockDivider
SwitchedClockControl_cpp.ClockSelector.ClockDivider	ClockDivider

SwitchedClockControl_cpp contains the following CADI targets:

- SwitchedClockControl

Ports for SwitchedClockControl_cpp

Table 3-171: Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Master	-
clkDivExt	ClockRateControl	Slave	-
clkDivSys	ClockRateControl	Slave	-
clkEnable	Signal	Slave	-
clkSel	Value	Slave	-
halt	Signal	Master	-
refClk_in	ClockSignal	Slave	-
sysClk_in	ClockSignal	Slave	-
xClk_in	ClockSignal	Slave	-

Parameters for SwitchedClockControl_cpp

clkDiv1.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkDiv1.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

0x1

clkGate.divider.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv0.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv0.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv1.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv1.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv10.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv10.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv2.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv2.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv3.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv3.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv4.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv4.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv5.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv5.mul

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA

Type

int

Default value

0x1

clkSelect.clkdiv6.div

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA

3.5 Core components

This section describes the Core components.

Code Translation (CT) components translate instructions on the fly and cache the translations to enable fast execution of code, but sacrificing timing accuracy. They also use efficient PV bus models to enable fast access to memory and devices.

CT components differ in some ways from the modeled IP:

- They do not model cycle timing. In aggregate, all instructions execute in one processor master clock cycle, except for Wait For Interrupt.
- Write buffers are not modeled on all processors.
- Most aspects of TLB behavior are implemented in the models. In Arm®v7 models and later, the TLB memory attribute settings are used when stateful cache is enabled.
- No device-accurate MicroTLB is implemented.
- Device-accurate modeling of multiple TLBs is off by default.
- A single memory access port is implemented. The port combines accesses for instruction, data, DMA, and peripherals. Configuration of the peripheral port memory map register is ignored.
- All memory accesses are atomic and are performed in Programmer's View order. Unaligned accesses are always performed as byte transfers.
- Some instruction sequences are executed atomically so that system time does not advance during their execution. This difference in behavior can affect sequential accesses of device registers where devices are expecting time to move on between each access.
- Interrupts are not taken at every instruction boundary.
- Integration and test registers are not implemented.
- Models do not support running Software Test Libraries (STLs).
- Not all CP14 debug registers are implemented on all processors.
- Breakpoint types that the models support directly are:
 - Single address unconditional instruction breakpoints.
 - Single address unconditional data breakpoints.
 - Unconditional instruction address range breakpoints.

- Pseudoregisters in the debugger support processor exception breakpoints. Setting an exception register to a nonzero value stops execution on entry to the associated exception vector.
- Cluster models do not simulate all cores at the same time. They execute a number of instructions on each core in turn. There can be a bias in the order in which cores run after a restart (for example, core 0 always runs first), so the simulation might hit breakpoints on the favored core more often.
- Performance counters are not implemented on all models.
- Some models implement caches, although all processor models implement cache control registers.
- ECC and parity schemes are hardware-specific so are not modeled.
- Models use a simplified view of the external buses.
- Clusters based on DSU-110 and later support OFF, ON, AND DBG_RECOV modes.

3.5.1 AEMv8RMPCT

AEMv8RMPCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-172: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- `has_restriction_on_speculative_data_loaded`

Parameters removed:

- `cpu0.CONFIG64`
- `cpu0.POWERCTLI`
- `cpu1.POWERCTLI`
- `cpu2.POWERCTLI`
- `cpu3.POWERCTLI`
- `has_restrictions_on_speculative_data_loaded`
- `max_32bit_el`

Iris and MTI instances for AEMv8RMPCT

This model has the following Iris instances:

Table 3-173: AEMv8RMPCT Iris instances

InstanceName	ComponentName
AEMv8RMPCT	Cluster_ARMAEMv8-R_MP
AEMv8RMPCT.AMU	PVBusLogger
AEMv8RMPCT.AMU.mapper	PVBusMapper
AEMv8RMPCT.DAP	PVBusLogger
AEMv8RMPCT.DAP.mapper	PVBusMapper
AEMv8RMPCT.MMAP	PVBusLogger
AEMv8RMPCT.MMAP.mapper	PVBusMapper
AEMv8RMPCT.acp_mapper	PVBusMapper
AEMv8RMPCT.cpu0	ARMAEMv8-R_MP
AEMv8RMPCT.cpu0.UTLB	TLB
AEMv8RMPCT.cpu0.dtlb	TlbCadi
AEMv8RMPCT.cpu0.l1dcache	PVCache

AEMv8RMPCT.l2_cache.upstream[8]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[9]	PVBusSlave
AEMv8RMPCT.l2_flusher	AsyncCacheFlushUnit

AEMv8RMPCT contains the following CADI targets:

- ARMAEMv8-R_MP
- Cluster_ARMAEMv8-R_MP
- PVCache
- TlbCadi

About AEMv8RMPCT

AEMv8RMPCT allows you to target AArch32 or AArch64, RAS, VFP, EL2, and other Arm®v8-R features.

This table lists the major differences between AEMv8RMPCT and Arm Cortex®-R82 Fast Models:

Table 3-175: Major differences between AEMv8RMPCT and Arm Cortex-R82 Fast Models

Feature	AEMv8R	Cortex-R82
VMSA_supported	Configurable	Not available
has_aarch64	Configurable	Not available
has_pl2	Configurable	Always true
has_pmu	Configurable	Always true
has_ras	Configurable	Always true
PA_SIZE	Configurable	Always 40
Armv8.5 feature-specific parameters	Configurable	Not available
stage1_tlb_size	Configurable	Not available
stage12_tlb_size	Configurable	Not available
has_writebuffer	Configurable	Not available
vfp-present	Configurable	Always true
def_mem_map	Configurable	Fixed, according to the specification
IMPDEF registers, for example all IMP_* registers in the R82 specification.	Not available	Supported

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for AEMv8RMPCT

Table 3-176: Ports

Name	Protocol	Type	Description
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cache_validation_control	Value	Slave	This signal provides default exception handling state.

Name	Protocol	Type	Description
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC
CNTHPSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVSIHQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC
CNTPSIHQ[4]	Signal	Master	Timer signals to SOC
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module
CNTVIRQ[4]	Signal	Master	Timer signals to SOC
commirq[4]	Signal	Master	Interrupt signal from debug communication channel.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	-
cti0extin[4]	Signal	Slave	-
cti0extout[4]	Signal	Master	-
cti1extin[4]	Signal	Slave	-
cti1extout[4]	Signal	Master	-
cti2extin[4]	Signal	Slave	-
cti2extout[4]	Signal	Master	-
cti3extin[4]	Signal	Slave	-
cti3extout[4]	Signal	Master	-
ctidbgirq[4]	Signal	Master	-
dbgen[4]	Signal	Slave	-
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrdownack[4]	Signal	Master	Debug power down acknowledge.
dbgpwrdownreq[4]	Signal	Slave	Debug power down request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
ext_slave_s	PVBus	Slave	External Slave port. Equivalent to AXIS port.
external_trace_reset[4]	Signal	Slave	ETMv4 External Trace Reset signal.

Name	Protocol	Type	Description
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
flash_m[4]	PVBus	Master	Flash Port
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
hiden[4]	Signal	Slave	External debug interface.
hniden[4]	Signal	Slave	External debug interface.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
irqs[224]	Signal	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	Signal	Slave	This signal resets timer and interrupt controller and l2cache
llpp_m[4]	PVBus	Master	LLPP (Low-Latency Peripheral Port).
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg[4]	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	-
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbar[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins
smpnamp[4]	Signal	Master	This signals AMP or SMP mode for each core
spiden[4]	Signal	Slave	Secure invasive debug enable.
spniden[4]	Signal	Slave	Secure non-invasive debug enable.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state
teinit[4]	Signal	Slave	This signal provides default exception handling state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[4]	Signal	Slave	ETMv4 Trace Unit Reset signal.

Name	Protocol	Type	Description
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for AEMv8RMPCT

ADFSR-AIFSR-implemented

ADFSR and AIFSR are implemented

Type

bool

Default value

0x0

AIDR

Value of AIDR_EL1 register.

Type

int

Default value

0x0

AMIIDR

Value of AMU Implementation Identification Register

Type

int

Default value

0x43b

AMPIDR

Value of AMU Peripheral Identification Register

Type

int

Default value

0x4000bb000

BPIMVA_causes_translation_lookup

Do a translation when BPIMVA instruction is executed (which may cause a translation fault).

Type

bool

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation to NC/DEV memory. The broadcastatomic signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTATOMICL

Enable broadcasting of atomic operation to LLRAM memory. The broadcastatomicl signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTCACHEMAIN

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CCSIDR-L1D_override

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L1I_override

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L2_override

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L3_override

If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CFGTFPEN_pin_reset

CFGTFPEN Configuration pin at reset for bitfield IMP_MEMPROTCTLR_EL1.TFPEN.

Type

bool

Default value

0x0

CHI

Selects the type of protocol the Main Manager(MM) interface implements. 0, MM port configured as AXI. 1, MM port configured as CHI.

Type

bool

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

CTIPIDR

If non-zero, override the CTI Peripheral Identification Register

Type

int

Default value

0x0

CTR-L1Ip-override

If non-zero, override the L1Ip bits in CTR/CTR_ELO system register. This does not change the behaviour of the cache, only what is present in the CTR register.

Type

int

Default value

0x0

DBGBCR_BT_applies_RES0_before_valid_check

If true, RES0 behaviour is applied to DBGBCR(_EL1).BT before checking for reserved values for this field.

Type

bool

Default value

0x1

DBGPIDR

If non-zero, override the Debug Peripheral Identification Register

Type

int

Default value

0x0

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x0

ERRIIDR

Value of RAS Implementation Identification Register

Type

int

Default value

0xd800143b

ERRPIDR

Value of RAS Peripheral Identification Register

Type

int

Default value

0x4100bbd80

ERXMISC0_mask

Write Mask for ERXMISC0 RAS Register

Type

int

Default value

0x0

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

MIDR

Value of MIDR_EL1 register.

Type

int

Default value

0x410fd0f0

NUM_CORES

Number of cores in cluster

Type

int

Default value

0x1

PA_SIZE

Physical address range supported (FEAT_LPA).

Type

int

Default value

0x28

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

PMCEID0

Performance Monitor Common Event ID Reg 0 value - 64 bit

Type

int

Default value

0xffffffff

PMCEID1

Performance Monitor Common Event ID Reg 1 value - 64 bit

Type

int

Default value

0xffffffff

PMSIDR.ArchInst

Defines whether architecture instruction sampling is implemented or not, if not only micro op sampling is implemented. Model only supports architecture instruction sampling, but allows ID register field to be configured.

Type

bool

Default value

0x1

PMSIDR.CRR

Defines whether call return branch records (FEAT_SPE_CRR) is implemented or not

Type

bool

Default value

0x0

PMSIDR.LDS

Defines whether data source for sampled load instruction is implemented or not. Model does not implement loaded data source, but allows ID register field to be configured.

Type

bool

Default value

0x0

PMUPIDR

If non-zero, override the PMU Peripheral Identification Register

Type

int

Default value

0x0

VMSA_supported

VMSA is supported at EL1

Type

bool

Default value

0x1

abort_execution_from_device_memory

Execution from device memory generates a prefetch abort.

Type

bool

Default value

0x0

advsimd_overread

AdvSIMD element load operations access all bytes of a 16-byte aligned window, even in Device memory

Type

bool

Default value

0x0

align_pc_on_branch_to_unaligned_pc_aarch32

Force PC align for branches to an unaligned PC counter in A32 state

Type

bool

Default value

0x0

align_pc_on_debug_exit_to_aarch32

Exit to AARCH32 state from debug state forces pc bit0 to 0

Type

bool

Default value

0x0

align_pc_on_illegal_exception_return_to_aarch32

Align PC when performing an illegal exception return from AArch64 to AArch32.

Type

bool

Default value

0x1

amu_aux_type_fixed

Lists which AMU auxiliary registers that are fixed and to which event type. The JSON schema is: {fixed_aux_reg:evt_type, ...}. For example {"0":0x300} would make auxiliary register 0 fixed to event type 0x300

Type

string

Default value**amu_mmap_address**

AMU base address for each core on system bus. 0 means the AMU is not mapped, otherwise the address must be 4KB aligned. JSON schema for the parameter value is: {"format":"all_addrs_are_absolute_wrt_systembus", "cores": [{"amu":0x0}, {"amu":0x0}, {"amu":0x0}, {"amu":0x0}]}

Type

string

Default value**amu_num_auxiliary_counters**

Number of AMU auxiliary counters implemented

Type

int

Default value

0x0

apshr_read_restrict

At EL0, unknown bits of APSR are RAZ.

Type

bool

Default value

0x0

atomic_memtype_fault_priority

This parameter describes the priority of unsupported atomic/exclusive memtype fault w.r.t alignment and permission fault. 0, BEFORE_ALIGN_MEM_FAULT. 1, AFTER_ALIGN_BEFORE_PERM_FAULT. 2, AFTER_PERM_FAULT.

Type

int

Default value

0x0

auxilliary_feature_register0

Value of AFR0 ID register.

Type

int

Default value

0x0

branch-predictor-clear-policy

Set branch prediction policy as defined for MMFR1[31:28]. This does not change the behaviour of the branch predictor, only what is reported in MMFR1.BPred.

Type

int

Default value

0x2

branch-predictor-supported-ops

Set branch prediction policy as defined for MMFR3[11:8]. This does not change the behaviour of the branch predictor, only what is reported in MMFR3.BPMaint.

Type

int

Default value

0x1

bus_protection_enable_at_reset

Enable TCM, L1Cache bus protection after reset

Type

bool

Default value

0x0

cache-log2linelen

Log2 of the cache line length in bytes.

Type

int

Default value

0x6

cache_maintenance_hits_watchpoints

DCIMVA operations executed in AArch32 modes hit watchpoints.

Type

bool

Default value

0x0

changing_block_size_without_bbm_support

Level of support for changing block size without break-before-make (FEAT_BBM).

Type

int

Default value

0x0

check_memory_attributes

Detect and report TLB use of conflicting memory attributes for views of the same physical address

Type

bool

Default value

0x1

clean_invalidate_cache_on_warm_reset

Clean and invalidate caches on warm reset

Type

bool

Default value

0x0

clear_reg_top_eret

Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32

Type

int

Default value

0x1

clear_reg_top_set

Whether to clear upper 32-bits of the Xn register when corresponding AArch32 register is set via CADI/Iris.

Type

bool

Default value

0x1

cluster_utid

Unique cluster transaction identifier for interconnect protection

Type

int

Default value

0x0

configure_pmu_events_with_json

"Configure v8.6 and newer PMU events. Note : This param has high priority and overrides the setting of "has_*_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["EVENT_NAME_1","EVENT_NAME_2"]}"

Type

string

Default value**configure_v8_6_pmu_events_with_json**

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.6 PMU events. Note : This param has high priority and overrides the setting of "has_v8_6_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_INDNR_RETIRE", "BR_IND_RETIRE", "BR_RETURN_SKIP_RETIRE", "BR_RETURN_ANY_RETIRE", "BR_INDNR_SKIP_RETIRE",

"BR_INDNR_TAKEN_RETIRED", "BR_IND_SKIP_RETIRED", "BR_IND_TAKEN_RETIRED",
"BR_IMMED_SKIP_RETIRED", "BR_IMMED_TAKEN_RETIRED", "BR_SKIP_RETIRED"]}]}

Type

string

Default value**configure_v8_8_pmu_events_with_json**

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.8 PMU events. Note : This param has high priority and overrides the setting of "has_v8_8_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_HINT_COND_RETIRED", "BR_COND_TAKEN_RETIRED", "BR_UNCOND_RETIRED", "BR_COND_RETIRED", "BRNL_TAKEN_RETIRED", "BRNL_IND_TAKEN_RETIRED", "BRNL_INDNR_TAKEN_RETIRED", "BRNL_IMMED_TAKEN_RETIRED", "BL_TAKEN_RETIRED", "BL_IND_TAKEN_RETIRED", "BL_IMMED_TAKEN_RETIRED"]}]}

Type

string

Default value**configure_v8_9_pmu_events_with_json**

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.9 PMU events. Note : This param has high priority and overrides the setting of "has_v8_9_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["ASE_SVE_RETIRED", "ASE_RETIRED", "VFP_RETIRED", "SVE_RETIRED", "CRYPTO_RETIRED", "SIMD_INST_RETIRED", "ASE_INST_RETIRED", "SVE_INST_RETIRED", "ASE_SVE_INST_RETIRED", "LD_ANY_RETIRED", "ST_ANY_RETIRED", "LDST_ANY_RETIRED", "DP_RETIRED"]}]}

Type

string

Default value**core_cache_protection**

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled

Type

int

Default value

0xffffffffffffffff

cpacr_trcds_behaviour

Behaviour of CPACR.TRCDIS/NSACR.NSTRCDIS when there is no CP14 ETM interface. 0, RAZ/WI. 2, implemented.

Type

int

Default value

0x2

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CP15SDISABLE2

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.DCZID-log2-block-size

Log2 of the block size cleared by DC ZVA instruction (as read from DCZID_EL0).

Type

int

Default value

0x8

cpuX.DCZVA_single_write

Execute the DCZVA as a single write

Type

bool

Default value

0x0

cpuX.MPIDR-override

Override of MPIDR value. If nonzero will override the MT, cluster and CPU ID bits in MPIDR.

Type

int

Default value

0x0

cpuX.RVBAR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.RVBAR32

Reset vector address in AARCH32 when VINITHI is not set and ignore_rvbar_in_aarch32 is set

Type

int

Default value

0x0

cpuX.SMPnAMP

Enable broadcast messages necessary for correct SMP operation at reset.

Type

bool

Default value

0x1

cpuX.TEINIT

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.aarch32_reset_from_impdef_addr

If PE resets into AArch32, Whether execution starts from IMPDEF address or hi/low vector

Type

bool

Default value

0x1

cpuX.ase-present

Set whether the model has been built with NEON support

Type

bool

Default value

0x1

cpuX.clock_divider

Clock divider ratio for asymmetric MP clocking.

Type

int

Default value

0x1

cpuX.clock_multiplier

Clock divider ratio for asymmetric MP clocking.

Type

int

Default value

0x1

cpuX.crypto_aes

AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 2, AES and PMULL instructions implemented (FEAT_AES, FEAT_PMULL).

Type

int

Default value

0x2

cpuX.crypto_sha1

SHA-1 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA1 instructions implemented (FEAT_SHA1).

Type

int

Default value

0x1

cpuX.crypto_sha256

SHA-256 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA256 instructions implemented (FEAT_SHA256).

Type

int

Default value

0x1

cpuX.cti-intack_mask

Set bits represent that the corresponding trigger requires software acknowledge via CTIINTACK

Type

int

Default value

0x1

cpuX.cti-number_of_claim_bits

Number of implemented bits in CTICLAIMSET

Type

int

Default value

0x0

cpuX.cti-number_of_triggers

Number of cti event triggers (default: 8, valid values: {3, 8-32})

Type

int

Default value

0x8

cpuX.dcache-size

L1 D-Cache size in bytes

Type

int

Default value

0x8000

cpuX.enable_crc32

CRC32 instructions supported. 0, not implemented. 1, CRC32 instructions implemented (FEAT_CRC32).

Type

int

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.etm-present

Set whether the model has ETM support

Type

bool

Default value

0x1

cpuX.flash.enable

Enable flash by default after reset

Type

bool

Default value

0x0

cpuX.force-fpsid

Override the FPSID value

Type

bool

Default value

0x0

cpuX.force-fpsid-value

Value to override the FPSID value to

Type

int

Default value

0x0

cpuX.has_hcptr_tase

If false, HCPTR.TASE is RES0

Type

bool

Default value

0x1

cpuX.icache-size

L1 I-Cache size in bytes

Type

int

Default value

0x8000

cpuX.llpp.base

Sets the base address of Low Latency Peripheral Port

Type

int

Default value

0x0

cpuX.llpp.size

Sets the size of LLPP(in bytes)

Type

int

Default value

0x1000

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.number-of-breakpoints

Number of breakpoints.

Type

int

Default value

0x10

cpuX.number-of-context-breakpoints

Number of breakpoints that are context aware.

Type

int

Default value

0x10

cpuX.number-of-watchpoints

Number of watchpoints.

Type

int

Default value

0x10

cpuX.operation_bandwidth

Operation width for ARMv8.4 PMU extension

Type

int

Default value

0x1

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.semihosting-stderr_istty

Result for semihost istry call when argument is stderr

Type

bool

Default value

0x1

cpuX.semihosting-stdin_istty

Result for semihost istry call when argument is stdin

Type

bool

Default value

0x1

cpuX.semihosting-stdout_istty

Result for semihost istry call when argument is stdout

Type

bool

Default value

0x1

cpuX.semihosting-use_stderr

Send stderr from the simulated process to host stderr

Type

bool

Default value

0x0

cpuX.tcm-present

Disables the TCMs

Type

bool

Default value

0x0

cpuX.tcm-supports-exclusive

Whether TCM supports exclusive access

Type

bool

Default value

0x0

cpuX.tcm.a.base

Sets the base address of the ATCM. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only

Type

int

Default value

0x0

cpuX.tcm.a.enable

Enable ATCM by default after reset. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only

Type

bool

Default value

0x0

cpuX.tcm.a.size

Sets the size of the ATCM(in bytes). The size should be aligned with 4KB. The lower 12 bits will be masked out.

Type

int

Default value

0x4000

cpuX.tcm.a.stretch_clk

Whether ATCM clock stretched to occupy full cycle

Type

bool

Default value

0x0

cpuX.tcm.a.wait

ATCM accesses wait states

Type

int

Default value

0x0

cpuX.tcm.b.base

Sets the base address of the BTCM. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only

Type

int

Default value

0x0

cpuX.tcm.b.enable

Enable BTCM by default after reset. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only

Type

bool

Default value

0x0

cpuX.tcm.b.size

Sets the size of the BTCM(in bytes). The size should be aligned with 4KB. The lower 12 bits will be masked out.

Type

int

Default value

0x4000

cpuX.tcm.b.stretch_clk

Whether BTCM clock stretched to occupy full cycle

Type

bool

Default value

0x0

cpuX.tcm.b.wait

BTCM accesses wait states

Type

int

Default value

0x0

cpuX.tcm.c.base

Sets the base address of the CTCM. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only

Type

int

Default value

0x0

cpuX.tcm.c.enable

Enable CTCM by default after reset. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only

Type

bool

Default value

0x0

cpuX.tcm.c.size

Sets the size of the CTCM(in bytes). The size should be aligned with 4KB. The lower 12 bits will be masked out.

Type

int

Default value

0x2000

cpuX.tcm.c.stretch_clk

Whether CTCM clock stretched to occupy full cycle

Type

bool

Default value

0x0

cpuX.tcm.c.wait

CTCM accesses wait states

Type

int

Default value

0x0

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.unpredictable_WPMASKANDBAS

Constrained unpredictable handling of watchpoints when mask and BAS fields specified. 0, IGNOREMASK. 1, IGNOREBAS (default). 2, REPEATBAS8. 3, REPEATBAS.

Type

int

Default value

0x1

cpuX.vfp-dp-present

Whether double-precision floating point feature is implemented (FEAT_F64MM).

Type

bool

Default value

0x1

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

cpuX.vfp-traps

Implement support for trapping floating-point exceptions

Type

bool

Default value

0x1

cpuX.vfp-traps-show-all

Report all trapped floating-point exceptions in the syndrome when a combination occurs.

Type

bool

Default value

0x0

cpuX.wfet_early_or_delayed_timeout

WFET early or delayed timeout beyond the threshold value of CNTVCT_ELO in percentage.

Type

int

Default value

0x0

cpuX.wfit_early_or_delayed_timeout

WFIT early or delayed timeout beyond the threshold value of CNTVCT_ELO in percentage.

Type

int

Default value

0x0

dbg-bcr-reserved-behavior

This is the behavior of the reserved values of the BT field in DBGBCR. Possible values are: - 0 = Disabled. - 1 = BT[2] is ignored.

Type

int

Default value

0x1

dbg_rom_dap_addr

Debug ROM dap base address.

Type

int

Default value

0x0

dbgitr_buffer_size

Number of instructions which can be buffered before EDSCR.ITE is cleared

Type

int

Default value

0x0

dbgxvr_ress_is_stateful

Whether DBGWVR/DBGBVR.RESS returns last written value. if set to false, RESS returns sign extended value

Type

bool

Default value

0x0

dc_fault_unaligned_s1_device_s2_fwb

Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_bus_width_in_bytes

L1 D-Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-ways

L1 D-Cache number of ways (sets are implicit from size).

Type

int

Default value

0x2

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_bus_width_in_bytes

L1 D-Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcimva_requires_s2_write_permissions

Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).

Type

bool

Default value

0x0

debug_auth_signals_sampled_at_reset

Debug authentication signals can be configured as either sampled at reset only or at any time for External Root Debug.

Type

bool

Default value

0x0

debug_components_dap_address

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on debug bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is:
 {"format":"all_addrs_are_absolute_wrt_debugbus", "cores": [{"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}]}

Type

string

Default value**debug_components_mmap_address**

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on system bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is:
 {"format":"all_addrs_are_absolute_wrt_systembus", "cores": [{"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}]}

Type

string

Default value**debug_entry_is_context_sync**

If true, Entry in debug state is Context sync. Exiting debug state is a context synchronising operation, but entering is not. However some cpu implementation can consider also the Entry in Debug state as a CSE

Type

bool

Default value

0x0

debug_rom_is_class_9

If true, present a debug ROM table as a class 9 device. Otherwise, use a class 1 ROM table.

Type

bool

Default value

0x0

debug_rom_is_flat

If true, present a debug ROM table recommended by ARMv8 Debug Architecture. Otherwise, use nested ROM tables.

Type

bool

Default value

0x0

def_mem_map

Default memory map in a json format which is: { "start-end_inclusive" : "attributes", "*" : "attributes" } Where the * represents the entire physical address range and must be provided and the attributes can be a combination of following. MemoryType - NORMAL, GRE, nGRE, nGnRE, nGnRnE Shareability - ISH, OSH, NSH InnerAttributes - IWB, IWT, INC OuterAttribute - OWB, OWT, ONC ExecuteNever - XN

Type

string

Default value

{ "*" : "NORMAL INC ONC OSH" }

def_mem_map_file_path

Path of file describing default memory map in json format. When a valid path is provided, the below parameter 'def_mem_map' will be ignored.

Type

string

Default value**default_inner_shareable**

shareability for default memory map regions which are shareable

Type

bool

Default value

0x0

delay_serror

Add a propagation delay of serror signal into the core

Type

int

Default value

0x0

dic-spi_count

Number of shared peripheral interrupts implemented

Type

int

Default value

0x40

disable_impdef_abort_on_ic_maintenance

Disable IMP_INTLATENCY_EL2.MMDVM/LLRAMDVM controlling the abort on IC maintenance on MM port/LLRAM

Type

bool

Default value

0x0

disable_sve_plugin

If true, SVE will not be implemented in this processor even if the plugin is loaded (FEAT_SVE).

Type

bool

Default value

0x0

disable_unknown_update_event_on_reset

Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserved or resets to architecturally unknown value

Type

bool

Default value

0x0

dsb_accumulate_threshold

Limit the maximum number of observable DSB side effects which can be queued (e.g. TLBI), after which DSB sync will be done automatically.

Type

int

Default value

0x100

edpfr_ras_unknown_bits_read_as_0

If true then UNKNOWN bits in RAS field in EDPFR are read as 0

Type

bool

Default value

0x0

e10_can_access_imp_def_functionality

If not made UNDEF by imp_def_functionality_behaviour, ELO can access IMPLEMENTATION DEFINED registers and system instructions.

Type

bool

Default value

0x0

e13_trap_priority_when_secure_debug_disabled

Undef when secure debug is disabled (EDSCR.SDD == 1) && boolean IMPLEMENTATION_DEFINED 'EL3 trap priority when SDD == 1'

Type

bool

Default value

0x0

enable_address_contig_check

Check the input address range for the table entries that have the contiguous hint bit set.

Type

bool

Default value

0x0

enable_debug_auth_signals_config

Debug Authentication Signals DBGEN, SPIDEN (and if RME is enabled RLPIDEN and RTPIDEN) are configurable (default) or not configurable, (hardwired to 1). This parameter is the integer representation of a bitmap to enable configuration of these signals, with: - BIT[0] = DBGEN - BIT[1] = SPIDEN - BIT[2] = RLPIDEN - BIT[3] = RTPIDEN

Type

int

Default value

0xf

enable_lock_step

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

Type

bool

Default value

0x0

enable_tlb_contig_check

Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set.

Type

bool

Default value

0x0

enhanced_pac2_level

Implements Enhanced PAC2. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only, 2: EnhancedPAC2 with FPAC, 3: EnhancedPAC2 with FPACCombined.

Type

int

Default value

0x0

error_record_feature_register

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"

Type

string

Default value**error_record_feature_register_json_file**

File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value

Type

string

Default value

erxpfctl_res0_stateful_mask

Mask for stateful bits for ERXPFGCTL which are RES0

Type

int

Default value

0x0

exception_catch_before_software_step

Exception catch priority for the exception trapping form of exception catch (Armv8.2 or later, or exception_catch_type=0). If true, the exception catch debug event has higher priority than software step and halting step.

Type

bool

Default value

0x1

exception_catch_type

Type of exception catch (Armv8.0 - Armv8.1 only). 0, exception trapping. 1, non-exception trapping, higher priority than step. 2, non-exception trapping, lower priority than step.

Type

int

Default value

0x0

exclusive_monitor_clear_on_atomic_from_same_master

Exclusive monitors in the cluster will be cleared by a atomic by the same master to the monitored address.

Type

bool

Default value

0x1

exclusive_monitor_clear_on_store_from_same_master

Exclusive monitors in the cluster will be cleared by a store by the same master to the monitored address.

Type

bool

Default value

0x1

exclusive_monitor_clear_on_strex_address_mismatch

Exclusive monitors in the cluster will be cleared when a strex fails because the address does not match.

Type

bool

Default value

0x1

exclusive_monitor_clear_on_strex_success

Exclusive monitors in the cluster will be cleared when a strex succeeds.

Type

bool

Default value

0x1

exercise_stxr_fail

Reject a pseudo-random majority of exclusive store instructions

Type

bool

Default value

0x0

ext_abort_device_GRE_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_GRE_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_GRE_read_is_critical

Critical reporting of device-GRE read external aborts.

Type

bool

Default value

0x0

ext_abort_device_GRE_read_is_sync

Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

Type

int

Default value

0x2

ext_abort_device_GRE_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_GRE_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_GRE_write_is_critical

Critical reporting of device-GRE write external aborts

Type

bool

Default value

0x0

ext_abort_device_GRE_write_is_sync

Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

Type

int

Default value

0x2

ext_abort_device_GRE_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_GRE_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_read_is_critical

Critical reporting of device-nGRE read external aborts.

Type

bool

Default value

0x0

ext_abort_device_nGRE_read_is_sync

Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

Type

int

Default value

0x2

ext_abort_device_nGRE_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_write_is_critical

Critical reporting of device-nGRE write external aborts

Type

bool

Default value

0x0

ext_abort_device_nGRE_write_is_sync

Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

Type

int

Default value

0x2

ext_abort_device_nGRE_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_read_acquire_is_sync

Synchronous reporting of device read with acquire external aborts

Type

bool

Default value

0x0

ext_abort_device_read_is_critical

Critical reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x1

ext_abort_device_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_device_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_device_write_is_critical

Critical reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_device_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_device_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_fill_data

Returned data, if external aborts are asynchronous

Type

int

Default value

0xfdfdfdfcfcfdfdfd

ext_abort_normal_cacheable_read_is_critical

Critical reporting of normal write-back cacheable-read external aborts

Type

bool

Default value

0x0

ext_abort_normal_cacheable_read_is_sync

Synchronous reporting of normal write-back cacheable-read external aborts

Type

bool

Default value

0x1

ext_abort_normal_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_normal_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_normal_cacheable_write_is_critical

Critical reporting of normal write-back cacheable write external aborts

Type

bool

Default value

0x0

ext_abort_normal_cacheable_write_is_sync

Synchronous reporting of normal write-back cacheable write external aborts

Type

bool

Default value

0x0

ext_abort_normal_cacheable_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_normal_cacheable_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_normal_noncacheable_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_noncacheable_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_noncacheable_read_is_critical

Critical reporting of normal noncacheable-read external aborts

Type

bool

Default value

0x0

ext_abort_normal_noncacheable_read_is_sync

Synchronous reporting of normal noncacheable-read external aborts

Type

bool

Default value

0x1

ext_abort_normal_noncacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_normal_noncacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_normal_noncacheable_write_is_critical

Critical reporting of normal noncacheable write external aborts

Type

bool

Default value

0x0

ext_abort_normal_noncacheable_write_is_sync

Synchronous reporting of normal noncacheable write external aborts

Type

bool

Default value

0x0

ext_abort_normal_noncacheable_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_normal_noncacheable_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_normal_wt_cacheable_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_wt_cacheable_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_wt_cacheable_read_is_critical

Critical reporting of normal write-through cacheable-read external aborts

Type

bool

Default value

0x0

ext_abort_normal_wt_cacheable_read_is_sync

Synchronous reporting of normal write-through read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_read_is_sync.

Type

int

Default value

0x2

ext_abort_normal_wt_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_wt_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_wt_cacheable_write_is_critical

Critical reporting of normal write-through write external aborts

Type

bool

Default value

0x0

ext_abort_normal_wt_cacheable_write_is_sync

Synchronous reporting of normal write-through write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_write_is_sync.

Type

int

Default value

0x2

ext_abort_normal_wt_cacheable_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_wt_cacheable_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_prefetch_device_GRE_read_is_critical

Critical reporting of external aborts generated by device-GRE instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_device_GRE_read_is_sync

Behaviour of external aborts generated by device-GRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_device_nGRE_read_is_critical

Critical reporting of external aborts generated by device-nGRE instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_device_nGRE_read_is_sync

Behaviour of external aborts generated by device-nGRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_device_read_is_critical

Critical reporting of external aborts generated by device-nGnRE instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_device_read_is_sync

Behaviour of external aborts generated by device-nGnRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_is_critical

Critical reporting of external aborts generated by normal writeback cacheable instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_is_sync

Behaviour of external aborts generated by normal writeback cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort.

Type

bool

Default value

0x1

ext_abort_prefetch_noncacheable_read_is_critical

Critical reporting of external aborts generated by normal noncacheable instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_noncacheable_read_is_sync

Behaviour of external aborts generated by normal noncacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_prefetch_so_read_is_critical

Critical reporting of external aborts generated by device-nGnRnE instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_so_read_is_sync

Behaviour of external aborts generated by device=nGnRnE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_wt_cacheable_read_is_critical

Critical reporting of external aborts generated by normal writethrough cacheable instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_wt_cacheable_read_is_sync

Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_so_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffffffff

ext_abort_so_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffffffff

ext_abort_so_read_is_critical

Critical reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x1

ext_abort_so_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_so_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_so_write_is_critical

Critical reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x1

ext_abort_so_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_so_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_ttw_cacheable_read_is_critical

Critical reporting of TTW cacheable read external aborts

Type

bool

Default value

0x0

ext_abort_ttw_cacheable_read_is_sync

Synchronous reporting of TTW cacheable read external aborts

Type

bool

Default value

0x1

ext_abort_ttw_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_ttw_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_ttw_noncacheable_read_is_critical

Critical reporting of TTW noncacheable read external aborts

Type

bool

Default value

0x0

ext_abort_ttw_noncacheable_read_is_sync

Synchronous reporting of TTW noncacheable read external aborts

Type

bool

Default value

0x1

ext_abort_ttw_noncacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_ttw_noncacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_ttw_wt_cacheable_read_is_critical

Critical reporting of TTW write-through cacheable read external aborts

Type

bool

Default value

0x0

ext_abort_ttw_wt_cacheable_read_is_sync

Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.

Type

int

Default value

0x2

ext_abort_ttw_wt_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_ttw_wt_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

external_oslar_access_disabled_by_authentication

If true, external accesses to OSLAR, when external debugging is not enabled, will generate an error (FEAT_Debugv8p2).

Type

bool

Default value

0x0

fault_on_nT_bit_set

Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.

Type

bool

Default value

0x1

fault_unalign_to_unsupported_access

If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB or the access crossing a 16-byte boundary generate fault. Bits 0,1,2,3 should be set accordingly to enable the fault behaviour. bit 0: atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault, bit 3: the access crossing a 16-byte boundary should fault

Type

int

Default value

0x8

fault_unaligned_s1_device_s2_fwb

Whether unaligned fault with stage1 Device memory and final memory attribute forced to normal by FWB. 0, No fault. 1, will fault. 2 No fault if final Shareability is NSH.

Type

int

Default value

0x0

flash_protection_enable_at_reset

Enable flash memory protection after reset

Type

bool

Default value

0x0

force_align_pc

UNPREDICTABLE branch to non-word-aligned address in ARM state is forced to be aligned

Type

bool

Default value

0x0

fpcr_short_vector_raz

FPSCR and FPCR fields LEN and STRIDE are hardwired to 0

Type

bool

Default value

0x0

fpsr_res0_stateful_mask

Mask for stateful bits of FPSR which are RES0

Type

int

Default value

0x0

gic.GICC-offset

Offset from PERIPHBASE for GICC registers.

Type

int

Default value

0x2000

gic.GICD-offset

Offset from PERIPHBASE for GICD registers. Will be ignored when GICv3 CPU interface is enabled, as distributor is then external to the cluster.

Type

int

Default value

0x1000

gic.GICH-offset

Offset from PERIPHBASE for GICH registers.

Type

int

Default value

0x4000

gic.GICH-other-CPU-offset

Offset from PERIPHBASE for GICH registers for accessing other CPUs in the cluster. Set to 0 to disable.

Type

int

Default value

0x5000

gic.GICV-alias

Offset from PERIPHBASE for alias of GICV registers. When gicv2-only, if zero no alias will be created; if gicv2-only=0, the param is deprecated, when zero or unset an alias is created in the place mandated by the architecture (GICV-base+0xF000)

Type

int

Default value

0x0

gic.GICV-offset

Offset from PERIPHBASE for GICV registers.

Type

int

Default value

0x6000

gic.PERIPH-size

Size of registers based at PERIPHBASE that are considered to be owned by the GIC. Any accesses in the range PERIPHBASE to PERIPHBASE+gic.PERIPH-size-1 that do not match GIC registers will be treated as RAZ/WI.

Type

int

Default value

0x8000

gic_iri.ARE-fixed-to-one

GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one

Type

bool

Default value

0x1

gic_iri.DPG-ARE-only

Limit application of DPG bits to interrupt groups for which ARE=1

Type

bool

Default value

0x0

gic_iri.DPG-bits-implemented

Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR

Type

bool

Default value

0x0

gic_iri.GICD-alias

In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode: the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled)

Type

int

Default value

0x0

gic_iri.GICD_ITARGETSR-RAZWI

If true, the GICD_ITARGETS registers are RAZ/WI

Type

bool

Default value

0x0

gic_iri.GICD_PIDR

The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

Type

int

Default value

0x0

gic_iri.GICR_PIDR

The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

Type

int

Default value

0x0

`gic_iri.GITS_PIDR`

The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

Type

int

Default value

0x0

`gic_iri.ICFGR-rsvd-bit`

If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGRn for n>0

Type

bool

Default value

0x1

`gic_iri.IIDR`

GICD_IIDR and GICR_IIDR value

Type

int

Default value

0x0

`gic_iri.IRI-ID-bits`

Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported

Type

int

Default value

0x10

`gic_iri.ITS-count`

Number of Interrupt Translation Services to be instantiated (0=none)

Type

int

Default value

0x0

gic_iri.SPI-count

Number of SPIs that are implemented.

Type

int

Default value

0x20

gic_iri.SPI-message-based-support

Distributor supports message based signaling of SPI

Type

bool

Default value

0x1

gic_iri.STATUSR-implemented

Determines whether the GICR_STATUSR register is implemented.

Type

bool

Default value

0x0

gic_iri.enable_protocol_checking

Enable/disable protocol checking at cpu interface

Type

bool

Default value

0x0

gic_iri.enabled

Enable GICv3 functionality; when false the component is inactive.

Type

bool

Default value

0x1

gic_iri.has-two-security-states

If true, has two security states

Type

bool

Default value

0x0

gic_iri.irouter-default-mask

Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'

Type

string

Default value

0.0.0.7

gic_iri.irouter-default-reset

Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or *

Type

string

Default value

0.0.0.0

gic_iri.monolithic

Indicate that the implementation is not distributed

Type

bool

Default value

0x1

gic_iri.non-ARE-core-count

Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.

Type

int

Default value

0x4

gic_iri.periph-size

Size in bytes allocated to internal GIC Distributor

Type

int

Default value

0x0

gic_iri.priority-bits

Number of implemented priority bits

Type

int

Default value

0x5

`gic_iri.processor-numbers`

Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.)
If not specified, will number processors starting at 0.

Type

string

Default value**`gic_iri.redistributor-offset`**

Offset from reg-offset where the Redistributors are accessible

Type

int

Default value

0x0

`gic_iri.redistributor-size`

Per Redistributor register space in bytes

Type

int

Default value

0x0

`gic_iri.reg-offset`

Offset from PERIPHBASE allocated to internal GIC Distributor

Type

int

Default value

0x0

`gic_iri.supports-shareability`

Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).

Type

bool

Default value

0x0

`gic_iri.virtual-lpi-support`

GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported

Type

bool

Default value

0x0

`gic_iri.wakeup-on-reset`

Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

Type

bool

Default value

0x0

`gicv3.A3-affinity-supported`

Whether a non-zero value for affinity at level 3 is supported.

Type

bool

Default value

0x0

`gicv3.BPR-min`

The minimum value for the GICC_BPR register (non-secure version will be 1 + this value).

Type

int

Default value

0x2

`gicv3.EOI-check-CPUID`

Check CPU ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

Type

bool

Default value

0x0

`gicv3.EOI-check-ID`

Check Interrupt ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

Type

bool

Default value

0x0

gicv3.EOI-deactivate-any-interrupt

Allow an EOI to deactivate interrupts that aren't the highest priority active interrupt (EOI-ignore-out-of-order must be false otherwise this is ignored).

Type

bool

Default value

0x0

gicv3.EOI-ignore-out-of-order

Ignore EOI writes that cannot end the highest priority active interrupt.

Type

bool

Default value

0x1

gicv3.FIQEn-RAO

GICC_CTLR.FIQEn is read as one, write insensitive

Type

bool

Default value

0x0

gicv3.IIDR_base

The base value for calculating the GICC_IIDR register value.

Type

int

Default value

0x43b

gicv3.LR-count

The number of implemented list registers.

Type

int

Default value

0x10

gicv3.PMHE-RAO-WI

ICC_CTLR_EL*.PHME is read as one, write insensitive

Type

bool

Default value

0x0

gicv3.PMHE-RAZ-WI

ICC_CTLR_EL*.PHME is read as zero, write insensitive

Type

bool

Default value

0x0

gicv3.PMHE-release-set-packet

if PHME is enabled, whether a SET packet is released by CPU Intf in Upstream Ack window.

Type

bool

Default value

0x0

gicv3.SRE-EL2-enable-RAO

When ICC_SRE_EL2.SRE is RAO/WI, makes ICC_SRE_EL2.Enable RAO/WI

Type

bool

Default value

0x0

gicv3.SRE-EL3-enable-RAO

When ICC_SRE_EL3.SRE is RAO/WI, makes ICC_SRE_EL3.Enable RAO/WI

Type

bool

Default value

0x0

gicv3.SRE-EL3-set-once

Restrict SRE EL3 to be set only once

Type

bool

Default value

0x0

gicv3.SRE-enable-action-on-mmap

Allowed values are: 0-SRE one allows mmap access. 1-SRE one disables mmap access. 2-SRE one makes mmap access RAZ-WI.

Type

int

Default value

0x0

gicv3.STATUSR-implemented

If GICv3 CPU interface is being used, this determines whether the STATUS registers are implemented

Type

bool

Default value

0x1

gicv3.VBPR-min

The minimum value for the GICV_BPR register (non-secure version will be 1 + this value).

Type

int

Default value

0x2

gicv3.VFIQEn-RAO

ICH_VMCR_EL2.VFIQEn is read as one, write insensitive

Type

bool

Default value

0x0

gicv3.cputnf-mmap-access-level

Allowed values are: 0-mmap access is supported for GICC,GICH,GICV registers. 1-mmap access is supported only for GICV registers. 2-mmap access is not supported.

Type

int

Default value

0x0

gicv3.dir-trap-support

The cpu supports separate trapping of ICC_DIR_EL1 to EL2

Type

bool

Default value

0x1

gicv3.el3_trap_priority_when_secure_debug_disabled

Undef to access priorities group register when secure debug is disabled

Type

bool

Default value

0x0

gicv3.extended-interrupt-range-support

Device has support for extended SPI/PPI ID ranges

Type

bool

Default value

0x0

gicv3.gicv2-only

Limit the GIC implementation to GICv2 features only

Type

bool

Default value

0x0

gicv3.idle-is-ff

For GICC/GICV RPR, when idle, return FF when true, minimum supported priority otherwise

Type

bool

Default value

0x1

gicv3.ignore-DIR-write-when-E0Imode-not-set

Ignore UNPREDICTABLE access to GICC_DIR register.

Type

bool

Default value

0x1

gicv3.interrupt-bypass-support

Interrupt bypass support, set to false for devices not supporting interrupt bypass

Type

bool

Default value

0x1

gicv3.local-SEIs

Generate SEI to signal internal issues

Type

bool

Default value

0x0

gicv3.local-VSEIs

Generate VSEI to signal internal issues

Type

bool

Default value

0x0

gicv3.physical-ID-bits

Number of physical ID bits implemented.

Type

int

Default value

0x10

gicv3.priority-bits

Number of priority bits implemented.

Type

int

Default value

0x5

gicv3.send-PMHE-command-only-when-priority-changes

Send PMHE upstream command to distributor only when write to ICC_PMR_EL1 changes the priority

Type

bool

Default value

0x0

gicv3.sgi-range-selector-support

Device has support for the Range Selector feature for SGI

Type

bool

Default value

0x0

gicv3.suppress-virtual-enables-comms

In GICv3 only mode, prevents the GIC CPUIF from communicating UpstreamWrite/VirtualEnables to the IRI

Type

bool

Default value

0x1

gicv3.virtual-ID-bits

Number of virtual ID bits implemented.

Type

int

Default value

0x10

gicv3.virtual-lpi-support

When GICv3 is supported, indicates a cut down CPUIF interface with no support of VLPI (GICv3 only) when false

Type

bool

Default value

0x1

gicv3.virtual-priority-bits

Number of virtual priority bits implemented.

Type

int

Default value

0x5

gicv3.without-DS-support

GICv3 CPU interfaces do not support disabling security in the distributor (GICD_CTLR.DS=1)

Type

bool

Default value

0x0

gicv4.mask-virtual-interrupt

If true, virtual interrupts can be masked from being reported to virtual CPU interface by setting ICH_HCR_EL2.DVIM 1. No control otherwise.

Type

bool

Default value

0x0

global_debug_rom.ROMDEVID

Value of Debug Rom Device Identification Register

Type

int

Default value

0x0

global_debug_rom.ROMPIDR

Value of Debug Rom Peripheral Identification Register

Type

int

Default value

0x4000bb000

global_debug_rom.ROMPRIDR0

Value of Debug ROM Power RequestID Register

Type

int

Default value

0x1

hardware_translation_table_update_implemented

Implement hardware translation table updates from ARMv8R-64.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has-gicv4.1

GICv4.1 is enabled, and all the features with GICv4.1 are implemented (FEAT_GICv4p1).

Type

bool

Default value

0x0

has_16bit_asids

Enable 16-bit ASIDs.

Type

bool

Default value

0x1

has_16bit_vmids

Implement support for 16-bit VMIDs from ARMv8R-64.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_16k_granule

Implement the 16k LPAE translation granule.

Type

bool

Default value

0x0

has_4k_granule

Implement the 4k LPAE translation granule.

Type

bool

Default value

0x1

has_64k_granule

Implement the 64k LPAE translation granule.

Type

bool

Default value

0x1

has_aarch32_dbgdidr_etc

DBGDIDR, DBGDRAR, DBGDSAR exist even if EL1 doesn't implement AArch32

Type

bool

Default value

0x1

has_aarch64

All implemented exception levels can run in AArch64

Type

bool

Default value

0x0

has_bc

Implement Armv8.8 Hinted Conditional Branch (FEAT_HBC)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_ccidx

Implement the ARMv8R-64 CCSIDR Extension. Extending the ccsidr number of sets (FEAT_CCIDX).

Type

bool

Default value

0x0

has_cluster_l1cache_size

Whether core supports cluster level l1cache size

Type

bool

Default value

0x1

has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x0

has_const_pac

Feature for singular selection of PAC field (FEAT_CONSTPACFIELD).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_cvadp_support

Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 (FEAT_DPB, FEAT_DPB2).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_debug_rom

If true, a debug ROM will be generated describing the cluster's debug components.

Type

bool

Default value

0x1

has_delayed_ctireg

Delay the functional effect of CTI register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_dbgreg

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_mdscr_el1

Delay the functional effect of MDSCR_EL1 register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_oslar_el1

Delay the functional effect of OSLAR_EL1 register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_pmureg

Delay the functional effect of PMU register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_sysreg

Delay the functional effect of system register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_dgh

Implements Data Gathering Hint instruction from ARMv8.6 (FEAT_DGH).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_e0pd

Implement ARMv8-R64 feature to prevent unprivileged access to one half of the memory

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_edacr

Implement EDACR register

Type

bool

Default value

0x1

has_enhanced_pac

If pointer authentication is enabled then implement enhanced PAC.

Type

bool

Default value

0x0

has_exception_trapping_form_of_vector_catch

Implement the exception trapping form of vector catch debug event.

Type

bool

Default value

0x1

has_export_m_port

The interrupt distributor has an optional interrupt export port for routing interrupts to an external device

Type

bool

Default value

0x1

has_far_not_valid

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts.

Type

bool

Default value

0x0

has_far_not_valid_dfsc

Implements FnV bit in ESR_ELx, FAR not valid for synchronous external aborts for Data Abort.

Type

bool

Default value

0x0

has_far_not_valid_ifsc

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts for Instruction Abort.

Type

bool

Default value

0x0

has_flash

Flash Port present

Type

bool

Default value

0x0

has_flash_protection

Implement flash memory protection

Type

bool

Default value

0x0

has_fp16

Implement the half-precision floating-point data processing instructions from ARMv8R-64 (FEAT_FP16).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_generic_authentication

Implement ARMv8.3 generic authentication.

Possible values of this parameter are: - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_hardware_translation_table_update

Type of hardware translation table supported (when enabled by hardware_translation_table_update_implemented). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented.

Type

int

Default value

0x2

has_internal_gic_iri

Is Internal GIC IRI implemented

Type

bool

Default value

0x0

has_itd

Implement the optional IT disable feature.

Type

bool

Default value

0x1

has_large_system_ext

Implement the ARMv8 Large System Extensions (FEAT_LSE).

Type

bool

Default value

0x0

has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8R-64 (FEAT_LVA).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_llpp

Low Latency Peripheral Port present

Type

bool

Default value

0x0

has_mpm

Implement max-power mitigation mechanism (MPMM)

Type

bool

Default value

0x0

has_no_os_double_lock

Do not implement the OS double-lock (FEAT_DoubleLock).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_par_bit10_razwi

Whether PAR_EL1[10] is RAZ/WI

Type

bool

Default value

0x0

has_partial_delayed_mdscr_el1

has_delayed_oslar_el1 only apply to some bits of MDSCR_EL1 (MDE, KDE, TDCC, SS).

Type

bool

Default value

0x0

has_pc_sample_based_profiling

If true, pc sample-based profiling is enabled (FEAT_PCSRv8, FEAT_PCSRv8p2).

Type

bool

Default value

0x1

has_per_cluster_debug_auth_ports

If true then the debug authentication ports i.e. spniden, niden, rpliden, rtpiden, dbgen, spiden are available per cluster

Type

bool

Default value

0x0

has_p12

Whether EL2 is implemented

Type

bool

Default value

0x1

has_pmc

Programmable MBIST controllers implemented

Type

bool

Default value

0x0

has_pmu

Implement the optional Performance Monitors Extension (FEAT_PMUv3). 0, Not Implemented. 1, Implemented. 2, PMU is IMPLEMENTATION_DEFINED, PMU version would be set to 0xF and would behave as if no PMU is implemented

Type

int

Default value

0x1

has_pointer_authentication

Implement ARMv8.3 pointer authentication (FEAT_PAuth).

Possible values of this parameter are: - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_prediction_invalidation_instructions

Implement execution and data prediction invalidation from ARMv8-R64 (FEAT_SPECRES).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_qarma3_pac

Supports QARMA3 pointer authentication algorithm (FEAT_PACQARMA3)

Type

bool

Default value

0x0

has_ras

Implements the ARMv8 RAS Extension. 0 = NO_RAS, 1 = MINIMAL_RAS, 2 = FULL_RAS (FEAT_RAS)

Type

int

Default value

0x0

has_ras_armv84_extension

Implement ARMv8R-64 RAS Extension (FEAT_RASv1p1).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ras_double_fault

Implement ARMv8.4 RAS Double Fault Extension (FEAT_DoubleFault).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_restriction_on_speculative_data_loaded

Implements the ARMv8-R64 security feature (Restrictions on the effects of speculation) (FEAT_CSV3)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_self_hosted_trace_extension

Implement support for the Self-hosted Trace Extensions from ARMv8R-64 (FEAT_TRF).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_small_page_table

Implement small page table support which increases the maximum value of TxSZ field from ARMv8R-64 (FEAT_TTST). Note: will be unimplemented only if both has_small_page_table=0x0 and has_pl2=0x0.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_software_lock

Implement software lock in memory-mapped CTI, PMU, and external debug interfaces

Type

bool

Default value

0x1

has_speculation_barrier_inst

Implement speculation barrier instruction (SB) from ARMv8-R64 (FEAT_SB).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_speculative_sei

If true, the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches

Type

bool

Default value

0x0

has_spp

Shared Peripheral Port present

Type

bool

Default value

0x0

has_stage2_ap_speculative_update

Speculative update of S2 AP bit on S1 TTW. 0 = No Update, 1 = Update, 2 = Update including for AT ops

Type

int

Default value

0x0

has_synchronous_load_atomics

Report asynchronous abort due to unsupported load atomics as synchronous (Cacheable)

Type

bool

Default value

0x1

has_synchronous_load_atomics_noncacheable

Report asynchronous abort due to unsupported load atomics as synchronous (Non-Cacheable)

Type

bool

Default value

0x1

has_synchronous_store_atomics

Report asynchronous abort due to unsupported store atomics as synchronous (Cacheable)

Type

bool

Default value

0x0

has_synchronous_store_atomics_noncacheable

Report asynchronous abort due to unsupported store atomics as synchronous (Non-Cacheable)

Type

bool

Default value

0x0

has_tlb_conflict_abort

Detected inconsistent TLB content generate aborts.

Type

bool

Default value

0x0

has_tlb_pa_caching

Whether intermediate caching of translation table walks might include NonCoherent caches of previous valid walks. 0, NonCoherent caches might be included. 1, No NonCoherent caches included (FEAT_nTLBPA)

Type

bool

Default value

0x0

has_unsupported_exclusive_fault

Report unsupported exclusive access with Unsupported Exclusive fault status (otherwise use external abort)

Type

bool

Default value

0x1

has_v8_4_pmu_extension

Implement PMU extension from ARMv8.4 (FEAT_PMUv3p4).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_5_debug_over_power_down

Implement ARMv8.5 Debug over powerdown

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_v8_6_pmu_events

Implements PMU events from ARMv8.6

Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_writebuffer

Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.

Type

bool

Default value

0x0

hcptr_tta_behaviour

Behaviour of HCPTR.TTA when there is no CP14 ETM interface. 0, RAZ/WI. 1, RAO/WI. 2, stateful.

Type

int

Default value

0x2

hcr_el2_miocnce_is_rw

If true, HCR_EL2.MIOCNCE is treated as R/W instead of RAZ/WI

Type

bool

Default value

0x0

hcr_swio_res1

Whether HCR.SWIO and/or HCR_EL2.SWIO are RES1.

Type

bool

Default value

0x0

hsr_uncond_cc

Condition codes reported in HSR as AL if it passes

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-log2linelen

If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-nprefetch

Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.

Type

int

Default value

0x1

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-prefetch_level

0 based cache level at which instructions are pre-fetched. This is only used when icache-prefetch_enabled=true.

Type

int

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_bus_width_in_bytes

L1 I-Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

icache-ways

L1 I-Cache number of ways (sets are implicit from size).

Type

int

Default value

0x2

ignore_tag_check_dcc_load_store_in_ma_mode_when_tco_is_disabled

Constrained unpredictable behavior for reads/writes to external debug interface DTR regs in memory access mode when PSTATE.TCO is 0. If true, tag check is ignored else, tag check is performed if required.

Type

bool

Default value

0x0

imp_def_functionality_behaviour

Behaviour of IMPLEMENTATION DEFINED registers and system instructions. 0, UNDEF. 1, RAZ/WI.

Type

int

Default value

0x0

instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)

Type

int

Default value

0x0

internal_vgic

Instantiate VGIC peripheral in this processor

Type

bool

Default value

0x0

is_debug_state_pmu_snapshot_allowed

If true, PMU snapshot is allowed in debug state.

Type

bool

Default value

0x1

is_first_pcsr_sample_ignored

If true, First read of PMPCSR register after reset returns 0xFFFFFFFF

Type

bool

Default value

0x0

is_serror_edge_triggered

If true, SError is edge-triggered. Otherwise, its level-triggered.

Type

bool

Default value

0x1

is_uniprocessor

Value for the U bit in MPIDR. true disables L1 cache coherency protocols

Type

bool

Default value

0x0

isb_is_branch

If true, ISB is traced as an immediate branch. This allows to count ISB as a branch in debug extensions (e.g. PMU)

Type

bool

Default value

0x0

ish_is_osh

Whether Innershareable is same as OuterShareable

Type

bool

Default value

0x0

itd_conditional_instructions_are_32bit

When SCTLR_ELx.ITD=1, an IT instruction plus a T16 instruction are considered a single 32bit conditional instruction.

Type

bool

Default value

0x0

jidr_is_undef_at_el0

If true, JIDR register access is UNDEF at EL0

Type

bool

Default value

0x0

jmcr_is_undef_at_el0

If true, JMCR register access is UNDEF at EL0

Type

bool

Default value

0x0

joscr_is_undef_at_el0

If true, JOSCR register access is UNDEF at EL0

Type

bool

Default value

0x0

l1cache_has_r52_cache_policy

Whether l1cache has r52 cache policy

Type

bool

Default value

0x0

l1cache_has_rsvd_flash_ways

Whether l1 cache segregates ways for flash and AXI data.

Type

bool

Default value

0x0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-mpamf.arch_major_ver

L3 Cache MPAMF_AIDR architecture major version

Type

int

Default value

0x0

l3cache-mpamf.arch_minor_ver

L3 Cache MPAMF_AIDR architecture minor version

Type

int

Default value

0x0

l3cache-mpamf.has_esr

L3 Cache's MPAMF_ESR, MPAMF_ECR, and MPAM error handling implemented.

Type

bool

Default value

0x0

l3cache-mpamf.has_extd_esr

L3 Cache's MPAMF_ESR is 64-bits.

Type

bool

Default value

0x0

l3cache-mpamf.has_impl_idr

L3 Cache's MPAMF_IMPL_IDR is present.

Type

bool

Default value

0x0

l3cache-mpamf.has_mbwu_long_counter

L3 Cache has long MBWU counter and capture registers.

Type

bool

Default value

0x0

l3cache-mpamf.has_mpamfidr_ext

MPAMF_IDR.EXT support

Type

bool

Default value

0x0

l3cache-mpamf.has_partid_nrw

Narrowing part ID register is present. This is global rather than per-instance.

Type

bool

Default value

0x0

l3cache-mpamf.has_priority_partitioning

The selected resource has priority partitioning described in MPAMF_PRI_IDR.

Type

bool

Default value

0x0

l3cache-mpamf.has_prod_id

L3 Cache MPAMF_IIDR product ID supported.

Type

int

Default value

0x0

l3cache-mpamf.has_prod_rev

L3 Cache MPAMF_IIDR product REVISION supported.

Type

int

Default value

0x0

l3cache-mpamf.has_prod_var

L3 Cache MPAMF_IIDR product VARIANT supported.

Type

int

Default value

0x0

l3cache-mpamf.has_ris

L3 Cache has resource instance selection support.

Type

bool

Default value

0x0

l3cache-mpamf.max_partid_ns

L3 Cache Maximum value of non-secure PARTID supported.

Type

int

Default value

0xffff

l3cache-mpamf.max_partid_rl

L3 Cache Maximum value of realm PARTID supported for RME implementations.

Type

int

Default value

0xffff

l3cache-mpamf.max_partid_rt

L3 Cache Maximum value of root PARTID supported for RME implementations.

Type

int

Default value

0xffff

l3cache-mpamf.max_partid_s

L3 Cache Maximum value of secure PARTID supported.

Type

int

Default value

0xffff

l3cache-mpamf.max_pmg_ns

L3 Cache Maximum value of non-secure PMG supported.

Type

int

Default value

0xff

l3cache-mpamf.max_pmg_rl

L3 Cache Maximum value of realm PMG supported for RME implementations.

Type

int

Default value

0xff

l3cache-mpamf.max_pmg_rt

L3 Cache Maximum value of root PMG supported for RME implementations.

Type

int

Default value

0xff

l3cache-mpamf.max_pmg_s

L3 Cache Maximum value of secure PMG supported.

Type

int

Default value

0xff

l3cache-mpamf.mbwu_long_counter_width

L3 Cache long MBWU counter width. 0: 63 bits, 1: 44 bits.

Type

int

Default value

0x0

l3cache-mpamf.no_impl_msmon

L3 Cache's MPAMF_IMPL_IDR does not describe resource monitors.

Type

bool

Default value

0x0

l3cache-mpamf.no_impl_part

L3 Cache's MPAMF_IMPL_IDR does not describe resource partitioning controls.

Type

bool

Default value

0x0

l3cache-mpamf.ris_max

L3 Cache's largest resource instance selector value defined.

Type

int

Default value

0x0

l3cache-mpamf_base

L3 Cache memory mapped MPAM registers base address

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_bus_width_in_bytes

L3 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x0

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

legacy_combining_exc_catch_trace

Whether exception catch is traced as part of exception entry/exit in same cycle

Type

bool

Default value

0x1

ls64_ignore_s1_unpred_memattr_transformation

If true, stage 1 unpredictable memory attribute transformations are ignored for FEAT_LS64 single-copy atomic 64-byte load/store instructions' (FEAT_LS64, FEAT_LS64_V, FEAT_LS64_ACCDATA).

Type

bool

Default value

0x0

ls64_memtype_check_use_combined_memattr

If true, FEAT_LS64 single-copy atomic 64-byte load/store instructions' memory attributes check is done on the combined memory attributes at the end of all enabled translation stages.

Type

bool

Default value

0x0

mdrar_el1_res0

MDRAR_EL1 is RES0.

Type

bool

Default value

0x0

memory.ext_slave_base

Base address of Slave Port. Each core's region will offset by ext_slave_size_per_core

Type

int

Default value

0x0

memory.ext_slave_size_per_core

Size of Slave region for each core

Type

int

Default value

0x0

memory.flash_base

Base address of Flash

Type

int

Default value

0x0

memory.flash_size

Size of the Flash RAM

Type

int

Default value

0x0

memory.has_llram

Low-Latency RAM present

Type

bool

Default value

0x0

memory.l2_cache.is_inner_cacheable

L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes)

Type

bool

Default value

0x1

memory.l2_cache.is_inner_shareable

L2 cache obeys inner shareable attributes (rather than outer shareable attributes)

Type

bool

Default value

0x1

memory.llram_base

Base address of LLRAM

Type

int

Default value

0x0

memory.llram_enable_at_reset

Whether llram is enabled at reset

Type

bool

Default value

0x0

memory.llram_shared

Controls the Low-Latency RAM's sharability attribute.

Type

bool

Default value

0x0

memory.llram_size

Size of the LLRAM

Type

int

Default value

0x0

memory.scu_present

L1 Caches are coherent

Type

bool

Default value

0x1

memory.transmit_vmid_in_user_flags

Transmit VMID in transaction attributes

Type

bool

Default value

0x0

mixed_endian

Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at ELO only.

Type

int

Default value

0x1

mpidr_layout

Layout of MPIDR. 0 AFF0 is CPUID, 1 AFF1 is CPUID

Type

int

Default value

0x0

non_secure_vgic_alias_when_ns_only

If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).

Type

int

Default value

0x0

num_protection_regions_s1

Number of v8-R protection regions

Type

int

Default value

0x20

num_protection_regions_s2

Number of v8-R hyp protection regions

Type

int

Default value

0x20

num_spi

Number of interrupts (SPI) into the internal GIC controller

Type

int

Default value

0x20

number_of_error_records

Cores Number of Error records supported for RAS

Type

int

Default value

0x0

page_based_hardware_attributes

Implement the page based hardware attributes from ARMv8R-64. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy (FEAT_HPDS2).

Type

int

Default value

0x0

par_ns_set_unknown_bit

Whether NS bit of PAR is set/clear when executing AT to perform non-secure regime translation. When true, NS is set to 1 else 0.

Type

bool

Default value

0x1

per_core_master_supported

If master port from each core is exposed out of cluster

Type

bool

Default value

0x0

pfr1_csv2_frac

Fractional revision number ID_AA64PFR1_EL1.CSV2_frac when ID_AA64PFR0_EL1.CSV==1 for CSV2 extension (FEAT_CSV2_1p1, FEAT_CSV2_1p2)

Type

int

Default value

0x0

pmb_idr_external_abort

Describes how the PE manages External aborts on writes made by the Statistical Profiling Extension to the Profiling Buffer. 0, External abort is reported to SPE, From Armv8.8 and Armv9.3, the value 0 is not permitted. 1, External abort is ignored. 2, The External abort generates an SError and the error is not reported to SPE.

Type

int

Default value

0x0

pmb_idr_flag_updates

Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state

Type

bool

Default value

0x1

pmcr_disable_events_export

If true, export for PMU events is disabled. This configures PMCFGR.EX field.

Type

bool

Default value

0x1

pmmir_ell_bus_slots

Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles.

Type

int

Default value

0x0

pmmir_ell_bus_width

Width, in bytes, of accesses counted by BUS_ACCESS

Type

int

Default value

0x0

pms_idr_max_size

Defines largest size for a single SPE record (rounded up to a power of 2)

Type

int

Default value

0x6

pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x8

pmu_cycle_counter_counts_actual_cycles

If true and Timing annotation is enabled, PMU cycle counter counts actual cycles, otherwise counts instructions executed

Type

bool

Default value

0x0

pmu_has_chain_event

PMU (if present) implements event number 0x1e, CHAIN.

Type

bool

Default value

0x1

pseudo_fault_generation_feature_register

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

Type

string

Default value**pstate_ssbs_type**

Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS (FEAT_SSBS). 2, fully supported (FEAT_SSBS2).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

ram_protection_enable_at_reset

Enable TCM, L1Cache memory protection after reset

Type

bool

Default value

0x0

randomize_unknowns_at_reset

Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset

Type

bool

Default value

0x0

ras_extra_configurations

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCn masks - these are 64 bit masks covering the 64 bit registers ERXMISCn_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}]

Type

string

Default value**ras_pfg_clock_mhz**

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0x18

register_reset_data

Data used to fill register bits when they become UNKNOWN at reset.

Type

int

Default value

0x0

register_reset_data_hi

Data used to fill the upper-half of 128-bit registers when the bits become UNKNOWN at reset.

Type

int

Default value

0x0

report_iside_cmo_ifsr

fault info for an iside cache maintenance operation is reported in the IFSR

Type

bool

Default value

0x1

report_second_access_align_fault_non_atomic_pair_access

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an alignment fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

Type

bool

Default value

0x0

report_second_access_mmu_fault_non_atomic_pair_access

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an MMU fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

Type

bool

Default value

0x0

reported_fp_revision

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored. Updates the FPSID.revision value

Type

int

Default value

0xffffffffffffffffffff

reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reserved_HMC_SSC_PAC_treated_disabled

When DBG[B|W]CR.{HMC,SSC,PAC} bits configuration is reserved, this parameter controls whether breakpoints/watchpoints are treated as Disabled or not

Type

bool

Default value

0x0

restore_fpsr_on_trapped_fp_exception

If true, FPSR is restored to the value of the FPSR immediately before the instruction that generated the trapped floating-point exception.

Type

bool

Default value

0x0

restriction_on_speculative_execution

Implements the ARMv8-R64 security feature (Restrictions on the effects of speculation): 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported) (FEAT_CSV2, FEAT_CSV2_2)

Type

int

Default value

0x0

rmr_always_implemented

Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.

Type

bool

Default value

0x0

s1_align_memtype_fault_prio_more_than_s2_perm_fault_on_s1_walk

If true, s1 alignment fault has priority over s2 permission faults

Type

bool

Default value

0x1

scheduler_mode

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!

Type

int

Default value

0x0

scr_nET_writeable

Whether SCR.nET is writeable. Writing to it is purely cosmetic (nET behavior not implemented)

Type

bool

Default value

0x0

scramble_unknowns_at_reset

Will fill in unknown bits in registers at reset with register_reset_data

Type

bool

Default value

0x1

serror_clear_delay

Delay for clearing of SError if SError is level-triggered, in cpu cycles.

Type

int

Default value

0x0

skip_trace_on_write_to_oseccr_el1_when_oslock_is_unlocked

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an unknown value on reads and ignores writes. When true, also skips the traces on writes to OSECCR_EL1 when OSLSR_EL1.OSLK == 0.

Type

bool

Default value

0x0

spp.base

Sets the base address of Shared Peripheral Port

Type

int

Default value

0x0

spp.size

Sets the size of SPP(in bytes)

Type

int

Default value

0x1000

spsr_el3_is_mapped_to_spsr_mon

Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon

Type

bool

Default value

0x0

spsr_m4_res0

Whether SPSR_ELx.M[4] bit should be RES0 for AARCH64 only implementations

Type

bool

Default value

0x0

stage12_tlb_size

If VMSA is supported at stage1, number of stage1+2 tlb entries. If instruction_tlb_size !=0, this is treated as dtlb size

Type

int

Default value

0x0

stage1_tlb_size

Number of stage1 only tlb entries.

Type

int

Default value

0x0

stage1_walkcache_size

Number of stage1 only walk cache entries.

Type

int

Default value

0x0

strex_fail_can_hit_watchpoint

If true, a strex fail can hit watchpoint

Type

bool

Default value

0x0

supports_multi_threading

Sets the MPIDR.MT bit. Setting this to true hints the the cluster is multi-threading compatible

Type

bool

Default value

0x0

swp_with_xzr_is_st_atomic

If true, swp with dest as xzr is treated as store atomic

Type

bool

Default value

0x1

take_ccfail_tsc_trap

When take_ccfail_undef=1 this parameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.

Type

bool

Default value

0x0

take_ccfail_undef

UNDEF exception is taken even if condition code check fails

Type

bool

Default value

0x1

tidcp_traps_el0_undef_imp_def

TIDCP has priority over UNDEF for accesses to IMPLEMENTATION DEFINED functionality from EL0

Type

bool

Default value

0x1

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_or_ic_invalid_xt

Behavior of TLBI and IC instructions that don't take Xt as an argument when Xt != 0b11111.
0: TLBI and IC not UNDEF, 1: TLBI UNDEF, IC not UNDEF, 2: TLBI not UNDEF, IC UNDEF, 3: TLBI and IC UNDEF

Type

int

Default value

0x0

trace_has_sysreg_access

ETM trace registers support access via system registers

Type

bool

Default value

0x1

trace_icc_registers_as_icv_when_redirected

If true, update trace with ICV, instead of ICC when ICV registers are accessed depending on the core state.

Type

bool

Default value

0x0

trace_physical_registers_when_host_virtualisation_enabled

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers)

Type

int

Default value

0x0

trap_dc_cmo_to_pou_if_nop

Whether traps to DC CMO operations to PoU are ignored if the same is treated as NOP.

Type

bool

Default value

0x1

trap_ic_cmo_to_pou_if_nop

Whether traps to IC CMO operations to PoU are ignored if the same is treated as NOP.

Type

bool

Default value

0x1

trap_reserved_group3_id_regs

Whether setting HCR_EL2.TID3 traps reserved group3 id registers.

Type

bool

Default value

0x0

treat-dcache-cmos-to-poc-as-nop

Whether dcache maintenance operations to the point of coherency are required for instruction to data coherence. 0 - Clean/Invalidate ops required, 1 - Clean/Invalidate ops not required and cannot generate faults, 2 - Clean/Invalidate ops not required but can generate faults

Type

int

Default value

0x0

treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

treat-dcache-invalidate-as-clean-invalidate

Treat data cache invalidate operations as clean and invalidate.

Type

bool

Default value

0x0

treat-icache-cmos-to-pou-as-nop

If has_coherent_icache is true, whether instruction cache invalidation operations to PoU which are treated as NOP can generate fault. 0 - cannot generate faults, 1 - can generate faults

Type

int

Default value

0x0

treat_forced_normal_as_device_for_excl_atomics

Whether exclusive/atomic access is supported in same manner as access to device if stage1 is Device memory and final memory attribute forced to normal by FWB

Type

bool

Default value

0x0

treat_pld_as_nop

If true, treat PLD as NOP.

Type

bool

Default value

0x0

treat_pli_as_nop

If true, treat PLI as NOP.

Type

bool

Default value

0x0

treat_wfi_wfe_as_nop

If true, never go into wait state for WFI or WFE instructions.

Type

bool

Default value

0x0

truncate_pc_on_illegal_exception_return_to_aarch32

On Illegal ERET to AArch32, truncate PC to 32-bits

Type

bool

Default value

0x1

unification-level

Level of Unification Inner Shareable for the cache hierarchy

Type

int

Default value

0x1

unification-uniprocessor-level

Level of Unification Uniprocessor for the cache hierarchy

Type

int

Default value

0x1

unpred_LSE128_overlap

Constrained unpredictable behaviours for 128-bit LSE overlap. 1 Constraint_UNDEF, 2 Constraint_NOP

Type

int

Default value

0x1

unpred_clear_ISV_for_exception_before_software_step

Whether ESR_ELx.ISV bit is cleared/set, when it is constrained unpredictable due to a different exception before a software step exception.

Type

bool

Default value

0x0

unpred_edscr_ns_set_unknown_bit

Unknown(x) bit in NS field in EDSCR can be configure to 0 or 1.

Type

bool

Default value

0x0

unpred_edscr_rw_unknown_bits_read_as_1

Unknown(x) bits in RW field in EDSCR are read as 1 instead of 0.

Type

bool

Default value

0x0

unpred_edscr_status_read_as_no_syndrome

Controls the choice of EDSCR.STATUS bit-values, when it is constrained unpredictable behaviour due to a different exception before a halting step debug event.

Type

bool

Default value

0x0

unpred_extdbg_unknown_bits

Data used to fill only in UNKNOWN bit-fields of external debug registers e.g., EDPFR and EDDFR.

Type

int

Default value

0x0

unpred_load_single_reg_overlap_with_wb

Constrained unpredictable behaviours for single load with writeback(might impact certain load pair instructions) 0 Constraint_WBSUPPRESS, 1 Constraint_UNDEF, 2 Constraint_NOP

Type

int

Default value

0x0

unpred_mrsmsr_currentlymapped_undef

UNPREDICTABLE register access (accessible from current mode using different instruction) modeled as NOP when false and UNDEF when true

Type

bool

Default value

0x0

unpred_mrsmsr_protfailed_undef

UNPREDICTABLE register access (not accessible from current PL and security state) modeled as NOP when false and UNDEF when true

Type

bool

Default value

0x0

unpred_par_attr_returns_mair

If true, PAR_EL1.ATTR represents the memory attributes as per the MAIR value instead of the ones in the descriptor.

Type

bool

Default value

0x0

unpred_sctlr_c_0_taggable_behaviour

Controls unpredictable effects when SCTLTR_ELx.C=0 for a stage 1 translation regime on whether memory is treated as taggable. Values: 0=Tagged, 1=Untagged but forced to Tagged when FWB=1 and stage 2 restores WB, 2 = Untagged

Type

int

Default value

0x2

unpred_stage2_mpu_and_bg_disabled

Constrained unpredictable when stage2 MPU and background disabled. 0, Stage-2 level 0 translation fault(Default). 1, Unknown memory attributes.

Type

int

Default value

0x0

unpred_store_exclusive_base_overlap

Constrained unpredictable behaviours for store exclusive when s==n. 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP

Type

int

Default value

0x0

unpred_store_pair_and_single_reg_overlap_with_wb

Constrained unpredictable behaviours for pair and single store with writeback(doesn't cover store exclusive) 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP

Type

int

Default value

0x0

unpred_tlbi_not_in_monitor_mode

Constrained unpredictable behaviors for AArch32 TLBI instructions executed in secure privileged mode other than Monitor mode. 0: Preferred behavior (default), 1: UNDEF, 2: NOP, 3: execute as if had been executed in Monitor mode

Type

int

Default value

0x0

unpred_tsize_aborts

Behaviour when TSize is out of range. 0, force into range. 1, translation fault, forces unpred_tsize_pamax_aborts to 1.

Type

bool

Default value

0x0

unpred_tsize_pamax_aborts

Behaviour when stage 2 TSize exceeds the physical address size (or 40bits, from AArch32). 0, force into range. 1, translation fault. Ignored if unpred_tsize_aborts is 1.

Type

bool

Default value

0x0

unpredictable_exclusive_abort_memtype

Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable)

Type

int

Default value

0x0

unpredictable_hvc_behaviour

HVC unpredictable behaviour. 0, UNDEF. 1, NOP.

Type

int

Default value

0x0

unpredictable_smc_behaviour

SMC unpredictable behaviour. 0, UNDEF. 1, NOP.

Type

int

Default value

0x0

unpredictable_wfet_and_wfit_behaviour

WFET and WFIT unpredictable behaviour in debug state. 0, UNDEFINED. 1, NOP.

Type

int

Default value

0x1

unsupported_atomic_fault_type

Type of fault reported on unsupported atomic access. 0 = external abort if any reported by interconnect, 1 = precise unsupported atomic fault, 2 = precise external abort, 3 = imprecise external abort.

Type

int

Default value

0x0

unsupported_hw_update_fault_type

Type of abort reported when hw update to descriptor is done using unsupported memtype (0=No abort, 1=IMPDEF abort caused by memtype, 2=Sync external abort)

Type

int

Default value

0x0

use_architectural_names

Use names SP/LR/PC instead of R13/R14/R15

Type

bool

Default value

0x0

use_stage1_sh_as_input_to_stage2

IMPDEF case of whether to use stage1 shareability or OuterShareable as input to stage2 if stage1 is Device memtype

Type

bool

Default value

0x0

use_tlb_contig_hint

Translation table entries with the contiguous hint bit set generate large TLB entries.

Type

bool

Default value

0x0

user_defined_rom_table_debug_power_config

User defined ROM Table debug power domains for ED,CTI,PMU and TRACE, and DBGPCR configuration. The "version" field and "cores" array are mandatory. The "dbgpcr" array, if provided, must contain unique integers in the range [0, 32) describing which debug power domains have power control implemented. The "rom" and "dbgpcr" fields in objects in the "cores" array are only allowed when 'debug_rom_is_flat' is false. All power domain ID fields ("rom", "ed/pmu", "cti", "etm") must be in the range [0, 32). The "ed/pmu" field is mandatory. Example JSON for a hierarchical debug ROM layout: '{"version": 0, "dbgpcr": [0, 1], "cores": [{"dbgpcr": [1, 31], "rom": 0, "ed/pmu": 0, "cti": 31, "etm": 1}, {"ed/pmu": 0}]}'

Type

string

Default value**vpu_datapath_width**

VPU data path width

Type

int

Default value

0x80

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

warn_unpredictable_in_v7

If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning

Type

bool

Default value

0x1

watchpoint-log2secondary_restriction

log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.

Type

int

Default value

0x0

wfe_wakeup_delay

Configure WFE wakeup delay in CPU cycles

Type

int

Default value

0x0

wfi_wakeup_delay

Configure WFI wakeup delay in CPU cycles

Type

int

Default value

0x0

wp_ignores_dbm_update

If true, dbm update is ignored on watchpoint hit

Type

bool

Default value

0x0

3.5.2 AEMvACT

ARM AEM A-Profile(MP) CPU component - number of cores configurable at runtime. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-177: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- `d128_disabled_ps_resvd_size`
- `has_delayed_brbe_records`
- `hpfar_unknown_when_ipa_invalid`
- `mdrar_ell_res0`
- `mops_mismatched_page_crossing_access_unpred`
- `mpmm_accumulator_multiplier`
- `rme_full_is_tagged_nsh_treated_as_tagged`
- `tlbi_or_ic_invalid_xt`
- `tlbi_stall_enabled`
- `unpred_clear_ISV_for_exception_before_software_step`
- `unpred_mte_stzgm_tag_operation_before_data`
- `unpred_sctlr_c_0_taggable_behaviour`
- `use_stage1_sh_as_input_to_stage2`

Parameters removed:

- `atomic_fault_priority_s1`
- `atomic_fault_priority_s2`
- `atomic_fault_priority_s2_on_s1`
- `tlbi_invalid_xt_behave_as_undef`

Iris and MTI instances for AEMvACT

This model has the following Iris instances:

Table 3-178: AEMvACT Iris instances

InstanceName	ComponentName
AEMvACT	Cluster_ARM_AEM-A_MP
AEMvACT.AMU	PVBusLogger
AEMvACT.AMU.mapper	PVBusMapper
AEMvACT.DAP	PVBusLogger
AEMvACT.DAP.mapper	PVBusMapper
AEMvACT.DSU	DSU

InstanceName	ComponentName
AEMvACT.DSU.mpam_busslave	PVBusSlave
AEMvACT.MMAP	PVBusLogger
AEMvACT.MMAP.mapper	PVBusMapper
AEMvACT.acp_mapper	PVBusMapper
AEMvACT.cpu0	ARM_AEM-A_MP
AEMvACT.cpu0.UTLB	TLB
AEMvACT.cpu0.dtlb	TlbCadi
AEMvACT.cpu0.l1dcache	PVCache
AEMvACT.cpu0.l1dcache.upstream[0]	PVBusSlave
AEMvACT.cpu0.l1icache	PVCache
AEMvACT.cpu0.l1icache.upstream[0]	PVBusSlave
AEMvACT.ext_bus	PVBusLogger
AEMvACT.ext_bus.mapper	PVBusMapper
AEMvACT.gic_cpuif_decoder_cluster	GLCv3CPUInterfaceDecoder
AEMvACT.l2_cache	PVCache
AEMvACT.l2_cache.upstream[0]	PVBusSlave
AEMvACT.l2_cache.upstream[10]	PVBusSlave

AEMvACT.l2_flusher	AsyncCacheFlushUnit

AEMvACT contains the following CADI targets:

- ARM_AEM-A_MP

- Cluster_ARM_AEM-A_MP
- PVCache
- TlbCadi

About AEMvACT

AEMvACT implements all architectural features in Arm®v8-A and Armv9-A.

It provides parameters to enable or disable support for particular architectural features. Some of these parameters allow you to enable features in versions of the architecture earlier than the one in which they were introduced. They have the possible values:

- 0** Feature is not enabled.
- 1** Feature is enabled, but only if the model is set to implement a version of the architecture in which the feature is supported.
- 2** Feature is enabled, regardless of which architecture version the model implements.

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Mapping architectural features to Fast Models releases

The following table shows which Fast Models releases support new architectural features, from Armv8.3-A onwards. Support is at EAC quality unless otherwise stated.

Table 3-180: Architectural features implemented in Fast Models

Architecture version	Feature	Fast Models version									
		11.26	11.25	11.24	11.23	11.22	11.21	11.20	11.19	11.18	11.17
Armv8.3-A	All. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.4-A	All. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.5-A	Memory Tagging Extension (MTE) functionality	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	MTE performance	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	All except MTE. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.6-A	All. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.7-A	Limited TLBI maintenance	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	All except TLBI maintenance. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓

Architecture version	Feature	Fast Models version									
		11.26	11.25	11.24	11.23	11.22	11.21	11.20	11.19	11.18	11.17
Armv8.8-A	All	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.9-A	Guarded Call Stack, 128-bit page table descriptors, and PMU updates	✓	✓	✓	✓	✓	✓	✓	-	-	-
	All other features	✓	✓	✓	✓	✓	✓	✓	-	-	-
Armv9.0-A to Armv9.3-A	Branch Record Buffer Extension (BRBE).	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	Trace Buffer Extension (TRBE) and Embedded Trace Extension (ETE). Reading TRBE registers was supported from 11.15.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	Realm Management Extension (RME) and Scalable Matrix Extension (SME).	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	Scalable Matrix Extension 2 (SME2).	✓	✓	✓	✓	✓	✓	✓	✓	-	-
	All other features. For details, see the list below this table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv9.4-A	RME without Secure EL2.	✓	✓	✓	✓	✓	✓	-	-	-	-
	All other features.	✓	✓	✓	✓	✓	✓	✓	-	-	-
Armv9.5-A	All features.	✓	✓	✓	-	-	-	-	-	-	-

- Armv8.3-A features implemented include:
 - Pointer authentication
 - Nested virtualization
 - Advanced SIMD complex number support
 - Improved Javascript data type conversion support
 - Memory consistency model changes
 - Support for larger system-visible caches
 - Debug over powerdown
- Armv8.4-A features implemented include:

- Secure EL2
- Additional cryptographic hashes
- Activity monitors
- Enhanced support for nested virtualization
- Memory Partitioning and Monitoring (MPAM)
- Stage 2 forced write-back
- Dot product instructions
- Data independent timing instructions
- Large System Extensions (LSE)
- Support for TLB maintenance instructions and for TLB range instructions
- Translation Table Level (TTL)
- Enhancements to weaker release consistency
- Debug relaxations and extensions
- Flag manipulation instructions
- Armv8.5-A features implemented include:
 - Branch Target Indicators (BTI)
 - Enhanced Virtualization Traps (EVT)
 - Random Number Generator (RNG)
 - Flag Manipulation instructions
 - Floating-point round to integer
 - DC CVADP
- Armv8.6-A features implemented include:
 - General Matrix Multiply (GEMM)
 - EnhancedPAC2
 - FPAC
 - Data Gathering Hint
 - Additional PMU events
 - Enhanced Counter Virtualization
- Armv8.7-A features implemented include:
 - WFE and WFI with timeouts
 - Larger physical address for 4KB and 16KB translation granules
 - MTE Asymmetric Fault Handling
 - Enhancements to Privilege Access Never (PAN)
 - Enhancements to PMU and SPE
- Other Armv9-A features implemented include:

- Scalable Vector Extension version 2 (SVE2)
- Transactional Memory Extension (TME)

AEMvA core personalities

The AEM core personalities feature allows you to configure AEM instances in a platform to use the **IMPLEMENTATION_DEFINED** registers and **UNPREDICTABLE** behavior for a specific implementation of your choice at model startup.

Configuring an AEM with a core personality requires a license for both the AEM and the selected implementation.

Set the personality using either:

- The environment variable `FASTSIM_AEM_A_PROFILE`.
- The parameter `impdef_regs_and_unpred_from_implementation`.

The parameter allows you to configure different instances in the same platform with different personalities, including subclusters in a heterogeneous AEM. The environment variable takes precedence over the parameter and affects all instances of the AEM in the platform. Otherwise the two options function identically.

To see the available values for the environment variable or parameter, set either of them to the special value `list`. The model prints the list of available values and exits. An example value is `ARM_Cortex-X2`. Then set the parameter or environment variable to the required value.

Configuring a core personality only affects **IMPLEMENTATION_DEFINED** registers and **UNPREDICTABLE** behavior. In other respects, the cluster or subcluster still behaves like the AEM. For example, all parameters default to the AEM default values. Therefore, you must manually set parameters to valid values for the configured personality, as many of the defaults are incompatible with any given implementation.

To assist with this configuration, the AEM prints warnings for any parameter with an invalid value for the configured personality. The warning lists the parameter name and the valid value or range of values it can be set to for the selected personality.

Running the model with invalid parameter configurations for the selected personality can lead to unexpected behavior.

Ports for AEMvACT

Table 3-181: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcasttinner</code>	Signal	Slave	ACE defined pins.

Name	Protocol	Type	Description
broadcastouter	Signal	Slave	ACE defined pins.
cfgend[8]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[8]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[8]	Signal	Master	Timer signals to SOC.
commirq[8]	Signal	Master	Interrupt signal from debug communications channel.
config64[8]	Signal	Slave	Register width after reset.
cp15sdisable[8]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
CRITICALIRQ[8]	Signal	Master	RAS Critical Error Interrupt.
cryptodisable[8]	Signal	Slave	Disable cryptography extensions after reset.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
cti0extin[4]	Signal	Slave	CTI trace inputs for core 0.
cti0extout[4]	Signal	Master	CTI trace outputs for core 0.
cti1extin[4]	Signal	Slave	CTI trace inputs for core 1.
cti1extout[4]	Signal	Master	CTI trace outputs for core 1.
cti2extin[4]	Signal	Slave	CTI trace inputs for core 2.
cti2extout[4]	Signal	Master	CTI trace outputs for core 2.
cti3extin[4]	Signal	Slave	CTI trace inputs for core 3.
cti3extout[4]	Signal	Master	CTI trace outputs for core 3.
cti4extin[4]	Signal	Slave	CTI trace inputs for core 4.
cti4extout[4]	Signal	Master	CTI trace outputs for core 4.
cti5extin[4]	Signal	Slave	CTI trace inputs for core 5.

Name	Protocol	Type	Description
cti5extout[4]	Signal	Master	CTI trace outputs for core 5.
cti6extin[4]	Signal	Slave	CTI trace inputs for core 6.
cti6extout[4]	Signal	Master	CTI trace outputs for core 6.
cti7extin[4]	Signal	Slave	CTI trace inputs for core 7.
cti7extout[4]	Signal	Master	CTI trace outputs for core 7.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[8]	Signal	Slave	External debug interface.
dbgnopwrdown[8]	Signal	Master	Debug no power down request.
dbgpwrdownack[8]	Signal	Master	Debug power down acknowledge.
dbgpwrdownreq[8]	Signal	Slave	Debug power down request.
dbgpwrupreq[8]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
ERRORIRQ[8]	Signal	Master	RAS Error Recovery Interrupt.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
external_trace_reset[8]	Signal	Slave	ETMv4 External Trace Reset signal.
FAULTIRQ[8]	Signal	Master	RAS Fault Handling Interrupt
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
fiq_nmi[8]	Signal	Slave	-
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 cpu interface ports.
hacdbsirq[8]	Signal	Master	Interrupt signal from the HACDBS unit.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.
irq_nmi[8]	Signal	Slave	-
irqs[224]	Signal	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	Signal	Slave	This signal resets timer and interrupt controller.
memorymapped_amu_s	PVBus	Slave	External interface for amu.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[8]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmbirq[8]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.

Name	Protocol	Type	Description
presetdbg[8]	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[8]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rlpiden[8]	Signal	Slave	External debug interface.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rtpiden[8]	Signal	Slave	External debug interface.
rvbar[8]	Value_64	Slave	Reset vector base address.
sei[8]	Signal	Slave	Per core System Error physical pins.
smpnamp[8]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[8]	Signal	Slave	External debug interface.
spniden[8]	Signal	Slave	External debug interface.
standbywfe[8]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[8]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	This signal indicated all cores and L2 are in a power down state
teinit[8]	Signal	Slave	This signal provides default exception handling state.
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[8]	Signal	Slave	ETMv4 Trace Unit Reset signal.
trbirq[8]	Signal	Master	Interrupt signal from the trace buffer unit.
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	Signal	Slave	Virtual FIQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[8]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	Signal	Slave	Virtual IRQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Name	Protocol	Type	Description
vsei[8]	Signal	Slave	Processor Virtual System Error Interrupt request.

Parameters for AEMvACT

ADFSR-AIFSR-implemented

ADFSR and AIFSR are implemented

Type

bool

Default value

0x0

AIDR

Value of AIDR_EL1 register.

Type

int

Default value

0x0

AMIIDR

Value of AMU Implementation Identification Register

Type

int

Default value

0x43b

AMPIDR

Value of AMU Peripheral Identification Register

Type

int

Default value

0x4000bb000

BPIMVA_causes_translation_lookup

Do a translation when BPIMVA instruction is executed (which may cause a translation fault).

Type

bool

Default value

0x0

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CCSIDR-L1D_override

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L1I_override

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L2_override

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L3_override

If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

CTIPIDR

If non-zero, override the CTI Peripheral Identification Register

Type

int

Default value

0x0

CTR-L1Ip-override

If non-zero, override the L1Ip bits in CTR/CTR_ELO system register. This does not change the behaviour of the cache, only what is present in the CTR register.

Type

int

Default value

0x0

DBGBCR_BT_applies_RES0_before_valid_check

If true, RES0 behaviour is applied to DBGBCR(EL1).BT before checking for reserved values for this field.

Type

bool

Default value

0x1

DBGPIDR

If non-zero, override the Debug Peripheral Identification Register

Type

int

Default value

0x0

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x0

ERRIIDR

Value of RAS Implementation Identification Register

Type

int

Default value

0xd800143b

ERRPIDR

Value of RAS Peripheral Identification Register

Type

int

Default value

0x4100bbd80

ERXMISC0_mask

Write Mask for ERXMISC0 RAS Register

Type

int

Default value

0x0

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

GMID-log2-block-size

Log2 of the block size accessed by STGM/LDGM/STZGM instructions

Type

int

Default value

0x4

ISV_set_to_0_for_stage2_synch_external_abort

Whether ESR_EL2.ISV is set to 0 on stage 2 synchronous external aborts

Type

bool

Default value

0x0

MIDR

Value of MIDR_EL1 register.

Type

int

Default value

0x410fd0f0

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

PA_SIZE

Physical address range supported For ARMv8.0 and ARMv8.1 this is limited to 48 bits (FEAT_LPA/FEAT_LPA3).

Type

int

Default value

0x28

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

PMCEID0

Performance Monitor Common Event ID Reg 0 value - 64 bit

Type

int

Default value

0xffffffff

PMCEID1

Performance Monitor Common Event ID Reg 1 value - 64 bit

Type

int

Default value

0xffffffff

PMSIDR.ArchInst

Defines whether architecture instruction sampling is implemented or not, if not only micro op sampling is implemented. Model only supports architecture instruction sampling, but allows ID register field to be configured.

Type

bool

Default value

0x1

PMSIDR.CRR

Defines whether call return branch records (FEAT_SPE_CRR) is implemented or not

Type

bool

Default value

0x0

PMSIDR.LDS

Defines whether data source for sampled load instruction is implemented or not. Model does not implement loaded data source, but allows ID register field to be configured.

Type

bool

Default value

0x0

PMUPIDR

If non-zero, override the PMU Peripheral Identification Register

Type

int

Default value

0x0

abort_execution_from_device_memory

Execution from device memory generates a prefetch abort.

Type

bool

Default value

0x0

advsimd_bf16_support_level

Implement BFloat16 operations from ARMv8.6. AArch64 Advanced SIMD and FP BFloat16 instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP BFloat16 instructions only (FEAT_BF16). - 2, AArch32 Advanced SIMD and VFP BFloat16 instructions only (FEAT_AA32BF16). - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP BFloat16 instructions.

Type

int

Default value

0x0

advsimd_i8mm_support_level

Implement Int8 matrix multiply operations from ARMv8.6. AArch64 Advanced SIMD and FP Int8 matrix multiply instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP Int8 matrix multiply instructions only (FEAT_I8MM). - 2, AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions only (FEAT_AA32I8MM). - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions (FEAT_I8MM, FEAT_AA32I8MM).

Type

int

Default value

0x0

advsimd_overread

AdvSIMD element load operations access all bytes of a 16-byte aligned window, even in Device memory

Type

bool

Default value

0x0

align_pc_on_branch_to_unaligned_pc_aarch32

Force PC align for branches to an unaligned PC counter in A32 state

Type

bool

Default value

0x0

align_pc_on_debug_exit_to_aarch32

Exit to AARCH32 state from debug state forces pc bit0 to 0

Type

bool

Default value

0x0

align_pc_on_illegal_exception_return_to_aarch32

Align PC when performing an illegal exception return from AArch64 to AArch32.

Type

bool

Default value

0x1

allow_s1_dbm_update_on_s2_mmu_fault

Whether s1 dirty bit update is done when s2 of ipa (not s1 ttw) generates mmu fault

Type

bool

Default value

0x1

amair_reg_rw_mask

RW mask for implementation-defined registers.

Type

int

Default value

0x0

amu_aux_type_fixed

Lists which AMU auxiliary registers that are fixed and to which event type. The JSON schema is: {fixed_aux_reg:evt_type, ...}. For example {"0":0x300} would make auxiliary register 0 fixed to event type 0x300

Type

string

Default value**amu_aux_voffset_mask**

If ARMv8.6 is implemented, each bit of the field, 0 to 15, when 1 indicates that the corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2, is implemented

Type

int

Default value

0x0

amu_has_external_interface

Implement external memory-mapped access to system register of activity monitor unit from ARMv8.4.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

amu_has_sysreg_interface

Implement system register access to activity monitor unit from ARMv8.4.

Type

bool

Default value

0x1

amu_mmap_address

AMU base address for each core on system bus. 0 means the AMU is not mapped, otherwise the address must be 4KB aligned. JSON schema for the parameter value is: {"format": "all_addrs_are_absolute_wrt_systembus", "cores": [{"amu": 0x0}, {"amu": 0x0}, {"amu": 0x0}, {"amu": 0x0}]}

Type

string

Default value**amu_num_auxiliary_counters**

Number of AMU auxiliary counters implemented

Type

int

Default value

0x0

amu_reset_domain

Reset domain for activity monitor unit. 0, COLD_RESET. 1, WARM_RESET. 2, NONE.

Type

int

Default value

0x0

amu_version

Selects the activity monitor version implemented - 1, AMUv1 for Armv8.4 is implemented. - 2, AMUv1 for Armv8.6 is implemented (FEAT_AMUv1p1).

Type

int

Default value

0x1

apsr_read_restrict

At EL0, unknown bits of APSR are RAZ.

Type

bool

Default value

0x0

arm_v8_7_accelerator_support_level

Implements Armv8.7 accelerator support instructions LD/ST64B, ST64BV, ST64BV0, etc. (FEAT_LS64, FEAT_LS64_V, FEAT_LS64_ACCDATA)

Type

int

Default value

0x0

atomic_memtype_fault_priority

This parameter describes the priority of unsupported atomic/exclusive memtype fault w.r.t alignment and permission fault. 0, BEFORE_ALIGN_MEM_FAULT. 1, AFTER_ALIGN_BEFORE_PERM_FAULT. 2, AFTER_PERM_FAULT.

Type

int

Default value

0x0

auxilliary_feature_register0

Value of AFR0 ID register.

Type

int

Default value

0x0

branch-predictor-clear-policy

Set branch prediction policy as defined for MMFR1[31:28]. This does not change the behaviour of the branch predictor, only what is reported in MMFR1.BPred.

Type

int

Default value

0x2

branch-predictor-supported-ops

Set branch prediction policy as defined for MMFR3[11:8]. This does not change the behaviour of the branch predictor, only what is reported in MMFR3.BPMaint.

Type

int

Default value

0x1

brbe_log2_num_records

Log2 of number of BRB records supported. 3 -> 8 records, ... 6 -> 64 records.

Type

int

Default value

0x6

cache-log2linelen

Log2 of the cache line length in bytes.

Type

int

Default value

0x6

cache_maintenance_hits_watchpoints

DCIMVA operations executed in AArch32 modes hit watchpoints.

Type

bool

Default value

0x0

changing_block_size_without_bbm_support

Level of support for changing block size without break-before-make (FEAT_BBM).

Type

int

Default value

0x0

check_memory_attributes

Detect and report TLB use of conflicting memory attributes for views of the same physical address

Type

bool

Default value

0x1

checked_pointer_arithmetic_support_level

Specify the Checked Pointer Arithmetic support level: 0, not implemented. 1, FEAT_CPA is implemented. 2, FEAT_CPA2 is implemented.

Type

int

Default value

0x0

clean_invalidate_cache_on_warm_reset

Clean and invalidate caches on warm reset

Type

bool

Default value

0x0

clear_IT_when_IL_set

Clear IT bits when performing a *legal* exception return to AArch32 when IL is set

Type

bool

Default value

0x0

clear_IT_when_IL_set_explicitly

Apart from clear_IT_when_IL_set, also clear IT bits when loading CPSR from SPSR/memory and IL == 1 in the value being loaded.

Type

bool

Default value

0x0

clear_ec_in_debug_state

When ARMv8.8 debug extension is implemented, whether EDES.RC bit is set/cleared on entering debug state due to pending exception catch caused by EDES.RC=1.

Type

bool

Default value

0x0

clear_reg_top_eret

Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32

Type

int

Default value

0x1

clear_reg_top_set

Whether to clear upper 32-bits of the Xn register when corresponding AArch32 register is set via CADI/Iris.

Type

bool

Default value

0x1

configure_pmu_events_with_json

"Configure v8.6 and newer PMU events. Note : This param has high priority and overrides the setting of "has_*_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["EVENT_NAME_1","EVENT_NAME_2"]}"

Type

string

Default value**configure_v8_6_pmu_events_with_json**

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.6 PMU events. Note : This param has high priority and overrides the setting of "has_v8_6_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_INDNR_RETIRE", "BR_IND_RETIRE",

"BR_RETURN_SKIP_RETIRED", "BR_RETURN_ANY_RETIRED", "BR_INDNR_SKIP_RETIRED",
 "BR_INDNR_TAKEN_RETIRED", "BR_IND_SKIP_RETIRED", "BR_IND_TAKEN_RETIRED",
 "BR_IMMED_SKIP_RETIRED", "BR_IMMED_TAKEN_RETIRED", "BR_SKIP_RETIRED"]}]"

Type

string

Default value**configure_v8_8_pmu_events_with_json**

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.8 PMU events. Note : This param has high priority and overrides the setting of "has_v8_8_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_HINT_COND_RETIRED", "BR_COND_TAKEN_RETIRED", "BR_UNCOND_RETIRED", "BR_COND_RETIRED", "BRNL_TAKEN_RETIRED", "BRNL_IND_TAKEN_RETIRED", "BRNL_INDNR_TAKEN_RETIRED", "BRNL_IMMED_TAKEN_RETIRED", "BL_TAKEN_RETIRED", "BL_IND_TAKEN_RETIRED", "BL_IMMED_TAKEN_RETIRED"]}]"

Type

string

Default value**configure_v8_9_pmu_events_with_json**

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.9 PMU events. Note : This param has high priority and overrides the setting of "has_v8_9_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["ASE_SVE_RETIRED", "ASE_RETIRED", "VFP_RETIRED", "SVE_RETIRED", "CRYPTO_RETIRED", "SIMD_INST_RETIRED", "ASE_INST_RETIRED", "SVE_INST_RETIRED", "ASE_SVE_INST_RETIRED", "LD_ANY_RETIRED", "ST_ANY_RETIRED", "LDST_ANY_RETIRED", "DP_RETIRED"]}]"

Type

string

Default value**core_cache_protection**

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled

Type

int

Default value

0xffffffffffffffff

cpacr_trcds_behaviour

Behaviour of CPACR.TRCDIS/NSACR.NSTRCDIS when there is no CP14 ETM interface. 0, RAZ/WI. 2, implemented.

Type

int

Default value

0x2

cpu_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpu_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CONFIG64

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CP15SDISABLE2

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.DCZID-log2-block-size

Log2 of the block size cleared by DC ZVA instruction (as read from DCZID_EL0).

Type

int

Default value

0x8

cpuX.DCZVA_single_write

Execute the DCZVA as a single write

Type

bool

Default value

0x0

cpuX.MPIDR-override

Override of MPIDR value. If nonzero will override the MT, cluster and CPU ID bits in MPIDR.

Type

int

Default value

0x0

cpuX.RVBAR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.RVBAR32

Reset vector address in AARCH32 when VINITHI is not set and ignore_rvbar_in_aarch32 is set

Type

int

Default value

0x0

cpuX.SMPnAMP

Enable broadcast messages necessary for correct SMP operation at reset.

Type

bool

Default value

0x1

cpuX.TEINIT

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.aarch32_reset_from_impdef_addr

If PE resets into AArch32, Whether execution starts from IMPDEF address or hi/low vector

Type

bool

Default value

0x1

cpuX.ase-present

Set whether the model has been built with NEON support

Type

bool

Default value

0x1

cpuX.clock_divider

Clock divider ratio for asymmetric MP clocking.

Type

int

Default value

0x1

cpuX.clock_multiplier

Clock divider ratio for asymmetric MP clocking.

Type

int

Default value

0x1

cpuX.crypto_aes

AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 2, AES and PMULL instructions implemented (FEAT_AES, FEAT_PMULL).

Type

int

Default value

0x2

cpuX.crypto_sha1

SHA-1 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA1 instructions implemented (FEAT_SHA1).

Type

int

Default value

0x1

cpuX.crypto_sha256

SHA-256 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA256 instructions implemented (FEAT_SHA256).

Type

int

Default value

0x1

cpuX.crypto_sha3

Implement ARMv8.4 SHA-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA3).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

cpuX.crypto_sha512

Implement ARMv8.4 SHA-512 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA512).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

cpuX.crypto_sm3

Implement ARMv8.4 SM-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SM3).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

cpuX.crypto_sm4

Implement ARMv8.4 SM-4 instructions (requires CryptoPlugin to be loaded) (FEAT_SM4).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

cpuX.cti-intack_mask

Set bits represent that the corresponding trigger requires software acknowledge via CTIINTACK

Type

int

Default value

0x1

cpuX.cti-number_of_claim_bits

Number of implemented bits in CTICLAIMSET

Type

int

Default value

0x0

cpuX.cti-number_of_triggers

Number of cti event triggers (default: 8, valid values: {3, 8-32})

Type

int

Default value

0x8

cpuX.enable_crc32

CRC32 instructions supported. 0, not implemented. 1, CRC32 instructions implemented (FEAT_CRC32).

Type

int

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.etm-present

Set whether the model has ETM support

Type

bool

Default value

0x1

cpuX.force-fpsid

Override the FPSID value

Type

bool

Default value

0x0

cpuX.force-fpsid-value

Value to override the FPSID value to

Type

int

Default value

0x0

cpuX.has_hcptr_tase

If false, HCPtr.TASE is RES0

Type

bool

Default value

0x1

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.number-of-breakpoints

Number of breakpoints.

Type

int

Default value

0x10

cpuX.number-of-context-breakpoints

Number of breakpoints that are context aware.

Type

int

Default value

0x10

cpuX.number-of-watchpoints

Number of watchpoints.

Type

int

Default value

0x10

cpuX.operation_bandwidth

Operation width for ARMv8.4 PMU extension

Type

int

Default value

0x1

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.semihosting-stderr_istty

Result for semihost istty call when argument is stderr

Type

bool

Default value

0x1

cpuX.semihosting-stdin_istty

Result for semihost istry call when argument is stdin

Type

bool

Default value

0x1

cpuX.semihosting-stdout_istty

Result for semihost istry call when argument is stdout

Type

bool

Default value

0x1

cpuX.semihosting-use_stderr

Send stderr from the simulated process to host stderr

Type

bool

Default value

0x0

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.unpredictable_WPMASKANDBAS

Constrained unpredictable handling of watchpoints when mask and BAS fields specified. 0, IGNOREMASK. 1, IGNOREBAS (default). 2, REPEATBAS8. 3, REPEATBAS.

Type

int

Default value

0x1

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

cpuX.vfp-traps

Implement support for trapping floating-point exceptions

Type

bool

Default value

0x1

cpuX.vfp-traps-show-all

Report all trapped floating-point exceptions in the syndrome when a combination occurs.

Type

bool

Default value

0x0

cpuX.wfet_early_or_delayed_timeout

WFET early or delayed timeout beyond the threshold value of CNTVCT_ELO in percentage.

Type

int

Default value

0x0

cpuX.wfit_early_or_delayed_timeout

WFIT early or delayed timeout beyond the threshold value of CNTVCT_ELO in percentage.

Type

int

Default value

0x0

cpuselr_el3_sync_immediate

Adjust when the patching selection register synchronises - either immediately (true - default), or awaiting for barrier event

Type

bool

Default value

0x1

cpy_mops_option

Set option for Armv8.8 CPY(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B

Type

int

Default value

0x0

cpyf_mops_option

Set option for Armv8.8 CPYF(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B

Type

int

Default value

0x0

cycle_counter_freeze_on_spe_event

Whether pmu cycle counter does not count when pmcr_el0.dp=1 and pmu event counters are frozen by pmcr_el0.fzs.

Type

bool

Default value

0x0

d128_disabled_ps_resvd_size

Physical size treated when TCR.(I)PS is programmed with value seven and D128 is disabled via TCR. 0, 48 bits. 1, 52 bits. 2, 56.

Type

int

Default value

0x2

dbg-bcr-reserved-behavior

This is the behavior of the reserved values of the BT field in DBGBCR. Possible values are: - 0 = Disabled. - 1 = BT[2] is ignored.

Type

int

Default value

0x1

dbg_rom_dap_addr

Debug ROM dap base address.

Type

int

Default value

0x0

dbgitr_buffer_size

Number of instructions which can be buffered before EDSCR.ITE is cleared

Type

int

Default value

0x0

dbgxvr_ress_is_stateful

Whether DBGWVR/DBGBVR.RESS returns last written value. if set to false, RESS returns sign extended value

Type

bool

Default value

0x0

dc_fault_unaligned_s1_device_s2_fwb

Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_bus_width_in_bytes

L1 D-Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-ways

L1 D-Cache number of ways (sets are implicit from size).

Type

int

Default value

0x2

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_bus_width_in_bytes

L1 D-Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcimva_requires_s2_write_permissions

Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).

Type

bool

Default value

0x0

dczva_reports_lowest_addr_on_tag_check_fail

Whether DC ZVA reports lowest address in FAR on tag check fail

Type

bool

Default value

0x0

dczva_wp_far_behaviour

Set option for address stored in FAR/EDWARD after watchpoints hit by DC ZVA. 0 - FAR recorded matches lowest watchpointed address accessed by the instruction 1 - FAR recorded matches lowest address accessed by the instruction within same translation granule as watchpointed address 2 - FAR recorded matches highest address accessed by the instruction within same translation granule as watchpointed address

Type

int

Default value

0x0

debug_auth_signals_sampled_at_reset

Debug authentication signals can be configured as either sampled at reset only or at any time for External Root Debug.

Type

bool

Default value

0x0

debug_components_dap_address

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on debug bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is: {"format": "all_addrs_are_absolute_wrt_debugbus", "cores": [{"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}]}

Type

string

Default value**debug_components_mmap_address**

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on system bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is: {"format": "all_addrs_are_absolute_wrt_systembus", "cores": [{"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}]}

```
"trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}}}
```

Type

string

Default value**debug_entry_is_context_sync**

If true, Entry in debug state is Context sync. Exiting debug state is a context synchronising operation, but entering is not. However some cpu implementation can consider also the Entry in Debug state as a CSE

Type

bool

Default value

0x0

debug_rom_is_class_9

If true, present a debug ROM table as a class 9 device. Otherwise, use a class 1 ROM table.

Type

bool

Default value

0x0

debug_rom_is_flat

If true, present a debug ROM table recommended by ARMv8 Debug Architecture. Otherwise, use nested ROM tables.

Type

bool

Default value

0x0

delay_serror

Add a propagation delay of serror signal into the core

Type

int

Default value

0x0

delayed_dbgreg_between_secure_views

If delayed_dbgreg is enabled, whether the secure and nonsecure external views require explicit synchronization.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

delayed_pmureg_between_secure_views

If delayed_pmureg is enabled, whether the secure and nonsecure external views require explicit synchronization.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

dfr1_reads_actual_bp_wp_ctx_cmp

If true, the register ID_AA64DFR1_EL1/EDDFR1 reports the actual number of BRPs, WRPs and CTX_CMPs even when the number of bp/wp/ctx_cmp is less than 16.

Type

bool

Default value

0x0

dic-spi_count

Number of shared peripheral interrupts implemented

Type

int

Default value

0x40

disable_sve_plugin

If true, SVE will not be implemented in this processor even if the plugin is loaded (FEAT_SVE).

Type

bool

Default value

0x0

disable_unknown_update_event_on_reset

Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserved or resets to architecturally unknown value

Type

bool

Default value

0x0

dsb_accumulate_threshold

Limit the maximum number of observable DSB side effects which can be queued (e.g. TLBI), after which DSB sync will be done automatically.

Type

int

Default value

0x100

early_implicit_error_sync_event_behaviour

Set option for Early Implicit Error Synchronization event (FEAT_IESB) 0x0 - Behavior is not described ID_AA64MMFR4_EL1.EIESB = 0x0 0x1 - Implicit Error synchronization event is inserted before an exception is taken to EL3 (depending on SCR_EL3.NMEA) ID_AA64MMFR4_EL1.EIESB = 0x1 0x2 - Implicit Error synchronization event is inserted before an exception is taken to ELx (depending on SCR_EL3.NMEA and SCTLR2_ELx.NMEA) ID_AA64MMFR4_EL1.EIESB = 0x2 0xF - Implicit Error synchronization event is inserted after an exception is taken ID_AA64MMFR4_EL1.EIESB = 0xF

Type

int

Default value

0x0

ecv_support_level

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

Type

int

Default value

0x0

eddfr1_reads_idreg_mask

Mask to configure each bitfield for EDDFR1 register, whether to be read from corresponding bitfield in AA64DFR1 register. Note: Only those bitfield which supports 'same as ID register or res0' functionality can be configured

Type

int

Default value

0xffffffffffffffff

eddfr2_reads_idreg_mask

Mask to configure each bitfield for EDDFR2 register, whether to be read from corresponding bitfield in ID_AA64DFR2 register. Note: Only those bitfield which supports 'same as ID register or res0' functionality can be configured

Type

int

Default value

0xffffffffffffffff

eddfr_reads_idreg_mask

Mask to configure each bitfield for EDDFR register, whether to be read from corresponding bitfield in AA64DFR register. Note: Only those bitfield which supports 'same as ID register or res0' functionality can be configured

Type

int

Default value

0xffffffffffffffff

edpfr_ras_unknown_bits_read_as_0

If true then UNKNOWN bits in RAS field in EDPFR are read as 0

Type

bool

Default value

0x0

edxfr_reads_idreg

Whether EDDFR,EDDFR1 and EDDFR2 reads corresponding bitfield value from ID_AA64DFR reg. Also, when this parameter is enabled, bitfields of these registers are configurable through 'eddfr*_reads_idreg_mask' parameter

Type

bool

Default value

0x0

e10_can_access_imp_def_functionality

If not made UNDEF by imp_def_functionality_behaviour, ELO can access IMPLEMENTATION DEFINED registers and system instructions.

Type

bool

Default value

0x0

e10_e11_only_non_secure

Secure/non-secure state if EL2 and EL3 are not implemented. 0, secure. 1, non-secure.

Type

bool

Default value

0x0

e13_trap_priority_when_secure_debug_disabled

Undef when secure debug is disabled (EDSCR.SDD == 1) && boolean IMPLEMENTATION_DEFINED 'EL3 trap priority when SDD == 1'

Type

bool

Default value

0x0

enable_address_contig_check

Check the input address range for the table entries that have the contiguous hint bit set.

Type

bool

Default value

0x0

enable_debug_auth_signals_config

Debug Authentication Signals DBGEN, SPIDEN (and if RME is enabled RLPIDEN and RTPIDEN) are configurable (default) or not configurable, (hardwired to 1). This parameter is the integer representation of a bitmap to enable configuration of these signals, with: - BIT[0] = DBGEN - BIT[1] = SPIDEN - BIT[2] = RLPIDEN - BIT[3] = RTPIDEN

Type

int

Default value

0xf

enable_tlb_contig_check

Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set.

Type

bool

Default value

0x0

enhanced_pac2_level

Implements Enhanced PAC2 from ARMv8.6 (FEAT_PAuth2), and PAC enhancements from ARMv9.5 (FEAT_PAuth_LR). options 0-3 of this feature are mandatory for ARMv8.6 but can be cherry-picked to a ARMv8.3(or greater) implementation. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only (FEAT_PAuth2), 2: EnhancedPAC2 with FPAC (FEAT_FPAC), 3: EnhancedPAC2 with FPACCombined (FEAT_FPACCOMBINE), 4: EnhancedPAC2 with LR signing (FEAT_PAuth_LR).

Type

int

Default value

0x0

error_record_feature_register

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"

Type

string

Default value**error_record_feature_register_json_file**

File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value

Type

string

Default value**erxpfctl_res0_stateful_mask**

Mask for stateful bits for ERXPFGCTL which are RES0

Type

int

Default value

0x0

esr_write_update_res0

If true, and RASv2 is enabled, then ESR_ELx.WU field is RES0 for errors on both loads and stores (FEAT_RASv2).

Type

bool

Default value

0x0

ete.ASYNC_PACKETS_WHEN_VIEWINST_OFF

Generate the non-periodic alignment synchronisation packet generation when trace unit is operative

Type

bool

Default value

0x0

ete.ATBTRIG

ATB trigger support

Type

bool

Default value

0x1

ete.CCITMIN

Minimum cycle count value

Type

int

Default value

0x4

ete.CCSIZE

Cycle counter size

Type

int

Default value

0xc

ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x8

ete.COMMOPT

Commit mode

Type

bool

Default value

0x1

ete.COMMTRANS

Commit transaction mode

Type

bool

Default value

0x0

ete.DEBUG

DEBUG

Type

int

Default value

0x2

ete.DESIGNER

DESIGNER value

Type

int

Default value

0x41

ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3

Type

int

Default value

0x0

ete.EXCEPTION_WITH_CONTEXT

Whether EXCEPTION_WITH_CONTEXT packet is supported

Type

bool

Default value

0x1

ete.EXPLICITLY_COMMIT_PO_ELEMS

Whether to unilaterally explicitly emit a commit after a PO packet

Type

bool

Default value

0x0

ete.IMPDEFEXCEPPERCENTAGE

Percentage of IMPDEF exceptions inserted in instruction blocks

Type

int

Default value

0x0

ete.IMPDEF_TRACE_ONWhether trace is flushed and trace on packet generated by events described by bitmap value.
bit 0 - PE entering low power state, bit 1 - PE entering debug state**Type**

int

Default value

0x0

ete.IMPRECISE_FILTERING

Number of instruction blocks traced on a transition in the filtering

Type

int

Default value

0x0

ete.LPOVERRIDE

Low power override

Type

bool

Default value

0x1

ete.MAXSPEC

Maximum speculation depth

Type

int

Default value

0x0

ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

ete.NOOVERFLOW

No overflow

Type

bool

Default value

0x0

ete.NUMACPAIRS

Number of instruction address comparators pairs

Type

int

Default value

0x4

ete.NUMCIDC

Number of context ID comparators

Type

int

Default value

0x1

ete.NUMCNTR

Number of counters

Type

int

Default value

0x2

ete.NUMEXTINSEL

Number of external input selectors

Type

int

Default value

0x4

ete.NUMPC

Number of PE comparators

Type

int

Default value

0x0

ete.NUMSEQSTATE

Number of sequencer states

Type

int

Default value

0x4

ete.NUMSSCC

Number of single shot comparators

Type

int

Default value

0x1

ete.NUMVMIDC

Number of virtual ID comparators

Type

int

Default value

0x1

ete.NumberOfETEEEvents

Number of trace events

Type

int

Default value

0x2

ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

ete.PIDR_DESIGNER

TRCPIDR DESIGNER value

Type

int

Default value

0x0

ete.PIDR_PART

TRCPIDR PART number value

Type

int

Default value

0x0

ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

ete.QFILT

Q filtering

Type

bool

Default value

0x0

ete.QSUP

Q support

Type

int

Default value

0x0

ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

ete.RAZWI_REG_SEL_TOP_BIT

Implement Resource Selectors or Resource Selector Pairs bits as RAZ/WI

Type

bool

Default value

0x0

ete.REG_ACCESS_ONLY_MODE

If enabled, all traces are disabled. Plugin only allows register acceses

Type

bool

Default value

0x0

ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

ete.STALLCTRL

Stall control

Type

bool

Default value

0x1

ete.SYSSTALL

System stall

Type

bool

Default value

0x1

ete.TRACEIDSIZE

Trace ID size

Type

int

Default value

0x7

ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**ete.TRACE_OUTPUT_ENABLE**

ETE Trace output enable: 1=enable, 0=disable

Type

bool

Default value

0x0

ete.TRCSRSTA_FORCED_EXCEP

TRCSRSTA value for a forcibly traced exception

Type

bool

Default value

0x0

ete.TSMARK

Whether timestamp markers are supported

Type

bool

Default value

0x0

ete.TSSIZE

Timestamp size

Type

int

Default value

0x8

ete.WFXMODE

WFX mode

Type

bool

Default value

0x1

ets_level

Level of Enhanced Translation Synchronization supported. 0: not supported (may be override to 1 if has_ets=true), 1: supported FEAT_ETTS, 2: supported FEAT_ETTS2

Type

int

Default value

0x0

exception_catch_before_software_step

Exception catch priority for the exception trapping form of exception catch (Armv8.2 or later, or exception_catch_type=0). If true, the exception catch debug event has higher priority than software step and halting step.

Type

bool

Default value

0x1

exception_catch_type

Type of exception catch (Armv8.0 - Armv8.1 only). 0, exception trapping. 1, non-exception trapping, higher priority than step. 2, non-exception trapping, lower priority than step.

Type

int

Default value

0x0

exclusive_monitor_clear_on_atomic_from_same_master

Exclusive monitors in the cluster will be cleared by a atomic by the same master to the monitored address.

Type

bool

Default value

0x1

exclusive_monitor_clear_on_store_from_same_master

Exclusive monitors in the cluster will be cleared by a store by the same master to the monitored address.

Type

bool

Default value

0x1

exclusive_monitor_clear_on_strex_address_mismatch

Exclusive monitors in the cluster will be cleared when a strex fails because the address does not match.

Type

bool

Default value

0x1

exclusive_monitor_clear_on_strex_success

Exclusive monitors in the cluster will be cleared when a strex succeeds.

Type

bool

Default value

0x1

exercise_stxr_fail

Reject a pseudo-random majority of exclusive store instructions

Type

bool

Default value

0x0

ext_abort_device_GRE_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffffffff

ext_abort_device_GRE_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffffffff

ext_abort_device_GRE_read_is_critical

Critical reporting of device-GRE read external aborts.

Type

bool

Default value

0x0

ext_abort_device_GRE_read_is_sync

Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

Type

int

Default value

0x2

ext_abort_device_GRE_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffffffff

ext_abort_device_GRE_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffffffff

ext_abort_device_GRE_write_is_critical

Critical reporting of device-GRE write external aborts

Type

bool

Default value

0x0

ext_abort_device_GRE_write_is_sync

Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

Type

int

Default value

0x2

ext_abort_device_GRE_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_GRE_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_read_is_critical

Critical reporting of device-nGRE read external aborts.

Type

bool

Default value

0x0

ext_abort_device_nGRE_read_is_sync

Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

Type

int

Default value

0x2

ext_abort_device_nGRE_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_write_is_critical

Critical reporting of device-nGRE write external aborts

Type

bool

Default value

0x0

ext_abort_device_nGRE_write_is_sync

Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

Type

int

Default value

0x2

ext_abort_device_nGRE_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_nGRE_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_device_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_device_read_acquire_is_sync

Synchronous reporting of device read with acquire external aborts

Type

bool

Default value

0x0

ext_abort_device_read_is_critical

Critical reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x1

ext_abort_device_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_device_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_device_write_is_critical

Critical reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_device_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_device_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_fill_data

Returned data, if external aborts are asynchronous

Type

int

Default value

0xfdfdfdfcfcfdfdfd

ext_abort_normal_cacheable_read_is_critical

Critical reporting of normal write-back cacheable-read external aborts

Type

bool

Default value

0x0

ext_abort_normal_cacheable_read_is_sync

Synchronous reporting of normal write-back cacheable-read external aborts

Type

bool

Default value

0x1

ext_abort_normal_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_normal_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_normal_cacheable_write_is_critical

Critical reporting of normal write-back cacheable write external aborts

Type

bool

Default value

0x0

ext_abort_normal_cacheable_write_is_sync

Synchronous reporting of normal write-back cacheable write external aborts

Type

bool

Default value

0x0

ext_abort_normal_cacheable_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_normal_cacheable_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_normal_noncacheable_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_noncacheable_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_noncacheable_read_is_critical

Critical reporting of normal noncacheable-read external aborts

Type

bool

Default value

0x0

ext_abort_normal_noncacheable_read_is_sync

Synchronous reporting of normal noncacheable-read external aborts

Type

bool

Default value

0x1

ext_abort_normal_noncacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_normal_noncacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_normal_noncacheable_write_is_critical

Critical reporting of normal noncacheable write external aborts

Type

bool

Default value

0x0

ext_abort_normal_noncacheable_write_is_sync

Synchronous reporting of normal noncacheable write external aborts

Type

bool

Default value

0x0

ext_abort_normal_noncacheable_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_normal_noncacheable_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_normal_wt_cacheable_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_wt_cacheable_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

ext_abort_normal_wt_cacheable_read_is_critical

Critical reporting of normal write-through cacheable-read external aborts

Type

bool

Default value

0x0

ext_abort_normal_wt_cacheable_read_is_sync

Synchronous reporting of normal write-through read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_read_is_sync.

Type

int

Default value

0x2

ext_abort_normal_wt_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffffffff

ext_abort_normal_wt_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffffffff

ext_abort_normal_wt_cacheable_write_is_critical

Critical reporting of normal write-through write external aborts

Type

bool

Default value

0x0

ext_abort_normal_wt_cacheable_write_is_sync

Synchronous reporting of normal write-through write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_write_is_sync.

Type

int

Default value

0x2

ext_abort_normal_wt_cacheable_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffffffff

ext_abort_normal_wt_cacheable_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffffffff

ext_abort_prefetch_device_GRE_read_is_critical

Critical reporting of external aborts generated by device-GRE instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_device_GRE_read_is_sync

Behaviour of external aborts generated by device-GRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_device_nGRE_read_is_critical

Critical reporting of external aborts generated by device-nGRE instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_device_nGRE_read_is_sync

Behaviour of external aborts generated by device-nGRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_device_read_is_critical

Critical reporting of external aborts generated by device-nGnRE instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_device_read_is_sync

Behaviour of external aborts generated by device-nGnRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_is_critical

Critical reporting of external aborts generated by normal writeback cacheable instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_is_sync

Behaviour of external aborts generated by normal writeback cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort.

Type

bool

Default value

0x1

ext_abort_prefetch_noncacheable_read_is_critical

Critical reporting of external aborts generated by normal noncacheable instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_noncacheable_read_is_sync

Behaviour of external aborts generated by normal noncacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_prefetch_so_read_is_critical

Critical reporting of external aborts generated by device-nGnRnE instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_so_read_is_sync

Behaviour of external aborts generated by device=nGnRnE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_prefetch_wt_cacheable_read_is_critical

Critical reporting of external aborts generated by normal writethrough cacheable instruction fetches

Type

bool

Default value

0x0

ext_abort_prefetch_wt_cacheable_read_is_sync

Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

Type

int

Default value

0x2

ext_abort_so_prefetch_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffffffff

ext_abort_so_prefetch_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffffffff

ext_abort_so_read_is_critical

Critical reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x1

ext_abort_so_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_so_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_so_write_is_critical

Critical reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x1

ext_abort_so_write_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_so_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_ttw_cacheable_read_is_critical

Critical reporting of TTW cacheable read external aborts

Type

bool

Default value

0x0

ext_abort_ttw_cacheable_read_is_sync

Synchronous reporting of TTW cacheable read external aborts

Type

bool

Default value

0x1

ext_abort_ttw_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_ttw_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_ttw_noncacheable_read_is_critical

Critical reporting of TTW noncacheable read external aborts

Type

bool

Default value

0x0

ext_abort_ttw_noncacheable_read_is_sync

Synchronous reporting of TTW noncacheable read external aborts

Type

bool

Default value

0x1

ext_abort_ttw_noncacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records).

Type

int

Default value

0x0

ext_abort_ttw_noncacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x0

ext_abort_ttw_wt_cacheable_read_is_critical

Critical reporting of TTW write-through cacheable read external aborts

Type

bool

Default value

0x0

ext_abort_ttw_wt_cacheable_read_is_sync

Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.

Type

int

Default value

0x2

ext_abort_ttw_wt_cacheable_read_ras_index

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records).

Type

int

Default value

0xffffffffffffffff

ext_abort_ttw_wt_cacheable_read_ras_type

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0xffffffffffffffff

external_debug_request_delay

Configure External Debug Request delay in CPU cycles

Type

int

Default value

0x0

external_oslar_access_disabled_by_authentication

If true, external accesses to OSLAR, when external debugging is not enabled, will generate an error (FEAT_Debugv8p2).

Type

bool

Default value

0x0

fault_on_misprogrammed_gpt_contig_region

Whether GPF faults occur when GPT contiguous entries are misprogrammed.

Type

bool

Default value

0x0

fault_on_nT_bit_set

Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.

Type

bool

Default value

0x1

fault_unalign_to_unsupported_access

If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB or the access crossing a 16-byte boundary

generate fault. Bits 0,1,2,3 should be set accordingly to enable the fault behaviour. bit 0: atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault, bit 3: the access crossing a 16-byte boundary should fault

Type

int

Default value

0x8

fault_unaligned_s1_device_s2_fwb

Whether unaligned fault with stage1 Device memory and final memory attribute forced to normal by FWB. 0, No fault. 1, will fault. 2 No fault if final Shareability is NSH.

Type

int

Default value

0x0

force_align_pc

UNPREDICTABLE branch to non-word-aligned address in ARM state is forced to be aligned

Type

bool

Default value

0x0

force_deterministic_irg_tag_generation

Force the random tag generated by the IRG instruction when GCR_EL1.RRND=1 to equal RGSR_EL1.SEED[3:0] rather than a non-deterministic value

Type

bool

Default value

0x0

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

force_wnr_read_unsupported_exclusive_or_atomic

Whether ESR_ELx.WnR is forced to 0 for unsupported atomic and exclusives

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

fp8_support_level

0->No support for Advanced SIMD, SVE2 FP8 instructions 1->Support for FEAT_FP8
2->Support for FEAT_FP8FMA 3->Support for FEAT_FP8DOT4 4->Support for FEAT_FP8DOT2

Type

int

Default value

0x0

fpcr_short_vector_raz

FPSCR and FPCR fields LEN and STRIDE are hardwired to 0

Type

bool

Default value

0x0

fpsr_res0_stateful_mask

Mask for stateful bits of FPSR which are RES0

Type

int

Default value

0x0

fsr_ext_bit_update_kind

Set/Clear DFSR/IFSR EA bit on Synchronous/Async External Aborts. 0: Never Set, 1: Set on Synchronous Ext Aborts 2: Set on Asynchronous Ext Aborts 3: Set on both Sync and Async Ext Aborts.

Type

int

Default value

0x3

gcs_data_check_overrides_data_abort

GCS Data check exceptions are taken before Data Aborts

Type

bool

Default value

0x0

gcs_overshoot_writes

Number of overshooting GCS records written after a writing a record

Type

int

Default value

0x0

gic.GICC-offset

Offset from PERIPHBASE for GICC registers.

Type

int

Default value

0x2000

gic.GICD-offset

Offset from PERIPHBASE for GICD registers. Will be ignored when GICv3 CPU interface is enabled, as distributor is then external to the cluster.

Type

int

Default value

0x1000

gic.GICH-offset

Offset from PERIPHBASE for GICH registers.

Type

int

Default value

0x4000

gic.GICH-other-CPU-offset

Offset from PERIPHBASE for GICH registers for accessing other CPUs in the cluster. Set to 0 to disable.

Type

int

Default value

0x5000

gic.GICV-alias

Offset from PERIPHBASE for alias of GICV registers. When gicv2-only, if zero no alias will be created; if gicv2-only=0, the param is deprecated, when zero or unset an alias is created in the place mandated by the architecture (GICV-base+0xF000)

Type

int

Default value

0x0

gic.GICV-offset

Offset from PERIPHBASE for GICV registers.

Type

int

Default value

0x6000

gic.PERIPH-size

Size of registers based at PERIPHBASE that are considered to be owned by the GIC. Any accesses in the range PERIPHBASE to PERIPHBASE+gic.PERIPH-size-1 that do not match GIC registers will be treated as RAZ/WI.

Type

int

Default value

0x8000

gicv3.A3-affinity-supported

Whether a non-zero value for affinity at level 3 is supported.

Type

bool

Default value

0x0

gicv3.BPR-min

The minimum value for the GICC_BPR register (non-secure version will be 1 + this value).

Type

int

Default value

0x2

gicv3.EOI-check-CPUID

Check CPU ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

Type

bool

Default value

0x0

gicv3.EOI-check-ID

Check Interrupt ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

Type

bool

Default value

0x0

gicv3.EOI-deactivate-any-interrupt

Allow an EOI to deactivate interrupts that aren't the highest priority active interrupt (EOI-ignore-out-of-order must be false otherwise this is ignored).

Type

bool

Default value

0x0

gicv3.EOI-ignore-out-of-order

Ignore EOI writes that cannot end the highest priority active interrupt.

Type

bool

Default value

0x1

gicv3.FIQEn-RAO

GICC_CTLR.FIQEn is read as one, write insensitive

Type

bool

Default value

0x0

gicv3.IIDR_base

The base value for calculating the GICC_IIDR register value.

Type

int

Default value

0x43b

gicv3.LR-count

The number of implemented list registers.

Type

int

Default value

0x10

gicv3.PMHE-RAO-WI

ICC_CTLR_EL*.PHME is read as one, write insensitive

Type

bool

Default value

0x0

gicv3.PMHE-RAZ-WI

ICC_CTLR_EL*.PHME is read as zero, write insensitive

Type

bool

Default value

0x0

gicv3.PMHE-release-set-packet

if PHME is enabled, whether a SET packet is released by CPU Intf in Upstream Ack window.

Type

bool

Default value

0x0

gicv3.SRE-EL2-enable-RAO

When ICC_SRE_EL2.SRE is RAO/WI, makes ICC_SRE_EL2.Enable RAO/WI

Type

bool

Default value

0x0

gicv3.SRE-EL3-enable-RAO

When ICC_SRE_EL3.SRE is RAO/WI, makes ICC_SRE_EL3.Enable RAO/WI

Type

bool

Default value

0x0

gicv3.SRE-EL3-set-once

Restrict SRE EL3 to be set only once

Type

bool

Default value

0x0

gicv3.SRE-enable-action-on-mmap

Allowed values are: 0-SRE one allows mmap access. 1-SRE one disables mmap access. 2-SRE one makes mmap access RAZ-WI.

Type

int

Default value

0x0

gicv3.STATUSR-implemented

If GICv3 CPU interface is being used, this determines whether the STATUS registers are implemented

Type

bool

Default value

0x1

gicv3.VBPR-min

The minimum value for the GICV_BPR register (non-secure version will be 1 + this value).

Type

int

Default value

0x2

gicv3.VFIQEn-RAO

ICH_VMCR_EL2.VFIQEn is read as one, write insensitive

Type

bool

Default value

0x0

gicv3.cpuintf-mmap-access-level

Allowed values are: 0-mmap access is supported for GICC,GICH,GICV registers. 1-mmap access is supported only for GICV registers. 2-mmap access is not supported.

Type

int

Default value

0x0

gicv3.dir-trap-support

The cpu supports separate trapping of ICC_DIR_EL1 to EL2

Type

bool

Default value

0x1

gicv3.el3_trap_priority_when_secure_debug_disabled

Undef to access priorities group register when secure debug is disabled

Type

bool

Default value

0x0

gicv3.extended-interrupt-range-support

Device has support for extended SPI/PPI ID ranges

Type

bool

Default value

0x0

gicv3.gicv2-only

Limit the GIC implementation to GICv2 features only

Type

bool

Default value

0x0

gicv3.idle-is-ff

For GICC/GICV RPR, when idle, return FF when true, minimum supported priority otherwise

Type

bool

Default value

0x1

gicv3.ignore-DIR-write-when-EOImode-not-set

Ignore UNPREDICTABLE access to GICC_DIR register.

Type

bool

Default value

0x1

gicv3.interrupt-bypass-support

Interrupt bypass support, set to false for devices not supporting interrupt bypass

Type

bool

Default value

0x1

gicv3.local-SEIs

Generate SEI to signal internal issues

Type

bool

Default value

0x0

gicv3.local-VSEIs

Generate VSEI to signal internal issues

Type

bool

Default value

0x0

gicv3.physical-ID-bits

Number of physical ID bits implemented.

Type

int

Default value

0x10

gicv3.priority-bits

Number of priority bits implemented.

Type

int

Default value

0x5

gicv3.send-PMHE-command-only-when-priority-changes

Send PMHE upstream command to distributor only when write to ICC_PMR_EL1 changes the priority

Type

bool

Default value

0x0

gicv3.sgi-range-selector-support

Device has support for the Range Selector feature for SGI

Type

bool

Default value

0x0

gicv3.suppress-virtual-enables-comms

In GICv3 only mode, prevents the GIC CPUIF from communicating UpstreamWrite/VirtualEnables to the IRI

Type

bool

Default value

0x1

gicv3.virtual-ID-bits

Number of virtual ID bits implemented.

Type

int

Default value

0x10

gicv3.virtual-lpi-support

When GICv3 is supported, indicates a cut down CPUIF interface with no support of VLPI (GICv3 only) when false

Type

bool

Default value

0x1

gicv3.virtual-priority-bits

Number of virtual priority bits implemented.

Type

int

Default value

0x5

gicv3.without-DS-support

GICv3 CPU interfaces do not support disabling security in the distributor (GICD_CTLR.DS=1)

Type

bool

Default value

0x0

gicv4.mask-virtual-interrupt

If true, virtual interrupts can be masked from being reported to virtual CPU interface by setting ICH_HCR_EL2.DVIM 1. No control otherwise.

Type

bool

Default value

0x0

global_debug_rom.ROMDEVID

Value of Debug Rom Device Identification Register

Type

int

Default value

0x0

global_debug_rom.ROMPIDR

Value of Debug Rom Peripheral Identification Register

Type

int

Default value

0x4000bb000

global_debug_rom.ROMPRIDR0

Value of Debug ROM Power RequestID Register

Type

int

Default value

0x1

gpccr_el3_gpcp_behaviour

Used to control impdef behaviour when GPCP=1 (0->Faults are always generated and reported, 1->Faults are not generated and reported), 2->Faults are generated and reported only for Arm recommended cases

Type

int

Default value

0x2

gpt_tlb_size

Number of separate GPT TLB entries.

Type

int

Default value

0x0

gpt_walkcache_size

Number of GPT walk cache entries.

Type

int

Default value

0x0

hardware_translation_table_update_implemented

Implement hardware translation table updates from ARMv8.1 (FEAT_HAFDBS).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has-gicv4.1

GICv4.1 is enabled, and all the features with GICv4.1 are implemented (FEAT_GICv4p1).

Type

bool

Default value

0x0

has_128_bit_atomic_instructions

Implement 128-bit Atomic Instructions (FEAT_LSE128)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_128_bit_tt_descriptors

Implement 128-bit Translation Table Descriptors (FEAT_D128)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_16bit_asids

Enable 16-bit ASIDs.

Type

bool

Default value

0x1

has_16bit_vmids

Implement support for 16-bit VMIDs from ARMv8.1 (FEAT_VMID16).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_16k_granule

Implement the 16k LPAE translation granule.

Type

bool

Default value

0x0

has_4k_granule

Implement the 4k LPAE translation granule.

Type

bool

Default value

0x1

has_52bit_address_with_16k

Implements Armv8.7 52-bit IPA/PA support for 16k (FEAT_LPA2).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_52bit_address_with_4k

Implements Armv8.7 52-bit IPA/PA support for 4k (FEAT_LPA2).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_56_bit_va

56-bit Physical Address, identified as (FEAT_LVA3)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_64bit_pmu_ext_access

Implement 64-bit pmu external interface access

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_64k_granule

Implement the 64k LPAE translation granule.

Type

bool

Default value

0x1

has_aarch32_dbgdidr_etc

DBGDIDR, DBGDRAR, DBGDSAR exist even if EL1 doesn't implement AArch32

Type

bool

Default value

0x1

has_aarch32_hpd

If true then hierarchical permission disable is supported in AArch32 (FEAT_AA32HPD)

Type

bool

Default value

0x0

has_aarch64

All implemented exception levels can run in AArch64

Type

bool

Default value

0x1

has_actlr2

If true ACTLR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32]

Type

bool

Default value

0x0

has_actlr_virtualisation

If true ACTLR_EL12 is implemented and ACTLR_EL1 supports virtualisation

Type

bool

Default value

0x0

has_address_breakpoint_linking

Implement Address Breakpoint Linking Extension (FEAT_ABLE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_amu

Implement activity monitor functionality from ARMv8.4 (FEAT_AMUv1).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_amu_ext64

Implement 64-bit external interface to the Activity Monitors (FEAT_AMU_EXT64).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_arm_v8-1

Implement the ARMv8.1 Extension.

Type

bool

Default value

0x0

has_arm_v8-2

Implement the ARMv8.2 Extension.

Type

bool

Default value

0x0

has_arm_v8-3

Implement the ARMv8.3 Extension.

Type

bool

Default value

0x0

has_arm_v8-4

Implement the ARMv8.4 Extension.

Type

bool

Default value

0x0

has_arm_v8-5

Implement the ARMv8.5 Extension.

Type

bool

Default value

0x0

has_arm_v8-6

Implement the ARMv8.6 Extension.

Type

bool

Default value

0x0

has_arm_v8-7

Implement the Armv8.7 Extension.

Type

bool

Default value

0x0

has_arm_v8-8

Implement the ARMv8.8 Extension.

Type

bool

Default value

0x0

has_arm_v8-9

Implement the ARMv8.9 Extension.

Type

bool

Default value

0x0

has_arm_v9-0

Implement the ARMv9.0 Extension.

Type

bool

Default value

0x0

has_arm_v9-1

Implement the ARMv9.1 Extension.

Type

bool

Default value

0x0

has_arm_v9-2

Implement the ARMv9.2 Extension.

Type

bool

Default value

0x0

has_arm_v9-3

Implement the ARMv9.3 Extension.

Type

bool

Default value

0x0

has_arm_v9-4

Implement the ARMv9.4 Extension.

Type

bool

Default value

0x0

has_arm_v9-5

Implement the ARMv9.5 Extension.

Type

bool

Default value

0x0

has_asid2

If true then support for use of two concurrent ASIDs (FEAT_ASID2)

Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_at_with_pan

Implement new AT instructions with PAN support (FEAT_PAN2).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_ats1a

Support for ATS1ExR instructions (FEAT_ATS1A)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_attribute_index_enhancement

Memory Attribute Index Enhancement (FEAT_AIE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_axflag_xaflag

Implement flag manipulation instructions (AXFlag, XAFlag) from ARMv8.5 (FEAT_FlagM2).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_axflag_xaflag_frint

Implement flag manipulation instructions (AXFlag, XAFlag) and floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. If this parameter is enabled, it also enables both has_axflag_xaflag and has_frint. If support for only one of the features is needed, please use the individual parameters and do not enable this one (FEAT_FlagM2, FEAT_FRINTTS).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_bc

Implement Armv8.8 Hinted Conditional Branch (FEAT_HBC)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_branch_target_exception

Implement Branch target identification mechanism from ARMv8.5 (FEAT_BTI).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_brbe

If true, implements branch record buffer extension (FEAT_BRBE).

Type

bool

Default value

0x0

has_brbe_v1p1

If true, implements FEAT_BRBEv1p1.

Type

bool

Default value

0x0

has_ccidx

Implement the ARMv8.3 CCSIDR Extension. Extending the ccidr number of sets.

Type

bool

Default value

0x0

has_cfinv_rmif_setf

Implement flag manipulation (CFINV, RMIF, SETF8, SETF16) instructions from ARMv8.4 (FEAT_FlagM).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_chkfeat

Implement CHKFEAT instruction from ARMv9.4 (FEAT_CHK).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_clear_bhb

Implement Clear Branch History information instruction (FEAT_CLRBHB).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_clear_other_speculation_by_context

Implement execution and data prediction invalidation from Armv8.9 (FEAT_SPECRES2).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_cmo_wr_control

Whether stage1/2 CMO write perm control is supported (FEAT_CMOW)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x0

has_common_not_private_translations

Implement the TTBRn_ELx.CnP (Common not Private) controls from ARMv8.2 (FEAT_TTCNP).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_complex_number

Implement ARMv8.3 complex number support, Multiply Accumulate and Add instructions (FEAT_FCMA).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_const_pac

Feature for singular selection of PAC field (FEAT_CONSTPACFIELD).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_cssc

Support for common short sequence compression instructions (FEAT_CSSC)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_cvadp_support

Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 (FEAT_DPB, FEAT_DPB2).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_data_alignment_flag

Implement non-optimal misalignment flag for PMU/SPE from ARMv8.5

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_debug_rom

If true, a debug ROM will be generated describing the cluster's debug components.

Type

bool

Default value

0x1

has_delayed_brbe_records

If true, a synchronization barrier is required to update the BRB records (FEAT_BRBE).

Type

bool

Default value

0x1

has_delayed_ctireg

Delay the functional effect of CTI register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_dbgreg

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_mdscr_el1

Delay the functional effect of MDSCR_EL1 register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_oslar_el1

Delay the functional effect of OSLAR_EL1 register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_pmureg

Delay the functional effect of PMU register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_sysreg

Delay the functional effect of system register writes until ISB or implicit barrier.

Type

bool

Default value

0x0

has_delayed_wfe_trap

Implements Configurable Delayed WFE trapping from ARMv8.6 (FEAT_TWED).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_dgh

Implements Data Gathering Hint instruction from ARMv8.6 (FEAT_DGH).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_dot_product

Implement the dot product (UDOT, SDOT) instructions from ARMv8.4 (FEAT_DotProd).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_e0pd

Implement ARMv8.5 feature to prevent unprivileged access to one half of the memory (FEAT_E0PD).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_e2h_rao

Whether the implementation treats HCR_EL2.E2H as Read-As-One (RAO). 0 : FEAT_E2H0 implemented

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ebep

Implement Exception-Based Event Profiling from ARMv9.4 (FEAT_EBEP).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ebf16

Support for Extended BFloat16 Behaviours (FEAT_EBF16)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ecbhb

Implement Exploitative Control using Branch History information between exception levels (FEAT_ECBHB).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_edacr

Implement EDACR register

Type

bool

Default value

0x1

has_edhsr

Implement external debug halt status register (FEAT_EDHSR). 0: FEAT_EDHSR is not implemented unless architecturally required by another feature, 1: FEAT_EDHSR is implemented, 2: FEAT_EDHSR is implemented (extends EDHSR to include the VNCR, CM, and WnR fields), 0xF: FEAT_EDHSR implementation is dependent on FEAT_SME.

Type

int

Default value

0xf

has_e12

Implements EL2

Type

bool

Default value

0x1

has_e13

Implements EL3

Type

bool

Default value

0x1

has_enhanced_pac

If pointer authentication is enabled then implement enhanced PAC (FEAT_EPAC).

Type

bool

Default value

0x0

has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_enhanced_software_step

Implement Enhanced Software Step Extension (FEAT_STEP2).

Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

has_ets

Whether Enhanced Translation Synchronization is supported (FEAT_ETS).

Type

bool

Default value

0x0

has_exception_trapping_form_of_vector_catch

Implement the exception trapping form of vector catch debug event.

Type

bool

Default value

0x1

has_extended_recp_estimate

Implements increased precision of reciprocal instructions (FEAT_RPRES).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_external_rndr

Implement external random number generator module. When enabling this with has_rndr enabled, the external random number generator will be used instead of internal random number generator

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_faminmax

Implement FEAT_FAMINMAX

Type

bool

Default value

0x0

has_far_not_valid

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts.

Type

bool

Default value

0x0

has_far_not_valid_dfsc

Implements FnV bit in ESR_ELx, FAR not valid for synchronous external aborts for Data Abort.

Type

bool

Default value

0x0

has_far_not_valid_ifsc

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts for Instruction Abort.

Type

bool

Default value

0x0

has_fgt

Implements Fine-grained Virtualization Traps extension from ARMv8.6 (FEAT_FGT).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_fgt2

Implement additional FGT traps introduced in ARMv8.9 (FEAT_FGT2).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_fgwt3

If true then Fine Grained Write EL3 is enabled (FEAT_FGWTE3)

Type

bool

Default value

0x0

has_fixed_function_instr_counter

Implement fixed-function instruction counter (FEAT_PMUv3_ICNTR)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_fp16

Implement the half-precision floating-point data processing instructions from ARMv8.2 (FEAT_FP16).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_fp16_fmlal

Implement the New Floating Point Multiplication Variant (FP16 FMLAL, FMLSL) instructions from ARMv8.4. Only supported if has_fp16=0x1 (FEAT_FHM).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_fpmr

Implement FPMR (FEAT_FPMR)

Type

bool

Default value

0x0

has_frint

Implement floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5 (FEAT_FRINTTS).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_gcs

Implement Guarded Control Stack Extension from ARMv9.4 (FEAT_GCS).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_generic_authentication

Implement ARMv8.3 generic authentication.

Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_guest_translation_granule

Implement mechanism for guest translation granule identification from ARMv8.5, ID values determined by stage1 granule configuration parameters (FEAT_GTG).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_haft

Implement Hardware managed Access Flag for Table Descriptors (FEAT_HAFT)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_hardware_accelerator_for_cleaning_dirty_state

Whether hardware accelerator for cleaning Dirty state is supported (FEAT_HACDBS).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_hardware_dirty_state_tracking_structure

Whether hardware Dirty state tracking Structure is supported (FEAT_HDBSS).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_hardware_translation_table_update

Type of hardware translation table supported (when enabled by hardware_translation_table_update_implemented). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented (FEAT_HAFDBS).

Type

int

Default value

0x2

has_hcrx_el2

Implements new HCRX_EL2 id register from Armv8.7 (FEAT_HCX).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_hpmn0

Allow hypervisor to set MDCR_EL2.HPMN to 0 (FEAT_HPMN0)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_id_reg_read

Implement read access to the ID registers (ESR_ELx.EC=0x18) (FEAT_IDST)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_iesb

Implement support for implicit error sync event from ARMv8.2 (FEAT_IESB).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_itd

Implement the optional IT disable feature.

Type

bool

Default value

0x1

has_ite

Implement Instrumentation Trace Extension from ARMv9.4 (FEAT_ITE).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_jscvt

Implement ARMv8.3 javascript Floating-point to Integer conversion instruction (FEAT_JSCVT).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_large_system_ext

Implement the ARMv8 Large System Extensions (FEAT_LSE).

Type

bool

Default value

0x0

has_large_ttbr_ba_without_lpa

When FEAT_LPA is not implemented, whether TTBR base address supports large values (52 bits) or not (48 bits)

Type

bool

Default value

0x1

has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ldapur_stlur

Implement support for LDAPR and STLUR instructions with immediate offsets from ARMv8.4 (FEAT_LRCPC2).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_ldm_stm_ordering_control

Implement the SCTLR_ELx.LSMAOE (Load/Store Multiple Atomicity and Ordering Enable) and SCTLR_ELx.nTLSMD (no Trap Load/Store Multiple to Device) controls from ARMv8.2 (FEAT_LSMAOC).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_lrcpc

If true then it support the RCpc feature from ARMv8.3 (FEAT_LRCPC).

Type

bool

Default value

0x0

has_lrcpc3

Implement Release Consistency processor consistent (RCpc) feature from Armv8.9 (FEAT_LRCPC3).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_lut

Implement FEAT_LUT

Type

bool

Default value

0x0

has_mismatch_and_range_breakpoints

Implement Mismatch and Range Breakpoints (FEAT_BWE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_mismatch_watchpoints

Implement Breakpoints and Watchpoints Enhancements (FEAT_BWE2).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_mops_option

Implement Armv8.8 standard instructions for memory operations (FEAT_MOPS). 0, not implemented (unsupported if Armv8.8 is enabled). 1, implemented using Option A. 2, implemented using Option B

Type

int

Default value

0x0

has_mpam

Implement ARMv8.4 MPAM Registers and associated functionality (FEAT_MPAM).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_mpm

Implement max-power mitigation mechanism (MPMM)

Type

bool

Default value

0x0

has_mt_pmu_disable_feature

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, 0xF: The feature is disabled and is represented by value 0xF in ID_AA64DFR0_EL1.MTPMU.

Type

int

Default value

0x0

has_mte_async_faults

Whether MTE asynchronous faults are supported (FEAT_MTE_ASYNC)

Type

bool

Default value

0x1

has_mte_ctrl_bits_stateful

if memory_tagging_support_level == 1, Whether mte specific control bits in system registers are stateful

Type

bool

Default value

0x0

has_mte_perm

Implement tag access permission (FEAT_MTE_PERM)

Type

bool

Default value

0x0

has_mte_tag_related_fault_high_prio_than_data

For DC GZVA, Whether MMU faults generated by tag access has higher priority than faults due to data access

Type

bool

Default value

0x0

has_nested_virtualization

Implement ARMv8.3 nested virtualization (FEAT_NV).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_nmi

Implement AARCH64 Non-Maskable Interrupts (FEAT_NMI)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_no_os_double_lock

Do not implement the OS double-lock (FEAT_DoubleLock).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_non_context_synchronizing_exception_controls

Implement cosmetic controls for whether exception entry and exit are context synchronizing events (SCTLR_ELx.{EIS,EOS}) from ARMv8.5 (FEAT_ExS).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_nv1_raz

Whether the implementation treats HCR_EL2.NV1 as Read-As-Zero (RAZ), if has_e2h_rao = 1.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_nv_frac

Whether the NV_frac behavior is supported.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_par_bit10_razwi

Whether PAR_EL1[10] is RAZ/WI

Type

bool

Default value

0x0

has_partial_delayed_mdscr_el1

has_delayed_oslar_el1 only apply to some bits of MDSCR_EL1 (MDE, KDE, TDCC, SS).

Type

bool

Default value

0x0

has_pc_sample_based_profiling

If true, pc sample-based profiling is enabled (FEAT_PCSRv8, FEAT_PCSRv8p2).

Type

bool

Default value

0x1

has_pc_sample_profiling_enable

Whether PC Sample profiling enable is implemented (FEAT_PCSRv8p9)

Type

bool

Default value

0x0

has_per_cluster_debug_auth_ports

If true then the debug authentication ports i.e. spniden, niden, rpliden, rtpiden, dbgen, spiden are available per cluster

Type

bool

Default value

0x0

has_permission_indirection_s1

Implement the Permission Indirection Extension at stage 1 (FEAT_S1PIE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_permission_indirection_s2

Implement the Permission Indirection Extension at stage 2 (FEAT_S2PIE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_permission_overlay_s1

Implement the Permission Overlay Extension at stage 1 (FEAT_S1POE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_permission_overlay_s2

Implement the Permission Overlay Extension at stage 2 (FEAT_S2POE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_pmss

Implement PMU Snapshot Extension from Armv8.9 (FEAT_PMUv3_SS).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_pmu

Implement the optional Performance Monitors Extension (FEAT_PMUv3). 0, Not Implemented. 1, Implemented. 2, PMU is IMPLEMENTATION_DEFINED, PMU version would be set to 0xF and would behave as if no PMU is implemented

Type

int

Default value

0x1

has_pmu_edge_detection

Implement PMU Event edge detection (FEAT_PMUv3_EDGE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_pmu_for_sme_extension

Implement PMUv3 for Scalable Matrix Extension (SME) from ARMv9.5 (FEAT_PMUv3_SME)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_pmu_threshold_linking_control

Implement PMU threshold linking control (FEAT_PMUv3_TH2)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_pointer_authentication

Implement ARMv8.3 pointer authentication (FEAT_PAuth).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_prediction_invalidation_instructions

Implement execution and data prediction invalidation from ARMv8.5 (FEAT_SPECRES).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_prfm_slc

Implement PRFM with SLC hint (FEAT_PRFMSLC).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_pstate_dit

Implement timing insensitivity of data processing instructions from ARMv8.4 (FEAT_DIT).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_pstate_pan

Implement the PSTATE.PAN (Privileged Access Never) control from ARMv8.1 (FEAT_PAN)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_pstate_uao

Implement the PSTATE.UAO (User Access Override) control from ARMv8.2 (FEAT_UAO).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_qarma3_pac

Supports QARMA3 pointer authentication algorithm (FEAT_PACQARMA3)

Type

bool

Default value

0x0

has_ras

Implements the ARMv8 RAS Extension. 0 = NO_RAS, 1 = MINIMAL_RAS, 2 = FULL_RAS (FEAT_RAS)

Type

int

Default value

0x0

has_ras_aderr

Implement RAS Asynchronous Device Read Error from Armv8.9 (FEAT_ADERR).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ras_anerr

Implement RAS Asynchronous Normal Read Error from Armv8.9 (FEAT_ANERR).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ras_armv84_extension

Implement ARMv8.4 RAS Extension (FEAT_RASv1p1).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_ras_armv89_double_fault

Implement RAS Double Fault Extension from Armv8.9 (FEAT_DoubleFault2).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ras_armv89_extension

Implement RAS extension from Armv8.9 (FEAT_RASv2).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_ras_critical_error

[DEPRECATED: Set CI field on first register in error_record_feature_register JSON instead]
ARMv8.4 AArch64 RAS Critical Error is implemented or not. 0 - Feature Not Supported, 1 - Feature always enabled, 2 - Feature is controllable.

Type

int

Default value

0x0

has_ras_delegated_serror_exceptions_for_el3

Implement Delegated SError exceptions for EL3 (FEAT_E3DSE).

Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_ras_double_fault

Implement ARMv8.4 RAS Double Fault Extension (FEAT_DoubleFault).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_ras_fault_injection

[DEPRECATED: Set INJ field on first register in error_record_feature_register JSON instead]
Implement ARMv8.4 Standard Fault Injection mechanism.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ras_pfar

Implement RAS Physical Fault Address Registers from Armv8.9 (FEAT_PFAR).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_ras_timestamp

[DEPRECATED: Set TS field on first register in error_record_feature_register JSON instead] ARMv8.4 AArch64 RAS Timestamp register is implemented or not. 0 - No Timestamp is recorded, 1 - Generic Timer timestamp is recorded, 2 - IMP DEF timestamp is recorded.

Type

int

Default value

0x0

has_restriction_on_speculative_data_loaded

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation) (FEAT_CSV3).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_rme

If true, implements full realm management extension (FEAT_RME). Note: This parameter is deprecated and will be removed in future releases, please use rme_support_level parameter.

Type

bool

Default value

0x0

has_rme_gpc2

If true then RME GPC2 extension is enabled (FEAT_RME_GPC2)

Type

bool

Default value

0x0

has_rndr

Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5 (FEAT_RNG).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_rndr_trap

Implement trapping for RNDR and RNDRSS random number registers from ARMv8.8. (FEAT_RNG_TRAP)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_rounding_doubling_multiply_add_subtract

Implement the rounding doubling multiply add and subtract instructions from ARMv8.1 (FEAT_RDM).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_rprfm

Support for RPRFM hint instruction (FEAT_RPRFM)

Type

bool

Default value

0x0

has_sctlr2

Implement SCTL2_ELx registers (FEAT_SCTL2).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_sebep

Implement Synchronous-Exception-Based Event Profiling from ARMv9.4 (FEAT_SEBEP).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_secure_el2

Implement support for Secure EL2 (FEAT_SEL2).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_self_hosted_trace_extension

Implement support for the Self-hosted Trace Extensions from ARMv8.4 (FEAT_TRF).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_small_page_table

Implement small page table support which increases the maximum value of TxSZ field from ARMv8.4 (FEAT_TTST). Note: will be unimplemented only if both has_small_page_table=0x0 and has_secure_el2=0x0.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_software_lock

Implement software lock in memory-mapped CTI, PMU, and external debug interfaces

Type

bool

Default value

0x1

has_spe_eft

Implement SPE extended operation type filtering from ARMv9.5 (FEAT_SPE_EFT)

Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_spe_fds

Implement SPE filter by data source from ARMv8.9 (FEAT_SPE_FDS)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_spe_for_sme_extension

Implement support of SME to SPE from ARMv9.5 (FEAT_SPE_SME).

Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_spe_fpf

Implement SPE operation type extension for ASIMD and FP from ARMv9.5 (FEAT_SPE_FPF)

Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_speculation_barrier_inst

Implement speculation barrier instruction (SB) from ARMv8.5 (FEAT_SB).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_speculative_sei

If true, the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches

Type

bool

Default value

0x0

has_stage2_ap_speculative_update

Speculative update of S2 AP bit on S1 TTW. 0 = No Update, 1 = Update, 2 = Update including for AT ops

Type

int

Default value

0x0

has_stage2_fwb

Implement HCR_EL2.FWB, stage 2 control of memory types and cacheability (FEAT_S2FWB)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_stage2_xnx

Implement the extended XN[1:0] stage 2 control from ARMv8.2 (FEAT_XNX).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_stage2_xnx_in_aarch32

Implement the extended XN[1:0] stage 2 control from ARMv8.2 for Aarch32 (FEAT_XNX).

Type

bool

Default value

0x1

has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x1

has_supersections

Whether VMSAv8-32 supersection to support more than 32-bit PA using short descriptor is implemented.

Type

bool

Default value

0x1

has_sve

Whether SVE is implemented (FEAT_SVE). Note: this is required to enable SME (FEAT_SME) with sve.has_sme=1. An SME only implementation can be enabled by setting both as well as sve.sme_only=1

Type

int

Default value

0x0

has_synchronous_load_atomics

Report asynchronous abort due to unsupported load atomics as synchronous (Cacheable)

Type

bool

Default value

0x1

has_synchronous_load_atomics_noncacheable

Report asynchronous abort due to unsupported load atomics as synchronous (Non-Cacheable)

Type

bool

Default value

0x1

has_synchronous_store_atomics

Report asynchronous abort due to unsupported store atomics as synchronous (Cacheable)

Type

bool

Default value

0x0

has_synchronous_store_atomics_noncacheable

Report asynchronous abort due to unsupported store atomics as synchronous (Non-Cacheable)

Type

bool

Default value

0x0

has_sysinstr128

Support for System Instructions that can take 128-bit inputs (FEAT_SYSINSTR128)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_sysreg128

Support for 128-bit System Registers (FEAT_SYSREG128)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_tcr2

Implement TCR2_ELx registers (FEAT_TCR2)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_tidcp1

Implement Armv8.8 ELO use of implementation defined functionality (FEAT_TIDCP1)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_tlb_conflict_abort

Detected inconsistent TLB content generate aborts.

Type

bool

Default value

0x0

has_tlb_pa_caching

Whether intermediate caching of translation table walks might include NonCoherent caches of previous valid walks. 0, NonCoherent caches might be included. 1, No NonCoherent caches included (FEAT_nTLBPA)

Type

bool

Default value

0x0

has_tlbi_range

Implement support for TLB Range Maintenance instructions (TLBI RVAE1, etc) from ARMv8.4 (FEAT_TLBI RANGE).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_tlbi_to_outer_shareable

Implement support for TLB Maintenance instructions that extend to the Outer Shareable domain (TLBI VAE1OS, etc) from ARMv8.4 (FEAT_TLBIOS).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_tlbi_ttl

Implement support for the TTL level hint in by-address TLB Maintenance instructions from ARMv8.4 (FEAT_TTL).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_tlbiw

Implement TLBI instruction for stage2 dirty (FEAT_TLBIW).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_tme

If true, implements TME, the Transactional Memory Extension (FEAT_TME).

Type

bool

Default value

0x0

has_translation_hardening

Implement the Translation Hardening Extension (FEAT_THE)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_trbe

If true, implements the Trace Buffer Extension (FEAT_TRBE).

Type

bool

Default value

0x0

has_trbe_ext

Implements the Trace Buffer external mode extension (FEAT_TRBE_EXT).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_unaligned_single_copy_atomicity

Implement support for SCTL_R_EL_x.nAA from ARMv8.4, and A64 atomic, exclusive and acquire/release instructions accessing unaligned bytes inside a 16byte window will not generate alignment fault (FEAT_LSE2).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_unsupported_exclusive_fault

Report unsupported exclusive access with Unsupported Exclusive fault status (otherwise use external abort)

Type

bool

Default value

0x1

has_v8_4_debug_extension

Implement ARMv8.4 debug extensions (FEAT_Debugv8p4)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_4_pmu_extension

Implement PMU extension from ARMv8.4 (FEAT_PMUv3p4).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_5_debug_over_power_down

Implement ARMv8.5 Debug over powerdown (FEAT_DoPD).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

has_v8_5_pmu_extension

Implement PMU extension from ARMv8.5 (FEAT_PMUv3p5).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_5_spe_extension

Implement SPE extension from ARMv8.5 (FEAT_SPEv1p1).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_6_pmu_events

Implements PMU events from ARMv8.6

Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_7_fp_enhancements

Implements the Floating Point enhancements from Armv8.7 (introduces FPCR.FIZ/AH/NEP, etc. (FEAT_AFP).)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_7_pmu_events

Implement PMU events from ARMv8.7.

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_7_pmu_extension

Implement PMU extension from ARMv8.7 (FEAT_PMUv3p7).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_7_spe_extension

Implement SPE extension from ARMv8.7 (FEAT_SPEv1p2)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_7_spe_inverted_filtering

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events

Type

bool

Default value

0x1

has_v8_7_spe_previous_branch_target

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented

Type

bool

Default value

0x1

has_v8_8_debug_extension

Implement ARMv8.8 debug extensions (FEAT_Debugv8p8)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_8_pmu_events

Implement PMU events from ARMv8.8 (FEAT_PMUv3).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_8_pmu_extension

Implement PMU extension from ARMv8.8 (FEAT_PMUv3p8).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_8_spe_extension

Implement SPE extension from ARMv8.8 (FEAT_SPEv1p3)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_9_debug_extension

Implement ARMv8.9 debug extensions (FEAT_Debugv8p9)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_9_pc_sample_based_profiling

Implement PC Sample-based Profiling from ARMv8.9 (FEAT_PCSRv8p9)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_9_pmu_events

Implement PMU events from ARMv8.9 (FEAT_PMUv3).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_9_pmu_extension

Implement PMU extension from ARMv8.9 (FEAT_PMUv3p9).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_v8_9_spe_extension

Implement SPE extension from ARMv8.9 (FEAT_SPEv1p4)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_vnocr_el2

Implement support for nested virtualization enhancements from ARMv8.4 (FEAT_NV2).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_wfet_and_wfit

Implements WFE and WFI with Timeout from Armv8.7 (FEAT_WFXT)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

has_writebuffer

Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.

Type

bool

Default value

0x0

has_xs

Implements Armv8.7 XS, TLBInXS, DSBnXS instruction (FEAT_XS).

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

hcptr_tta_behaviour

Behaviour of HCPTR.TTA when there is no CP14 ETM interface. 0, RAZ/WI. 1, RAO/WI. 2, stateful.

Type

int

Default value

0x2

hcr_el2_miocnce_is_rw

If true, HCR_EL2.MIOCNC is treated as R/W instead of RAZ/WI

Type

bool

Default value

0x0

hcr_swio_res1

Whether HCR.SWIO and/or HCR_EL2.SWIO are RES1.

Type

bool

Default value

0x0

hdbss_error_fault_type

Type of fault reported for HDBSS errors. 0 = precise exception, 1 = fault logged in HDBSSPROD_EL2.FSC (FEAT_HDBSS).

Type

int

Default value

0x0

hpfar_unknown_when_ipa_invalid

If true, HPFAR_EL2 is set to 0 when IPA is not valid for stage 2 faults.

Type

bool

Default value

0x0

hsr_uncond_cc

Condition codes reported in HSR as AL if it passes

Type

bool

Default value

0x0

hvbar_reset_is_rvbar

If true then the reset value of HVBAR is RVBAR, if false the reset value is UNKNOWN.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-log2linelen

If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-nprefetch

Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.

Type

int

Default value

0x1

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-prefetch_level

0 based cache level at which instructions are pre-fetched. This is only used when icache-prefetch_enabled=true.

Type

int

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or

miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type

int

Default value

0x0

`icache-read_bus_width_in_bytes`

L1 I-Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

`icache-read_latency`

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type

int

Default value

0x0

`icache-size`

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

`icache-state_modelled`

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

`icache-ways`

L1 I-Cache number of ways (sets are implicit from size).

Type

int

Default value

0x2

id_spec_fpacc_raz

If true, implementation opts not to disclose the speculative use of pointers processed by a PAC authentication failure by having value 0 for Spec_FPACC bits of ID_AA64MMFR3_EL1 register.

Type

bool

Default value

0x0

ignore_DBGPRCR_CWRR

Ignore writes to the deprecated DBGPRCR.CWRR bit.

Type

bool

Default value

0x0

ignore_access_flag_update_by_at_ops

If true, AT operations do not update access flag

Type

bool

Default value

0x0

ignore_data_abt_on_af_update_by_at_ops

If true, Data abort generated on AF update by AT operations are ignored. This parameter is only valid if ignore_access_flag_update_by_at_ops is false.

Type

bool

Default value

0x1

ignore_large_address_top_bits_in_page_walk

Whether page table bits [15:12] are ignored if PA_SIZE < 52 and output address is configured < 52 with large page

Type

bool

Default value

0x0

ignore_tag_check_dcc_load_store_in_ma_mode_when_tco_is_disabled

Constrained unpredictable behavior for reads/writes to external debug interface DTR regs in memory access mode when PSTATE.TCO is 0. If true, tag check is ignored else, tag check is performed if required.

Type

bool

Default value

0x0

ignore_traps_to_dcc_regs_in_debug

Whether traps get ignored for the following registers in debug state: * AArch64: MDCCSR_EL0, OSDTRENX_EL1, OSDTRTX_EL1, MDCCINT_EL1. * AArch32: DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR, DBGDTRRXext, DBGDTRTXext, DBGDCCINT.

Type

bool

Default value

0x0

imp_def_functionality_behaviour

Behaviour of IMPLEMENTATION DEFINED registers and system instructions. 0, UNDEF. 1, RAZ/WI.

Type

int

Default value

0x0

impdef_regs_and_unpred_from_implementation

Configure implementation defined registers and unpredictable behaviour to match the specified implementation. Requires a license for the selected implementation model. User has to provide the default values for the published or configurable parameters through commandline arguments. Use ARM_Cortex-A<num> or ARM_<codename> for licensed pre-release cores.

Type

string

Default value**impdef_sysreg_json**

Configure mask/reset bitmasks for impdef. registers in a JSON format which is (where 'bitwise' indicates 'reset'/'mask' to flip existing bits): [{ "name": "IMP_SYSREG0_EL1", "reset": 0, "mask": 0, "encoding": 0, "bitwise": true}]

Type

string

Default value

[]

independent_cache_control_traps

Implement Independent Cache Control traps from ARMv8.5. 0, No support. 1, Supported but not for tlb maintenance instructions. 2, Full support. (FEAT_EVT)

Type

int

Default value

0x0

insert_iesb_before_exception

If true then inserts an IESB before taking with Exception otherwise has no effect and IESB is taken after PState is changed due to the Exception.

Type

bool

Default value

0x0

instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)

Type

int

Default value

0x0

internal_vgic

Instantiate VGIC peripheral in this processor

Type

bool

Default value

0x0

is_debug_state_pmu_snapshot_allowed

If true, PMU snapshot is allowed in debug state.

Type

bool

Default value

0x1

is_first_pcsr_sample_ignored

If true, First read of PMPCSR register after reset returns 0xFFFFFFFF

Type

bool

Default value

0x0

is_mt_res0

If ARMv8.6 is not implemented, and PMUV3 is implemented, this parameter controls whether PMEVTYPER<n>.MT bit is RES0 or RW. For other implementations, this parameter has no effect

Type

bool

Default value

0x0

is_serror_edge_triggered

If true, SError is edge-triggered. Otherwise, its level-triggered.

Type

bool

Default value

0x1

is_tagged_nsh_treated_as_tagged

Whether a tagged NonShared memory attribute is treated as tagged or not

Type

bool

Default value

0x1

is_uniprocessor

Value for the U bit in MPIDR. true disables L1 cache coherency protocols

Type

bool

Default value

0x0

isb_is_branch

If true, ISB is traced as an immediate branch. This allows to count ISB as a branch in debug extensions (e.g. PMU)

Type

bool

Default value

0x0

ish_is_osh

Whether Innershareable is same as OuterShareable

Type

bool

Default value

0x0

itd_conditional_instructions_are_32bit

When SCTLx_ELx.ITD=1, an IT instruction plus a T16 instruction are considered a single 32bit conditional instruction.

Type

bool

Default value

0x0

jidr_is_undef_at_el0

If true, JIDR register access is UNDEF at EL0

Type

bool

Default value

0x0

jmcr_is_undef_at_el0

If true, JMCR register access is UNDEF at EL0

Type

bool

Default value

0x0

joscr_is_undef_at_el0

If true, JOSCR register access is UNDEF at EL0

Type

bool

Default value

0x0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-mpamf.arch_major_ver

L3 Cache MPAMF_AIDR architecture major version

Type

int

Default value

0x0

l3cache-mpamf.arch_minor_ver

L3 Cache MPAMF_AIDR architecture minor version

Type

int

Default value

0x0

l3cache-mpamf.bwa_width_ns

L3 Cache width of MPAM bandwidth allocation fields for non-secure accesses.

Type

int

Default value

0x10

l3cache-mpamf.bwa_width_s

L3 Cache width of MPAM bandwidth allocation fields for secure accesses.

Type

int

Default value

0x10

l3cache-mpamf.cmax_width_ns

L3 Cache number of fractional bits in MPAM cache capacity partition control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type

int

Default value

0x0

l3cache-mpamf.cmax_width_s

L3 Cache number of fractional bits in MPAM cache capacity partition control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type

int

Default value

0x0

l3cache-mpamf.cpbm_width_ns

L3 Cache width of MPAM cache portion bitmap for non-secure accesses. If 0, the feature is not implemented, and all ways are available.

Type

int

Default value

0x0

l3cache-mpamf.cpbm_width_rl

L3 Cache width of MPAM cache portion bitmap for realm accesses. If 0, the feature is not implemented, and all ways are available.

Type

int

Default value

0x0

l3cache-mpamf.cpbm_width_rt

L3 Cache width of MPAM cache portion bitmap for root accesses. If 0, the feature is not implemented, and all ways are available.

Type

int

Default value

0x0

l3cache-mpamf.cpbm_width_s

L3 Cache width of MPAM cache portion bitmap for secure accesses. If 0, the feature is not implemented, and all ways are available.

Type

int

Default value

0x0

l3cache-mpamf.csu_num_mon_ns

L3 Cache number of MPAM cache storage usage monitors for non-secure accesses.

Type

int

Default value

0x0

l3cache-mpamf.csu_num_mon_rl

L3 Cache number of MPAM cache storage usage monitors for realm accesses.

Type

int

Default value

0x0

l3cache-mpamf.csu_num_mon_rt

L3 Cache number of MPAM cache storage usage monitors for root accesses.

Type

int

Default value

0x0

l3cache-mpamf.csu_num_mon_s

L3 Cache number of MPAM cache storage usage monitors for secure accesses.

Type

int

Default value

0x0

l3cache-mpamf.has_esr

L3 Cache's MPAMF_ESR, MPAMF_ECR, and MPAM error handling implemented.

Type

bool

Default value

0x0

l3cache-mpamf.has_extd_esr

L3 Cache's MPAMF_ESR is 64-bits.

Type

bool

Default value

0x0

l3cache-mpamf.has_impl_idr

L3 Cache's MPAMF_IMPL_IDR is present.

Type

bool

Default value

0x0

l3cache-mpamf.has_mbwu_long_counter

L3 Cache has long MBWU counter and capture registers.

Type

bool

Default value

0x0

l3cache-mpamf.has_mpamfidr_ext

MPAMF_IDR.EXT support

Type

bool

Default value

0x0

l3cache-mpamf.has_partid_nrw

Narrowing part ID register is present. This is global rather than per-instance.

Type

bool

Default value

0x0

l3cache-mpamf.has_priority_partitioning

The selected resource has priority partitioning described in MPAMF_PRI_IDR.

Type

bool

Default value

0x0

l3cache-mpamf.has_prod_id

L3 Cache MPAMF_IIDR product ID supported.

Type

int

Default value

0x0

l3cache-mpamf.has_prod_rev

L3 Cache MPAMF_IIDR product REVISION supported.

Type

int

Default value

0x0

l3cache-mpamf.has_prod_var

L3 Cache MPAMF_IIDR product VARIANT supported.

Type

int

Default value

0x0

l3cache-mpamf.has_prop_ns

Enable memory bandwidth proportional stride control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type

bool

Default value

0x0

l3cache-mpamf.has_prop_s

Enable memory bandwidth proportional stride control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

Type

bool

Default value

0x0

l3cache-mpamf.has_ris

L3 Cache has resource instance selection support.

Type

bool

Default value

0x0

l3cache-mpamf.max_partid_ns

L3 Cache Maximum value of non-secure PARTID supported.

Type

int

Default value

0xffff

l3cache-mpamf.max_partid_rl

L3 Cache Maximum value of realm PARTID supported for RME implementations.

Type

int

Default value

0xffff

l3cache-mpamf.max_partid_rt

L3 Cache Maximum value of root PARTID supported for RME implementations.

Type

int

Default value

0xffff

l3cache-mpamf.max_partid_s

L3 Cache Maximum value of secure PARTID supported.

Type

int

Default value

0xffff

l3cache-mpamf.max_pmg_ns

L3 Cache Maximum value of non-secure PMG supported.

Type

int

Default value

0xff

l3cache-mpamf.max_pmg_rl

L3 Cache Maximum value of realm PMG supported for RME implementations.

Type

int

Default value

0xff

l3cache-mpamf.max_pmg_rt

L3 Cache Maximum value of root PMG supported for RME implementations.

Type

int

Default value

0xff

l3cache-mpamf.max_pmg_s

L3 Cache Maximum value of secure PMG supported.

Type

int

Default value

0xff

l3cache-mpamf.mbwu_long_counter_width

L3 Cache long MBWU counter width. 0: 63 bits, 1: 44 bits.

Type

int

Default value

0x0

l3cache-mpamf.no_impl_msmon

L3 Cache's MPAMF_IMPL_IDR does not describe resource monitors.

Type

bool

Default value

0x0

l3cache-mpamf.no_impl_part

L3 Cache's MPAMF_IMPL_IDR does not describe resource partitioning controls.

Type

bool

Default value

0x0

l3cache-mpamf.ris_max

L3 Cache's largest resource instance selector value defined.

Type

int

Default value

0x0

l3cache-mpamf_base

L3 Cache memory mapped MPAM registers base address

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_bus_width_in_bytes

L3 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x0

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x8

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

legacy_combining_exc_catch_trace

Whether exception catch is traced as part of exception entry/exit in same cycle

Type

bool

Default value

0x1

log2_trace_buffer_alignment

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib)

Type

int

Default value

0x0

ls64_ignore_s1_unpred_memattr_transformation

If true, stage 1 unpredictable memory attribute transformations are ignored for FEAT_LS64 single-copy atomic 64-byte load/store instructions' (FEAT_LS64, FEAT_LS64_V, FEAT_LS64_ACCDATA).

Type

bool

Default value

0x0

ls64_memtype_check_use_combined_memattr

If true, FEAT_LS64 single-copy atomic 64-byte load/store instructions' memory attributes check is done on the combined memory attributes at the end of all enabled translation stages.

Type

bool

Default value

0x0

max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, x:
[0:3] - All the levels below supplied ELx supports A32

Type

int

Default value

0x3

mdrar_el1_res0

MDRAR_EL1 is RES0.

Type

bool

Default value

0x0

mdselr_le_16_bps_wps_behaviour

Behaviour of MDSELR_EL1 and related traps/enables if fewer than 16 watchpoints and fewer than 16 breakpoints are implemented: 0 - MDSELR_EL1 is stateful 1 - MDSELR_EL1, EBWE, FGTS are RAZ/WI, traps and enables do not apply

Type

int

Default value

0x0

mec_support_level

0 -> Memory Encryption Contexts not implemented, 1 -> LEGACY_TZ_EN mode i.e. MEC register fields are stateful but only supports secure/non-secure states, 2 -> Memory Encryption Contexts fully implemented (FEAT_MEC).

Type

int

Default value

0x0

memory.acp.AxCACHE_mask

Used with memory.acp.AxCACHE_pattern to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.

Type

int

Default value

0x0

memory.acp.AxCACHE_pattern

Used with memory.acp.AxCACHE_mask to define which memory types the ACP port accepts. All transactions which do not satisfy (AxCACHE & mask) == pattern will abort.

Type

int

Default value

0x0

memory.l2_cache.is_inner_cacheable

L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes)

Type

bool

Default value

0x1

memory.l2_cache.is_inner_shareable

L2 cache obeys inner shareable attributes (rather than outer shareable attributes)

Type

bool

Default value

0x1

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented. 1, instructions and registers only are implemented (FEAT_MTE). 2, implemented (FEAT_MTE2). 3, implemented with asymmetric handling of exceptions (FEAT_MTE3). 4, implemented (FEAT_MTE4).

Type

int

Default value

0x0

mixed_endian

Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at ELO only.

Type

int

Default value

0x1

mops_cpy_block_size

Block size used for memcpy memory accesses

Type

int

Default value

0x40

mops_cpy_default_dir

Default direction for non-overlapping memcpy operations: 0, forwards. 1, backwards

Type

int

Default value

0x0

mops_cpy_handle_async_exceptions

Handle any pending async exceptions after copying a block of data, instead of waiting until instruction end.

Type

bool

Default value

0x0

mops_cpy_post_size

Percentage of data copied in memcpy 'E' instructions

Type

int

Default value

0xa

mops_cpy_pre_size

Percentage of data copied in memcpy 'P' instructions

Type

int

Default value

0xa

mops_cpy_pre_size_threshold

Size threshold in Bytes for CPY*P* instructions

Type

int

Default value

0x0

mops_cpy_single_access

Execute memcpy as a single read and single write access

Type

bool

Default value

0x0

mops_cpy_write_abort_before_read

Report the data aborts and watchpoint of the write accesses, before those of the read accesses

Type

bool

Default value

0x0

mops_cpy_zero_size_can_fault

Fault because of mismatched implementation option when the operation is of size 0.

Type

bool

Default value

0x1

mops_exec_order_can_fault

Enable exception on the Main/Epilogue instruction when executed after a mismatched Prologue/Main in a CPY/SET sequence, or after another random instruction

Type

bool

Default value

0x0

mops_inst_cpy_zero_size_can_fault

Fault because of mismatched implementation option when inst_cpy_size is 0

Type

bool

Default value

0x1

mops_inst_set_zero_size_can_fault

Fault because of mismatched implementation option when inst_set_size is 0

Type

bool

Default value

0x1

mops_mismatched_page_crossing_access_unpred

Constrained unpredictable behaviour for FEAT_MOPS instructions when crossing page boundary with different memory types, 0 : Memory block access uses the attributes of it's own address block 1: Alignment Fault

Type

int

Default value

0x0

mops_mmu_abort_far_aligned

If true, in case of an MMU abort on a MOPS instruction, report FAR aligned to current translation granule.

Type

bool

Default value

0x0

mops_set_block_size

Block size used for memset memory accesses

Type

int

Default value

0x40

mops_set_handle_async_exceptions

Handle any pending async exceptions after setting a block of data, instead of waiting until instruction end.

Type

bool

Default value

0x0

mops_set_post_size

Percentage of data copied in memset 'E' instructions

Type

int

Default value

0xa

mops_set_pre_size

Percentage of data copied in memset 'P' instructions

Type

int

Default value

0xa

mops_set_single_access

Execute memset as a single read and single write access

Type

bool

Default value

0x0

mops_set_zero_size_can_fault

Fault because of mismatched implementation option when the operation is of size 0.

Type

bool

Default value

0x1

mops_setg_unaligned_does_mismatch_fault

If true, in case of unaligned SETGM / SETGE, raise a mismatched memset exception because of impdef reasons, instead of alignment fault

Type

bool

Default value

0x0

mops_wp_far_behaviour

Set option for address stored in FAR/EDWARD after watchpoints hit by MOPS instructions

- 0 - FAR recorded matches lowest watchpointed address accessed by the instruction
- 1 - FAR recorded matches lowest address accessed by the instruction within same translation granule as watchpointed address
- 2 - FAR recorded matches highest watchpointed address accessed by the instruction that triggered the watchpoint

Type

int

Default value

0x0

mpam_force_ns_rao

Whether MPAM3_EL3.FORCE_NS bit is RAO/WI.

Type

bool

Default value

0x0

mpam_frac

MPAM fractional revision number in ID_AA64PFR1_EL1.MPAM_frac field. Combines with has_mpam to give the mpam version has_mpam = false, mpam_frac = 0 -> Not implemented has_mpam = false, mpam_frac = 1 -> FEAT_MPAMv0p1 has_mpam = true, mpam_frac = 0 -> FEAT_MPAMv1p0 has_mpam = true, mpam_frac = 1 -> FEAT_MPAMv1p1

Type

int

Default value

0x0

mpam_has_altsp

MPAM Whether MPAMIDR_EL1.HAS_ALTSP bit is set or clear

Type

bool

Default value

0x0

mpam_has_hcr

MPAM Whether MPAMIDR_EL1 HAS_HCR bit is set or clear

Type

bool

Default value

0x0

mpam_max_partid

MPAM Maximum PARTID Supported

Type

int

Default value

0xffff

mpam_max_pmg

MPAM Maximum PMG Supported

Type

int

Default value

0xff

mpam_max_vpmr

MPAM Maximum VPMR Supported

Type

int

Default value

0x0

mpamidr_has_force_ns

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

mpamidr_has_sdeflt

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

mpamidr_has_tidr

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

mpidr_layout

Layout of MPIDR. 0 AFF0 is CPUID, 1 AFF1 is CPUID

Type

int

Default value

0x0

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

mpmm_config

MPMMTUNE register value. The JSON schema is : { "DT_THR":0, "MPMM_G2_TP":2, "MPMM_G2_ATHR":100, "MPMM_G1_TP":2, "MPMM_G1_ATHR":75, "MPMM_GO_TP":2, "MPMM_GO_ATHR":50 } . The value given for threshold value is just an indication, not specific to any core. This parameter is used only when has_mpmm is set.

Type

string

Default value**mte_report_which_failed_address**

Set to "first", "last" or "random". Applicable only for MTE synchronous check. If "first" then report first failed address. If "last" then report the first address of last failed MTE granule or first address of transfer if it doesn't cross a granule boundary. If "random" then report the first address of a random failed MTE granule.

Type

string

Default value

first

mte_tminline

Value of CTR_ELO.TminLine for reading purpose only. A value configured using this does not indicate the presence of separate tag cache. 0, TminLine evaluated from smallest data cache line.

Type

int

Default value

0x0

mvbar_reset_is_rvbar

If true then the reset value of MVBAR is RVBAR, if false the reset value is UNKNOWN.

Type

bool

Default value

0x1

non_secure_vgic_alias_when_ns_only

If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).

Type

int

Default value

0x0

num_loregion_descriptors

Number of Limited Ordering Region descriptors implemented (if ARM v8.1 extensions are implemented) (FEAT_LOR).

Type

int

Default value

0x0

num_loregions

Number of Limited Ordering Regions implemented excluding background region (if ARM v8.1 extensions are implemented) (FEAT_LOR).

Type

int

Default value

0x0

number_of_abl_breakpoints

if FEAT_ABLE is implemented, Number of address matching breakpoints that support address linking.

Type

int

Default value

0x0

number_of_error_records

Cores Number of Error records supported for RAS

Type

int

Default value

0x0

optimal_alignment_size

Alignment boundary which does not incur additional performance penalty from ARMv8.5.

- 1, architectural misalignment is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]
- 2, access crossing 4 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]
- 3, access crossing 8 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]
- ... - 12, access crossing 4 Kbyte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11]

Type

int

Default value

0x1

output_attributes

User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.

Type

string

Default value

ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS

pacm_support_level

Implements PSTATE.PACM from ARMv9.5. 0: Not supported, 1: Trivial implementation when FEAT_PAuth_LR and FEAT_PACIMP are supported, 2: Full implementation when FEAT_PAuth_LR is supported.

Type

int

Default value

0x2

page_based_hardware_attributes

Implement the page based hardware attributes from ARMv8.2. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy (FEAT_HPDS2).

Type

int

Default value

0x0

par_ns_set_unknown_bit

Whether NS bit of PAR is set/clear when executing AT to perform non-secure regime translation. When true, NS is set to 1 else 0.

Type

bool

Default value

0x1

pfar_is_valid

IMPLEMENTATION DEFINED choice to configure ESR_ELx.PFV: whether PFAR_ELx is valid or UNKNOWN when ESR_ELx.PFV is not forced to be 0.

Type

bool

Default value

0x1

pfrr1_csv2_frac

Fractional revision number ID_AA64PFR1_EL1.CSV2_frac when ID_AA64PFR0_EL1.CSV==1 for CSV2 extension (FEAT_CSV2_1p1, FEAT_CSV2_1p2)

Type

int

Default value

0x0

pmb_idr_external_abort

Describes how the PE manages External aborts on writes made by the Statistical Profiling Extension to the Profiling Buffer. 0, External abort is reported to SPE, From Armv8.8 and Armv9.3, the value 0 is not permitted. 1, External abort is ignored. 2, The External abort generates an SError and the error is not reported to SPE.

Type

int

Default value

0x0

pmb_idr_flag_updates

Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state

Type

bool

Default value

0x1

pmcr_disable_events_export

If true, export for PMU events is disabled. This configures PMCFGR.EX field.

Type

bool

Default value

0x1

pmmir_ell_bus_slots

Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles. From v8.7 PMU extension

Type

int

Default value

0x0

pmmir_ell_bus_width

Width, in bytes, of accesses counted by BUS_ACCESS. From v8.7 PMU extension

Type

int

Default value

0x0

pms_idr_max_size

Defines largest size for a single SPE record (rounded up to a power of 2)

Type

int

Default value

0x6

pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x8

pmu_async_exception_delay

Configure PMU asynchronous exception delay in CPU cycles (FEAT_SEBEP)

Type

int

Default value

0x0

pmu_cycle_counter_counts_actual_cycles

If true and Timing annotation is enabled, PMU cycle counter counts actual cycles, otherwise counts instructions executed

Type

bool

Default value

0x0

pmu_has_chain_event

PMU (if present) implements event number 0x1e, CHAIN.

Type

bool

Default value

0x1

pmu_precise_events

"Configure v9.4 Precise PMU events. {"pmu_events":["SW_INCR", "PC_WRITE_RETIRED", "BR_RETIRED", "BR_IND_RETIRED", "BR_RETURN_RETIRED", "BR_RETURN_ANY_RETIRED", "BR_IND_TAKEN_RETIRED", "LD_RETIRED", "ST_RETIRED", "UNALIGNED_LD_ST", "INST_RETIRED", "EXCEP_TAKEN", "EXCEP_RETURN", "CHAIN"]}"

Type

string

Default value**pmu_threshold_bit_width**

Implement FEAT_PMUV3_TH and if so the width of PMEVTYPER<n>_ELO.TH in bits. 0, not implemented. 1-12 number of bits in PMEVTYPER<n>_ELO.TH.

Type

int

Default value

0x0

pseudo_fault_generation_feature_register

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

Type

string

Default value**pstate_ssbs_reset**

Reset value of pstate.ssbs

Type

bool

Default value

0x0

pstate_ssbs_type

Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS (FEAT_SSBS). 2, fully supported (FEAT_SSBS2).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

randomize_unknowns_at_reset

Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset

Type

bool

Default value

0x0

ras_aderr_anerr_controls_are_same

If true and FEAT_ADERR and FEAT_ANERR is implemented then ADERR and ANERR controls should always be set to the same value (FEAT_ADERR) (FEAT_ANERR)

Type

bool

Default value

0x0

ras_err_registers_undef_if_no_error_records

If true, all RAS error record registers, along with ERRSELR_EL1, will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.

Type

bool

Default value

0x0

ras_errselr_undef_if_no_error_records

If true, ERRSELR_EL1 will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.

Type

bool

Default value

0x0

ras_extra_configurations

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCn masks - these are 64 bit masks covering the 64 bit registers ERXMISCn_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}]

Type

string

Default value

ras_frac

0, No additional feature implemented. 1, Additional ERXMISC*, ERXPFG* registers and FaultInjection trap from RAS v1.1. implemented

Type

int

Default value

0x0

ras_log2_fault_granule_size

Log2 of the RAS fault granule size in KB.

Type

int

Default value

0x2

ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0x18

ras_report_aligned_pa_in_pfar

If true, the PFAR_ELx register reports the PA aligned to the RAS fault granule size on a sync external abort or SError exception.

Type

bool

Default value

0x0

register_reset_data

Data used to fill register bits when they become UNKNOWN at reset.

Type

int

Default value

0x0

register_reset_data_hi

Data used to fill the upper-half of 128-bit registers when the bits become UNKNOWN at reset.

Type

int

Default value

0x0

report_iside_cmo_ifsr

fault info for an iside cache maintenance operation is reported in the IFSR

Type

bool

Default value

0x1

report_second_access_align_fault_non_atomic_pair_access

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an alignment fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

Type

bool

Default value

0x0

report_second_access_mmu_fault_non_atomic_pair_access

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an MMU fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

Type

bool

Default value

0x0

reported_fp_revision

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored. Updates the FPSID.revision value

Type

int

Default value

0xffffffffffffffff

reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reserved_HMC_SSC_PAC_treated_disabled

When DBG[B|W]CR.{HMC,SSC,PAC} bits configuration is reserved, this parameter controls whether breakpoints/watchpoints are treated as Disabled or not

Type

bool

Default value

0x0

restore_fpsr_on_trapped_fp_exception

If true, FPSR is restored to the value of the FPSR immediately before the instruction that generated the trapped floating-point exception.

Type

bool

Default value

0x0

restriction_on_speculative_execution

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation), ID_AA64PFR0_EL1.CSV2: 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported) (FEAT_CSV2, FEAT_CSV2_2), 3: FEAT_CSV2_3 is supported

Type

int

Default value

0x0

restriction_on_speculative_execution_aarch32

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation), ID_PFR0.CSV2: 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context, 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context or at a different address in the same hardware described context (FEAT_CSV2, FEAT_CSV2_2).

Type

int

Default value

0x0

revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x0

rgsr_res0_stateful

Whether RGSr read of RES0 bits return last written value

Type

bool

Default value

0x0

rme_default_mecid_nonsecure

Default MECID value for NON-SECURE PAS

Type

int

Default value

0x0

rme_default_mecid_realm

Default MECID value for REALM PAS

Type

int

Default value

0x0

rme_default_mecid_root

Default MECID value for ROOT PAS

Type

int

Default value

0x0

rme_default_mecid_secure

Default MECID value for SECURE PAS

Type

int

Default value

0x0

rme_full_is_tagged_nsh_treated_as_tagged

Whether a tagged NonShared memory attribute is treated as tagged or not. Does nothing if effective RME support is not full

Type

bool

Default value

0x0

rme_level0_gpt_size

The range of address space protected by each entry in the level 0 GPT (0->1GB 1->16GB, 2->64GB, 3->512GB)

Type

int

Default value

0x0

rme_mecid_width

Width of MECID in bits

Type

int

Default value

0x1

rme_support_level

0 -> Realm management extension not implemented, 1 -> LEGACY_TZ_EN mode i.e. RME register fields are stateful but only supports secure/non-secure states, 2 -> Realm management extension fully implemented (FEAT_RME).

Type

int

Default value

0x0

rmr_always_implemented

Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.

Type

bool

Default value

0x0

rndr_rndrrs_seed

Initial seed for random engine used in RNDR register

Type

int

Default value

0x0

s1_align_memtype_fault_prio_more_than_s2_perm_fault_on_s1_walk

If true, s1 alignment fault has priority over s2 permission faults

Type

bool

Default value

0x1

scheduler_mode

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!

Type

int

Default value

0x0

scr_nET_writeable

Whether SCR.nET is writeable. Writing to it is purely cosmetic (nET behavior not implemented)

Type

bool

Default value

0x0

scramble_unknowns_at_reset

Will fill in unknown bits in registers at reset with register_reset_data

Type

bool

Default value

0x1

serror_clear_delay

Delay for clearing of SError if SError is level-triggered, in cpu cycles.

Type

int

Default value

0x0

set_mops_option

Set option for Armv8.8 SET(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B

Type

int

Default value

0x0

set_rasv10_for_armv84_and_higher

ARMv8.4 mandates RAS System Architecture v1.1, but when there are no error records and FEAT_DoubleFault is not implemented then there is no functional difference between the RAS System Architecture v1.0 (that is, the RAS extension as in pre-ARMv8.4 implementations) and the RAS System Architecture v1.1 (also known as FEAT_RASv1p1). This flag if true will set the RAS ID to declare RAS v1.0 rather than RAS v1.1 for ARMv8.4 and higher implementations. If this is set and the core does not conform to the restrictions then this parameter is ignored.

Type

bool

Default value

0x0

setg_mops_option

Set option for Armv8.8 SETG(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B

Type

int

Default value

0x0

skip_trace_on_write_to_oseccr_el1_when_oslock_is_unlocked

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an unknown value on reads and ignores writes. When true, also skips the traces on writes to OSECCR_EL1 when OSLSR_EL1.OSLK == 0.

Type

bool

Default value

0x0

spe_counter_size

Size of counter packet payload in Statistical Profiling Extension - 1, Counter packet payloads are 12-bit saturating counters - 2, Counter packet payloads are 16-bit saturating counters

Type

int

Default value

0x1

spmu_support_level

Implement System PMU: 0: Not supported, 1: v8.9 System PMU Extension is implemented (FEAT_SPMU), 2: v9.5 System PMU2 Extension is implemented (FEAT_SPMU2)

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

spsr_el3_is_mapped_to_spsr_mon

Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon

Type

bool

Default value

0x1

spsr_m4_res0

Whether SPSR_ELx.M[4] bit should be RES0 for AARCH64 only implementations

Type

bool

Default value

0x0

stage12_tlb_size

Number of stage1+2 tlb entries.

Type

int

Default value

0x80

stage1_tlb_size

Number of stage1 only tlb entries.

Type

int

Default value

0x0

stage1_walkcache_size

Number of stage1 only walk cache entries.

Type

int

Default value

0x0

stage2_tlb_size

Number of stage2 only tlb entries.

Type

int

Default value

0x0

stage2_walkcache_size

Number of stage2 only walk cache entries.

Type

int

Default value

0x0

statistical_profiling_buffer_alignment

Statistical profiling alignment constraint for sample buffer

Type

int

Default value

0x1

statistical_profiling_random_interval_is_separate

Statistical profiling random interval gets added to the main timer interval(false) or (true) runs as separate timer

Type

bool

Default value

0x0

statistical_profiling_recommended_min_sampling

Statistical profiling recommended minimum sampling interval

Type

int

Default value

0x100

stex_fail_suppress_sync_data_aborts

If true, synchronous data aborts are not reported if store exclusive fails

Type

bool

Default value

0x0

store_excl_fail_tag_check_action

Behavior of tag check by core when a store exclusive fails. 0, Tag check ignored, 1, Tag check done if exclusive fails by global monitor.

Type

int

Default value

0x0

strex_fail_can_hit_watchpoint

If true, a strex fail can hit watchpoint

Type

bool

Default value

0x0

stzgm_reports_fault_address_from_reg_arg

Which faulting address should be reported in FAR_ELx on a failed STZGM: 0: the lowest aligned addr to DCZID-log2-block-size, 1: the addr held in the register argument, 2: if it is a tag-check fault, the addr aligned to DCZID-log2-block-size, otherwise the addr held in the register argument.

Type

int

Default value

0x0

supports_multi_threading

Sets the MPIDR.MT bit. Setting this to true hints the the cluster is multi-threading compatible

Type

bool

Default value

0x0

sve.clear_constrained_lanes

When a constrained vector length increases, previously inaccessible bits are set to zero. Possible values are: 0=never, 1=always, 2=if the register was written to while the vector length was constrained

Type

int

Default value

0x0

sve.combine_movprfx_and_destructive

Attempt to combine the execution of MOVPRFX and the destructively-encoded instruction that follows it

Type

bool

Default value

0x0

sve.disable_speculative_accesses

All speculative memory accesses behave as though faulting, without accessing memory

Type

bool

Default value

0x0

sve.enable_at_reset

Start with system registers set up for Scalable Vector Extension use

Type

bool

Default value

0x0

sve.ffr_16b_pattern_UNKNOWN

A specific 16-bit UNKNOWN value that is used by parameter force_UNKNOWN_to_ffr.

Type

int

Default value

0x0

sve.force_UNKNOWN_to_ffr

Governs behavior if WRFFR writes a non-monotonic value to FFR. Possible values are: 0 - Write non-canonical value to FFR, 1 - Overwrite FFR with a specific pattern of 16-bit UNKNOWN value. See ffr_16b_pattern_UNKNOWN, 2 - Clear all bits above first zero 3 - Set all bits after first one

Type

int

Default value

0x0

sve.fp_exception_report_lowest

If true, for multiple trapped FP exceptions, report the lowest lane in VECITR. Otherwise, report the highest

Type

bool

Default value

0x0

sve.fp_exception_set_tfv

Set ESR_ELx.TFV during FP exception. Trapped exception flags are valid

Type

bool

Default value

0x1

sve.fp_exception_set_vecitr

If true, set ESR_ELx.VECITR during FP exception. Otherwise, set RES0.

Type

bool

Default value

0x0

sve.has_b16b16

Whether FEAT_SVE_B16B16 is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if either FEAT_SVE2 or FEAT_SME2 is implemented

Type

int

Default value

0x0

sve.has_sme

Whether SME is implemented (FEAT_SME)

Type

bool

Default value

0x0

sve.has_sme2

Whether SME2 is implemented (FEAT_SME2)

Type

bool

Default value

0x0

sve.has_sme_f16f16

Whether FEAT_SME_F16F16 is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if FEAT_SME2 is implemented

Type

int

Default value

0x0

sve.has_sme_f64f64

If SME is implemented, whether double-precision FMOPA and FMOPS are implemented

Type

int

Default value

0x1

sve.has_sme_f8f16

If SME2 is implemented, whether FEAT_SME_F8F16 is implemented

Type

int

Default value

0x1

sve.has_sme_f8f32

If SME2 is implemented, whether FEAT_SME_F8F32 is implemented

Type

int

Default value

0x1

sve.has_sme_fa64

Whether FEAT_SME_FA64 is implemented

Type

bool

Default value

0x0

sve.has_sme_i16i64

If SME is implemented, whether instructions that accumulate 16-bit integer outer products into 64-bit integer tiles are implemented

Type

int

Default value

0x1

sve.has_sme_lutv2

Whether FEAT_SME_LUTv2 is implemented

Type

bool

Default value

0x0

sve.has_sme_priority_control

Whether SME Priority Control is implemented

Type

bool

Default value

0x1

sve.has_sve2

Whether SVE2 is implemented (FEAT_SVE2).

Type

bool

Default value

0x0

sve.has_sve2_aes

If SVE2 is implemented, whether AES instructions are implemented. Possible values are:
0 - not implemented, 1 - SVE2 AESE, AESD, AESMC, and AESIMC are implemented (FEAT_SVE_AES), 2 - Same as 1 but in addition SVE2 PMULLB and PMULLT with 64-bit source are implemented (FEAT_SVE_PMULL128).

Type

int

Default value

0x2

sve.has_sve2_bit_perm

If SVE2 is implemented, whether BitPerm instructions are implemented (FEAT_SVE_BitPerm).

Type

bool

Default value

0x1

sve.has_sve2_sha3

If SVE2 is implemented, whether SHA3 instructions are implemented (FEAT_SVE_SHA3).

Type

bool

Default value

0x1

sve.has_sve2_sm4

If SVE2 is implemented, whether SM4 instructions are implemented (FEAT_SVE_SM4).

Type

bool

Default value

0x1

sve.has_sve_bf16

Whether SVE BFloat16 instructions are implemented

Type

bool

Default value

0x1

sve.has_sve_extended_bf16

Deprecated: to enable FEAT_EBF16, use CPU parameter has_ebf16. Whether Extended BFloat16 instructions are implemented. Possible values are: 0 - Disabled, 1 - Enabled if SME or SVE is implemented, 2 - Enabled if SME is implemented

Type

int

Default value

0x2

sve.has_sve_mm_f32

Whether the SVE FP32 Matrix Multiply instructions are implemented (FEAT_F32MM).

Type

bool

Default value

0x1

sve.has_sve_mm_f64

Whether the SVE FP64 Matrix Multiply instructions are implemented (FEAT_F64MM).

Type

bool

Default value

0x1

sve.has_sve_mm_i8

Whether the SVE Int8 Matrix Multiply instructions are implemented (FEAT_I8MM).

Type

bool

Default value

0x1

sve.movprfx_unpredictable_behavior

Defines the behavior of MOVPRFX and the instruction it immediately precedes when the behavior is CONSTRAINED UNPREDICTABLE. Possible values are: 0 - UNDEF execution from MOVPRFX, 1 - MOVPRFX and second half of instruction executes as NOP, 2 - NOP MOVPRFX only, 3 - UNDEF execution from MOVPRFX unless otherwise trapped

Type

int

Default value

0x0

sve.predicated_sp_align_check_behaviour

Governs behavior of SP alignment checking for predicated memory accesses. Possible values are: 0 - Always perform, 1 - Skip if governing predicate is 0, 2 - Skip for contiguous accesses if governing predicate is 0, 3 - Skip for gather/scatter accesses if governing predicate is 0

Type

int

Default value

0x0

sve.relax_sme_watchpoint_matching_16

Whether memory accesses through Z and P registers in Streaming Mode and all accesses through ZA match watchpoints rounded to 16-byte alignment

Type

bool

Default value

0x0

sve.relax_sve_watchpoint_matching_16

If FEAT_DEBUGv8p9 is implemented, whether memory accesses through Z and P registers outside Streaming Mode match watchpoints rounded to 16-byte alignment

Type

bool

Default value

0x0

sve.sm_tag_checked

Whether SME, SVE, and SIMD&FP load and store instructions executed when the PE is in Streaming SVE mode perform a Tag Check

Type

bool

Default value

0x1

sve.sme2_version

The version of SME2 if implemented. Possible values are: 0 - FEAT_SME2, 1 - FEAT_SME2p1

Type

int

Default value

0x0

sve.sme_only

If SME is implemented, whether SVE functionality is available only when SM=1

Type

bool

Default value

0x0

sve.sme_ssve_fp8_support_level

If FEAT_SME2 and FEAT_FP8 are implemented, whether FP8 operations are supported in Streaming Mode where not implemented outside Streaming Mode. Possible values are: 0 - No support above FEAT_FP8, 1 - FEAT_SSVE_F8FMA, 2 - FEAT_SSVE_F8DOT4, 3 - FEAT_SSVE_F8DOT2

Type

int

Default value

0x0

sve.sme_veclens_implemented

Which SME vector lengths are implemented. Represented as a bitfield where bit[n]==1 implies SME vector length of $128 \cdot 2^n$ bits is implemented

Type

int

Default value

0x7

sve.smidr_el1_implementer_val

The value of SMIDR_EL1.Implementer

Type

int

Default value

0x41

sve.smidr_el1_revision_val

The value of SMIDR_EL1.Revision

Type

int

Default value

0x0

sve.sve2_version

The version of SVE2 if implemented. Possible values are: 0 - FEAT_SVE2, 1 - FEAT_SVE2p1

Type

int

Default value

0x0

sve.sve_dabt_far_behaviour

Whether the FAR reported on a Data Abort is imprecise. Possible values are: 0 - FAR Precise, 1 - FAR not Precise on abort due to an SVE contiguous vector load/store in Streaming SVE mode, or an SME load/store. , 2 - As per 1, but only for predicated SVE/SME instructions.

Type

int

Default value

0x0

sve.sve_wp_far_behaviour

FAR reporting behavior on a Watchpoint debug exception. Possible values are: 0 - FAR Precise, 1 - FAR not Precise on abort due to an SVE contiguous vector load/store in Streaming SVE mode, or an SME load/store, 2 - FAR not valid on abort due to an SVE contiguous vector load/store in Streaming SVE mode, or an SME load/store, 3 - As per 1, but only for predicated SVE/SME instructions.

Type

int

Default value

0x0

sve.trace_za_tilewise

Whether tile-wise accesses to ZA are traced tile-wise rather than array-wise. Note: if false, column-wise accesses cause an event for every vector in the tile

Type

bool

Default value

0x1

sve.undef_invalid_combined_movprfx

If a combined MOVPRFX is invalid, raise an UNDEF exception. Otherwise, NOP the second half. This parameter is deprecated

Type

bool

Default value

0x1

sve.unknown_value

Simulated value for a state that has an UNKNOWN value after reset

Type

int

Default value

0xdeaddeaddeaddead

sve.vecLEN

SVE vector length in units of 64 bits

Type

int

Default value

0x8

sve.z_reg_on_load_fault_behaviour

Governs the behavior of destination Z-registers in case of a load fault. Possible values are: 0 - Register becomes UNKNOWN, 1 - Register is preserved

Type

int

Default value

0x0

sve.za_on_svl_increase_behaviour

Controls the state of the previously inaccessible portion of the ZA registers on SVL increase. Possible values are: 0 - Retain values, 1 - Zero ZA

Type

int

Default value

0x0

sve.za_tag_checked

Whether memory accesses due to SME LDR and STR instructions that access the SME ZA array perform a Tag Check

Type

bool

Default value

0x1

swp_with_xzr_is_st_atomic

If true, swp with dest as xzr is treated as store atomic

Type

bool

Default value

0x1

sync_ext_abort_is_sync_error

Treat synchronous external aborts as synchronous SErrors (RASv8.9). 0, synchronous external abort. 1, synchronous error.

Type

bool

Default value

0x0

system_pmu_id

When FEAT_SPMU is implemented, indicates the largest value *s* to select a System PMU <*s*>

Type

int

Default value

0x0

take_ccfail_tsc_trap

When take_ccfail_undef=1 this parameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.

Type

bool

Default value

0x0

take_ccfail_undef

UNDEF exception is taken even if condition code check fails

Type

bool

Default value

0x1

tcr_ps_reserved_value_size

Physical size treated when TCR.(I)PS is programmed with a reserved value. 0, 48 bits. 1, 52 bits. The parameter value is treated 0 if LPA is not supported.

Type

int

Default value

0x0

tcr_txsz_undersize_should_fault

If large VA is not supported, Whether undersized TxSZ value should generate translation fault

Type

bool

Default value

0x1

tdosa_traps_osdlr_if_no_os_double_lock

MDCR_EL*.TDOSA enables trap on OSDLR_EL1 and DBGOSDLR when OS double-lock is not implemented.

Type

bool

Default value

0x1

tidcp_traps_el0_undef_imp_def

TIDCP has priority over UNDEF for accesses to IMPLEMENTATION DEFINED functionality from EL0

Type

bool

Default value

0x1

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_or_ic_invalid_xt

Behavior of TLBI and IC instructions that don't take Xt as an argument when Xt != 0b11111.
0: TLBI and IC not UNDEF, 1: TLBI UNDEF, IC not UNDEF, 2: TLBI not UNDEF, IC UNDEF, 3: TLBI and IC UNDEF

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

tme_disable-read-write-set-optimizations

If true, disables the read/write set related optimizations of the model.

Type

bool

Default value

0x0

tme_imp-failures-can-retry

If true, IMP=1 failures introduced by the parameters: tme_wfe-fails-transactions tme_tcommit-fails-transactions tme_wakeup-from-wfe-always-fails-transactions will also report RTRY=1.

Type

bool

Default value

0x0

tme_implementation-type

Implementation type for TME.

The following options are available: 0x0: Always fail starting transactions with the IMP cause. 0x1: Fail on forbidden operations (e.g. some system register accesses) and at model's convenience. 0x2: As 0x1 but also enable inter PE memory conflict checking.

Type

int

Default value

0x0

tme_random-memory-access-fail-chance

If >0, add a pseudorandom chance for every memory access (loads, stores, TCOMMIT) inside a transaction to cause the transaction to fail with IMP.

Type

int

Default value

0x0

tme_read-set-size

Size of the transactional read set in bytes, rounded up to the nearest integer number of transaction granules. 0 == unlimited

Type

int

Default value

0x0

tme_support-only-guaranteed-mem-attr

If true, a transactional access to memory with a type not architecturally guaranteed to be supported will cause a transaction failure with IMP=1

Type

bool

Default value

0x0

tme_tcommit-fails-transactions

If true, executing TCOMMIT inside a transaction will cause it to fail with IMP=1

Type

bool

Default value

0x0

tme_wakeup-from-wfe-always-fails-transactions

If true, waking up from a WFE will always fail the transaction, even if not required

Type

bool

Default value

0x0

tme_wfe-fails-transactions

If true, executing WFE inside a transaction will cause it to fail with IMP=1

Type

bool

Default value

0x0

tme_write-set-size

Size of the transactional write set in bytes, rounded up to the nearest integer number of transaction granules. 0 == unlimited

Type

int

Default value

0x0

trace_full_simd_reg_with_nep

Whether full simd register is traced even if partial update is done when FPCR.NEP=1

Type

bool

Default value

0x0

trace_has_sysreg_access

ETM trace registers support access via system registers

Type

bool

Default value

0x1

trace_icc_registers_as_icv_when_redirected

If true, update trace with ICV, instead of ICC when ICV registers are accessed depending on the core state.

Type

bool

Default value

0x0

trace_physical_registers_when_host_virtualisation_enabled

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers)

Type

int

Default value

0x0

trap_dc_cmo_to_pou_if_nop

Whether traps to DC CMO operations to PoU are ignored if the same is treated as NOP.

Type

bool

Default value

0x1

trap_ic_cmo_to_pou_if_nop

Whether traps to IC CMO operations to PoU are ignored if the same is treated as NOP.

Type

bool

Default value

0x1

trap_reserved_group3_id_regs

Whether setting HCR_EL2.TID3 traps reserved group3 id registers.

Type

bool

Default value

0x0

trbe_cmod

TRBE Customer Modified.

Type

int

Default value

0x0

trbe_des

Designer, JEP106 identification code.

Type

int

Default value

0x0

trbe_external_abort_handling

Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer. (0->External abort is reported to TRBE. From Armv9.3, the value 0 is not

permitted and will be 1 if Armv9.3 is implemented. 1-> External abort is ignored. 2->The External abort generates an SError and the error is not reported to TRBE.)

Type

int

Default value

0x0

trbe_has_hardware_translation_table_update

If true, address translation performed by the Trace Buffer Extension manages the Access Flag and dirty state

Type

bool

Default value

0x1

trbe_implemented_version

Trace Buffer Extension implemented version, 1: FEAT_TRBE implemented (Armv9.0).

Type

int

Default value

0x1

trbe_mpam

TRBE MPAM support.

Type

int

Default value

0x0

trbe_part

Part number.

Type

int

Default value

0x0

trbe_partid_max

Largest permitted TRBDEVID1.PARTID value.

Type

int

Default value

0x0

trbe_pmg_max

Largest permitted TRBDEVID1.PMG value.

Type

int

Default value

0x0

trbe_revand

TRBE component minor revision.

Type

int

Default value

0x0

trbe_revision

TRBE architecture revision.

Type

int

Default value

0x0

treat-dcache-cmos-to-poc-as-nop

Whether dcache maintenance operations to the point of coherency are required for instruction to data coherence. 0 - Clean/Invalidate ops required, 1 - Clean/Invalidate ops not required and cannot generate faults, 2 - Clean/Invalidate ops not required but can generate faults

Type

int

Default value

0x0

treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

treat-dcache-invalidate-as-clean-invalidate

Treat data cache invalidate operations as clean and invalidate.

Type

bool

Default value

0x0

treat-icache-cmos-to-pou-as-nop

If has_coherent_icache is true, whether instruction cache invalidation operations to PoU which are treated as NOP can generate fault. 0 - cannot generate faults, 1 - can generate faults

Type

int

Default value

0x0

treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

treat_forced_normal_as_device_for_excl_atomics

Whether exclusive/atomic access is supported in same manner as access to device if stage1 is Device memory and final memory attribute forced to normal by FWB

Type

bool

Default value

0x0

treat_pld_as_nop

If true, treat PLD as NOP.

Type

bool

Default value

0x0

treat_pli_as_nop

If true, treat PLI as NOP.

Type

bool

Default value

0x0

treat_wfi_wfe_as_nop

If true, never go into wait state for WFI or WFE instructions.

Type

bool

Default value

0x0

truncate_pc_on_illegal_exception_return_to_aarch32

On Illegal ERET to AArch32, truncate PC to 32-bits

Type

bool

Default value

0x1

undef_ccsidr2_access_for_unimplemented_aarch32

Whether access to CCSIDR2 is undef if AArch32 is implemented or not at EL1

Type

bool

Default value

0x0

unification-level

Level of Unification Inner Shareable for the cache hierarchy

Type

int

Default value

0x1

unification-uniprocessor-level

Level of Unification Uniprocessor for the cache hierarchy

Type

int

Default value

0x1

unpred_LSE128_overlap

Constrained unpredictable behaviours for 128-bit LSE overlap. 1 Constraint_UNDEF, 2 Constraint_NOP

Type

int

Default value

0x1

unpred_brb_iall_or_inj_invalid_xt_behave_as_undef

If true, BRB IALL/INJ instruction will behave as UNDEFINED if Xt != 0b11111

Type

bool

Default value

0x0

unpred_clear_ISV_for_exception_before_software_step

Whether ESR_ELx.ISV bit is cleared/set, when it is constrained unpredictable due to a different exception before a software step exception.

Type

bool

Default value

0x0

unpred_edscr_ns_set_unknown_bit

Unknown(x) bit in NS field in EDSCR can be configure to 0 or 1.

Type

bool

Default value

0x0

unpred_edscr_rw_unknown_bits_read_as_1

Unknown(x) bits in RW field in EDSCR are read as 1 instead of 0.

Type

bool

Default value

0x0

unpred_edscr_status_read_as_no_syndrome

Controls the choice of EDSCR.STATUS bit-values, when it is constrained unpredictable behaviour due to a different exception before a halting step debug event.

Type

bool

Default value

0x0

unpred_extdbg_unknown_bits

Data used to fill only in UNKNOWN bit-fields of external debug registers e.g., EDPFR and EDDFR.

Type

int

Default value

0x0

unpred_load_single_reg_overlap_with_wb

Constrained unpredictable behaviours for single load with writeback(might impact certain load pair instructions) 0 Constraint_WBSUPPRESS, 1 Constraint_UNDEF, 2 Constraint_NOP

Type

int

Default value

0x0

unpred_mrsmsr_currentlymapped_undef

UNPREDICTABLE register access (accessible from current mode using different instruction) modeled as NOP when false and UNDEF when true

Type

bool

Default value

0x0

unpred_mrsmsr_protfailed_undef

UNPREDICTABLE register access (not accessible from current PL and security state) modeled as NOP when false and UNDEF when true

Type

bool

Default value

0x0

unpred_mte_stzgm_tag_operation_before_data

Whether Tag operations are performed before data operations for an STGZM instruction.

Type

bool

Default value

0x1

unpred_mte_tag_read_when_ata_controls_are_zero_or_untagged_attr

Constrained unpredictable for MTE tag read when ATA controls are 0 or untagged attribute. false, Read as zero. true, Permitted to generate an external abort if a read of data from the same address would generate an external abort.

Type

bool

Default value

0x0

unpred_mte_tag_store_data_cache_instr_to_device_mem_as_alignment_fault

Constrained unpredictable choice for MTE instructions which store tags (on DC instructions) to memory locations marked as Device. false, Storing the data, if any, to the locations. true, Generating an Alignment Fault.

Type

bool

Default value

0x0

unpred_mte_tag_store_to_device_mem_as_alignment_fault

Constrained unpredictable choice for STZGM instruction which store tags to memory locations marked as Device. false, Storing the data, if any, to the locations. true, Generating an Alignment Fault.

Type

bool

Default value

0x0

unpred_nested_virtualization_nv_behaviour

Constrained unpredictable choices for HCR_EL2.NV=0 and HCR_EL2.NV1=1 with respect to nested virtualization - 0, Behave as defined in the specification as per bit values - 1, Behave as if HCR_EL2.NV=1 and HCR_EL2.NV1=1 for all purpose other than reading back HCR_EL2.NV - 2, Behave as if HCR_EL2.NV=0 and HCR_EL2.NV1=0 for all purpose other than reading back HCR_EL2.NV1

Type

int

Default value

0x0

unpred_par_attr_returns_mair

If true, PAR_EL1.ATTR represents the memory attributes as per the MAIR value instead of the ones in the descriptor.

Type

bool

Default value

0x0

unpred_sctlr_c_0_taggable_behaviour

Controls unpredictable effects when SCTLTR_ELx.C=0 for a stage 1 translation regime on whether memory is treated as taggable. Values: 0=Tagged, 1=Untagged but forced to Tagged when FWB=1 and stage 2 restores WB, 2 = Untagged

Type

int

Default value

0x2

unpred_store_exclusive_base_overlap

Constrained unpredictable behaviours for store exclusive when s==n. 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP

Type

int

Default value

0x0

unpred_store_pair_and_single_reg_overlap_with_wb

Constrained unpredictable behaviours for pair and single store with writeback(doesn't cover store exclusive) 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP

Type

int

Default value

0x0

unpred_tlbis_not_in_monitor_mode

Constrained unpredictable behaviors for AArch32 TLBI instructions executed in secure privileged mode other than Monitor mode. 0: Preferred behavior (default), 1: UNDEF, 2: NOP, 3: execute as if had been executed in Monitor mode

Type

int

Default value

0x0

unpred_tsize_aborts

Behaviour when TSize is out of range. 0, force into range. 1, translation fault, forces unpred_tsize_pamax_aborts to 1.

Type

bool

Default value

0x0

unpred_tsize_pamax_aborts

Behaviour when stage 2 TSize exceeds the physical address size (or 40bits, from AArch32). 0, force into range. 1, translation fault. Ignored if unpred_tsize_aborts is 1.

Type

bool

Default value

0x0

unpred_vnchr_el2_ress_mismatch

Constrained unpredictable choices when bits marked as RESS do not all have the same value for VNCR_EL2 - 0, Generating an EL2 translation regime translation abort on use of the VNCR_EL2 register - 1, Reserved sign extended bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register - 2, Reserved sign extended bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes

Type

int

Default value

0x0

unpred_zero_spsr_btype

Constrained unpredictable control to make SPSR_ELx.BTYPE 0 instead of PSTATE.BTYPE on synchronous exceptions other than Software Step, PC alignment fault, Instruction Abort, Breakpoint or Address Matching Vector Catch, Illegal Execution State, BRK instruction, Branch Target

Type

bool

Default value

0x1

unpredictable_exclusive_abort_memtype

Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable)

Type

int

Default value

0x0

unpredictable_hvc_behaviour

HVC unpredictable behaviour. 0, UNDEF. 1, NOP.

Type

int

Default value

0x0

unpredictable_smc_behaviour

SMC unpredictable behaviour. 0, UNDEF. 1, NOP.

Type

int

Default value

0x0

unpredictable_wfet_and_wfit_behaviour

WFET and WFIT unpredictable behaviour in debug state. 0, UNDEFINED. 1, NOP.

Type

int

Default value

0x1

unsupported_atomic_fault_type

Type of fault reported on unsupported atomic access. 0 = external abort if any reported by interconnect, 1 = precise unsupported atomic fault, 2 = precise external abort, 3 = imprecise external abort.

Type

int

Default value

0x0

unsupported_hw_update_fault_type

Type of abort reported when hw update to descriptor is done using unsupported memtype (0=No abort, 1=IMPDEF abort caused by memtype, 2=Sync external abort)

Type

int

Default value

0x0

use_Xt_as_LDG_STG_input

Use new MTE Instructions formats for LDG/ST(Z)(2)G, which use Xt as an input

Type

bool

Default value

0x1

use_architectural_names

Use names SP/LR/PC instead of R13/R14/R15

Type

bool

Default value

0x0

use_mte_eac_02_instructions_encoding

Use new MTE Instructions encoding since MTE spec EAC 0.2 in ARMv8.5.

Type

bool

Default value

0x1

use_mte_eac_08_tfsr_encoding

Use new MTE TFSR_ELx encodings since MTE spec EAC 0.8 in ARMv8.5.

Type

bool

Default value

0x1

use_rosetta_disass

Use Rosetta disassembly library.

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

Type

int

Default value

0x1

use_sif_to_compute_pan

Where FEAT_PAN3 is implemented, whether SCR_EL3.SIF bit is used to determine instruction access permission for the purpose of PAN

Type

bool

Default value

0x0

use_stage1_sh_as_input_to_stage2

IMPDEF case of whether to use stage1 shareability or OuterShareable as input to stage2 if stage1 is Device memtype

Type

bool

Default value

0x0

use_tlb_contig_hint

Translation table entries with the contiguous hint bit set generate large TLB entries.

Type

bool

Default value

0x0

user_defined_rom_table_debug_power_config

User defined ROM Table debug power domains for ED,CTI,PMU and TRACE, and DBGPCR configuration. The "version" field and "cores" array are mandatory. The "dbgpcr" array, if provided, must contain unique integers in the range [0, 32) describing which debug power domains have power control implemented. The "rom" and "dbgpcr" fields in objects in the "cores" array are only allowed when 'debug_rom_is_flat' is false. All power domain ID fields ("rom", "ed/pmu", "cti", "etm") must be in the range [0, 32). The "ed/pmu" field is mandatory. Example JSON for a hierarchical debug ROM layout: '{"version": 0, "dbgpcr": [0, 1], "cores": [{"dbgpcr": [1, 31], "rom": 0, "ed/pmu": 0, "cti": 31, "etm": 1}, {"ed/pmu": 0}]}'

Type

string

Default value**vpu_datapath_width**

VPU data path width

Type

int

Default value

0x80

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

warn_unpredictable_in_v7

If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning

Type

bool

Default value

0x1

watchpoint-log2secondary_restriction

log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.

Type

int

Default value

0x0

wfe_wakeup_delay

Configure WFE wakeup delay in CPU cycles

Type

int

Default value

0x0

wfi_wakeup_delay

Configure WFI wakeup delay in CPU cycles

Type

int

Default value

0x0

wnr_is_read_for_s2f_on_s1_atomic_instr_fault

Whether WnR is 0 for stage2 fault on stage1 for atomic instructions

Type

bool

Default value

0x0

wnr_is_read_for_s2f_on_s1_dbm_update

Whether WnR is 0 for stage2 fault on stage1 descriptor dbm update

Type

bool

Default value

0x0

wp_ignores_dbm_update

If true, dbm update is ignored on watchpoint hit

Type

bool

Default value

0x0

wp_num_reporting

When reporting of the watchpoint number on Watchpoint Exceptions and Debug Events is performed 0 - When FEAT_Debugv8p9 is implemented or otherwise required 1 - When FEAT_Debugv8p9 or FEAT_SME is implemented

Type

int

Default value

0x0

3.5.3 ARMAEMv8MCT

ARMAEMv8MCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-182: IP revisions support

Revision	Quality level
v8.0M	Full support
v8.1M	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMAEMv8MCT

This model has the following Iris instances:

Table 3-183: ARMAEMv8MCT Iris instances

InstanceName	ComponentName
ARMAEMv8MCT	ARM_AEMv8M
ARMAEMv8MCT.acp_mapper	PVBusMapper
ARMAEMv8MCT.ext_bus	PVBusLogger
ARMAEMv8MCT.ext_bus.mapper	PVBusMapper
ARMAEMv8MCT.l1_incoherent_interconnect	PVCache
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMAEMv8MCT.l1dcache	PVCache
ARMAEMv8MCT.l1dcache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l1icache	PVCache
ARMAEMv8MCT.l1icache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-184: ARMAEMv8MCT MTI instances

InstanceName	ComponentName
ARMAEMv8MCT	ARM_AEMv8M
ARMAEMv8MCT.acp_mapper	PVBusMapper
ARMAEMv8MCT.ext_bus	PVBusLogger
ARMAEMv8MCT.ext_bus.mapper	PVBusMapper
ARMAEMv8MCT.l1_incoherent_interconnect	PVCache
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[0]	PVBusSlave

InstanceName	ComponentName
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMAEMv8MCT.l1dcache	PVCache
ARMAEMv8MCT.l1dcache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l1icache	PVCache
ARMAEMv8MCT.l1icache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l2_flusher	AsyncCacheFlushUnit

ARMAEMv8MCT contains the following CADI targets:

- ARM_AEMv8M

Ports for ARMAEMv8MCT

Table 3-185: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
ahbp_m	PVBus	Master	The core will generate Vendor System data accesses on this port.
ahbs	PVBus	Slave	External master (e.g. DMA) can write TCMs (whether or not enabled in xTCMCR).
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
coproc_bus	CoprocBusProtocol	Slave	Co-Processor Interface
cpuwait	Signal	Slave	When this signal is HIGH out of reset, it forces the processor into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven LOW.

Name	Protocol	Type	Description
currpri	Value	Master	Current execution priority.
dap_s	PVBus	Slave	Debug Access Port (DAP).
dbgen	Signal	Slave	Invasive debug enable.
dbgrestart	Signal	Slave	External debug request.
dbgrestarted	Signal	Master	External debug request.
edbgrq	Signal	Slave	External debug request.
etm_reset	Signal	Slave	Separate reset for ETM, if param "has_etm_reset" is true.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
halted	Signal	Master	External debug request.
idau	PVBus	Master	The core will generate IDAU Bus request.
idau_invalidate_region	Value_64	Slave	64 bit number to invalid IDAU memory range (start_address<<32 end_address)
initpahben	Signal	Slave	Enable P-AHB on the next reset
initvtor_ns	Value	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initvtor_s	Value	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
intisr[496]	Signal	Slave	This signal array delivers signals to the NVIC.
intnmi	Signal	Slave	Configure non maskable interrupt.
intnum	Value	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
lockdcaic	Signal	Slave	-
locknsmpu	Signal	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	Signal	Slave	Disable writes to VTOR_NS

Name	Protocol	Type	Description
lockpahb	Signal	Slave	P-AHB related ports Disable writes to PAHBCR
locksau	Signal	Slave	Disable writes to the SAU_* registers
locksmpu	Signal	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	Signal	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINIS
lockup	Signal	Master	Asserted when the processor is in lockup state.
niden	Signal	Slave	Non-invasive debug enable.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbush_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
spiden	Signal	Slave	Secure invasive debug enable.
spniden	Signal	Slave	Secure non-invasive debug enable.
stcalib[2]	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARMAEMv8MCT

AFSR_type

0:No AFSR, 1:state-only 2:Many bits set from (im)precise aborts on AXI, TCM, etc

Type

int

Default value

0x1

AIRCR.BFHFNMINIS_reset

If true, set the bit after reset (as if by IMP_DEF mechanism). Ignored if SECEXT=false

Type

bool

Default value

0x0

AIRCR.BFHFNMINIS_writable

Is AIRCR.BFHFNMINIS bit[13] writeable

Type

bool

Default value

0x1

AIRCR.ENDIANNESS

Initialize processor to big endian mode

Type

bool

Default value

0x0

AIRCR.PRIS_writable

Is AIRCR.PRIS bit[14] writeable

Type

bool

Default value

0x1

AIRCR.VECTCLRACTIVE_changes_mode

Asserting AIRCR.VECTCLRACTIVE clears IPSR and any active exceptions. The mode is also changed to thread if this flag is true. Ignored for v8-M

Type

bool

Default value

0x1

AIRCR_NS.DIT_reset

If true and AIRCR_NS.DIT_writable==0, set the bit after reset (as if by IMP_DEF mechanism)

Type

bool

Default value

0x1

AIRCR_NS.DIT_writable

Is AIRCR_NS.DIT bit[4] writeable

Type

bool

Default value

0x1

AIRCR_S.DIT_reset

If true and AIRCR_S.DIT_writable==0, set the bit after reset (as if by IMP_DEF mechanism)

Type

bool

Default value

0x1

AIRCR_S.DIT_writable

Is AIRCR_S.DIT bit[4] writeable

Type

bool

Default value

0x1

BB_PRESENT

Enable bitbanding

Type

bool

Default value

0x0

BEATS_PER_TICK

Number of beats from each in-flight vector instruction executed in 1 tick (1,2 or 4).

Type

int

Default value

0x2

BF_is_nop

BF instruction executes as NOP, even if we have LO_BRANCH_INFO.

Type

bool

Default value

0x1

CCR.BP

Reset value of the Configuration and Control Register's branch prediction enable bit

Type

bool

Default value

0x1

CCR.BP_writable

Whether it is possible to modify the Configuration and Control Register's branch prediction enable bit

Type

bool

Default value

0x0

CDEMAPPEDONCP

Bit N specifies whether the instruction for coprocessor N (CP7:CP0) is redirected to the CDE module

Type

int

Default value

0xff

CDERTLID

Value of ID_AFR0.CDERTLID

Type

int

Default value

0x20

CFGMEMALIAS

Memory address alias bit for the ITCM, DTCM and P-AHB regions. 0=No alias, 1=Alias bit 24, 2=Alias bit 25, 4=Alias bit 26, 8=Alias bit 27, 16=Alias bit 28

Type

int

Default value

0x0

CFGNOCDECP

Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor

Type

int

Default value

0x0

CFGPAHBSZ

Size of the P-AHB peripheral port memory region. 0=P-AHB disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB

Type

int

Default value

0x0

CPNSPRESENT

Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state

Type

int

Default value

0xff

CPSPPRESENT

Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state

Type

int

Default value

0xff

CPUID

Set SCS CPUID Base Register. If set to zero, a default CPUID is used.

Type

int

Default value

0x0

CTI

CTI (Cross Trigger Interface) included

Type

bool

Default value

0x0

CTI_irq0_pin

CTI interrupt request 0 pin

Type

int

Default value

0x4

CTI_irq1_pin

CTI interrupt request 1 pin

Type

int

Default value

0x5

DTGU

DTCM Security Gate Unit included

Type

bool

Default value

0x0

DTGUBLKSZ

DTCM gate unit block size. Size=pow(2, DTGUBLKSZ + 5) bytes

Type

int

Default value

0x3

DTGUMAXBLKS

Maximum number of DTCM gate unit blocks. Number of blocks=pow(2, DTGUMAXBLKS)

Type

int

Default value

0x0

DWT_CTRL.NOCYCCNT

DWT cycle-counter not present (v8M_bl/v6M never have one).

Type

bool

Default value

0x0

DWT_CTRL.NOPRFCNT

DWT performance-counters not present (v8M_bl/v6M never have them).

Type

bool

Default value

0x0

DWT_CTRL.NUMCOMP

Number of watchpoint unit comparators implemented

Type

int

Default value

0x4

DWT_DEVARCH.REVISION

0: V2, 1: V2.1.

Type

int

Default value

0x1

DWT_FUNCTION0.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION0. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0xb

DWT_FUNCTION1.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION1. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0x1e

DWT_FUNCTION10.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION10. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0xb

DWT_FUNCTION11.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION11. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0x1e

DWT_FUNCTION12.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION12. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0xb

DWT_FUNCTION13.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION13. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0x1e

DWT_FUNCTION14.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION14. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0xb

DWT_FUNCTION15.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION15. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0x1e

DWT_FUNCTION2.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION2. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0xb

DWT_FUNCTION3.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION3.
If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0x1e

DWT_FUNCTION4.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION4.
If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0xb

DWT_FUNCTION5.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION5.
If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0x1e

DWT_FUNCTION6.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION6.
If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0xb

DWT_FUNCTION7.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION7.
If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0x1e

DWT_FUNCTION8.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION8. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0xb

DWT_FUNCTION9.ID

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION9. If 'baseline' is set, invalid ID bits are cleared

Type

int

Default value

0x1e

DWT_TRACE

Support for DWT trace, controls the DWT_CTRL.NOTRCPKT bit. false : No DWT trace included, true: DWT trace included

Type

bool

Default value

0x1

DWT_VMASK_reset_data

DWT_VMASK register reset value

Type

int

Default value

0x0

ERRDEVID.NUM

RAS: Number of implemented error record indexes, 0 to 56.

Type

int

Default value

0x38

FPB_HAS_LSR

FPB has LAR and LSR for software lock if mainline

Type

bool

Default value

0x1

FP_CTRL.NUM_CODE

Number of breakpoint unit comparators implemented (limited to 15 in V6M or baseline)

Type

int

Default value

0x8

FP_CTRL.NUM_LIT

How many Literals FPB supports remapping (ignored if baseline or TZM)

Type

int

Default value

0x0

FP_REMAP.RMPSPT

FPB supports remapping (ignored if baseline or SECEXT)

Type

bool

Default value

0x1

ID_DFR0.Debug_Model_M_profile

Set whether debug extensions are implemented

Type

bool

Default value

0x1

ID_ISAR0.CmpBranch

Support for Compare and Branch instructions. 1 = Supports CBNZ and CBZ instructions; 3 = Supports non-predicated low overhead looping (WLS, DLS, LE, and LC) and branch future (BF, BFX, BFL, BFLX, and BFCSEL) instructions.

Type

int

Default value

0x3

ID_ISAR0.coproc_instrs

Supported Coprocessor instructions 0: None 1: CDP, LDC, MCR, MRC, and STC instructions
2: As for 1, and CDP2, LDC2, MCR2, MRC2, and STC2 instructions 3: As for 2, and MCRR
and MRRC instructions 4: As for 2, and MCRR and MRRC instructions

Type

int

Default value

0x4

ID_ISAR1.extend_instrs

level of support for extend instructions

Type

int

Default value

0x2

ID_ISAR1.interwork_instrs

level of support for Interworking instructions

Type

int

Default value

0x2

ID_ISAR2.MultiAccessInt

level of support for interruptible multi-access instructions

Type

int

Default value

0x2

ID_ISAR2.multS_instrs

level of support for advanced signed Multiply instructions

Type

int

Default value

0x3

ID_ISAR2.multU_instrs

level of support for advanced unsigned Multiply instructions

Type

int

Default value

0x2

ID_ISAR3.SIMD_instrs

level of support for SIMD instructions

Type

int

Default value

0x3

ID_ISAR3.saturate_instrs

level of support for saturate instructions

Type

int

Default value

0x1

ID_ISAR3.synchprim_instrs

level of support for synchronization primitives ID_ISAR3

Type

int

Default value

0x1

ID_ISAR4.synchPrim_instrs_frac

level of support for synchronization primitives ID_ISAR4

Type

int

Default value

0x3

ID_ISAR4.unpriv_instrssupported unprivileged instructions 0: None 1: LDRBT, LDRT, STRBT, and STRT instructions
2: As for 1, and LDRHT, LDRSBT, LDRSHT, and STRHT instructions**Type**

int

Default value

0x2

ID_ISAR4.withshifts_instrs

level of support for instructions with shifts

Type

int

Default value

0x3

ID_ISAR5.PACBTI

0: PAC/BTI not implemented, 1: PAC implemented using the QARMA5 algorithm with BTI, 2: PAC implemented using an IMP DEF algorithm with BTI, 4: PAC implemented using the QARMA3 algorithm with BTI

Type

int

Default value

0x0

ID_MMFR0.Auxiliary_registers

Auxiliary registers bits in ID_MMFR0, indicate the support for Auxiliary registers

Type

bool

Default value

0x1

ID_MMFR0.Outermost_shareability

Outermost shareability bits in ID_MMFR0, indicate the outermost shareability domain implemented

Type

int

Default value

0x0

ID_MMFR0.ShareLvl

Shareability levels bits in ID_MMFR0, indicate the number of Shareability levels implemented

Type

int

Default value

0x1

INITPAHBEN

The P-AHB enable state at reset

Type

bool

Default value

0x0

INITVTOR_NS

Non-Secure vector-table offset at reset

Type

int

Default value

0x0

INITVTOR_S

Secure vector-table offset at reset

Type

int

Default value

0x0

IOP

Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in

Type

bool

Default value

0x0

IRQDIS0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0]

Type

int

Default value

0x0

IRQDIS1

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32]

Type

int

Default value

0x0

IRQDIS10

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320]

Type

int

Default value

0x0

IRQDIS11

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352]

Type

int

Default value

0x0

IRQDIS12

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384]

Type

int

Default value

0x0

IRQDIS13

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416]

Type

int

Default value

0x0

IRQDIS14

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448]

Type

int

Default value

0x0

IRQDIS15

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+480]

Type

int

Default value

0x0

IRQDIS2

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64]

Type

int

Default value

0x0

IRQDIS3

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96]

Type

int

Default value

0x0

IRQDIS4

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128]

Type

int

Default value

0x0

IRQDIS5

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160]

Type

int

Default value

0x0

IRQDIS6

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192]

Type

int

Default value

0x0

IRQDIS7

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224]

Type

int

Default value

0x0

IRQDIS8

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256]

Type

int

Default value

0x0

IRQDIS9

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288]

Type

int

Default value

0x0

ITGU

ITCM Security Gate Unit included

Type

bool

Default value

0x0

ITGUBLKSZ

ITCM gate unit block size. Size=pow(2, ITGUBLKSZ + 5) bytes

Type

int

Default value

0x3

ITGUMAXBLKS

Maximum number of ITCM gate unit blocks. Number of blocks=pow(2, ITGUMAXBLKS)

Type

int

Default value

0x0

ITM

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included (unless baseline)

Type

bool

Default value

0x1

ITM_HAS_LSR

ITM support LAR and LSR for software lock

Type

bool

Default value

0x1

LOCKDTGU

Lock down of Data TGU registers write

Type

bool

Default value

0x0

LOCKITGU

Lock down of Instruction TGU registers write

Type

bool

Default value

0x0

LOCKTCM

Lock down of TCM registers write

Type

bool

Default value

0x0

LOCK_NS_MPU

Lock down of Non-Secure MPU registers write

Type

bool

Default value

0x0

LOCK_SAU

Lock down of SAU registers write

Type

bool

Default value

0x0

LOCK_S_MPU

Lock down of Secure MPU registers write

Type

bool

Default value

0x0

LVL_WIDTH

Number of bits of interrupt priority (baseline has 2)

Type

int

Default value

0x3

MEMORY_REGION_MASK

Read/Write Mask for MPU_RBAR, MPU_RLAR, SAU_RBAR, SAU_RLAR. Bits[4:0] of this parameter are ignored

Type

int

Default value

0xffffffff

MPU_TYPE_NS.DREGION

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions

Type

int

Default value

0x10

MPU_TYPE_S.DREGION

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored

Type

int

Default value

0x10

MVE

Set whether the model has MVE support. If FPU = 0: 0=MVE not included, 1=Integer subset of MVE included. If FPU = 1: 0=MVE not included, 1=Integer subset of MVE included, 2=Integer and half and single precision floating point MVE included

Type

int

Default value

0x2

MVFR0.Double-precision

Support 8-byte floats

Type

bool

Default value

0x1

MVFR1.FP16

FP extension implements half-precision floating-point operations. 0 = Not supported; 1 = Supported.

Type

bool

Default value

0x1

MVFR1.FPHP

FP extension implements half-precision floating-point conversion instructions. 0x1: Half-precision to single-precision, 0x2: As for 0x1 and also half-precision to double-precision

Type

int

Default value

0x2

MVFR1.MVE

DEPRECATED: Use parameter MVE instead

Type

int

Default value

0x2

NUM_IRQ

Number of user interrupts

Type

int

Default value

0x10

NVIC_ITNS0

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS1**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS10**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS11**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value

NVIC_ITNS12

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS13**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS14**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS15**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS2**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS3**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS4**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS5**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS6**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value

NVIC_ITNS7

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS8**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**NVIC_ITNS9**

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure

Type

string

Default value**REGISTER_POP_ORDER**

Order in which the registers are popped off the stack during exception return. A comma separated list of register names and ranges.

Type

string

Default value

R4-R11,R0-R3,R12,R14,RETURN_ADDR,CPSR,S0-S15,FPSCR,PADDING,S16-S31

REGISTER_PUSH_ORDER

Order in which the registers are pushed on to the stack during exception handling. A comma separated list of register names and ranges.

Type

string

Default value

R0-R3,R12,R14,RETURN_ADDR,CPSR,S0-S15,FPSCR,PADDING,S16-S31

SAU_CTRL.ALLNS

At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set

Type

bool

Default value

0x0

SAU_CTRL.ENABLE

Enable SAU at reset

Type

bool

Default value

0x0

SAU_REGION0.BADDR

Base address of SAU region0 at reset

Type

int

Default value

0x0

SAU_REGION0.ENABLE

Enable SAU region0 at reset

Type

bool

Default value

0x0

SAU_REGION0.LADDR

Limit address of SAU region0 at reset

Type

int

Default value

0x0

SAU_REGION0.NSC

Set NSC for SAU region0 at reset

Type

bool

Default value

0x0

SAU_REGION1.BADDR

Base address of SAU region1 at reset

Type

int

Default value

0x0

SAU_REGION1.ENABLE

Enable SAU region1 at reset

Type

bool

Default value

0x0

SAU_REGION1.LADDR

Limit address of SAU region1 at reset

Type

int

Default value

0x0

SAU_REGION1.NSC

Set NSC for SAU region1 at reset

Type

bool

Default value

0x0

SAU_REGION10.BADDR

Base address of SAU region10 at reset

Type

int

Default value

0x0

SAU_REGION10.ENABLE

Enable SAU region10 at reset

Type

bool

Default value

0x0

SAU_REGION10.LADDR

Limit address of SAU region10 at reset

Type

int

Default value

0x0

SAU_REGION10.NSC

Set NSC for SAU region10 at reset

Type

bool

Default value

0x0

SAU_REGION100.BADDR

Base address of SAU region100 at reset

Type

int

Default value

0x0

SAU_REGION100.ENABLE

Enable SAU region100 at reset

Type

bool

Default value

0x0

SAU_REGION100.LADDR

Limit address of SAU region100 at reset

Type

int

Default value

0x0

SAU_REGION100.NSC

Set NSC for SAU region100 at reset

Type

bool

Default value

0x0

SAU_REGION101.BADDR

Base address of SAU region101 at reset

Type

int

Default value

0x0

SAU_REGION101.ENABLE

Enable SAU region101 at reset

Type

bool

Default value

0x0

SAU_REGION101.LADDR

Limit address of SAU region101 at reset

Type

int

Default value

0x0

SAU_REGION101.NSC

Set NSC for SAU region101 at reset

Type

bool

Default value

0x0

SAU_REGION102.BADDR

Base address of SAU region102 at reset

Type

int

Default value

0x0

SAU_REGION102.ENABLE

Enable SAU region102 at reset

Type

bool

Default value

0x0

SAU_REGION102.LADDR

Limit address of SAU region102 at reset

Type

int

Default value

0x0

SAU_REGION102.NSC

Set NSC for SAU region102 at reset

Type

bool

Default value

0x0

SAU_REGION103.BADDR

Base address of SAU region103 at reset

Type

int

Default value

0x0

SAU_REGION103.ENABLE

Enable SAU region103 at reset

Type

bool

Default value

0x0

SAU_REGION103.LADDR

Limit address of SAU region103 at reset

Type

int

Default value

0x0

SAU_REGION103.NSC

Set NSC for SAU region103 at reset

Type

bool

Default value

0x0

SAU_REGION104.BADDR

Base address of SAU region104 at reset

Type

int

Default value

0x0

SAU_REGION104.ENABLE

Enable SAU region104 at reset

Type

bool

Default value

0x0

SAU_REGION104.LADDR

Limit address of SAU region104 at reset

Type

int

Default value

0x0

SAU_REGION104.NSC

Set NSC for SAU region104 at reset

Type

bool

Default value

0x0

SAU_REGION105.BADDR

Base address of SAU region105 at reset

Type

int

Default value

0x0

SAU_REGION105.ENABLE

Enable SAU region105 at reset

Type

bool

Default value

0x0

SAU_REGION105.LADDR

Limit address of SAU region105 at reset

Type

int

Default value

0x0

SAU_REGION105.NSC

Set NSC for SAU region105 at reset

Type

bool

Default value

0x0

SAU_REGION106.BADDR

Base address of SAU region106 at reset

Type

int

Default value

0x0

SAU_REGION106.ENABLE

Enable SAU region106 at reset

Type

bool

Default value

0x0

SAU_REGION106.LADDR

Limit address of SAU region106 at reset

Type

int

Default value

0x0

SAU_REGION106.NSC

Set NSC for SAU region106 at reset

Type

bool

Default value

0x0

SAU_REGION107.BADDR

Base address of SAU region107 at reset

Type

int

Default value

0x0

SAU_REGION107.ENABLE

Enable SAU region107 at reset

Type

bool

Default value

0x0

SAU_REGION107.LADDR

Limit address of SAU region107 at reset

Type

int

Default value

0x0

SAU_REGION107.NSC

Set NSC for SAU region107 at reset

Type

bool

Default value

0x0

SAU_REGION108.BADDR

Base address of SAU region108 at reset

Type

int

Default value

0x0

SAU_REGION108.ENABLE

Enable SAU region108 at reset

Type

bool

Default value

0x0

SAU_REGION108.LADDR

Limit address of SAU region108 at reset

Type

int

Default value

0x0

SAU_REGION108.NSC

Set NSC for SAU region108 at reset

Type

bool

Default value

0x0

SAU_REGION109.BADDR

Base address of SAU region109 at reset

Type

int

Default value

0x0

SAU_REGION109.ENABLE

Enable SAU region109 at reset

Type

bool

Default value

0x0

SAU_REGION109.LADDR

Limit address of SAU region109 at reset

Type

int

Default value

0x0

SAU_REGION109.NSC

Set NSC for SAU region109 at reset

Type

bool

Default value

0x0

SAU_REGION11.BADDR

Base address of SAU region11 at reset

Type

int

Default value

0x0

SAU_REGION11.ENABLE

Enable SAU region11 at reset

Type

bool

Default value

0x0

SAU_REGION11.LADDR

Limit address of SAU region11 at reset

Type

int

Default value

0x0

SAU_REGION11.NSC

Set NSC for SAU region11 at reset

Type

bool

Default value

0x0

SAU_REGION110.BADDR

Base address of SAU region110 at reset

Type

int

Default value

0x0

SAU_REGION110.ENABLE

Enable SAU region110 at reset

Type

bool

Default value

0x0

SAU_REGION110.LADDR

Limit address of SAU region110 at reset

Type

int

Default value

0x0

SAU_REGION110.NSC

Set NSC for SAU region110 at reset

Type

bool

Default value

0x0

SAU_REGION111.BADDR

Base address of SAU region111 at reset

Type

int

Default value

0x0

SAU_REGION111.ENABLE

Enable SAU region111 at reset

Type

bool

Default value

0x0

SAU_REGION111.LADDR

Limit address of SAU region111 at reset

Type

int

Default value

0x0

SAU_REGION111.NSC

Set NSC for SAU region111 at reset

Type

bool

Default value

0x0

SAU_REGION112.BADDR

Base address of SAU region112 at reset

Type

int

Default value

0x0

SAU_REGION112.ENABLE

Enable SAU region112 at reset

Type

bool

Default value

0x0

SAU_REGION112.LADDR

Limit address of SAU region112 at reset

Type

int

Default value

0x0

SAU_REGION112.NSC

Set NSC for SAU region112 at reset

Type

bool

Default value

0x0

SAU_REGION113.BADDR

Base address of SAU region113 at reset

Type

int

Default value

0x0

SAU_REGION113.ENABLE

Enable SAU region113 at reset

Type

bool

Default value

0x0

SAU_REGION113.LADDR

Limit address of SAU region113 at reset

Type

int

Default value

0x0

SAU_REGION113.NSC

Set NSC for SAU region113 at reset

Type

bool

Default value

0x0

SAU_REGION114.BADDR

Base address of SAU region114 at reset

Type

int

Default value

0x0

SAU_REGION114.ENABLE

Enable SAU region114 at reset

Type

bool

Default value

0x0

SAU_REGION114.LADDR

Limit address of SAU region114 at reset

Type

int

Default value

0x0

SAU_REGION114.NSC

Set NSC for SAU region114 at reset

Type

bool

Default value

0x0

SAU_REGION115.BADDR

Base address of SAU region115 at reset

Type

int

Default value

0x0

SAU_REGION115.ENABLE

Enable SAU region115 at reset

Type

bool

Default value

0x0

SAU_REGION115.LADDR

Limit address of SAU region115 at reset

Type

int

Default value

0x0

SAU_REGION115.NSC

Set NSC for SAU region115 at reset

Type

bool

Default value

0x0

SAU_REGION116.BADDR

Base address of SAU region116 at reset

Type

int

Default value

0x0

SAU_REGION116.ENABLE

Enable SAU region116 at reset

Type

bool

Default value

0x0

SAU_REGION116.LADDR

Limit address of SAU region116 at reset

Type

int

Default value

0x0

SAU_REGION116.NSC

Set NSC for SAU region116 at reset

Type

bool

Default value

0x0

SAU_REGION117.BADDR

Base address of SAU region117 at reset

Type

int

Default value

0x0

SAU_REGION117.ENABLE

Enable SAU region117 at reset

Type

bool

Default value

0x0

SAU_REGION117.LADDR

Limit address of SAU region117 at reset

Type

int

Default value

0x0

SAU_REGION117.NSC

Set NSC for SAU region117 at reset

Type

bool

Default value

0x0

SAU_REGION118.BADDR

Base address of SAU region118 at reset

Type

int

Default value

0x0

SAU_REGION118.ENABLE

Enable SAU region118 at reset

Type

bool

Default value

0x0

SAU_REGION118.LADDR

Limit address of SAU region118 at reset

Type

int

Default value

0x0

SAU_REGION118.NSC

Set NSC for SAU region118 at reset

Type

bool

Default value

0x0

SAU_REGION119.BADDR

Base address of SAU region119 at reset

Type

int

Default value

0x0

SAU_REGION119.ENABLE

Enable SAU region119 at reset

Type

bool

Default value

0x0

SAU_REGION119.LADDR

Limit address of SAU region119 at reset

Type

int

Default value

0x0

SAU_REGION119.NSC

Set NSC for SAU region119 at reset

Type

bool

Default value

0x0

SAU_REGION12.BADDR

Base address of SAU region12 at reset

Type

int

Default value

0x0

SAU_REGION12.ENABLE

Enable SAU region12 at reset

Type

bool

Default value

0x0

SAU_REGION12.LADDR

Limit address of SAU region12 at reset

Type

int

Default value

0x0

SAU_REGION12.NSC

Set NSC for SAU region12 at reset

Type

bool

Default value

0x0

SAU_REGION120.BADDR

Base address of SAU region120 at reset

Type

int

Default value

0x0

SAU_REGION120.ENABLE

Enable SAU region120 at reset

Type

bool

Default value

0x0

SAU_REGION120.LADDR

Limit address of SAU region120 at reset

Type

int

Default value

0x0

SAU_REGION120.NSC

Set NSC for SAU region120 at reset

Type

bool

Default value

0x0

SAU_REGION121.BADDR

Base address of SAU region121 at reset

Type

int

Default value

0x0

SAU_REGION121.ENABLE

Enable SAU region121 at reset

Type

bool

Default value

0x0

SAU_REGION121.LADDR

Limit address of SAU region121 at reset

Type

int

Default value

0x0

SAU_REGION121.NSC

Set NSC for SAU region121 at reset

Type

bool

Default value

0x0

SAU_REGION122.BADDR

Base address of SAU region122 at reset

Type

int

Default value

0x0

SAU_REGION122.ENABLE

Enable SAU region122 at reset

Type

bool

Default value

0x0

SAU_REGION122.LADDR

Limit address of SAU region122 at reset

Type

int

Default value

0x0

SAU_REGION122.NSC

Set NSC for SAU region122 at reset

Type

bool

Default value

0x0

SAU_REGION123.BADDR

Base address of SAU region123 at reset

Type

int

Default value

0x0

SAU_REGION123.ENABLE

Enable SAU region123 at reset

Type

bool

Default value

0x0

SAU_REGION123.LADDR

Limit address of SAU region123 at reset

Type

int

Default value

0x0

SAU_REGION123.NSC

Set NSC for SAU region123 at reset

Type

bool

Default value

0x0

SAU_REGION124.BADDR

Base address of SAU region124 at reset

Type

int

Default value

0x0

SAU_REGION124.ENABLE

Enable SAU region124 at reset

Type

bool

Default value

0x0

SAU_REGION124.LADDR

Limit address of SAU region124 at reset

Type

int

Default value

0x0

SAU_REGION124.NSC

Set NSC for SAU region124 at reset

Type

bool

Default value

0x0

SAU_REGION125.BADDR

Base address of SAU region125 at reset

Type

int

Default value

0x0

SAU_REGION125.ENABLE

Enable SAU region125 at reset

Type

bool

Default value

0x0

SAU_REGION125.LADDR

Limit address of SAU region125 at reset

Type

int

Default value

0x0

SAU_REGION125.NSC

Set NSC for SAU region125 at reset

Type

bool

Default value

0x0

SAU_REGION126.BADDR

Base address of SAU region126 at reset

Type

int

Default value

0x0

SAU_REGION126.ENABLE

Enable SAU region126 at reset

Type

bool

Default value

0x0

SAU_REGION126.LADDR

Limit address of SAU region126 at reset

Type

int

Default value

0x0

SAU_REGION126.NSC

Set NSC for SAU region126 at reset

Type

bool

Default value

0x0

SAU_REGION127.BADDR

Base address of SAU region127 at reset

Type

int

Default value

0x0

SAU_REGION127.ENABLE

Enable SAU region127 at reset

Type

bool

Default value

0x0

SAU_REGION127.LADDR

Limit address of SAU region127 at reset

Type

int

Default value

0x0

SAU_REGION127.NSC

Set NSC for SAU region127 at reset

Type

bool

Default value

0x0

SAU_REGION128.BADDR

Base address of SAU region128 at reset

Type

int

Default value

0x0

SAU_REGION128.ENABLE

Enable SAU region128 at reset

Type

bool

Default value

0x0

SAU_REGION128.LADDR

Limit address of SAU region128 at reset

Type

int

Default value

0x0

SAU_REGION128.NSC

Set NSC for SAU region128 at reset

Type

bool

Default value

0x0

SAU_REGION129.BADDR

Base address of SAU region129 at reset

Type

int

Default value

0x0

SAU_REGION129.ENABLE

Enable SAU region129 at reset

Type

bool

Default value

0x0

SAU_REGION129.LADDR

Limit address of SAU region129 at reset

Type

int

Default value

0x0

SAU_REGION129.NSC

Set NSC for SAU region129 at reset

Type

bool

Default value

0x0

SAU_REGION13.BADDR

Base address of SAU region13 at reset

Type

int

Default value

0x0

SAU_REGION13.ENABLE

Enable SAU region13 at reset

Type

bool

Default value

0x0

SAU_REGION13.LADDR

Limit address of SAU region13 at reset

Type

int

Default value

0x0

SAU_REGION13.NSC

Set NSC for SAU region13 at reset

Type

bool

Default value

0x0

SAU_REGION130.BADDR

Base address of SAU region130 at reset

Type

int

Default value

0x0

SAU_REGION130.ENABLE

Enable SAU region130 at reset

Type

bool

Default value

0x0

SAU_REGION130.LADDR

Limit address of SAU region130 at reset

Type

int

Default value

0x0

SAU_REGION130.NSC

Set NSC for SAU region130 at reset

Type

bool

Default value

0x0

SAU_REGION131.BADDR

Base address of SAU region131 at reset

Type

int

Default value

0x0

SAU_REGION131.ENABLE

Enable SAU region131 at reset

Type

bool

Default value

0x0

SAU_REGION131.LADDR

Limit address of SAU region131 at reset

Type

int

Default value

0x0

SAU_REGION131.NSC

Set NSC for SAU region131 at reset

Type

bool

Default value

0x0

SAU_REGION132.BADDR

Base address of SAU region132 at reset

Type

int

Default value

0x0

SAU_REGION132.ENABLE

Enable SAU region132 at reset

Type

bool

Default value

0x0

SAU_REGION132.LADDR

Limit address of SAU region132 at reset

Type

int

Default value

0x0

SAU_REGION132.NSC

Set NSC for SAU region132 at reset

Type

bool

Default value

0x0

SAU_REGION133.BADDR

Base address of SAU region133 at reset

Type

int

Default value

0x0

SAU_REGION133.ENABLE

Enable SAU region133 at reset

Type

bool

Default value

0x0

SAU_REGION133.LADDR

Limit address of SAU region133 at reset

Type

int

Default value

0x0

SAU_REGION133.NSC

Set NSC for SAU region133 at reset

Type

bool

Default value

0x0

SAU_REGION134.BADDR

Base address of SAU region134 at reset

Type

int

Default value

0x0

SAU_REGION134.ENABLE

Enable SAU region134 at reset

Type

bool

Default value

0x0

SAU_REGION134.LADDR

Limit address of SAU region134 at reset

Type

int

Default value

0x0

SAU_REGION134.NSC

Set NSC for SAU region134 at reset

Type

bool

Default value

0x0

SAU_REGION135.BADDR

Base address of SAU region135 at reset

Type

int

Default value

0x0

SAU_REGION135.ENABLE

Enable SAU region135 at reset

Type

bool

Default value

0x0

SAU_REGION135.LADDR

Limit address of SAU region135 at reset

Type

int

Default value

0x0

SAU_REGION135.NSC

Set NSC for SAU region135 at reset

Type

bool

Default value

0x0

SAU_REGION136.BADDR

Base address of SAU region136 at reset

Type

int

Default value

0x0

SAU_REGION136.ENABLE

Enable SAU region136 at reset

Type

bool

Default value

0x0

SAU_REGION136.LADDR

Limit address of SAU region136 at reset

Type

int

Default value

0x0

SAU_REGION136.NSC

Set NSC for SAU region136 at reset

Type

bool

Default value

0x0

SAU_REGION137.BADDR

Base address of SAU region137 at reset

Type

int

Default value

0x0

SAU_REGION137.ENABLE

Enable SAU region137 at reset

Type

bool

Default value

0x0

SAU_REGION137.LADDR

Limit address of SAU region137 at reset

Type

int

Default value

0x0

SAU_REGION137.NSC

Set NSC for SAU region137 at reset

Type

bool

Default value

0x0

SAU_REGION138.BADDR

Base address of SAU region138 at reset

Type

int

Default value

0x0

SAU_REGION138.ENABLE

Enable SAU region138 at reset

Type

bool

Default value

0x0

SAU_REGION138.LADDR

Limit address of SAU region138 at reset

Type

int

Default value

0x0

SAU_REGION138.NSC

Set NSC for SAU region138 at reset

Type

bool

Default value

0x0

SAU_REGION139.BADDR

Base address of SAU region139 at reset

Type

int

Default value

0x0

SAU_REGION139.ENABLE

Enable SAU region139 at reset

Type

bool

Default value

0x0

SAU_REGION139.LADDR

Limit address of SAU region139 at reset

Type

int

Default value

0x0

SAU_REGION139.NSC

Set NSC for SAU region139 at reset

Type

bool

Default value

0x0

SAU_REGION14.BADDR

Base address of SAU region14 at reset

Type

int

Default value

0x0

SAU_REGION14.ENABLE

Enable SAU region14 at reset

Type

bool

Default value

0x0

SAU_REGION14.LADDR

Limit address of SAU region14 at reset

Type

int

Default value

0x0

SAU_REGION14.NSC

Set NSC for SAU region14 at reset

Type

bool

Default value

0x0

SAU_REGION140.BADDR

Base address of SAU region140 at reset

Type

int

Default value

0x0

SAU_REGION140.ENABLE

Enable SAU region140 at reset

Type

bool

Default value

0x0

SAU_REGION140.LADDR

Limit address of SAU region140 at reset

Type

int

Default value

0x0

SAU_REGION140.NSC

Set NSC for SAU region140 at reset

Type

bool

Default value

0x0

SAU_REGION141.BADDR

Base address of SAU region141 at reset

Type

int

Default value

0x0

SAU_REGION141.ENABLE

Enable SAU region141 at reset

Type

bool

Default value

0x0

SAU_REGION141.LADDR

Limit address of SAU region141 at reset

Type

int

Default value

0x0

SAU_REGION141.NSC

Set NSC for SAU region141 at reset

Type

bool

Default value

0x0

SAU_REGION142.BADDR

Base address of SAU region142 at reset

Type

int

Default value

0x0

SAU_REGION142.ENABLE

Enable SAU region142 at reset

Type

bool

Default value

0x0

SAU_REGION142.LADDR

Limit address of SAU region142 at reset

Type

int

Default value

0x0

SAU_REGION142.NSC

Set NSC for SAU region142 at reset

Type

bool

Default value

0x0

SAU_REGION143.BADDR

Base address of SAU region143 at reset

Type

int

Default value

0x0

SAU_REGION143.ENABLE

Enable SAU region143 at reset

Type

bool

Default value

0x0

SAU_REGION143.LADDR

Limit address of SAU region143 at reset

Type

int

Default value

0x0

SAU_REGION143.NSC

Set NSC for SAU region143 at reset

Type

bool

Default value

0x0

SAU_REGION144.BADDR

Base address of SAU region144 at reset

Type

int

Default value

0x0

SAU_REGION144.ENABLE

Enable SAU region144 at reset

Type

bool

Default value

0x0

SAU_REGION144.LADDR

Limit address of SAU region144 at reset

Type

int

Default value

0x0

SAU_REGION144.NSC

Set NSC for SAU region144 at reset

Type

bool

Default value

0x0

SAU_REGION145.BADDR

Base address of SAU region145 at reset

Type

int

Default value

0x0

SAU_REGION145.ENABLE

Enable SAU region145 at reset

Type

bool

Default value

0x0

SAU_REGION145.LADDR

Limit address of SAU region145 at reset

Type

int

Default value

0x0

SAU_REGION145.NSC

Set NSC for SAU region145 at reset

Type

bool

Default value

0x0

SAU_REGION146.BADDR

Base address of SAU region146 at reset

Type

int

Default value

0x0

SAU_REGION146.ENABLE

Enable SAU region146 at reset

Type

bool

Default value

0x0

SAU_REGION146.LADDR

Limit address of SAU region146 at reset

Type

int

Default value

0x0

SAU_REGION146.NSC

Set NSC for SAU region146 at reset

Type

bool

Default value

0x0

SAU_REGION147.BADDR

Base address of SAU region147 at reset

Type

int

Default value

0x0

SAU_REGION147.ENABLE

Enable SAU region147 at reset

Type

bool

Default value

0x0

SAU_REGION147.LADDR

Limit address of SAU region147 at reset

Type

int

Default value

0x0

SAU_REGION147.NSC

Set NSC for SAU region147 at reset

Type

bool

Default value

0x0

SAU_REGION148.BADDR

Base address of SAU region148 at reset

Type

int

Default value

0x0

SAU_REGION148.ENABLE

Enable SAU region148 at reset

Type

bool

Default value

0x0

SAU_REGION148.LADDR

Limit address of SAU region148 at reset

Type

int

Default value

0x0

SAU_REGION148.NSC

Set NSC for SAU region148 at reset

Type

bool

Default value

0x0

SAU_REGION149.BADDR

Base address of SAU region149 at reset

Type

int

Default value

0x0

SAU_REGION149.ENABLE

Enable SAU region149 at reset

Type

bool

Default value

0x0

SAU_REGION149.LADDR

Limit address of SAU region149 at reset

Type

int

Default value

0x0

SAU_REGION149.NSC

Set NSC for SAU region149 at reset

Type

bool

Default value

0x0

SAU_REGION15.BADDR

Base address of SAU region15 at reset

Type

int

Default value

0x0

SAU_REGION15.ENABLE

Enable SAU region15 at reset

Type

bool

Default value

0x0

SAU_REGION15.LADDR

Limit address of SAU region15 at reset

Type

int

Default value

0x0

SAU_REGION15.NSC

Set NSC for SAU region15 at reset

Type

bool

Default value

0x0

SAU_REGION150.BADDR

Base address of SAU region150 at reset

Type

int

Default value

0x0

SAU_REGION150.ENABLE

Enable SAU region150 at reset

Type

bool

Default value

0x0

SAU_REGION150.LADDR

Limit address of SAU region150 at reset

Type

int

Default value

0x0

SAU_REGION150.NSC

Set NSC for SAU region150 at reset

Type

bool

Default value

0x0

SAU_REGION151.BADDR

Base address of SAU region151 at reset

Type

int

Default value

0x0

SAU_REGION151.ENABLE

Enable SAU region151 at reset

Type

bool

Default value

0x0

SAU_REGION151.LADDR

Limit address of SAU region151 at reset

Type

int

Default value

0x0

SAU_REGION151.NSC

Set NSC for SAU region151 at reset

Type

bool

Default value

0x0

SAU_REGION152.BADDR

Base address of SAU region152 at reset

Type

int

Default value

0x0

SAU_REGION152.ENABLE

Enable SAU region152 at reset

Type

bool

Default value

0x0

SAU_REGION152.LADDR

Limit address of SAU region152 at reset

Type

int

Default value

0x0

SAU_REGION152.NSC

Set NSC for SAU region152 at reset

Type

bool

Default value

0x0

SAU_REGION153.BADDR

Base address of SAU region153 at reset

Type

int

Default value

0x0

SAU_REGION153.ENABLE

Enable SAU region153 at reset

Type

bool

Default value

0x0

SAU_REGION153.LADDR

Limit address of SAU region153 at reset

Type

int

Default value

0x0

SAU_REGION153.NSC

Set NSC for SAU region153 at reset

Type

bool

Default value

0x0

SAU_REGION154.BADDR

Base address of SAU region154 at reset

Type

int

Default value

0x0

SAU_REGION154.ENABLE

Enable SAU region154 at reset

Type

bool

Default value

0x0

SAU_REGION154.LADDR

Limit address of SAU region154 at reset

Type

int

Default value

0x0

SAU_REGION154.NSC

Set NSC for SAU region154 at reset

Type

bool

Default value

0x0

SAU_REGION155.BADDR

Base address of SAU region155 at reset

Type

int

Default value

0x0

SAU_REGION155.ENABLE

Enable SAU region155 at reset

Type

bool

Default value

0x0

SAU_REGION155.LADDR

Limit address of SAU region155 at reset

Type

int

Default value

0x0

SAU_REGION155.NSC

Set NSC for SAU region155 at reset

Type

bool

Default value

0x0

SAU_REGION156.BADDR

Base address of SAU region156 at reset

Type

int

Default value

0x0

SAU_REGION156.ENABLE

Enable SAU region156 at reset

Type

bool

Default value

0x0

SAU_REGION156.LADDR

Limit address of SAU region156 at reset

Type

int

Default value

0x0

SAU_REGION156.NSC

Set NSC for SAU region156 at reset

Type

bool

Default value

0x0

SAU_REGION157.BADDR

Base address of SAU region157 at reset

Type

int

Default value

0x0

SAU_REGION157.ENABLE

Enable SAU region157 at reset

Type

bool

Default value

0x0

SAU_REGION157.LADDR

Limit address of SAU region157 at reset

Type

int

Default value

0x0

SAU_REGION157.NSC

Set NSC for SAU region157 at reset

Type

bool

Default value

0x0

SAU_REGION158.BADDR

Base address of SAU region158 at reset

Type

int

Default value

0x0

SAU_REGION158.ENABLE

Enable SAU region158 at reset

Type

bool

Default value

0x0

SAU_REGION158.LADDR

Limit address of SAU region158 at reset

Type

int

Default value

0x0

SAU_REGION158.NSC

Set NSC for SAU region158 at reset

Type

bool

Default value

0x0

SAU_REGION159.BADDR

Base address of SAU region159 at reset

Type

int

Default value

0x0

SAU_REGION159.ENABLE

Enable SAU region159 at reset

Type

bool

Default value

0x0

SAU_REGION159.LADDR

Limit address of SAU region159 at reset

Type

int

Default value

0x0

SAU_REGION159.NSC

Set NSC for SAU region159 at reset

Type

bool

Default value

0x0

SAU_REGION16.BADDR

Base address of SAU region16 at reset

Type

int

Default value

0x0

SAU_REGION16.ENABLE

Enable SAU region16 at reset

Type

bool

Default value

0x0

SAU_REGION16.LADDR

Limit address of SAU region16 at reset

Type

int

Default value

0x0

SAU_REGION16.NSC

Set NSC for SAU region16 at reset

Type

bool

Default value

0x0

SAU_REGION160.BADDR

Base address of SAU region160 at reset

Type

int

Default value

0x0

SAU_REGION160.ENABLE

Enable SAU region160 at reset

Type

bool

Default value

0x0

SAU_REGION160.LADDR

Limit address of SAU region160 at reset

Type

int

Default value

0x0

SAU_REGION160.NSC

Set NSC for SAU region160 at reset

Type

bool

Default value

0x0

SAU_REGION161.BADDR

Base address of SAU region161 at reset

Type

int

Default value

0x0

SAU_REGION161.ENABLE

Enable SAU region161 at reset

Type

bool

Default value

0x0

SAU_REGION161.LADDR

Limit address of SAU region161 at reset

Type

int

Default value

0x0

SAU_REGION161.NSC

Set NSC for SAU region161 at reset

Type

bool

Default value

0x0

SAU_REGION162.BADDR

Base address of SAU region162 at reset

Type

int

Default value

0x0

SAU_REGION162.ENABLE

Enable SAU region162 at reset

Type

bool

Default value

0x0

SAU_REGION162.LADDR

Limit address of SAU region162 at reset

Type

int

Default value

0x0

SAU_REGION162.NSC

Set NSC for SAU region162 at reset

Type

bool

Default value

0x0

SAU_REGION163.BADDR

Base address of SAU region163 at reset

Type

int

Default value

0x0

SAU_REGION163.ENABLE

Enable SAU region163 at reset

Type

bool

Default value

0x0

SAU_REGION163.LADDR

Limit address of SAU region163 at reset

Type

int

Default value

0x0

SAU_REGION163.NSC

Set NSC for SAU region163 at reset

Type

bool

Default value

0x0

SAU_REGION164.BADDR

Base address of SAU region164 at reset

Type

int

Default value

0x0

SAU_REGION164.ENABLE

Enable SAU region164 at reset

Type

bool

Default value

0x0

SAU_REGION164.LADDR

Limit address of SAU region164 at reset

Type

int

Default value

0x0

SAU_REGION164.NSC

Set NSC for SAU region164 at reset

Type

bool

Default value

0x0

SAU_REGION165.BADDR

Base address of SAU region165 at reset

Type

int

Default value

0x0

SAU_REGION165.ENABLE

Enable SAU region165 at reset

Type

bool

Default value

0x0

SAU_REGION165.LADDR

Limit address of SAU region165 at reset

Type

int

Default value

0x0

SAU_REGION165.NSC

Set NSC for SAU region165 at reset

Type

bool

Default value

0x0

SAU_REGION166.BADDR

Base address of SAU region166 at reset

Type

int

Default value

0x0

SAU_REGION166.ENABLE

Enable SAU region166 at reset

Type

bool

Default value

0x0

SAU_REGION166.LADDR

Limit address of SAU region166 at reset

Type

int

Default value

0x0

SAU_REGION166.NSC

Set NSC for SAU region166 at reset

Type

bool

Default value

0x0

SAU_REGION167.BADDR

Base address of SAU region167 at reset

Type

int

Default value

0x0

SAU_REGION167.ENABLE

Enable SAU region167 at reset

Type

bool

Default value

0x0

SAU_REGION167.LADDR

Limit address of SAU region167 at reset

Type

int

Default value

0x0

SAU_REGION167.NSC

Set NSC for SAU region167 at reset

Type

bool

Default value

0x0

SAU_REGION168.BADDR

Base address of SAU region168 at reset

Type

int

Default value

0x0

SAU_REGION168.ENABLE

Enable SAU region168 at reset

Type

bool

Default value

0x0

SAU_REGION168.LADDR

Limit address of SAU region168 at reset

Type

int

Default value

0x0

SAU_REGION168.NSC

Set NSC for SAU region168 at reset

Type

bool

Default value

0x0

SAU_REGION169.BADDR

Base address of SAU region169 at reset

Type

int

Default value

0x0

SAU_REGION169.ENABLE

Enable SAU region169 at reset

Type

bool

Default value

0x0

SAU_REGION169.LADDR

Limit address of SAU region169 at reset

Type

int

Default value

0x0

SAU_REGION169.NSC

Set NSC for SAU region169 at reset

Type

bool

Default value

0x0

SAU_REGION17.BADDR

Base address of SAU region17 at reset

Type

int

Default value

0x0

SAU_REGION17.ENABLE

Enable SAU region17 at reset

Type

bool

Default value

0x0

SAU_REGION17.LADDR

Limit address of SAU region17 at reset

Type

int

Default value

0x0

SAU_REGION17.NSC

Set NSC for SAU region17 at reset

Type

bool

Default value

0x0

SAU_REGION170.BADDR

Base address of SAU region170 at reset

Type

int

Default value

0x0

SAU_REGION170.ENABLE

Enable SAU region170 at reset

Type

bool

Default value

0x0

SAU_REGION170.LADDR

Limit address of SAU region170 at reset

Type

int

Default value

0x0

SAU_REGION170.NSC

Set NSC for SAU region170 at reset

Type

bool

Default value

0x0

SAU_REGION171.BADDR

Base address of SAU region171 at reset

Type

int

Default value

0x0

SAU_REGION171.ENABLE

Enable SAU region171 at reset

Type

bool

Default value

0x0

SAU_REGION171.LADDR

Limit address of SAU region171 at reset

Type

int

Default value

0x0

SAU_REGION171.NSC

Set NSC for SAU region171 at reset

Type

bool

Default value

0x0

SAU_REGION172.BADDR

Base address of SAU region172 at reset

Type

int

Default value

0x0

SAU_REGION172.ENABLE

Enable SAU region172 at reset

Type

bool

Default value

0x0

SAU_REGION172.LADDR

Limit address of SAU region172 at reset

Type

int

Default value

0x0

SAU_REGION172.NSC

Set NSC for SAU region172 at reset

Type

bool

Default value

0x0

SAU_REGION173.BADDR

Base address of SAU region173 at reset

Type

int

Default value

0x0

SAU_REGION173.ENABLE

Enable SAU region173 at reset

Type

bool

Default value

0x0

SAU_REGION173.LADDR

Limit address of SAU region173 at reset

Type

int

Default value

0x0

SAU_REGION173.NSC

Set NSC for SAU region173 at reset

Type

bool

Default value

0x0

SAU_REGION174.BADDR

Base address of SAU region174 at reset

Type

int

Default value

0x0

SAU_REGION174.ENABLE

Enable SAU region174 at reset

Type

bool

Default value

0x0

SAU_REGION174.LADDR

Limit address of SAU region174 at reset

Type

int

Default value

0x0

SAU_REGION174.NSC

Set NSC for SAU region174 at reset

Type

bool

Default value

0x0

SAU_REGION175.BADDR

Base address of SAU region175 at reset

Type

int

Default value

0x0

SAU_REGION175.ENABLE

Enable SAU region175 at reset

Type

bool

Default value

0x0

SAU_REGION175.LADDR

Limit address of SAU region175 at reset

Type

int

Default value

0x0

SAU_REGION175.NSC

Set NSC for SAU region175 at reset

Type

bool

Default value

0x0

SAU_REGION176.BADDR

Base address of SAU region176 at reset

Type

int

Default value

0x0

SAU_REGION176.ENABLE

Enable SAU region176 at reset

Type

bool

Default value

0x0

SAU_REGION176.LADDR

Limit address of SAU region176 at reset

Type

int

Default value

0x0

SAU_REGION176.NSC

Set NSC for SAU region176 at reset

Type

bool

Default value

0x0

SAU_REGION177.BADDR

Base address of SAU region177 at reset

Type

int

Default value

0x0

SAU_REGION177.ENABLE

Enable SAU region177 at reset

Type

bool

Default value

0x0

SAU_REGION177.LADDR

Limit address of SAU region177 at reset

Type

int

Default value

0x0

SAU_REGION177.NSC

Set NSC for SAU region177 at reset

Type

bool

Default value

0x0

SAU_REGION178.BADDR

Base address of SAU region178 at reset

Type

int

Default value

0x0

SAU_REGION178.ENABLE

Enable SAU region178 at reset

Type

bool

Default value

0x0

SAU_REGION178.LADDR

Limit address of SAU region178 at reset

Type

int

Default value

0x0

SAU_REGION178.NSC

Set NSC for SAU region178 at reset

Type

bool

Default value

0x0

SAU_REGION179.BADDR

Base address of SAU region179 at reset

Type

int

Default value

0x0

SAU_REGION179.ENABLE

Enable SAU region179 at reset

Type

bool

Default value

0x0

SAU_REGION179.LADDR

Limit address of SAU region179 at reset

Type

int

Default value

0x0

SAU_REGION179.NSC

Set NSC for SAU region179 at reset

Type

bool

Default value

0x0

SAU_REGION18.BADDR

Base address of SAU region18 at reset

Type

int

Default value

0x0

SAU_REGION18.ENABLE

Enable SAU region18 at reset

Type

bool

Default value

0x0

SAU_REGION18.LADDR

Limit address of SAU region18 at reset

Type

int

Default value

0x0

SAU_REGION18.NSC

Set NSC for SAU region18 at reset

Type

bool

Default value

0x0

SAU_REGION180.BADDR

Base address of SAU region180 at reset

Type

int

Default value

0x0

SAU_REGION180.ENABLE

Enable SAU region180 at reset

Type

bool

Default value

0x0

SAU_REGION180.LADDR

Limit address of SAU region180 at reset

Type

int

Default value

0x0

SAU_REGION180.NSC

Set NSC for SAU region180 at reset

Type

bool

Default value

0x0

SAU_REGION181.BADDR

Base address of SAU region181 at reset

Type

int

Default value

0x0

SAU_REGION181.ENABLE

Enable SAU region181 at reset

Type

bool

Default value

0x0

SAU_REGION181.LADDR

Limit address of SAU region181 at reset

Type

int

Default value

0x0

SAU_REGION181.NSC

Set NSC for SAU region181 at reset

Type

bool

Default value

0x0

SAU_REGION182.BADDR

Base address of SAU region182 at reset

Type

int

Default value

0x0

SAU_REGION182.ENABLE

Enable SAU region182 at reset

Type

bool

Default value

0x0

SAU_REGION182.LADDR

Limit address of SAU region182 at reset

Type

int

Default value

0x0

SAU_REGION182.NSC

Set NSC for SAU region182 at reset

Type

bool

Default value

0x0

SAU_REGION183.BADDR

Base address of SAU region183 at reset

Type

int

Default value

0x0

SAU_REGION183.ENABLE

Enable SAU region183 at reset

Type

bool

Default value

0x0

SAU_REGION183.LADDR

Limit address of SAU region183 at reset

Type

int

Default value

0x0

SAU_REGION183.NSC

Set NSC for SAU region183 at reset

Type

bool

Default value

0x0

SAU_REGION184.BADDR

Base address of SAU region184 at reset

Type

int

Default value

0x0

SAU_REGION184.ENABLE

Enable SAU region184 at reset

Type

bool

Default value

0x0

SAU_REGION184.LADDR

Limit address of SAU region184 at reset

Type

int

Default value

0x0

SAU_REGION184.NSC

Set NSC for SAU region184 at reset

Type

bool

Default value

0x0

SAU_REGION185.BADDR

Base address of SAU region185 at reset

Type

int

Default value

0x0

SAU_REGION185.ENABLE

Enable SAU region185 at reset

Type

bool

Default value

0x0

SAU_REGION185.LADDR

Limit address of SAU region185 at reset

Type

int

Default value

0x0

SAU_REGION185.NSC

Set NSC for SAU region185 at reset

Type

bool

Default value

0x0

SAU_REGION186.BADDR

Base address of SAU region186 at reset

Type

int

Default value

0x0

SAU_REGION186.ENABLE

Enable SAU region186 at reset

Type

bool

Default value

0x0

SAU_REGION186.LADDR

Limit address of SAU region186 at reset

Type

int

Default value

0x0

SAU_REGION186.NSC

Set NSC for SAU region186 at reset

Type

bool

Default value

0x0

SAU_REGION187.BADDR

Base address of SAU region187 at reset

Type

int

Default value

0x0

SAU_REGION187.ENABLE

Enable SAU region187 at reset

Type

bool

Default value

0x0

SAU_REGION187.LADDR

Limit address of SAU region187 at reset

Type

int

Default value

0x0

SAU_REGION187.NSC

Set NSC for SAU region187 at reset

Type

bool

Default value

0x0

SAU_REGION188.BADDR

Base address of SAU region188 at reset

Type

int

Default value

0x0

SAU_REGION188.ENABLE

Enable SAU region188 at reset

Type

bool

Default value

0x0

SAU_REGION188.LADDR

Limit address of SAU region188 at reset

Type

int

Default value

0x0

SAU_REGION188.NSC

Set NSC for SAU region188 at reset

Type

bool

Default value

0x0

SAU_REGION189.BADDR

Base address of SAU region189 at reset

Type

int

Default value

0x0

SAU_REGION189.ENABLE

Enable SAU region189 at reset

Type

bool

Default value

0x0

SAU_REGION189.LADDR

Limit address of SAU region189 at reset

Type

int

Default value

0x0

SAU_REGION189.NSC

Set NSC for SAU region189 at reset

Type

bool

Default value

0x0

SAU_REGION19.BADDR

Base address of SAU region19 at reset

Type

int

Default value

0x0

SAU_REGION19.ENABLE

Enable SAU region19 at reset

Type

bool

Default value

0x0

SAU_REGION19.LADDR

Limit address of SAU region19 at reset

Type

int

Default value

0x0

SAU_REGION19.NSC

Set NSC for SAU region19 at reset

Type

bool

Default value

0x0

SAU_REGION190.BADDR

Base address of SAU region190 at reset

Type

int

Default value

0x0

SAU_REGION190.ENABLE

Enable SAU region190 at reset

Type

bool

Default value

0x0

SAU_REGION190.LADDR

Limit address of SAU region190 at reset

Type

int

Default value

0x0

SAU_REGION190.NSC

Set NSC for SAU region190 at reset

Type

bool

Default value

0x0

SAU_REGION191.BADDR

Base address of SAU region191 at reset

Type

int

Default value

0x0

SAU_REGION191.ENABLE

Enable SAU region191 at reset

Type

bool

Default value

0x0

SAU_REGION191.LADDR

Limit address of SAU region191 at reset

Type

int

Default value

0x0

SAU_REGION191.NSC

Set NSC for SAU region191 at reset

Type

bool

Default value

0x0

SAU_REGION192.BADDR

Base address of SAU region192 at reset

Type

int

Default value

0x0

SAU_REGION192.ENABLE

Enable SAU region192 at reset

Type

bool

Default value

0x0

SAU_REGION192.LADDR

Limit address of SAU region192 at reset

Type

int

Default value

0x0

SAU_REGION192.NSC

Set NSC for SAU region192 at reset

Type

bool

Default value

0x0

SAU_REGION193.BADDR

Base address of SAU region193 at reset

Type

int

Default value

0x0

SAU_REGION193.ENABLE

Enable SAU region193 at reset

Type

bool

Default value

0x0

SAU_REGION193.LADDR

Limit address of SAU region193 at reset

Type

int

Default value

0x0

SAU_REGION193.NSC

Set NSC for SAU region193 at reset

Type

bool

Default value

0x0

SAU_REGION194.BADDR

Base address of SAU region194 at reset

Type

int

Default value

0x0

SAU_REGION194.ENABLE

Enable SAU region194 at reset

Type

bool

Default value

0x0

SAU_REGION194.LADDR

Limit address of SAU region194 at reset

Type

int

Default value

0x0

SAU_REGION194.NSC

Set NSC for SAU region194 at reset

Type

bool

Default value

0x0

SAU_REGION195.BADDR

Base address of SAU region195 at reset

Type

int

Default value

0x0

SAU_REGION195.ENABLE

Enable SAU region195 at reset

Type

bool

Default value

0x0

SAU_REGION195.LADDR

Limit address of SAU region195 at reset

Type

int

Default value

0x0

SAU_REGION195.NSC

Set NSC for SAU region195 at reset

Type

bool

Default value

0x0

SAU_REGION196.BADDR

Base address of SAU region196 at reset

Type

int

Default value

0x0

SAU_REGION196.ENABLE

Enable SAU region196 at reset

Type

bool

Default value

0x0

SAU_REGION196.LADDR

Limit address of SAU region196 at reset

Type

int

Default value

0x0

SAU_REGION196.NSC

Set NSC for SAU region196 at reset

Type

bool

Default value

0x0

SAU_REGION197.BADDR

Base address of SAU region197 at reset

Type

int

Default value

0x0

SAU_REGION197.ENABLE

Enable SAU region197 at reset

Type

bool

Default value

0x0

SAU_REGION197.LADDR

Limit address of SAU region197 at reset

Type

int

Default value

0x0

SAU_REGION197.NSC

Set NSC for SAU region197 at reset

Type

bool

Default value

0x0

SAU_REGION198.BADDR

Base address of SAU region198 at reset

Type

int

Default value

0x0

SAU_REGION198.ENABLE

Enable SAU region198 at reset

Type

bool

Default value

0x0

SAU_REGION198.LADDR

Limit address of SAU region198 at reset

Type

int

Default value

0x0

SAU_REGION198.NSC

Set NSC for SAU region198 at reset

Type

bool

Default value

0x0

SAU_REGION199.BADDR

Base address of SAU region199 at reset

Type

int

Default value

0x0

SAU_REGION199.ENABLE

Enable SAU region199 at reset

Type

bool

Default value

0x0

SAU_REGION199.LADDR

Limit address of SAU region199 at reset

Type

int

Default value

0x0

SAU_REGION199.NSC

Set NSC for SAU region199 at reset

Type

bool

Default value

0x0

SAU_REGION2.BADDR

Base address of SAU region2 at reset

Type

int

Default value

0x0

SAU_REGION2.ENABLE

Enable SAU region2 at reset

Type

bool

Default value

0x0

SAU_REGION2.LADDR

Limit address of SAU region2 at reset

Type

int

Default value

0x0

SAU_REGION2.NSC

Set NSC for SAU region2 at reset

Type

bool

Default value

0x0

SAU_REGION20.BADDR

Base address of SAU region20 at reset

Type

int

Default value

0x0

SAU_REGION20.ENABLE

Enable SAU region20 at reset

Type

bool

Default value

0x0

SAU_REGION20.LADDR

Limit address of SAU region20 at reset

Type

int

Default value

0x0

SAU_REGION20.NSC

Set NSC for SAU region20 at reset

Type

bool

Default value

0x0

SAU_REGION200.BADDR

Base address of SAU region200 at reset

Type

int

Default value

0x0

SAU_REGION200.ENABLE

Enable SAU region200 at reset

Type

bool

Default value

0x0

SAU_REGION200.LADDR

Limit address of SAU region200 at reset

Type

int

Default value

0x0

SAU_REGION200.NSC

Set NSC for SAU region200 at reset

Type

bool

Default value

0x0

SAU_REGION201.BADDR

Base address of SAU region201 at reset

Type

int

Default value

0x0

SAU_REGION201.ENABLE

Enable SAU region201 at reset

Type

bool

Default value

0x0

SAU_REGION201.LADDR

Limit address of SAU region201 at reset

Type

int

Default value

0x0

SAU_REGION201.NSC

Set NSC for SAU region201 at reset

Type

bool

Default value

0x0

SAU_REGION202.BADDR

Base address of SAU region202 at reset

Type

int

Default value

0x0

SAU_REGION202.ENABLE

Enable SAU region202 at reset

Type

bool

Default value

0x0

SAU_REGION202.LADDR

Limit address of SAU region202 at reset

Type

int

Default value

0x0

SAU_REGION202.NSC

Set NSC for SAU region202 at reset

Type

bool

Default value

0x0

SAU_REGION203.BADDR

Base address of SAU region203 at reset

Type

int

Default value

0x0

SAU_REGION203.ENABLE

Enable SAU region203 at reset

Type

bool

Default value

0x0

SAU_REGION203.LADDR

Limit address of SAU region203 at reset

Type

int

Default value

0x0

SAU_REGION203.NSC

Set NSC for SAU region203 at reset

Type

bool

Default value

0x0

SAU_REGION204.BADDR

Base address of SAU region204 at reset

Type

int

Default value

0x0

SAU_REGION204.ENABLE

Enable SAU region204 at reset

Type

bool

Default value

0x0

SAU_REGION204.LADDR

Limit address of SAU region204 at reset

Type

int

Default value

0x0

SAU_REGION204.NSC

Set NSC for SAU region204 at reset

Type

bool

Default value

0x0

SAU_REGION205.BADDR

Base address of SAU region205 at reset

Type

int

Default value

0x0

SAU_REGION205.ENABLE

Enable SAU region205 at reset

Type

bool

Default value

0x0

SAU_REGION205.LADDR

Limit address of SAU region205 at reset

Type

int

Default value

0x0

SAU_REGION205.NSC

Set NSC for SAU region205 at reset

Type

bool

Default value

0x0

SAU_REGION206.BADDR

Base address of SAU region206 at reset

Type

int

Default value

0x0

SAU_REGION206.ENABLE

Enable SAU region206 at reset

Type

bool

Default value

0x0

SAU_REGION206.LADDR

Limit address of SAU region206 at reset

Type

int

Default value

0x0

SAU_REGION206.NSC

Set NSC for SAU region206 at reset

Type

bool

Default value

0x0

SAU_REGION207.BADDR

Base address of SAU region207 at reset

Type

int

Default value

0x0

SAU_REGION207.ENABLE

Enable SAU region207 at reset

Type

bool

Default value

0x0

SAU_REGION207.LADDR

Limit address of SAU region207 at reset

Type

int

Default value

0x0

SAU_REGION207.NSC

Set NSC for SAU region207 at reset

Type

bool

Default value

0x0

SAU_REGION208.BADDR

Base address of SAU region208 at reset

Type

int

Default value

0x0

SAU_REGION208.ENABLE

Enable SAU region208 at reset

Type

bool

Default value

0x0

SAU_REGION208.LADDR

Limit address of SAU region208 at reset

Type

int

Default value

0x0

SAU_REGION208.NSC

Set NSC for SAU region208 at reset

Type

bool

Default value

0x0

SAU_REGION209.BADDR

Base address of SAU region209 at reset

Type

int

Default value

0x0

SAU_REGION209.ENABLE

Enable SAU region209 at reset

Type

bool

Default value

0x0

SAU_REGION209.LADDR

Limit address of SAU region209 at reset

Type

int

Default value

0x0

SAU_REGION209.NSC

Set NSC for SAU region209 at reset

Type

bool

Default value

0x0

SAU_REGION21.BADDR

Base address of SAU region21 at reset

Type

int

Default value

0x0

SAU_REGION21.ENABLE

Enable SAU region21 at reset

Type

bool

Default value

0x0

SAU_REGION21.LADDR

Limit address of SAU region21 at reset

Type

int

Default value

0x0

SAU_REGION21.NSC

Set NSC for SAU region21 at reset

Type

bool

Default value

0x0

SAU_REGION210.BADDR

Base address of SAU region210 at reset

Type

int

Default value

0x0

SAU_REGION210.ENABLE

Enable SAU region210 at reset

Type

bool

Default value

0x0

SAU_REGION210.LADDR

Limit address of SAU region210 at reset

Type

int

Default value

0x0

SAU_REGION210.NSC

Set NSC for SAU region210 at reset

Type

bool

Default value

0x0

SAU_REGION211.BADDR

Base address of SAU region211 at reset

Type

int

Default value

0x0

SAU_REGION211.ENABLE

Enable SAU region211 at reset

Type

bool

Default value

0x0

SAU_REGION211.LADDR

Limit address of SAU region211 at reset

Type

int

Default value

0x0

SAU_REGION211.NSC

Set NSC for SAU region211 at reset

Type

bool

Default value

0x0

SAU_REGION212.BADDR

Base address of SAU region212 at reset

Type

int

Default value

0x0

SAU_REGION212.ENABLE

Enable SAU region212 at reset

Type

bool

Default value

0x0

SAU_REGION212.LADDR

Limit address of SAU region212 at reset

Type

int

Default value

0x0

SAU_REGION212.NSC

Set NSC for SAU region212 at reset

Type

bool

Default value

0x0

SAU_REGION213.BADDR

Base address of SAU region213 at reset

Type

int

Default value

0x0

SAU_REGION213.ENABLE

Enable SAU region213 at reset

Type

bool

Default value

0x0

SAU_REGION213.LADDR

Limit address of SAU region213 at reset

Type

int

Default value

0x0

SAU_REGION213.NSC

Set NSC for SAU region213 at reset

Type

bool

Default value

0x0

SAU_REGION214.BADDR

Base address of SAU region214 at reset

Type

int

Default value

0x0

SAU_REGION214.ENABLE

Enable SAU region214 at reset

Type

bool

Default value

0x0

SAU_REGION214.LADDR

Limit address of SAU region214 at reset

Type

int

Default value

0x0

SAU_REGION214.NSC

Set NSC for SAU region214 at reset

Type

bool

Default value

0x0

SAU_REGION215.BADDR

Base address of SAU region215 at reset

Type

int

Default value

0x0

SAU_REGION215.ENABLE

Enable SAU region215 at reset

Type

bool

Default value

0x0

SAU_REGION215.LADDR

Limit address of SAU region215 at reset

Type

int

Default value

0x0

SAU_REGION215.NSC

Set NSC for SAU region215 at reset

Type

bool

Default value

0x0

SAU_REGION216.BADDR

Base address of SAU region216 at reset

Type

int

Default value

0x0

SAU_REGION216.ENABLE

Enable SAU region216 at reset

Type

bool

Default value

0x0

SAU_REGION216.LADDR

Limit address of SAU region216 at reset

Type

int

Default value

0x0

SAU_REGION216.NSC

Set NSC for SAU region216 at reset

Type

bool

Default value

0x0

SAU_REGION217.BADDR

Base address of SAU region217 at reset

Type

int

Default value

0x0

SAU_REGION217.ENABLE

Enable SAU region217 at reset

Type

bool

Default value

0x0

SAU_REGION217.LADDR

Limit address of SAU region217 at reset

Type

int

Default value

0x0

SAU_REGION217.NSC

Set NSC for SAU region217 at reset

Type

bool

Default value

0x0

SAU_REGION218.BADDR

Base address of SAU region218 at reset

Type

int

Default value

0x0

SAU_REGION218.ENABLE

Enable SAU region218 at reset

Type

bool

Default value

0x0

SAU_REGION218.LADDR

Limit address of SAU region218 at reset

Type

int

Default value

0x0

SAU_REGION218.NSC

Set NSC for SAU region218 at reset

Type

bool

Default value

0x0

SAU_REGION219.BADDR

Base address of SAU region219 at reset

Type

int

Default value

0x0

SAU_REGION219.ENABLE

Enable SAU region219 at reset

Type

bool

Default value

0x0

SAU_REGION219.LADDR

Limit address of SAU region219 at reset

Type

int

Default value

0x0

SAU_REGION219.NSC

Set NSC for SAU region219 at reset

Type

bool

Default value

0x0

SAU_REGION22.BADDR

Base address of SAU region22 at reset

Type

int

Default value

0x0

SAU_REGION22.ENABLE

Enable SAU region22 at reset

Type

bool

Default value

0x0

SAU_REGION22.LADDR

Limit address of SAU region22 at reset

Type

int

Default value

0x0

SAU_REGION22.NSC

Set NSC for SAU region22 at reset

Type

bool

Default value

0x0

SAU_REGION220.BADDR

Base address of SAU region220 at reset

Type

int

Default value

0x0

SAU_REGION220.ENABLE

Enable SAU region220 at reset

Type

bool

Default value

0x0

SAU_REGION220.LADDR

Limit address of SAU region220 at reset

Type

int

Default value

0x0

SAU_REGION220.NSC

Set NSC for SAU region220 at reset

Type

bool

Default value

0x0

SAU_REGION221.BADDR

Base address of SAU region221 at reset

Type

int

Default value

0x0

SAU_REGION221.ENABLE

Enable SAU region221 at reset

Type

bool

Default value

0x0

SAU_REGION221.LADDR

Limit address of SAU region221 at reset

Type

int

Default value

0x0

SAU_REGION221.NSC

Set NSC for SAU region221 at reset

Type

bool

Default value

0x0

SAU_REGION222.BADDR

Base address of SAU region222 at reset

Type

int

Default value

0x0

SAU_REGION222.ENABLE

Enable SAU region222 at reset

Type

bool

Default value

0x0

SAU_REGION222.LADDR

Limit address of SAU region222 at reset

Type

int

Default value

0x0

SAU_REGION222.NSC

Set NSC for SAU region222 at reset

Type

bool

Default value

0x0

SAU_REGION223.BADDR

Base address of SAU region223 at reset

Type

int

Default value

0x0

SAU_REGION223.ENABLE

Enable SAU region223 at reset

Type

bool

Default value

0x0

SAU_REGION223.LADDR

Limit address of SAU region223 at reset

Type

int

Default value

0x0

SAU_REGION223.NSC

Set NSC for SAU region223 at reset

Type

bool

Default value

0x0

SAU_REGION224.BADDR

Base address of SAU region224 at reset

Type

int

Default value

0x0

SAU_REGION224.ENABLE

Enable SAU region224 at reset

Type

bool

Default value

0x0

SAU_REGION224.LADDR

Limit address of SAU region224 at reset

Type

int

Default value

0x0

SAU_REGION224.NSC

Set NSC for SAU region224 at reset

Type

bool

Default value

0x0

SAU_REGION225.BADDR

Base address of SAU region225 at reset

Type

int

Default value

0x0

SAU_REGION225.ENABLE

Enable SAU region225 at reset

Type

bool

Default value

0x0

SAU_REGION225.LADDR

Limit address of SAU region225 at reset

Type

int

Default value

0x0

SAU_REGION225.NSC

Set NSC for SAU region225 at reset

Type

bool

Default value

0x0

SAU_REGION226.BADDR

Base address of SAU region226 at reset

Type

int

Default value

0x0

SAU_REGION226.ENABLE

Enable SAU region226 at reset

Type

bool

Default value

0x0

SAU_REGION226.LADDR

Limit address of SAU region226 at reset

Type

int

Default value

0x0

SAU_REGION226.NSC

Set NSC for SAU region226 at reset

Type

bool

Default value

0x0

SAU_REGION227.BADDR

Base address of SAU region227 at reset

Type

int

Default value

0x0

SAU_REGION227.ENABLE

Enable SAU region227 at reset

Type

bool

Default value

0x0

SAU_REGION227.LADDR

Limit address of SAU region227 at reset

Type

int

Default value

0x0

SAU_REGION227.NSC

Set NSC for SAU region227 at reset

Type

bool

Default value

0x0

SAU_REGION228.BADDR

Base address of SAU region228 at reset

Type

int

Default value

0x0

SAU_REGION228.ENABLE

Enable SAU region228 at reset

Type

bool

Default value

0x0

SAU_REGION228.LADDR

Limit address of SAU region228 at reset

Type

int

Default value

0x0

SAU_REGION228.NSC

Set NSC for SAU region228 at reset

Type

bool

Default value

0x0

SAU_REGION229.BADDR

Base address of SAU region229 at reset

Type

int

Default value

0x0

SAU_REGION229.ENABLE

Enable SAU region229 at reset

Type

bool

Default value

0x0

SAU_REGION229.LADDR

Limit address of SAU region229 at reset

Type

int

Default value

0x0

SAU_REGION229.NSC

Set NSC for SAU region229 at reset

Type

bool

Default value

0x0

SAU_REGION23.BADDR

Base address of SAU region23 at reset

Type

int

Default value

0x0

SAU_REGION23.ENABLE

Enable SAU region23 at reset

Type

bool

Default value

0x0

SAU_REGION23.LADDR

Limit address of SAU region23 at reset

Type

int

Default value

0x0

SAU_REGION23.NSC

Set NSC for SAU region23 at reset

Type

bool

Default value

0x0

SAU_REGION230.BADDR

Base address of SAU region230 at reset

Type

int

Default value

0x0

SAU_REGION230.ENABLE

Enable SAU region230 at reset

Type

bool

Default value

0x0

SAU_REGION230.LADDR

Limit address of SAU region230 at reset

Type

int

Default value

0x0

SAU_REGION230.NSC

Set NSC for SAU region230 at reset

Type

bool

Default value

0x0

SAU_REGION231.BADDR

Base address of SAU region231 at reset

Type

int

Default value

0x0

SAU_REGION231.ENABLE

Enable SAU region231 at reset

Type

bool

Default value

0x0

SAU_REGION231.LADDR

Limit address of SAU region231 at reset

Type

int

Default value

0x0

SAU_REGION231.NSC

Set NSC for SAU region231 at reset

Type

bool

Default value

0x0

SAU_REGION232.BADDR

Base address of SAU region232 at reset

Type

int

Default value

0x0

SAU_REGION232.ENABLE

Enable SAU region232 at reset

Type

bool

Default value

0x0

SAU_REGION232.LADDR

Limit address of SAU region232 at reset

Type

int

Default value

0x0

SAU_REGION232.NSC

Set NSC for SAU region232 at reset

Type

bool

Default value

0x0

SAU_REGION233.BADDR

Base address of SAU region233 at reset

Type

int

Default value

0x0

SAU_REGION233.ENABLE

Enable SAU region233 at reset

Type

bool

Default value

0x0

SAU_REGION233.LADDR

Limit address of SAU region233 at reset

Type

int

Default value

0x0

SAU_REGION233.NSC

Set NSC for SAU region233 at reset

Type

bool

Default value

0x0

SAU_REGION234.BADDR

Base address of SAU region234 at reset

Type

int

Default value

0x0

SAU_REGION234.ENABLE

Enable SAU region234 at reset

Type

bool

Default value

0x0

SAU_REGION234.LADDR

Limit address of SAU region234 at reset

Type

int

Default value

0x0

SAU_REGION234.NSC

Set NSC for SAU region234 at reset

Type

bool

Default value

0x0

SAU_REGION235.BADDR

Base address of SAU region235 at reset

Type

int

Default value

0x0

SAU_REGION235.ENABLE

Enable SAU region235 at reset

Type

bool

Default value

0x0

SAU_REGION235.LADDR

Limit address of SAU region235 at reset

Type

int

Default value

0x0

SAU_REGION235.NSC

Set NSC for SAU region235 at reset

Type

bool

Default value

0x0

SAU_REGION236.BADDR

Base address of SAU region236 at reset

Type

int

Default value

0x0

SAU_REGION236.ENABLE

Enable SAU region236 at reset

Type

bool

Default value

0x0

SAU_REGION236.LADDR

Limit address of SAU region236 at reset

Type

int

Default value

0x0

SAU_REGION236.NSC

Set NSC for SAU region236 at reset

Type

bool

Default value

0x0

SAU_REGION237.BADDR

Base address of SAU region237 at reset

Type

int

Default value

0x0

SAU_REGION237.ENABLE

Enable SAU region237 at reset

Type

bool

Default value

0x0

SAU_REGION237.LADDR

Limit address of SAU region237 at reset

Type

int

Default value

0x0

SAU_REGION237.NSC

Set NSC for SAU region237 at reset

Type

bool

Default value

0x0

SAU_REGION238.BADDR

Base address of SAU region238 at reset

Type

int

Default value

0x0

SAU_REGION238.ENABLE

Enable SAU region238 at reset

Type

bool

Default value

0x0

SAU_REGION238.LADDR

Limit address of SAU region238 at reset

Type

int

Default value

0x0

SAU_REGION238.NSC

Set NSC for SAU region238 at reset

Type

bool

Default value

0x0

SAU_REGION239.BADDR

Base address of SAU region239 at reset

Type

int

Default value

0x0

SAU_REGION239.ENABLE

Enable SAU region239 at reset

Type

bool

Default value

0x0

SAU_REGION239.LADDR

Limit address of SAU region239 at reset

Type

int

Default value

0x0

SAU_REGION239.NSC

Set NSC for SAU region239 at reset

Type

bool

Default value

0x0

SAU_REGION24.BADDR

Base address of SAU region24 at reset

Type

int

Default value

0x0

SAU_REGION24.ENABLE

Enable SAU region24 at reset

Type

bool

Default value

0x0

SAU_REGION24.LADDR

Limit address of SAU region24 at reset

Type

int

Default value

0x0

SAU_REGION24.NSC

Set NSC for SAU region24 at reset

Type

bool

Default value

0x0

SAU_REGION240.BADDR

Base address of SAU region240 at reset

Type

int

Default value

0x0

SAU_REGION240.ENABLE

Enable SAU region240 at reset

Type

bool

Default value

0x0

SAU_REGION240.LADDR

Limit address of SAU region240 at reset

Type

int

Default value

0x0

SAU_REGION240.NSC

Set NSC for SAU region240 at reset

Type

bool

Default value

0x0

SAU_REGION241.BADDR

Base address of SAU region241 at reset

Type

int

Default value

0x0

SAU_REGION241.ENABLE

Enable SAU region241 at reset

Type

bool

Default value

0x0

SAU_REGION241.LADDR

Limit address of SAU region241 at reset

Type

int

Default value

0x0

SAU_REGION241.NSC

Set NSC for SAU region241 at reset

Type

bool

Default value

0x0

SAU_REGION242.BADDR

Base address of SAU region242 at reset

Type

int

Default value

0x0

SAU_REGION242.ENABLE

Enable SAU region242 at reset

Type

bool

Default value

0x0

SAU_REGION242.LADDR

Limit address of SAU region242 at reset

Type

int

Default value

0x0

SAU_REGION242.NSC

Set NSC for SAU region242 at reset

Type

bool

Default value

0x0

SAU_REGION243.BADDR

Base address of SAU region243 at reset

Type

int

Default value

0x0

SAU_REGION243.ENABLE

Enable SAU region243 at reset

Type

bool

Default value

0x0

SAU_REGION243.LADDR

Limit address of SAU region243 at reset

Type

int

Default value

0x0

SAU_REGION243.NSC

Set NSC for SAU region243 at reset

Type

bool

Default value

0x0

SAU_REGION244.BADDR

Base address of SAU region244 at reset

Type

int

Default value

0x0

SAU_REGION244.ENABLE

Enable SAU region244 at reset

Type

bool

Default value

0x0

SAU_REGION244.LADDR

Limit address of SAU region244 at reset

Type

int

Default value

0x0

SAU_REGION244.NSC

Set NSC for SAU region244 at reset

Type

bool

Default value

0x0

SAU_REGION245.BADDR

Base address of SAU region245 at reset

Type

int

Default value

0x0

SAU_REGION245.ENABLE

Enable SAU region245 at reset

Type

bool

Default value

0x0

SAU_REGION245.LADDR

Limit address of SAU region245 at reset

Type

int

Default value

0x0

SAU_REGION245.NSC

Set NSC for SAU region245 at reset

Type

bool

Default value

0x0

SAU_REGION246.BADDR

Base address of SAU region246 at reset

Type

int

Default value

0x0

SAU_REGION246.ENABLE

Enable SAU region246 at reset

Type

bool

Default value

0x0

SAU_REGION246.LADDR

Limit address of SAU region246 at reset

Type

int

Default value

0x0

SAU_REGION246.NSC

Set NSC for SAU region246 at reset

Type

bool

Default value

0x0

SAU_REGION247.BADDR

Base address of SAU region247 at reset

Type

int

Default value

0x0

SAU_REGION247.ENABLE

Enable SAU region247 at reset

Type

bool

Default value

0x0

SAU_REGION247.LADDR

Limit address of SAU region247 at reset

Type

int

Default value

0x0

SAU_REGION247.NSC

Set NSC for SAU region247 at reset

Type

bool

Default value

0x0

SAU_REGION248.BADDR

Base address of SAU region248 at reset

Type

int

Default value

0x0

SAU_REGION248.ENABLE

Enable SAU region248 at reset

Type

bool

Default value

0x0

SAU_REGION248.LADDR

Limit address of SAU region248 at reset

Type

int

Default value

0x0

SAU_REGION248.NSC

Set NSC for SAU region248 at reset

Type

bool

Default value

0x0

SAU_REGION249.BADDR

Base address of SAU region249 at reset

Type

int

Default value

0x0

SAU_REGION249.ENABLE

Enable SAU region249 at reset

Type

bool

Default value

0x0

SAU_REGION249.LADDR

Limit address of SAU region249 at reset

Type

int

Default value

0x0

SAU_REGION249.NSC

Set NSC for SAU region249 at reset

Type

bool

Default value

0x0

SAU_REGION25.BADDR

Base address of SAU region25 at reset

Type

int

Default value

0x0

SAU_REGION25.ENABLE

Enable SAU region25 at reset

Type

bool

Default value

0x0

SAU_REGION25.LADDR

Limit address of SAU region25 at reset

Type

int

Default value

0x0

SAU_REGION25.NSC

Set NSC for SAU region25 at reset

Type

bool

Default value

0x0

SAU_REGION250.BADDR

Base address of SAU region250 at reset

Type

int

Default value

0x0

SAU_REGION250.ENABLE

Enable SAU region250 at reset

Type

bool

Default value

0x0

SAU_REGION250.LADDR

Limit address of SAU region250 at reset

Type

int

Default value

0x0

SAU_REGION250.NSC

Set NSC for SAU region250 at reset

Type

bool

Default value

0x0

SAU_REGION251.BADDR

Base address of SAU region251 at reset

Type

int

Default value

0x0

SAU_REGION251.ENABLE

Enable SAU region251 at reset

Type

bool

Default value

0x0

SAU_REGION251.LADDR

Limit address of SAU region251 at reset

Type

int

Default value

0x0

SAU_REGION251.NSC

Set NSC for SAU region251 at reset

Type

bool

Default value

0x0

SAU_REGION252.BADDR

Base address of SAU region252 at reset

Type

int

Default value

0x0

SAU_REGION252.ENABLE

Enable SAU region252 at reset

Type

bool

Default value

0x0

SAU_REGION252.LADDR

Limit address of SAU region252 at reset

Type

int

Default value

0x0

SAU_REGION252.NSC

Set NSC for SAU region252 at reset

Type

bool

Default value

0x0

SAU_REGION253.BADDR

Base address of SAU region253 at reset

Type

int

Default value

0x0

SAU_REGION253.ENABLE

Enable SAU region253 at reset

Type

bool

Default value

0x0

SAU_REGION253.LADDR

Limit address of SAU region253 at reset

Type

int

Default value

0x0

SAU_REGION253.NSC

Set NSC for SAU region253 at reset

Type

bool

Default value

0x0

SAU_REGION254.BADDR

Base address of SAU region254 at reset

Type

int

Default value

0x0

SAU_REGION254.ENABLE

Enable SAU region254 at reset

Type

bool

Default value

0x0

SAU_REGION254.LADDR

Limit address of SAU region254 at reset

Type

int

Default value

0x0

SAU_REGION254.NSC

Set NSC for SAU region254 at reset

Type

bool

Default value

0x0

SAU_REGION255.BADDR

Base address of SAU region255 at reset

Type

int

Default value

0x0

SAU_REGION255.ENABLE

Enable SAU region255 at reset

Type

bool

Default value

0x0

SAU_REGION255.LADDR

Limit address of SAU region255 at reset

Type

int

Default value

0x0

SAU_REGION255.NSC

Set NSC for SAU region255 at reset

Type

bool

Default value

0x0

SAU_REGION26.BADDR

Base address of SAU region26 at reset

Type

int

Default value

0x0

SAU_REGION26.ENABLE

Enable SAU region26 at reset

Type

bool

Default value

0x0

SAU_REGION26.LADDR

Limit address of SAU region26 at reset

Type

int

Default value

0x0

SAU_REGION26.NSC

Set NSC for SAU region26 at reset

Type

bool

Default value

0x0

SAU_REGION27.BADDR

Base address of SAU region27 at reset

Type

int

Default value

0x0

SAU_REGION27.ENABLE

Enable SAU region27 at reset

Type

bool

Default value

0x0

SAU_REGION27.LADDR

Limit address of SAU region27 at reset

Type

int

Default value

0x0

SAU_REGION27.NSC

Set NSC for SAU region27 at reset

Type

bool

Default value

0x0

SAU_REGION28.BADDR

Base address of SAU region28 at reset

Type

int

Default value

0x0

SAU_REGION28.ENABLE

Enable SAU region28 at reset

Type

bool

Default value

0x0

SAU_REGION28.LADDR

Limit address of SAU region28 at reset

Type

int

Default value

0x0

SAU_REGION28.NSC

Set NSC for SAU region28 at reset

Type

bool

Default value

0x0

SAU_REGION29.BADDR

Base address of SAU region29 at reset

Type

int

Default value

0x0

SAU_REGION29.ENABLE

Enable SAU region29 at reset

Type

bool

Default value

0x0

SAU_REGION29.LADDR

Limit address of SAU region29 at reset

Type

int

Default value

0x0

SAU_REGION29.NSC

Set NSC for SAU region29 at reset

Type

bool

Default value

0x0

SAU_REGION3.BADDR

Base address of SAU region3 at reset

Type

int

Default value

0x0

SAU_REGION3.ENABLE

Enable SAU region3 at reset

Type

bool

Default value

0x0

SAU_REGION3.LADDR

Limit address of SAU region3 at reset

Type

int

Default value

0x0

SAU_REGION3.NSC

Set NSC for SAU region3 at reset

Type

bool

Default value

0x0

SAU_REGION30.BADDR

Base address of SAU region30 at reset

Type

int

Default value

0x0

SAU_REGION30.ENABLE

Enable SAU region30 at reset

Type

bool

Default value

0x0

SAU_REGION30.LADDR

Limit address of SAU region30 at reset

Type

int

Default value

0x0

SAU_REGION30.NSC

Set NSC for SAU region30 at reset

Type

bool

Default value

0x0

SAU_REGION31.BADDR

Base address of SAU region31 at reset

Type

int

Default value

0x0

SAU_REGION31.ENABLE

Enable SAU region31 at reset

Type

bool

Default value

0x0

SAU_REGION31.LADDR

Limit address of SAU region31 at reset

Type

int

Default value

0x0

SAU_REGION31.NSC

Set NSC for SAU region31 at reset

Type

bool

Default value

0x0

SAU_REGION32.BADDR

Base address of SAU region32 at reset

Type

int

Default value

0x0

SAU_REGION32.ENABLE

Enable SAU region32 at reset

Type

bool

Default value

0x0

SAU_REGION32.LADDR

Limit address of SAU region32 at reset

Type

int

Default value

0x0

SAU_REGION32.NSC

Set NSC for SAU region32 at reset

Type

bool

Default value

0x0

SAU_REGION33.BADDR

Base address of SAU region33 at reset

Type

int

Default value

0x0

SAU_REGION33.ENABLE

Enable SAU region33 at reset

Type

bool

Default value

0x0

SAU_REGION33.LADDR

Limit address of SAU region33 at reset

Type

int

Default value

0x0

SAU_REGION33.NSC

Set NSC for SAU region33 at reset

Type

bool

Default value

0x0

SAU_REGION34.BADDR

Base address of SAU region34 at reset

Type

int

Default value

0x0

SAU_REGION34.ENABLE

Enable SAU region34 at reset

Type

bool

Default value

0x0

SAU_REGION34.LADDR

Limit address of SAU region34 at reset

Type

int

Default value

0x0

SAU_REGION34.NSC

Set NSC for SAU region34 at reset

Type

bool

Default value

0x0

SAU_REGION35.BADDR

Base address of SAU region35 at reset

Type

int

Default value

0x0

SAU_REGION35.ENABLE

Enable SAU region35 at reset

Type

bool

Default value

0x0

SAU_REGION35.LADDR

Limit address of SAU region35 at reset

Type

int

Default value

0x0

SAU_REGION35.NSC

Set NSC for SAU region35 at reset

Type

bool

Default value

0x0

SAU_REGION36.BADDR

Base address of SAU region36 at reset

Type

int

Default value

0x0

SAU_REGION36.ENABLE

Enable SAU region36 at reset

Type

bool

Default value

0x0

SAU_REGION36.LADDR

Limit address of SAU region36 at reset

Type

int

Default value

0x0

SAU_REGION36.NSC

Set NSC for SAU region36 at reset

Type

bool

Default value

0x0

SAU_REGION37.BADDR

Base address of SAU region37 at reset

Type

int

Default value

0x0

SAU_REGION37.ENABLE

Enable SAU region37 at reset

Type

bool

Default value

0x0

SAU_REGION37.LADDR

Limit address of SAU region37 at reset

Type

int

Default value

0x0

SAU_REGION37.NSC

Set NSC for SAU region37 at reset

Type

bool

Default value

0x0

SAU_REGION38.BADDR

Base address of SAU region38 at reset

Type

int

Default value

0x0

SAU_REGION38.ENABLE

Enable SAU region38 at reset

Type

bool

Default value

0x0

SAU_REGION38.LADDR

Limit address of SAU region38 at reset

Type

int

Default value

0x0

SAU_REGION38.NSC

Set NSC for SAU region38 at reset

Type

bool

Default value

0x0

SAU_REGION39.BADDR

Base address of SAU region39 at reset

Type

int

Default value

0x0

SAU_REGION39.ENABLE

Enable SAU region39 at reset

Type

bool

Default value

0x0

SAU_REGION39.LADDR

Limit address of SAU region39 at reset

Type

int

Default value

0x0

SAU_REGION39.NSC

Set NSC for SAU region39 at reset

Type

bool

Default value

0x0

SAU_REGION4.BADDR

Base address of SAU region4 at reset

Type

int

Default value

0x0

SAU_REGION4.ENABLE

Enable SAU region4 at reset

Type

bool

Default value

0x0

SAU_REGION4.LADDR

Limit address of SAU region4 at reset

Type

int

Default value

0x0

SAU_REGION4.NSC

Set NSC for SAU region4 at reset

Type

bool

Default value

0x0

SAU_REGION40.BADDR

Base address of SAU region40 at reset

Type

int

Default value

0x0

SAU_REGION40.ENABLE

Enable SAU region40 at reset

Type

bool

Default value

0x0

SAU_REGION40.LADDR

Limit address of SAU region40 at reset

Type

int

Default value

0x0

SAU_REGION40.NSC

Set NSC for SAU region40 at reset

Type

bool

Default value

0x0

SAU_REGION41.BADDR

Base address of SAU region41 at reset

Type

int

Default value

0x0

SAU_REGION41.ENABLE

Enable SAU region41 at reset

Type

bool

Default value

0x0

SAU_REGION41.LADDR

Limit address of SAU region41 at reset

Type

int

Default value

0x0

SAU_REGION41.NSC

Set NSC for SAU region41 at reset

Type

bool

Default value

0x0

SAU_REGION42.BADDR

Base address of SAU region42 at reset

Type

int

Default value

0x0

SAU_REGION42.ENABLE

Enable SAU region42 at reset

Type

bool

Default value

0x0

SAU_REGION42.LADDR

Limit address of SAU region42 at reset

Type

int

Default value

0x0

SAU_REGION42.NSC

Set NSC for SAU region42 at reset

Type

bool

Default value

0x0

SAU_REGION43.BADDR

Base address of SAU region43 at reset

Type

int

Default value

0x0

SAU_REGION43.ENABLE

Enable SAU region43 at reset

Type

bool

Default value

0x0

SAU_REGION43.LADDR

Limit address of SAU region43 at reset

Type

int

Default value

0x0

SAU_REGION43.NSC

Set NSC for SAU region43 at reset

Type

bool

Default value

0x0

SAU_REGION44.BADDR

Base address of SAU region44 at reset

Type

int

Default value

0x0

SAU_REGION44.ENABLE

Enable SAU region44 at reset

Type

bool

Default value

0x0

SAU_REGION44.LADDR

Limit address of SAU region44 at reset

Type

int

Default value

0x0

SAU_REGION44.NSC

Set NSC for SAU region44 at reset

Type

bool

Default value

0x0

SAU_REGION45.BADDR

Base address of SAU region45 at reset

Type

int

Default value

0x0

SAU_REGION45.ENABLE

Enable SAU region45 at reset

Type

bool

Default value

0x0

SAU_REGION45.LADDR

Limit address of SAU region45 at reset

Type

int

Default value

0x0

SAU_REGION45.NSC

Set NSC for SAU region45 at reset

Type

bool

Default value

0x0

SAU_REGION46.BADDR

Base address of SAU region46 at reset

Type

int

Default value

0x0

SAU_REGION46.ENABLE

Enable SAU region46 at reset

Type

bool

Default value

0x0

SAU_REGION46.LADDR

Limit address of SAU region46 at reset

Type

int

Default value

0x0

SAU_REGION46.NSC

Set NSC for SAU region46 at reset

Type

bool

Default value

0x0

SAU_REGION47.BADDR

Base address of SAU region47 at reset

Type

int

Default value

0x0

SAU_REGION47.ENABLE

Enable SAU region47 at reset

Type

bool

Default value

0x0

SAU_REGION47.LADDR

Limit address of SAU region47 at reset

Type

int

Default value

0x0

SAU_REGION47.NSC

Set NSC for SAU region47 at reset

Type

bool

Default value

0x0

SAU_REGION48.BADDR

Base address of SAU region48 at reset

Type

int

Default value

0x0

SAU_REGION48.ENABLE

Enable SAU region48 at reset

Type

bool

Default value

0x0

SAU_REGION48.LADDR

Limit address of SAU region48 at reset

Type

int

Default value

0x0

SAU_REGION48.NSC

Set NSC for SAU region48 at reset

Type

bool

Default value

0x0

SAU_REGION49.BADDR

Base address of SAU region49 at reset

Type

int

Default value

0x0

SAU_REGION49.ENABLE

Enable SAU region49 at reset

Type

bool

Default value

0x0

SAU_REGION49.LADDR

Limit address of SAU region49 at reset

Type

int

Default value

0x0

SAU_REGION49.NSC

Set NSC for SAU region49 at reset

Type

bool

Default value

0x0

SAU_REGION5.BADDR

Base address of SAU region5 at reset

Type

int

Default value

0x0

SAU_REGION5.ENABLE

Enable SAU region5 at reset

Type

bool

Default value

0x0

SAU_REGION5.LADDR

Limit address of SAU region5 at reset

Type

int

Default value

0x0

SAU_REGION5.NSC

Set NSC for SAU region5 at reset

Type

bool

Default value

0x0

SAU_REGION50.BADDR

Base address of SAU region50 at reset

Type

int

Default value

0x0

SAU_REGION50.ENABLE

Enable SAU region50 at reset

Type

bool

Default value

0x0

SAU_REGION50.LADDR

Limit address of SAU region50 at reset

Type

int

Default value

0x0

SAU_REGION50.NSC

Set NSC for SAU region50 at reset

Type

bool

Default value

0x0

SAU_REGION51.BADDR

Base address of SAU region51 at reset

Type

int

Default value

0x0

SAU_REGION51.ENABLE

Enable SAU region51 at reset

Type

bool

Default value

0x0

SAU_REGION51.LADDR

Limit address of SAU region51 at reset

Type

int

Default value

0x0

SAU_REGION51.NSC

Set NSC for SAU region51 at reset

Type

bool

Default value

0x0

SAU_REGION52.BADDR

Base address of SAU region52 at reset

Type

int

Default value

0x0

SAU_REGION52.ENABLE

Enable SAU region52 at reset

Type

bool

Default value

0x0

SAU_REGION52.LADDR

Limit address of SAU region52 at reset

Type

int

Default value

0x0

SAU_REGION52.NSC

Set NSC for SAU region52 at reset

Type

bool

Default value

0x0

SAU_REGION53.BADDR

Base address of SAU region53 at reset

Type

int

Default value

0x0

SAU_REGION53.ENABLE

Enable SAU region53 at reset

Type

bool

Default value

0x0

SAU_REGION53.LADDR

Limit address of SAU region53 at reset

Type

int

Default value

0x0

SAU_REGION53.NSC

Set NSC for SAU region53 at reset

Type

bool

Default value

0x0

SAU_REGION54.BADDR

Base address of SAU region54 at reset

Type

int

Default value

0x0

SAU_REGION54.ENABLE

Enable SAU region54 at reset

Type

bool

Default value

0x0

SAU_REGION54.LADDR

Limit address of SAU region54 at reset

Type

int

Default value

0x0

SAU_REGION54.NSC

Set NSC for SAU region54 at reset

Type

bool

Default value

0x0

SAU_REGION55.BADDR

Base address of SAU region55 at reset

Type

int

Default value

0x0

SAU_REGION55.ENABLE

Enable SAU region55 at reset

Type

bool

Default value

0x0

SAU_REGION55.LADDR

Limit address of SAU region55 at reset

Type

int

Default value

0x0

SAU_REGION55.NSC

Set NSC for SAU region55 at reset

Type

bool

Default value

0x0

SAU_REGION56.BADDR

Base address of SAU region56 at reset

Type

int

Default value

0x0

SAU_REGION56.ENABLE

Enable SAU region56 at reset

Type

bool

Default value

0x0

SAU_REGION56.LADDR

Limit address of SAU region56 at reset

Type

int

Default value

0x0

SAU_REGION56.NSC

Set NSC for SAU region56 at reset

Type

bool

Default value

0x0

SAU_REGION57.BADDR

Base address of SAU region57 at reset

Type

int

Default value

0x0

SAU_REGION57.ENABLE

Enable SAU region57 at reset

Type

bool

Default value

0x0

SAU_REGION57.LADDR

Limit address of SAU region57 at reset

Type

int

Default value

0x0

SAU_REGION57.NSC

Set NSC for SAU region57 at reset

Type

bool

Default value

0x0

SAU_REGION58.BADDR

Base address of SAU region58 at reset

Type

int

Default value

0x0

SAU_REGION58.ENABLE

Enable SAU region58 at reset

Type

bool

Default value

0x0

SAU_REGION58.LADDR

Limit address of SAU region58 at reset

Type

int

Default value

0x0

SAU_REGION58.NSC

Set NSC for SAU region58 at reset

Type

bool

Default value

0x0

SAU_REGION59.BADDR

Base address of SAU region59 at reset

Type

int

Default value

0x0

SAU_REGION59.ENABLE

Enable SAU region59 at reset

Type

bool

Default value

0x0

SAU_REGION59.LADDR

Limit address of SAU region59 at reset

Type

int

Default value

0x0

SAU_REGION59.NSC

Set NSC for SAU region59 at reset

Type

bool

Default value

0x0

SAU_REGION6.BADDR

Base address of SAU region6 at reset

Type

int

Default value

0x0

SAU_REGION6.ENABLE

Enable SAU region6 at reset

Type

bool

Default value

0x0

SAU_REGION6.LADDR

Limit address of SAU region6 at reset

Type

int

Default value

0x0

SAU_REGION6.NSC

Set NSC for SAU region6 at reset

Type

bool

Default value

0x0

SAU_REGION60.BADDR

Base address of SAU region60 at reset

Type

int

Default value

0x0

SAU_REGION60.ENABLE

Enable SAU region60 at reset

Type

bool

Default value

0x0

SAU_REGION60.LADDR

Limit address of SAU region60 at reset

Type

int

Default value

0x0

SAU_REGION60.NSC

Set NSC for SAU region60 at reset

Type

bool

Default value

0x0

SAU_REGION61.BADDR

Base address of SAU region61 at reset

Type

int

Default value

0x0

SAU_REGION61.ENABLE

Enable SAU region61 at reset

Type

bool

Default value

0x0

SAU_REGION61.LADDR

Limit address of SAU region61 at reset

Type

int

Default value

0x0

SAU_REGION61.NSC

Set NSC for SAU region61 at reset

Type

bool

Default value

0x0

SAU_REGION62.BADDR

Base address of SAU region62 at reset

Type

int

Default value

0x0

SAU_REGION62.ENABLE

Enable SAU region62 at reset

Type

bool

Default value

0x0

SAU_REGION62.LADDR

Limit address of SAU region62 at reset

Type

int

Default value

0x0

SAU_REGION62.NSC

Set NSC for SAU region62 at reset

Type

bool

Default value

0x0

SAU_REGION63.BADDR

Base address of SAU region63 at reset

Type

int

Default value

0x0

SAU_REGION63.ENABLE

Enable SAU region63 at reset

Type

bool

Default value

0x0

SAU_REGION63.LADDR

Limit address of SAU region63 at reset

Type

int

Default value

0x0

SAU_REGION63.NSC

Set NSC for SAU region63 at reset

Type

bool

Default value

0x0

SAU_REGION64.BADDR

Base address of SAU region64 at reset

Type

int

Default value

0x0

SAU_REGION64.ENABLE

Enable SAU region64 at reset

Type

bool

Default value

0x0

SAU_REGION64.LADDR

Limit address of SAU region64 at reset

Type

int

Default value

0x0

SAU_REGION64.NSC

Set NSC for SAU region64 at reset

Type

bool

Default value

0x0

SAU_REGION65.BADDR

Base address of SAU region65 at reset

Type

int

Default value

0x0

SAU_REGION65.ENABLE

Enable SAU region65 at reset

Type

bool

Default value

0x0

SAU_REGION65.LADDR

Limit address of SAU region65 at reset

Type

int

Default value

0x0

SAU_REGION65.NSC

Set NSC for SAU region65 at reset

Type

bool

Default value

0x0

SAU_REGION66.BADDR

Base address of SAU region66 at reset

Type

int

Default value

0x0

SAU_REGION66.ENABLE

Enable SAU region66 at reset

Type

bool

Default value

0x0

SAU_REGION66.LADDR

Limit address of SAU region66 at reset

Type

int

Default value

0x0

SAU_REGION66.NSC

Set NSC for SAU region66 at reset

Type

bool

Default value

0x0

SAU_REGION67.BADDR

Base address of SAU region67 at reset

Type

int

Default value

0x0

SAU_REGION67.ENABLE

Enable SAU region67 at reset

Type

bool

Default value

0x0

SAU_REGION67.LADDR

Limit address of SAU region67 at reset

Type

int

Default value

0x0

SAU_REGION67.NSC

Set NSC for SAU region67 at reset

Type

bool

Default value

0x0

SAU_REGION68.BADDR

Base address of SAU region68 at reset

Type

int

Default value

0x0

SAU_REGION68.ENABLE

Enable SAU region68 at reset

Type

bool

Default value

0x0

SAU_REGION68.LADDR

Limit address of SAU region68 at reset

Type

int

Default value

0x0

SAU_REGION68.NSC

Set NSC for SAU region68 at reset

Type

bool

Default value

0x0

SAU_REGION69.BADDR

Base address of SAU region69 at reset

Type

int

Default value

0x0

SAU_REGION69.ENABLE

Enable SAU region69 at reset

Type

bool

Default value

0x0

SAU_REGION69.LADDR

Limit address of SAU region69 at reset

Type

int

Default value

0x0

SAU_REGION69.NSC

Set NSC for SAU region69 at reset

Type

bool

Default value

0x0

SAU_REGION7.BADDR

Base address of SAU region7 at reset

Type

int

Default value

0x0

SAU_REGION7.ENABLE

Enable SAU region7 at reset

Type

bool

Default value

0x0

SAU_REGION7.LADDR

Limit address of SAU region7 at reset

Type

int

Default value

0x0

SAU_REGION7.NSC

Set NSC for SAU region7 at reset

Type

bool

Default value

0x0

SAU_REGION70.BADDR

Base address of SAU region70 at reset

Type

int

Default value

0x0

SAU_REGION70.ENABLE

Enable SAU region70 at reset

Type

bool

Default value

0x0

SAU_REGION70.LADDR

Limit address of SAU region70 at reset

Type

int

Default value

0x0

SAU_REGION70.NSC

Set NSC for SAU region70 at reset

Type

bool

Default value

0x0

SAU_REGION71.BADDR

Base address of SAU region71 at reset

Type

int

Default value

0x0

SAU_REGION71.ENABLE

Enable SAU region71 at reset

Type

bool

Default value

0x0

SAU_REGION71.LADDR

Limit address of SAU region71 at reset

Type

int

Default value

0x0

SAU_REGION71.NSC

Set NSC for SAU region71 at reset

Type

bool

Default value

0x0

SAU_REGION72.BADDR

Base address of SAU region72 at reset

Type

int

Default value

0x0

SAU_REGION72.ENABLE

Enable SAU region72 at reset

Type

bool

Default value

0x0

SAU_REGION72.LADDR

Limit address of SAU region72 at reset

Type

int

Default value

0x0

SAU_REGION72.NSC

Set NSC for SAU region72 at reset

Type

bool

Default value

0x0

SAU_REGION73.BADDR

Base address of SAU region73 at reset

Type

int

Default value

0x0

SAU_REGION73.ENABLE

Enable SAU region73 at reset

Type

bool

Default value

0x0

SAU_REGION73.LADDR

Limit address of SAU region73 at reset

Type

int

Default value

0x0

SAU_REGION73.NSC

Set NSC for SAU region73 at reset

Type

bool

Default value

0x0

SAU_REGION74.BADDR

Base address of SAU region74 at reset

Type

int

Default value

0x0

SAU_REGION74.ENABLE

Enable SAU region74 at reset

Type

bool

Default value

0x0

SAU_REGION74.LADDR

Limit address of SAU region74 at reset

Type

int

Default value

0x0

SAU_REGION74.NSC

Set NSC for SAU region74 at reset

Type

bool

Default value

0x0

SAU_REGION75.BADDR

Base address of SAU region75 at reset

Type

int

Default value

0x0

SAU_REGION75.ENABLE

Enable SAU region75 at reset

Type

bool

Default value

0x0

SAU_REGION75.LADDR

Limit address of SAU region75 at reset

Type

int

Default value

0x0

SAU_REGION75.NSC

Set NSC for SAU region75 at reset

Type

bool

Default value

0x0

SAU_REGION76.BADDR

Base address of SAU region76 at reset

Type

int

Default value

0x0

SAU_REGION76.ENABLE

Enable SAU region76 at reset

Type

bool

Default value

0x0

SAU_REGION76.LADDR

Limit address of SAU region76 at reset

Type

int

Default value

0x0

SAU_REGION76.NSC

Set NSC for SAU region76 at reset

Type

bool

Default value

0x0

SAU_REGION77.BADDR

Base address of SAU region77 at reset

Type

int

Default value

0x0

SAU_REGION77.ENABLE

Enable SAU region77 at reset

Type

bool

Default value

0x0

SAU_REGION77.LADDR

Limit address of SAU region77 at reset

Type

int

Default value

0x0

SAU_REGION77.NSC

Set NSC for SAU region77 at reset

Type

bool

Default value

0x0

SAU_REGION78.BADDR

Base address of SAU region78 at reset

Type

int

Default value

0x0

SAU_REGION78.ENABLE

Enable SAU region78 at reset

Type

bool

Default value

0x0

SAU_REGION78.LADDR

Limit address of SAU region78 at reset

Type

int

Default value

0x0

SAU_REGION78.NSC

Set NSC for SAU region78 at reset

Type

bool

Default value

0x0

SAU_REGION79.BADDR

Base address of SAU region79 at reset

Type

int

Default value

0x0

SAU_REGION79.ENABLE

Enable SAU region79 at reset

Type

bool

Default value

0x0

SAU_REGION79.LADDR

Limit address of SAU region79 at reset

Type

int

Default value

0x0

SAU_REGION79.NSC

Set NSC for SAU region79 at reset

Type

bool

Default value

0x0

SAU_REGION8.BADDR

Base address of SAU region8 at reset

Type

int

Default value

0x0

SAU_REGION8.ENABLE

Enable SAU region8 at reset

Type

bool

Default value

0x0

SAU_REGION8.LADDR

Limit address of SAU region8 at reset

Type

int

Default value

0x0

SAU_REGION8.NSC

Set NSC for SAU region8 at reset

Type

bool

Default value

0x0

SAU_REGION80.BADDR

Base address of SAU region80 at reset

Type

int

Default value

0x0

SAU_REGION80.ENABLE

Enable SAU region80 at reset

Type

bool

Default value

0x0

SAU_REGION80.LADDR

Limit address of SAU region80 at reset

Type

int

Default value

0x0

SAU_REGION80.NSC

Set NSC for SAU region80 at reset

Type

bool

Default value

0x0

SAU_REGION81.BADDR

Base address of SAU region81 at reset

Type

int

Default value

0x0

SAU_REGION81.ENABLE

Enable SAU region81 at reset

Type

bool

Default value

0x0

SAU_REGION81.LADDR

Limit address of SAU region81 at reset

Type

int

Default value

0x0

SAU_REGION81.NSC

Set NSC for SAU region81 at reset

Type

bool

Default value

0x0

SAU_REGION82.BADDR

Base address of SAU region82 at reset

Type

int

Default value

0x0

SAU_REGION82.ENABLE

Enable SAU region82 at reset

Type

bool

Default value

0x0

SAU_REGION82.LADDR

Limit address of SAU region82 at reset

Type

int

Default value

0x0

SAU_REGION82.NSC

Set NSC for SAU region82 at reset

Type

bool

Default value

0x0

SAU_REGION83.BADDR

Base address of SAU region83 at reset

Type

int

Default value

0x0

SAU_REGION83.ENABLE

Enable SAU region83 at reset

Type

bool

Default value

0x0

SAU_REGION83.LADDR

Limit address of SAU region83 at reset

Type

int

Default value

0x0

SAU_REGION83.NSC

Set NSC for SAU region83 at reset

Type

bool

Default value

0x0

SAU_REGION84.BADDR

Base address of SAU region84 at reset

Type

int

Default value

0x0

SAU_REGION84.ENABLE

Enable SAU region84 at reset

Type

bool

Default value

0x0

SAU_REGION84.LADDR

Limit address of SAU region84 at reset

Type

int

Default value

0x0

SAU_REGION84.NSC

Set NSC for SAU region84 at reset

Type

bool

Default value

0x0

SAU_REGION85.BADDR

Base address of SAU region85 at reset

Type

int

Default value

0x0

SAU_REGION85.ENABLE

Enable SAU region85 at reset

Type

bool

Default value

0x0

SAU_REGION85.LADDR

Limit address of SAU region85 at reset

Type

int

Default value

0x0

SAU_REGION85.NSC

Set NSC for SAU region85 at reset

Type

bool

Default value

0x0

SAU_REGION86.BADDR

Base address of SAU region86 at reset

Type

int

Default value

0x0

SAU_REGION86.ENABLE

Enable SAU region86 at reset

Type

bool

Default value

0x0

SAU_REGION86.LADDR

Limit address of SAU region86 at reset

Type

int

Default value

0x0

SAU_REGION86.NSC

Set NSC for SAU region86 at reset

Type

bool

Default value

0x0

SAU_REGION87.BADDR

Base address of SAU region87 at reset

Type

int

Default value

0x0

SAU_REGION87.ENABLE

Enable SAU region87 at reset

Type

bool

Default value

0x0

SAU_REGION87.LADDR

Limit address of SAU region87 at reset

Type

int

Default value

0x0

SAU_REGION87.NSC

Set NSC for SAU region87 at reset

Type

bool

Default value

0x0

SAU_REGION88.BADDR

Base address of SAU region88 at reset

Type

int

Default value

0x0

SAU_REGION88.ENABLE

Enable SAU region88 at reset

Type

bool

Default value

0x0

SAU_REGION88.LADDR

Limit address of SAU region88 at reset

Type

int

Default value

0x0

SAU_REGION88.NSC

Set NSC for SAU region88 at reset

Type

bool

Default value

0x0

SAU_REGION89.BADDR

Base address of SAU region89 at reset

Type

int

Default value

0x0

SAU_REGION89.ENABLE

Enable SAU region89 at reset

Type

bool

Default value

0x0

SAU_REGION89.LADDR

Limit address of SAU region89 at reset

Type

int

Default value

0x0

SAU_REGION89.NSC

Set NSC for SAU region89 at reset

Type

bool

Default value

0x0

SAU_REGION9.BADDR

Base address of SAU region9 at reset

Type

int

Default value

0x0

SAU_REGION9.ENABLE

Enable SAU region9 at reset

Type

bool

Default value

0x0

SAU_REGION9.LADDR

Limit address of SAU region9 at reset

Type

int

Default value

0x0

SAU_REGION9.NSC

Set NSC for SAU region9 at reset

Type

bool

Default value

0x0

SAU_REGION90.BADDR

Base address of SAU region90 at reset

Type

int

Default value

0x0

SAU_REGION90.ENABLE

Enable SAU region90 at reset

Type

bool

Default value

0x0

SAU_REGION90.LADDR

Limit address of SAU region90 at reset

Type

int

Default value

0x0

SAU_REGION90.NSC

Set NSC for SAU region90 at reset

Type

bool

Default value

0x0

SAU_REGION91.BADDR

Base address of SAU region91 at reset

Type

int

Default value

0x0

SAU_REGION91.ENABLE

Enable SAU region91 at reset

Type

bool

Default value

0x0

SAU_REGION91.LADDR

Limit address of SAU region91 at reset

Type

int

Default value

0x0

SAU_REGION91.NSC

Set NSC for SAU region91 at reset

Type

bool

Default value

0x0

SAU_REGION92.BADDR

Base address of SAU region92 at reset

Type

int

Default value

0x0

SAU_REGION92.ENABLE

Enable SAU region92 at reset

Type

bool

Default value

0x0

SAU_REGION92.LADDR

Limit address of SAU region92 at reset

Type

int

Default value

0x0

SAU_REGION92.NSC

Set NSC for SAU region92 at reset

Type

bool

Default value

0x0

SAU_REGION93.BADDR

Base address of SAU region93 at reset

Type

int

Default value

0x0

SAU_REGION93.ENABLE

Enable SAU region93 at reset

Type

bool

Default value

0x0

SAU_REGION93.LADDR

Limit address of SAU region93 at reset

Type

int

Default value

0x0

SAU_REGION93.NSC

Set NSC for SAU region93 at reset

Type

bool

Default value

0x0

SAU_REGION94.BADDR

Base address of SAU region94 at reset

Type

int

Default value

0x0

SAU_REGION94.ENABLE

Enable SAU region94 at reset

Type

bool

Default value

0x0

SAU_REGION94.LADDR

Limit address of SAU region94 at reset

Type

int

Default value

0x0

SAU_REGION94.NSC

Set NSC for SAU region94 at reset

Type

bool

Default value

0x0

SAU_REGION95.BADDR

Base address of SAU region95 at reset

Type

int

Default value

0x0

SAU_REGION95.ENABLE

Enable SAU region95 at reset

Type

bool

Default value

0x0

SAU_REGION95.LADDR

Limit address of SAU region95 at reset

Type

int

Default value

0x0

SAU_REGION95.NSC

Set NSC for SAU region95 at reset

Type

bool

Default value

0x0

SAU_REGION96.BADDR

Base address of SAU region96 at reset

Type

int

Default value

0x0

SAU_REGION96.ENABLE

Enable SAU region96 at reset

Type

bool

Default value

0x0

SAU_REGION96.LADDR

Limit address of SAU region96 at reset

Type

int

Default value

0x0

SAU_REGION96.NSC

Set NSC for SAU region96 at reset

Type

bool

Default value

0x0

SAU_REGION97.BADDR

Base address of SAU region97 at reset

Type

int

Default value

0x0

SAU_REGION97.ENABLE

Enable SAU region97 at reset

Type

bool

Default value

0x0

SAU_REGION97.LADDR

Limit address of SAU region97 at reset

Type

int

Default value

0x0

SAU_REGION97.NSC

Set NSC for SAU region97 at reset

Type

bool

Default value

0x0

SAU_REGION98.BADDR

Base address of SAU region98 at reset

Type

int

Default value

0x0

SAU_REGION98.ENABLE

Enable SAU region98 at reset

Type

bool

Default value

0x0

SAU_REGION98.LADDR

Limit address of SAU region98 at reset

Type

int

Default value

0x0

SAU_REGION98.NSC

Set NSC for SAU region98 at reset

Type

bool

Default value

0x0

SAU_REGION99.BADDR

Base address of SAU region99 at reset

Type

int

Default value

0x0

SAU_REGION99.ENABLE

Enable SAU region99 at reset

Type

bool

Default value

0x0

SAU_REGION99.LADDR

Limit address of SAU region99 at reset

Type

int

Default value

0x0

SAU_REGION99.NSC

Set NSC for SAU region99 at reset

Type

bool

Default value

0x0

SAU_TYPE.SREGION

Number of SAU regions (0 => no SAU)

Type

int

Default value

0x10

SECEXT

Whether the ARMv8-M Security Extensions are included

Type

bool

Default value

0x1

SYST

Include SysTick timer functionality (0=Absent, 1=Secure only, 2=Secure and NS)

Type

int

Default value

0x2

SYST_CALIB_NS_reset

SYST_CALIB_NS reset value

Type

int

Default value

0x0

SYST_CALIB_reset

SYST_CALIB reset value

Type

int

Default value

0x0

VTOR_NS

NonSecure Vector Table Offset Register is writeable

Type

bool

Default value

0x1

VTOR_NS_MASK

Non-Secure VTOR write mask

Type

int

Default value

0xffffffff80

VTOR_S

Secure Vector Table Offset Register is writeable

Type

bool

Default value

0x1

VTOR_S_MASK

Secure VTOR write mask

Type

int

Default value

0xffffffff80

WIC

Include support for WIC-mode deep sleep

Type

bool

Default value

0x1

abort_unaligned_nonNormal

If true, UNPREDICTABLE accesses of device and strongly ordered memory abort; if false they are allowed.

Type

bool

Default value

0x1

aircr_iesb_is_writable

IS the AIRCR.IESB bit [5] writable?

Type

bool

Default value

0x1

aircr_iesb_reset

Set the AIRCR.IESB bit [5] after reset

Type

bool

Default value

0x0

allow_dap_writes_while_core_running

Debug writes are respected even while the core is running, i.e. the core does not have to be halted

Type

bool

Default value

0x1

allow_debug_monitor_with_in_flight_inst

Allow handling Debug Monitor exception with in-flight instructions

Type

bool

Default value

0x0

allow_stack_accesses_to_ppb_space

Allow stack accesses to PPB space

Type

bool

Default value

0x0

always_undefinstr_over_nocp

Only v8.0M. Always fault with UNDEFINSTR for undefined instructions that fall in CP space (don't check coprocessor status)

Type

bool

Default value

0x0

apply_prigroup_to_pending_tree

DEPRECATED: please use sep_sec_state_then_apply_prigroup_to_pending. Original description: Apply AIRCR.PRIGROUP to the pending and active trees (instead of just the active tree) when selecting the highest priority pending exception

Type

bool

Default value

0x0

baseline

Use the baseline profile (if false, use mainline)

Type

bool

Default value

0x1

bp_on_2nd_halfword

Respect DWT/BPU breakpoint-hit on 2nd halfword of 32-bit instruction

Type

bool

Default value

0x1

callee_register_push_low_to_high

If true, push callee registers in order from R4 to R11. If false, push R11 to R4

Type

bool

Default value

0x1

cde_fp_check_on_unsupported

Run FP checks on both supported and unsupported CDE instructions

Type

bool

Default value

0x0

cde_impl_name

Name of the CDE implementation for this core (implementation contributed by MTI plugin).

Type

string

Default value**clear_non_secure_EXC_RETURN.ES_on_tailchain**

Clear EXC_RETURN.ES in LR value on entry to a tail-chained exception when returning from Non-secure state

Type

bool

Default value

0x1

condition_flags_reset

Reset Value of condition flags in APSR

Type

int

Default value

0x0

cpi_div

divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpu_can_access_debug_regs

The DWT, BPU, ROM table, DCB, and the SHCSR and DFSR registers access from the processor

Type

bool

Default value

0x1

dbg_coproc_load_store_enable

Enable LDCX and STCX instructions

Type

int

Default value

0x0

dcache-invalidate-ns-cleans-s

Whether V8M DCI* in non-secure should clean-and-invalidate secure cache contents.

Type

bool

Default value

0x0

dcache-size

L1 D-cache size in bytes

Type

int

Default value

0x8000

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

delay_faultmask_update

Delay FAULTMASK update to context sync

Type

bool

Default value

0x0

delay_sysreg_update

Delay some system register updates (e.g. SHCSR) to context sync

Type

bool

Default value

0x0

do_exclusive_monitor_check_first

In exclusive stores, check local exclusive monitor before detecting other memory aborts

Type

bool

Default value

0x0

drop_mem_fault

Whether to drop mem_fault in favour of subsequently generated NOCP/secure fault in PushStack

Type

bool

Default value

0x0

dtcm_enable

Enable DTCM at reset

Type

bool

Default value

0x0

dtcm_size

DTCM size in KB

Type

int

Default value

0x100

dwt_unaligned_word_access_as_half_word

DWT Treat unaligned word access as half word or bytes.

Type

bool

Default value

0x1

enable_helium_extension

Enable Helium extension

Type

bool

Default value

0x0

exercise_strex_fail

Reject a pseudo-random majority of exclusive store instructions

Type

bool

Default value

0x0

has_ahbp

Are Vendor-Sys accesses sent to a separate bus (AHBP on CM7).

Type

bool

Default value

0x1

has_arm_v8-1m

Enable v8.1M architecture version and features

Type

bool

Default value

0x0

has_cde

Enables Custom Datapath Extensions

Type

bool

Default value

0x0

has_core_dside_bus_gasket

STL gasket enabled

Type

bool

Default value

0x0

has_lob_cache

Support for LOB cache (only if support for LO instructions is enabled as well).

Type

bool

Default value

0x1

has_m55_tcmcr

If true, enables the CortexM55 TCM Control Registers (ITCMCR and DTCMCR), If false, CortexM55 TCM Control Registers are disabled

Type

bool

Default value

0x0

has_pmu

Availability of optional PMU.

Type

bool

Default value

0x0

has_separate_etm_reset

If true, signal 'etmreset' resets the core, else the core power-on-reset does

Type

bool

Default value

0x0

has_unprivileged_debug

Unprivileged Debug Extension supported for Mainline Extension

Type

bool

Default value

0x1

has_writebuffer

Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.

Type

bool

Default value

0x0

icache-size

L1 I-cache size in bytes

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

ignore_RNR_top_nibble

If set, only the bottom four bits of MPU_RNR.REGION are used

Type

bool

Default value

0x0

ignore_demcr_sdme_for_nonhalting_bkpt

Ignore the SDME bit of the DEMCR register when escalating a Debug Monitor exception to a HardFault.

Type

bool

Default value

0x0

ignore_out_of_range_RNR_write

If an MPU_RNR.REGION write is out of range, ignore it ; if false, MPU_RNR values wrap

Type

bool

Default value

0x0

ignore_unpred_SBZSBO

Use smaller decoder does not UNDEF some unpredictable SBZ/SBO fields.

Type

bool

Default value

0x0

ignore_unpred_ZeroRegistersInList

VLDM,VSTM,STM,LDM with no registers NOP instead of UNDEF.

Type

bool

Default value

0x0

itcm_enable

Enable ITCM at reset

Type

bool

Default value

0x0

itcm_size

ITCM size in KB

Type

int

Default value

0x100

late_arrival

Enable late arrival support

Type

bool

Default value

0x1

master_id

Master ID presented in bus transactions

Type

int

Default value

0x0

min_sync_level

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

mve_has_atomic_ticks

Enable atomic ticks behaviour for vector instructions flagged as such (e.g. VLDR)

Type

bool

Default value

0x0

num_pmu_counters

Number of available PMU counters.

Type

int

Default value

0x1f

number_of_itm_stimulus_ports

The number of ITM stimulus ports

Type

int

Default value

0x20

pend_overriden_exception_on_stack_push

Mark any overridden exceptions on stack push as pending (instead of dropping them)

Type

bool

Default value

0x0

preserve_unknown_caller_save_regs_at_S_to_S

preserve unknown caller registers when they become UNKNOWN at secure to secure

Type

bool

Default value

0x1

ras_ERRFR0

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR1

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR10

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR11

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR12

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR13

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR14

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR15

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR16

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR17

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR18

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR19

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR2

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR20

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR21

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR22

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR23

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR24

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR25

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR26

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR27

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR28

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR29

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR3

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR30

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR31

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR32

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR33

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR34

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR35

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR36

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR37

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR38

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR39

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR4

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR40

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR41

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR42

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR43

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR44

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR45

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR46

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR47

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR48

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR49

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR5

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR50

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR51

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR52

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR53

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR54

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR55

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR6

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR7

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR8

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_ERRFR9

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

Type

string

Default value

'{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'

ras_cei_pin

RAS: Critical error interrupt pin.

Type

int

Default value

0x2

ras_cei_support

RAS: Whether Critical Error Interrupt is supported

Type

bool

Default value

0x1

ras_eri_pin

RAS: Error recovery interrupt pin.

Type

int

Default value

0x1

ras_eri_support

RAS: Whether Error Recovery Interrupt is supported

Type

bool

Default value

0x1

ras_error_record

56 bit value that specifies which nodes out of 0-55 are implemented (ERRDEVID is derived from this parameter)

Type

int

Default value

0xffffffffffffffff

ras_fhi_pin

RAS: Fault handling interrupt pin.

Type

int

Default value

0x0

ras_fhi_support

RAS: Whether Fault Handling Interrupt is supported

Type

bool

Default value

0x1

rd_ns_bus_err_behave

External read aborts in nonsecure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

Type

int

Default value

0x1

rd_s_bus_err_behave

External read aborts in secure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

Type

int

Default value

0x1

register_reset_data

Data used to fill register bits when they become UNKNOWN at reset.

Type

int

Default value

0x0

reported_patch_level

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reported_revision_number

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

semihosting-Thumb_SVC

T32 SVC number for semihosting

Type

int

Default value

0xab

semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**semihosting-enable**

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

Type

bool

Default value

0x1

semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0x20700000

semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

semihosting-stack_base

Virtual address of base of descending stack

Type

int

Default value

0x20800000

semihosting-stack_limit

Virtual address of stack limit

Type

int

Default value

0x20700000

sep_sec_state_then_apply_prigroup_to_pending

Use separate comparison trees for Secure and Non-Secure pending exceptions and apply AIRCR.PRIGROUP to the output of each before they are compared to determine the overall highest priority

Type

bool

Default value

0x0

sequential_security_transitions

Allow transition of security state in sequential instruction fetches that cross from non-secure to secure memory with SG instruction 0: never, 1: always, 2: 32-bit instrs, 3: ISB.

Type

int

Default value

0x1

share_fault_address_reg

If true, Fault Address Register is shared

Type

bool

Default value

0x0

stack_limit_check

Implementation defined stack limit checks for instructions. Bit 0: Load-exclusive, Bit 1: Load-acquire, Bit 2: VLDM. Any instruction that can't be configured does stack limit check by default.

Type

int

Default value

0x7

stack_limit_check_optimization

Stack limit check optimization (0: limit check done for each word on the stack, 1: limit check done only on stack pointer)

Type

bool

Default value

0x1

stacking_writes_are_precise

Faults on stack writes are precise

Type

bool

Default value

0x1

supports_unprivileged

Enable support for Unprivileged/Privileged Extension

Type

bool

Default value

0x1

tail_chain

Enable tail-chaining optimisation

Type

bool

Default value

0x1

trace_style

MVE instruction trace style: Add 16 for [**-] beat trace. Add 32 for tracing IMPLIED LOB instructions. Add 64 to change opcode of implied BF to 0xBF00

Type

int

Default value

0x2

unknown_regs_at_exception_value

Data used to fill registers when they become UNKNOWN at exception and exception-return.

Type

int

Default value

0x0

unpred_WriteBackandBaseInList_stores_old_base_value

allow STM with write back to base register in register list

Type

bool

Default value

0x0

unpred_mon_step_write

Behavior on unpredictable updates to MON_STEP bit of DEMCR. 0: ignore write, 1: set one, 2: set zero

Type

int

Default value

0x0

unpred_msr_psr_with_one_mask_and_nodsp_is_nop

If true, MSR to *PSR with a one mask and no DSP does nothing.

Type

bool

Default value

0x1

unpred_msr_psr_with_zero_mask_is_nop

If true, MSR to *PSR with a zero mask does nothing.

Type

bool

Default value

0x0

unstack_R_regs_before_fp_cp_check

In exception return unstack normal register before checking fp coprocessor is enable to unstack FP register

Type

bool

Default value

0x0

vector_fetch_as_wpt_event

Watchpoint on exception vector fetch

Type

bool

Default value

0x0

vector_fetch_busfault_sets_HFSR_FORCED

Only v8.0M. Set HFSR.FORCED when a vector table read generates a HardFault

Type

bool

Default value

0x0

vector_fetch_on_ide

Perform vector fetch on I-side

Type

bool

Default value

0x1

vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

wr_ns_bus_err_behave

External write aborts in nonsecure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

Type

int

Default value

0x3

wr_s_bus_err_behave

External write aborts in secure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

Type

int

Default value

0x3

write_unknown_regs_at_exception

Do we write registers when they become UNKNOWN at exception or exception-return.

Type

bool

Default value

0x0

3.5.4 ARMCortexA5CT

ARMCortexA5CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-186: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA5CT

This model has the following Iris instances:

Table 3-187: ARMCortexA5CT Iris instances

InstanceName	ComponentName
ARMCortexA5CT	Cluster_ARM_Cortex-A5UP
ARMCortexA5CT.acp_mapper	PVBusMapper
ARMCortexA5CT.cpu0	ARM_Cortex-A5UP
ARMCortexA5CT.cpu0.UTLB	TLB
ARMCortexA5CT.cpu0.l1dcache	PVCache
ARMCortexA5CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA5CT.cpu0.l1icache	PVCache
ARMCortexA5CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA5CT.cpu0.utlb	TlbCadi
ARMCortexA5CT.ext_bus	PVBusLogger
ARMCortexA5CT.ext_bus.mapper	PVBusMapper
ARMCortexA5CT.l1_incoherent_interconnect	PVCache
ARMCortexA5CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave

InstanceName	ComponentName
ARMCortexA5CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA5CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-188: ARMCortexA5CT MTI instances

InstanceName	ComponentName
ARMCortexA5CT.acp_mapper	PVBusMapper
ARMCortexA5CT.cpu0	ARM_Cortex-A5
ARMCortexA5CT.cpu0.UTLB	TLB
ARMCortexA5CT.cpu0.l1dcache	PVCache
ARMCortexA5CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA5CT.cpu0.l1icache	PVCache
ARMCortexA5CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA5CT.ext_bus	PVBusLogger
ARMCortexA5CT.ext_bus.mapper	PVBusMapper
ARMCortexA5CT.l1_incoherent_interconnect	PVCache
ARMCortexA5CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA5CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA5CT contains the following CADI targets:

- ARM_Cortex-A5UP
- Cluster_ARM_Cortex-A5UP
- PVCache
- TlbCadi

About ARMCortexA5CT

- The `ase-present` and `vfp-present` parameters configure the synthesis options:
 - vfp present and ase present**
Neon™ and VFPv3-D32 are supported.
 - vfp present and ase not present**
VFPv3-D16 is supported.
 - vfp not present and ase present**
Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.
 - vfp not present and ase not present**
Model has neither Neon nor VFPv3-D32 support.
- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.

Ports for ARMCortexA5CT

Table 3-189: Ports

Name	Protocol	Type	Description
<code>cfgend[1]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgnmfi[1]</code>	Signal	Slave	This signal disables FIQ mask in CPSR.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>cp15sdisable[1]</code>	Signal	Slave	This signal disables write access to some system control processor registers.
<code>event</code>	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
<code>fiq[1]</code>	Signal	Slave	This signal drives the CPU's fast-interrupt handling.

Name	Protocol	Type	Description
irq[1]	Signal	Slave	This signal drives the CPU's interrupt handling.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[1]	Signal	Slave	This signal provides default exception handling state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	Signal	Slave	This signal controls of the location of the exception vectors at reset.

Parameters for ARMCortexA5CT

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Initialize to BE8 endianness

Type

bool

Default value

0x0

cpuX.CFGNMFI

Enable nonmaskable FIQ interrupts on startup

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.POWERCTLI

Default power control state for processor

Type

int

Default value

0x0

cpuX.TEINIT

T32 exception enable. The default has exceptions including reset handled in A32 state

Type

bool

Default value

0x0

cpuX.VINITHI

Initialize with high vectors enabled

Type

bool

Default value

0x0

cpuX.ase-present

Set whether model has NEON support

Type

bool

Default value

0x1

cpuX.dcache-size

Set D-cache size in bytes

Type

int

Default value

0x8000

cpuX.icache-size

Set I-cache size in bytes

Type

int

Default value

0x8000

cpuX.min_sync_level

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-ARM_HLT

ARM HLT number for semihosting

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

ARM SVC number for semihosting

Type

int

Default value

0x123456

cpuX.semihosting-Thumb_HLT

Thumb HLT number for semihosting

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

Thumb SVC number for semihosting

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0xf000000

cpuX.semihosting-hlt-enable

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true

Type

bool

Default value

0x0

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit

Type

int

Default value

0xf000000

cpuX.vfp-enable_at_reset

Enable coprocessor access and VFP at reset

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_access_latency

D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

device-accurate-tlb

Specify whether all TLBs are modeled

Type

bool

Default value

0x0

icache-hit_latency

I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_access_latency

I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

3.5.5 ARMCortexA5MPx1CT

ARMCortexA5MPx1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-190: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA5MPx1CT

This model has the following Iris instances:

Table 3-191: ARMCortexA5MPx1CT Iris instances

InstanceName	ComponentName
ARMCortexA5MPx1CT	Cluster_ARM_Cortex-A5MP
ARMCortexA5MPx1CT.acp_mapper	PVBusMapper
ARMCortexA5MPx1CT.cpu0	ARM_Cortex-A5MP
ARMCortexA5MPx1CT.cpu0.UTLB	TLB
ARMCortexA5MPx1CT.cpu0.l1dcache	PVCache
ARMCortexA5MPx1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA5MPx1CT.cpu0.l1icache	PVCache
ARMCortexA5MPx1CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA5MPx1CT.cpu0.utlb	TlbCadi
ARMCortexA5MPx1CT.ext_bus	PVBusLogger
ARMCortexA5MPx1CT.ext_bus.mapper	PVBusMapper
ARMCortexA5MPx1CT.internal_shareability_remapper	PVBusMapper
ARMCortexA5MPx1CT.l1_incoherent_interconnect	PVCache
ARMCortexA5MPx1CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexA5MPx1CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave

ARMCortexA5MPx1CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA5MPx1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA5MPx1CT contains the following CADI targets:

- ARM_Cortex-A5MP
- Cluster_ARM_Cortex-A5MP
- PVCache
- TlbCadi

About ARMCortexA5MPx1CT

- The following components also exist:
 - ARMCortexA5MPx2CT.
 - ARMCortexA5MPx4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv3-D32 are supported.

vfp present and ase not present

VFPv3-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv3-D32 support.

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- If you are using the `ARMCortexA5MPxnCT` component in a VE platform model, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- There is a single memory port combining instruction, data, DMA and peripheral access.
- The GIC does not respect the CFGSDISABLE signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of *Wait For Interrupt* (WFI) to wake up.
- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.

Ports for ARMCortexA5MPx1CT

Table 3-193: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgnmfi[1]	Signal	Slave	This signal disables FIQ mask in CPSR.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cp15sdisable[1]	Signal	Slave	This signal disables write access to some system control processor registers.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
filteren	Signal	Slave	This signal enables filtering of address ranges between master bus ports.
filterend	Value	Slave	This port sets end of region mapped to pvbus_m1.
filterstart	Value	Slave	This port sets start of region mapped to pvbus_m1.
fiq[1]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[1]	Signal	Master	This signal exports internal VGIC FIQ signal to the CPU.
ints[224]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq[1]	Signal	Slave	This signal drives the CPU's interrupt handling.
irqout[1]	Signal	Master	This signal exports internal VGIC IRQ signal to the CPU.
periphbase	Value	Slave	This port sets the base address of private peripheral region.

Name	Protocol	Type	Description
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down at least by factor of two.
periphreset	Signal	Slave	This signal resets timer and interrupt controller.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	AXI master 0 bus master channel.
pvbus_m1	PVBus	Master	AXI master 1 bus master channel.
pwrctl[1]	Value	Slave	This port sets reset value for scu CPU status register.
pwrctl0[1]	Value	Master	This port sends scu CPU status register bits.
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
scureset	Signal	Slave	This signal resets SCU.
smpnamp[1]	Signal	Master	This signals AMP or SMP mode for each Cortex-A5 processor.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[1]	Signal	Slave	This signal provides default exception handling state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
wdreset[1]	Signal	Slave	This signal resets individual watchdog.
wdresetreq[1]	Signal	Master	This signal resets rest of the CA5MP system.

Parameters for ARM Cortex A5MPx1CT

CFGSDISABLE

Disable some accesses to GIC registers

Type

bool

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

FILTEREN

Enable filtering of accesses through pvbus_m0

Type

bool

Default value

0x0

FILTEREND

End of region filtered to pvbus_m0

Type

int

Default value

0x0

FILTERSTART

Base of region filtered to pvbus_m0

Type

int

Default value

0x0

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Initialize to BE8 endianness

Type

bool

Default value

0x0

cpuX.CFGNMFI

Enable nonmaskable FIQ interrupts on startup

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.POWERCTLI

Default power control state for processor

Type

int

Default value

0x0

cpuX.SMPnAMP

Set whether the processor is part of a coherent domain

Type

bool

Default value

0x0

cpuX.TEINIT

T32 exception enable. The default has exceptions including reset handled in A32 state

Type

bool

Default value

0x0

cpuX.VINITHI

Initialize with high vectors enabled

Type

bool

Default value

0x0

cpuX.ase-present

Set whether model has NEON support

Type

bool

Default value

0x1

cpuX.dcache-size

Set D-cache size in bytes

Type

int

Default value

0x8000

cpuX.icache-size

Set I-cache size in bytes

Type

int

Default value

0x8000

cpuX.min_sync_level

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-ARM_HLT

ARM HLT number for semihosting

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

ARM SVC number for semihosting

Type

int

Default value

0x123456

cpuX.semihosting-Thumb_HLT

Thumb HLT number for semihosting

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

Thumb SVC number for semihosting

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0xf000000

cpuX.semihosting-hlt-enable

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true

Type

bool

Default value

0x0

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit

Type

int

Default value

0xf000000

cpuX.vfp-enable_at_reset

Enable coprocessor access and VFP at reset

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_access_latency

D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-snoop_data_transfer_latency

D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

device-accurate-tlb

Specify whether all TLBs are modeled

Type

bool

Default value

0x0

dic-spi_count

Number of shared peripheral interrupts implemented

Type

int

Default value

0x40

icache-hit_latency

I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_access_latency

I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

3.5.6 ARMCortexA7x1CT

ARMCortexA7x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-194: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA7x1CT

This model has the following Iris instances:

Table 3-195: ARMCortexA7x1CT Iris instances

InstanceName	ComponentName
ARMCortexA7x1CT	Cluster_ARM_Cortex-A7
ARMCortexA7x1CT.Cortex-A7_GIC	GICv2
ARMCortexA7x1CT.acp_mapper	PVBusMapper
ARMCortexA7x1CT.cpu0	ARM_Cortex-A7
ARMCortexA7x1CT.cpu0.DTLB	TLB
ARMCortexA7x1CT.cpu0.ITLB	TLB
ARMCortexA7x1CT.cpu0.dtlb	TlbCadi
ARMCortexA7x1CT.cpu0.itlb	TlbCadi
ARMCortexA7x1CT.cpu0.l1dcache	PVCache
ARMCortexA7x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA7x1CT.cpu0.l1icache	PVCache
ARMCortexA7x1CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA7x1CT.ext_bus	PVBusLogger
ARMCortexA7x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA7x1CT.l2_cache	PVCache
ARMCortexA7x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[4]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[6]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[7]	PVBusSlave

InstanceName	ComponentName
ARMCortexA7x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA7x1CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-196: ARMCortexA7x1CT MTI instances

InstanceName	ComponentName
ARMCortexA7x1CT.Cortex-A7_GIC	GICv2
ARMCortexA7x1CT.acp_mapper	PVBusMapper
ARMCortexA7x1CT.cpu0	ARM_Cortex-A7
ARMCortexA7x1CT.cpu0.DTLB	TLB
ARMCortexA7x1CT.cpu0.ITLB	TLB
ARMCortexA7x1CT.cpu0.l1dcache	PVCache
ARMCortexA7x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA7x1CT.cpu0.l1icache	PVCache
ARMCortexA7x1CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA7x1CT.ext_bus	PVBusLogger
ARMCortexA7x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA7x1CT.l2_cache	PVCache
ARMCortexA7x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[4]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[6]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA7x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA7x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA7x1CT contains the following CADI targets:

- ARM_Cortex-A7
- Cluster_ARM_Cortex-A7
- PVMCache
- TlbCadi

About ARMCortexA7x1CT

- The following components also exist:
 - ARMCortexA7x2CT.
 - ARMCortexA7x3CT.
 - ARMCortexA7x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv4-D32 are supported.

vfp present and ase not present

VFPv4-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to true so model has Neon and VFPv4-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv4-D32 support.

- If you are using the ARMCortexA7x_nCT component in a VE platform model, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

ACE limitation

AXI Coherency Extensions (ACE) are extensions to AXI4 that support system-level cache coherency between multiple clusters. The ACE cache models in the Arm® Cortex®-A15 and Cortex-A7, and the ACE support in the CCI-400 have the limitation that they only process one transaction at a time. Normally, the simulation processes each transaction to completion before allowing any master to generate another transaction. However, in the following situation the simulation might fail. If a SystemC bus slave calls `wait()` while it is processing a transaction, this call might allow another master to issue another transaction that passes through the CCI-400 or the Cortex-A15 or Cortex-A7 caches. This situation could happen if a SystemC bus master running in another thread is connected to one of the ACE-lite ports on the CCI-400.

Differences between the CT model and RTL implementations

This model has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the `CFGSDISABLE` signal. This leads to some registers wrongly being accessible.

- The Broadcast Translation Lookaside Buffer (TLB) or cache operations in this model do not cause other cores in the cluster that are asleep because of Wait For Interrupt (WFI) to wake up.
- The model ignores the RR bit in the SCTLR.
- The model implements the Power Control Register in the system control coprocessor but writing to it does not change the behavior of the model.
- The model does not implement ETM registers.
- The model does not support the Cortex®-A7 mechanism to read the internal memory that the Cache and TLB structures use through the implementation defined region of the system coprocessor interface.
- The model does not upgrade DCIMVAC operations to DCCIMVAC.

Ports for ARMCortexA7x1CT

Table 3-197: Ports

Name	Protocol	Type	Description
axierrirq	Signal	Master	Imprecise aborts from the L2 are signaled by pulsing this pin, typically they are connect to an interrupt controller.
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	Signal	Slave	This signal controls the SCTLR.EE bit.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Outputs of the generic timers.
CNTPNSIRQ[4]	Signal	Master	Outputs of the generic timers.
CNTPSIRQ[4]	Signal	Master	Outputs of the generic timers.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Outputs of the generic timers.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some secure system control processor registers.
cpuporeset[4]	Signal	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[4]	Signal	Master	This signal exports internal VGIC FIQ signal to the CPU..
irq[4]	Signal	Slave	This signal drives the CPU's interrupt handling.
irqout[4]	Signal	Master	This signal exports internal VGIC IRQ signal to the CPU.
irqs[480]	Signal	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	Signal	Slave	This signal resets the shared L2 memory system, interrupt controller and timer logic.
periphbase	Value_64	Slave	This port sets the base address of the private peripheral region.

Name	Protocol	Type	Description
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
teinit[4]	Signal	Slave	This signal enables Thumb exceptions (controls the SCTLR.TE bit).
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	Signal	Slave	Virtual FIQ inputs. Note that the fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[4]	Signal	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ inputs. Note that the irq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Parameters for ARM Cortex A7x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CFGSDISABLE

Disable some accesses to GIC registers

Type

bool

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Initialize to BE8 endianness

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.DBGROMADDR

This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address

Type

int

Default value

0x12000003

cpuX.DBGROMADDRV

If true this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

cpuX.DBGSELFADDR

This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address

Type

int

Default value

0x10003

cpuX.DBGSELFADDRV

If true this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid

Type

bool

Default value

0x1

cpuX.TEINIT

T32 exception enable. The default has exceptions including reset handled in A32 state

Type

bool

Default value

0x0

cpuX.VINITHI

Initialize with high vectors enabled

Type

bool

Default value

0x0

cpuX.ase-present

Set whether CT model has been built with NEON support

Type

bool

Default value

0x1

cpuX.l1_dcache-size

Size of L1 D-cache

Type

int

Default value

0x8000

cpuX.l1_ichache-size

Size of L1 I-cache

Type

int

Default value

0x8000

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-ARM_HLT

ARM HLT number for semihosting

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

ARM SVC number for semihosting

Type

int

Default value

0x123456

cpuX.semihosting-Thumb_HLT

Thumb HLT number for semihosting

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

Thumb SVC number for semihosting

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value

cpuX.semihosting-enable

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0xf000000

cpuX.semihosting-hlt-enable

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true

Type

bool

Default value

0x0

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit

Type

int

Default value

0xf000000

cpuX.vfp-enable_at_reset

Enable coprocessor access and VFP at reset

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether CT model has been built with VFP support

Type

bool

Default value

0x1

dic-spi_count

Number of shared peripheral interrupts implemented

Type

int

Default value

0x40

disable_periph_decoder

Disable memory mapped access to gic system registers

Type

bool

Default value

0x0

internal_vgic

Configures whether the model of the processor contains a VGIC

Type

bool

Default value

0x1

l1_dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `l1_dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l1_dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l1_dcache-state_modelled

Set whether L1 D-cache has stateful implementation

Type

bool

Default value

0x0

l1_dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l1_dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `l1_dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l1_icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. l1_icache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l1_ichache-state_modelled

Set whether L1 I-cache has stateful implementation

Type

bool

Default value

0x0

l2_cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2_cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond

to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2_cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-size

Set L2 cache size in bytes

Type

int

Default value

0x80000

l2_cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-state_modelled

Set whether L2 cache has stateful implementation

Type

bool

Default value

0x0

l2_cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

3.5.7 ARMCortexA8CT

ARMCortexA8CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-198: IP revisions support

Revision	Quality level
r2p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA8CT

This model has the following Iris instances:

Table 3-199: ARMCortexA8CT Iris instances

InstanceName	ComponentName
ARMCortexA8CT	ARM_Cortex-A8
ARMCortexA8CT.DTLB	TLB

InstanceName	ComponentName
ARMCortexA8CT.ITLB	TLB
ARMCortexA8CT.acp_mapper	PVBusMapper
ARMCortexA8CT.cpu0.dtlb	TlbCadi
ARMCortexA8CT.cpu0.itlb	TlbCadi

ARMCortexA8CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA8CT contains the following CADI targets:

- ARM_Cortex-A8
- PVCache
- TlbCadi

About ARMCortexA8CT

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- If the `l1_dcache-state_modelled` parameter is `true`, then `l2_cache-state_modelled` must also be `true`.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.

- This component provides the registers that the Technical Reference Manual (TRM) specifies, except for the coprocessor 14 registers, the integration and test registers, and the PLE model, which is register-based and has no implemented behavior.

These TLB registers do not have working implementations:

- D-TLB ATTR read/write.
- D-TLB CAM read/write.
- D-TLB PA read/write.
- Normal memory remap register.
- Primary memory remap register.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- There is a single memory port combining instruction, data, DMA and peripheral access.
- The L2 cache write allocate policy is not configurable. It defaults to write-allocate. Writes to the configuration register succeed but are ignored, meaning that data can be unexpectedly stored in the L2 cache.
- Unaligned accesses with the MMU disabled on the processor do not cause data aborts.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA8CT

Table 3-201: Ports

Name	Protocol	Type	Description
<code>cfgend0</code>	Signal	Slave	Configure BE8 mode after a reset.
<code>cfgnmfi</code>	Signal	Slave	Configure FIQs as non-maskable after a reset.
<code>cfgte</code>	Signal	Slave	Configure exceptions to be taken in thumb mode after a reset.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>dmaexterrirq</code>	Signal	Master	L1 PLE error interrupt.
<code>dmairq</code>	Signal	Master	Interrupt signal from L1 PLE.
<code>dmairq</code>	Signal	Master	Secure interrupt signal from L1 PLE.
<code>fiq</code>	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
<code>irq</code>	Signal	Slave	This signal drives the CPU's interrupt handling.
<code>pmuirq</code>	Signal	Master	Interrupt signal from performance monitoring unit.
<code>pvbus_m</code>	PVBus	Master	The core will generate bus requests on this port.
<code>reset</code>	Signal	Slave	Raising this signal will put the core into reset mode.
<code>ticks</code>	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
<code>vinithi</code>	Signal	Slave	Configure high vectors after a reset.

Parameters for ARMCortexA8CT

CFGEND0

Initialize to BE8 endianness

Type

bool

Default value

0x0

CFGNMFI

Enable nonmaskable FIQ interrupts on startup

Type

bool

Default value

0x0

CFGTE

Initialize to take exceptions in T32 state. Model starts in T32 state

Type

bool

Default value

0x0

CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

VINITHI

Initialize with high vectors enabled

Type

bool

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

device-accurate-tlb

Specify whether all TLBs are modeled

Type

bool

Default value

0x0

implements_vfp

Set whether the model has been built with VFP and NEON support

Type

bool

Default value

0x1

l1_dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. l1_dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-size

Set L1 D-cache size in bytes

Type

int

Default value

0x8000

l1_dcache-state_modelled

Include Level 1 data cache state model

Type

bool

Default value

0x0

l1_dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. l1_dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond

to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l1_icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `l1_icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l1_icache-size

Set L1 I-cache size in bytes

Type

int

Default value

0x8000

l1_icache-state_modelled

Include Level 1 instruction cache state model

Type

bool

Default value

0x0

l2_cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2_cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-size

Set L2 cache size in bytes

Type

int

Default value

0x40000

l2_cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-state_modelled

Include unified Level 2 cache state model

Type

bool

Default value

0x0

l2_cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

master_id

Master ID presented in bus transactions

Type

int

Default value

0x0

min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

semihosting-ARM_HLT

ARM HLT number for semihosting

Type

int

Default value

0xf000

semihosting-ARM_SVC

ARM SVC number for semihosting

Type

int

Default value

0x123456

semihosting-Thumb_HLT

Thumb HLT number for semihosting

Type

int

Default value

0x3c

semihosting-Thumb_SVC

Thumb SVC number for semihosting

Type

int

Default value

0xab

semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**semihosting-enable**

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Type

bool

Default value

0x1

semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0xf000000

semihosting-hlt-enable

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true

Type

bool

Default value

0x0

semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

semihosting-stack_base
Virtual address of base of descending stack

Type
int

Default value
0x10000000

semihosting-stack_limit
Virtual address of stack limit

Type
int

Default value
0xf000000

siliconID
Value as read by the system coprocessor siliconID register

Type
int

Default value
0x41000000

vfp-enable_at_reset
Enable coprocessor access and VFP at reset

Type
bool

Default value
0x0

3.5.8 ARMCortexA9MPx1CT

ARMCortexA9MPx1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-202: IP revisions support

Revision	Quality level
r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA9MPx1CT

This model has the following Iris instances:

Table 3-203: ARMCortexA9MPx1CT Iris instances

InstanceName	ComponentName
ARMCortexA9MPx1CT	Cluster_ARM_Cortex-A9MP
ARMCortexA9MPx1CT.acp_mapper	PVBusMapper
ARMCortexA9MPx1CT.cpu0	ARM_Cortex-A9MP

ARMCortexA9MPx1CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA9MPx1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA9MPx1CT contains the following CADI targets:

- ARM_Cortex-A9MP
- Cluster_ARM_Cortex-A9MP
- PVCache
- TlbCadi

About ARMCortexA9MPx1CT

- The following components also exist:
 - ARMCortexA9MPx2CT.
 - ARMCortexA9MPx4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv3-D32 are supported.

vfp present and ase not present

VFPv3-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv3-D32 support.

- If you are using the `ARMCortexA9MPxnCT` component in a VE platform model, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.
- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require L2 cache, you can add a PL310 Level 2 Cache Controller component.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the `CFGSDISABLE` signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of WFI to wake up.
- The RR bit in the SCTL_R is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- The following TLB registers do not have working implementations:

- Main TLB Attr.
- Main TLB PA.
- Main TLB VA.
- Normal memory remap register.
- Primary memory remap register.
- Read Main TLB Entry.
- Write Main TLB Entry.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

- Parity error support is hardware-specific so is not modeled.

Ports for ARMCortexA9MPx1CT

Table 3-205: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgnmfi[4]	Signal	Slave	This signal disables FIQ mask in CPSR.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
filteren	Signal	Slave	This signal enables filtering of address ranges between master bus ports.
filterend	Value	Slave	This port sets end of region mapped to pvbus_m1.
filterstart	Value	Slave	This port sets start of region mapped to pvbus_m1.
fiq[4]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[4]	Signal	Master	This signal exports internal VGIC FIQ signal to the CPU..
ints[224]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq[4]	Signal	Slave	This signal drives the CPU's interrupt handling.
irqout[4]	Signal	Master	This signal exports internal VGIC IRQ signal to the CPU.
periphbase	Value	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down at least by factor of two.
periphreset	Signal	Slave	This signal resets timer and interrupt controller.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	AXI master 0 bus master channel.
pvbus_m1	PVBus	Master	AXI master 1 bus master channel.
pwrcctl[4]	Value	Slave	This port sets reset value for scu CPU status register.

Name	Protocol	Type	Description
pwrtclo[4]	Value	Master	This port sends scu CPU status register bits.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
scureset	Signal	Slave	This signal resets SCU.
smpnamp[4]	Signal	Master	This signals AMP or SMP mode for each Cortex-A9 processor.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[4]	Signal	Slave	This signal provides default exception handling state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
wdreset[4]	Signal	Slave	This signal resets individual watchdog.
wdresetreq[4]	Signal	Master	This signal resets rest of the CA9MP system.

Parameters for ARMCortexA9MPx1CT

CFGSDISABLE

Disable some accesses to GIC registers

Type

bool

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

FILTEREN

Enable filtering of accesses through pvbus_m0

Type

bool

Default value

0x0

FILTEREND

End of region filtered to pvbus_m0

Type

int

Default value

0x0

FILTERSTART

Base of region filtered to pvbus_m0

Type

int

Default value

0x0

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Initialize to BE8 endianness

Type

bool

Default value

0x0

cpuX.CFGNMFI

Enable nonmaskable FIQ interrupts on startup

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.POWERCTLI

Default power control state for processor

Type

int

Default value

0x0

cpuX.SMPnAMP

Set whether the processor is part of a coherent domain

Type

bool

Default value

0x0

cpuX.TEINIT

T32 exception enable. The default has exceptions including reset handled in A32 state

Type

bool

Default value

0x0

cpuX.VINITHI

Initialize with high vectors enabled

Type

bool

Default value

0x0

cpuX.ase-present

Set whether model has NEON support

Type

bool

Default value

0x1

cpuX.dcache-size

Set D-cache size in bytes

Type

int

Default value

0x8000

cpuX.icache-size

Set I-cache size in bytes

Type

int

Default value

0x8000

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-ARM_HLT

ARM HLT number for semihosting

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

ARM SVC number for semihosting

Type

int

Default value

0x123456

cpuX.semihosting-Thumb_HLT

Thumb HLT number for semihosting

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

Thumb SVC number for semihosting

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0xf000000

cpuX.semihosting-hlt-enable

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true

Type

bool

Default value

0x0

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit

Type

int

Default value

0xf000000

cpuX.vfp-enable_at_reset

Enable coprocessor access and VFP at reset

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

D-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

D-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

D-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_access_latency

D-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

D-cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-snoop_data_transfer_latency

D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

D-cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

D-cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

device-accurate-tlb

Specify whether all TLBs are modeled

Type

bool

Default value

0x0

dic-spi_count

Number of shared peripheral interrupts implemented

Type

int

Default value

0x40

icache-hit_latency

I-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

I-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

I-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_access_latency

I-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

I-cache timing annotation latency for read accesses given in ticks per byte accessed.icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

3.5.9 ARMCortexA9UPCT

ARMCortexA9UPCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-206: IP revisions support

Revision	Quality level
r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARM Cortex-A9UPCT

This model has the following Iris instances:

Table 3-207: ARM Cortex-A9UPCT Iris instances

InstanceName	ComponentName
ARM Cortex-A9UPCT	Cluster_ARM_Cortex-A9UP
ARM Cortex-A9UPCT.acp_mapper	PVBusMapper
ARM Cortex-A9UPCT.cpu0	ARM_Cortex-A9UP
ARM Cortex-A9UPCT.cpu0.UTLB	TLB
ARM Cortex-A9UPCT.cpu0.l1dcache	PVCache
ARM Cortex-A9UPCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARM Cortex-A9UPCT.cpu0.l1icache	PVCache
ARM Cortex-A9UPCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARM Cortex-A9UPCT.cpu0.utlb	TlbCadi
ARM Cortex-A9UPCT.ext_bus	PVBusLogger
ARM Cortex-A9UPCT.ext_bus.mapper	PVBusMapper
ARM Cortex-A9UPCT.l1_incoherent_interconnect	PVCache
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARM Cortex-A9UPCT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARM Cortex-A9UPCT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-208: ARMCortexA9UPCT MTI instances

InstanceName	ComponentName
ARMCortexA9UPCT.acp_mapper	PVBusMapper
ARMCortexA9UPCT.cpu0	ARM_Cortex-A9UP
ARMCortexA9UPCT.cpu0.UTLB	TLB
ARMCortexA9UPCT.cpu0.l1dcache	PVCache
ARMCortexA9UPCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA9UPCT.cpu0.l1icache	PVCache
ARMCortexA9UPCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA9UPCT.ext_bus	PVBusLogger
ARMCortexA9UPCT.ext_bus.mapper	PVBusMapper
ARMCortexA9UPCT.l1_incoherent_interconnect	PVCache
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA9UPCT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA9UPCT contains the following CADI targets:

- ARM_Cortex-A9UP
- Cluster_ARM_Cortex-A9UP
- PVCache
- TlbCadi

About ARMCortexA9UPCT

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv3-D32 are supported.

vfp present and ase not present

VFPv3-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to `true` so model has Neon and VFPv3-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv3-D32 support.

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require L2 cache you can add a PL310 Level 2 Cache Controller component.
- Parity error support is hardware-specific so is not modeled.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

These TLB registers do not have working implementations:

- Normal memory remap register.
- Primary memory remap register.
- Read Main TLB Entry.
- Write Main TLB Entry.
- Main TLB VA.
- Main TLB PA.
- Main TLB Attr.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

Ports for ARMCortexA9UPCT

Table 3-209: Ports

Name	Protocol	Type	Description
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgnmfi[1]	Signal	Slave	This signal disables FIQ mask in CPSR.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cp15sdisable[1]	Signal	Slave	This signal disables write access to some system control processor registers.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq[1]	Signal	Slave	This signal drives the CPU's interrupt handling.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbush_m0	PVBus	Master	The core will generate bus requests on this port.
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[1]	Signal	Slave	This signal provides default exception handling state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	Signal	Slave	This signal controls the location of the exception vectors at reset.

Parameters for ARMCortexA9UPCT

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Initialize to BE8 endianness

Type

bool

Default value

0x0

cpuX.CFGNMFI

Enable nonmaskable FIQ interrupts on startup

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.POWERCTLI

Default power control state for processor

Type

int

Default value

0x0

cpuX.TEINIT

T32 exception enable. The default has exceptions including reset handled in A32 state

Type

bool

Default value

0x0

cpuX.VINITHI

Initialize with high vectors enabled

Type

bool

Default value

0x0

cpuX.ase-present

Set whether model has NEON support

Type

bool

Default value

0x1

cpuX.dcache-size

Set D-cache size in bytes

Type

int

Default value

0x8000

cpuX.icache-size

Set I-cache size in bytes

Type

int

Default value

0x8000

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-ARM_HLT

ARM HLT number for semihosting

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

ARM SVC number for semihosting

Type

int

Default value

0x123456

cpuX.semihosting-Thumb_HLT

Thumb HLT number for semihosting

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

Thumb SVC number for semihosting

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0xf000000

cpuX.semihosting-hlt-enable

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true

Type

bool

Default value

0x0

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit

Type

int

Default value

0xf000000

cpuX.vfp-enable_at_reset

Enable coprocessor access and VFP at reset

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

D-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

D-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

D-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_access_latency

D-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

D-cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

D-cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

D-cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

device-accurate-tlb

Specify whether all TLBs are modeled

Type

bool

Default value

0x0

icache-hit_latency

I-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

I-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

I-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_access_latency

I-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

I-cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

3.5.10 **ARMCortexA15x1CT**

ARMCortexA15x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-210: IP revisions support

Revision	Quality level
r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA15x1CT

This model has the following Iris instances:

Table 3-211: ARMCortexA15x1CT Iris instances

InstanceName	ComponentName
ARMCortexA15x1CT	Cluster_ARM_Cortex-A15
ARMCortexA15x1CT.Cortex-A15_GIC	GICv2
ARMCortexA15x1CT.acp_mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexA15x1CT.cpu0	ARM_Cortex-A15
ARMCortexA15x1CT.cpu0.DTLB	TLB
ARMCortexA15x1CT.cpu0.ITLB	TLB
ARMCortexA15x1CT.cpu0.dtlb	TlbCadi
ARMCortexA15x1CT.cpu0.itlb	TlbCadi
ARMCortexA15x1CT.cpu0.l1dcache	PVCache
ARMCortexA15x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA15x1CT.cpu0.l1icache	PVCache
ARMCortexA15x1CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA15x1CT.ext_bus	PVBusLogger
ARMCortexA15x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA15x1CT.l2_cache	PVCache
ARMCortexA15x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[4]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[6]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA15x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA15x1CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

ARMCortexA15x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA15x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA15x1CT contains the following CADI targets:

- ARM_Cortex-A15
- Cluster_ARM_Cortex-A15
- PVCache
- TlbCadi

About ARMCortexA15x1CT

- The following components also exist:
 - ARMCortexA15x2CT.
 - ARMCortexA15x3CT.
 - ARMCortexA15x4CT.

The per-core parameters are preceded by `cpu n .`, where n identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv4-D32 are supported.

vfp present and ase not present

VFPv4-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to `true` so model has Neon and VFPv4-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv4-D32 support.

- If you are using the `ARMCortexA15x_nCT` component on a VE model platform, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.

ACE limitation

AXI Coherency Extensions (ACE) are extensions to AXI4 that support system-level cache coherency between multiple clusters. The ACE cache models in the Arm® Cortex®-A15 and Cortex-A7, and the ACE support in the CCI-400 have the limitation that they only process one transaction at a time. Normally, the simulation processes each transaction to completion before allowing any master to generate another transaction. However, in the following situation the simulation might fail. If a SystemC bus slave calls `wait()` while it is processing a transaction, this call might allow another master to issue another transaction that passes through the CCI-400 or the Cortex-A15 or Cortex-A7 caches. This situation could happen if a SystemC bus master running in another thread is connected to one of the ACE-lite ports on the CCI-400.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the `CFGSDISABLE` signal. This leads to some registers wrongly being accessible.
- The Broadcast *Translation Lookaside Buffer* (TLB) or cache operations in the model do not cause other cores in the cluster that are asleep because of *Wait For Interrupt* (WFI) to wake up.
- It ignores the RR bit in the SCTLR.
- It implements the Power Control Register in the system control coprocessor but writing to it does not change the behavior of the model.
- When modeling the SCU, coherency operations are by memory writes then reads to refill from memory, rather than cache-to-cache transfers.
- It does not implement ETM registers.
- It implements TLB bitmap registers as RAZ/WI.
- It does not support the Cortex®-A15 mechanism to read the internal memory that the Cache and TLB structures use through the implementation defined region of the system coprocessor interface. This includes the RAM Index Register, IL1DATA Registers, DL1DATA Registers, and associated functionality.

- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA15x1CT

Table 3-213: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
<code>broadcastinner</code>	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
<code>broadcastouter</code>	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
<code>cfgend[4]</code>	Signal	Slave	This signal controls the SCTLR.EE bit.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clusterid</code>	Value	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
<code>CNTHPIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>CNTPSIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>cp15sdisable[4]</code>	Signal	Slave	This signal disables write access to some secure system control processor registers.
<code>cpuporeset[4]</code>	Signal	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.
<code>event</code>	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
<code>fiq[4]</code>	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
<code>fiqout[4]</code>	Signal	Master	This signal exports internal VGIC FIQ signal to the CPU..
<code>irq[4]</code>	Signal	Slave	This signal drives the CPU's interrupt handling.
<code>irqout[4]</code>	Signal	Master	This signal exports internal VGIC IRQ signal to the CPU.
<code>irqs[224]</code>	Signal	Slave	These signals drive the CPU's interrupt controller interrupt lines.
<code>l2reset</code>	Signal	Slave	This signal resets the shared L2 memory system, interrupt controller and timer logic.
<code>periphbase</code>	Value_64	Slave	This port sets the base address of the private peripheral region.
<code>pmuirq[4]</code>	Signal	Master	Interrupt signal from performance monitoring unit.
<code>presetdbg</code>	Signal	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
<code>pvbus_m0</code>	PVBus	Master	The core will generate bus requests on this port.
<code>reset[4]</code>	Signal	Slave	Raising this signal will put the core into reset mode.
<code>standbywfe[4]</code>	Signal	Master	This signal indicates if a core is in WFE state.
<code>standbywfi[4]</code>	Signal	Master	This signal indicates if a core is in WFI state.
<code>standbywfil2</code>	Signal	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.

Name	Protocol	Type	Description
teinit[4]	Signal	Slave	This signal enables Thumb exceptions (controls the SCTLR.TE bit).
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	Signal	Slave	Virtual FIQ inputs. Note that the fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[4]	Signal	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ inputs. Note that the irq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Parameters for ARM Cortex A15x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CFGSDISABLE

Disable some accesses to GIC registers

Type

bool

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

IMINLN

Instruction cache minimum line size: false=32 bytes, true=64 bytes

Type

bool

Default value

0x1

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Initialize to BE8 endianness

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.DBGROMADDR

This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address

Type

int

Default value

0x12000003

cpuX.DBGROMADDRV

If true, this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

cpuX.DBGSELFADDR

This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address

Type

int

Default value

0x10003

cpuX.DBGSELFADDRV

If true, this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid

Type

bool

Default value

0x1

cpuX.TEINIT

T32 exception enable. The default has exceptions including reset handled in A32 state

Type

bool

Default value

0x0

cpuX.VINITHI

Initialize with high vectors enabled

Type

bool

Default value

0x0

cpuX.ase-present

Set whether CT model has been built with NEON support

Type

bool

Default value

0x1

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-ARM_HLT

ARM HLT number for semihosting

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

ARM SVC number for semihosting

Type

int

Default value

0x123456

cpuX.semihosting-Thumb_HLT

Thumb HLT number for semihosting

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

Thumb SVC number for semihosting

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0xf000000

cpuX.semihosting-hlt-enable

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true

Type

bool

Default value

0x0

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit

Type

int

Default value

0xf000000

cpuX.vfp-enable_at_reset

Enable coprocessor access and VFP at reset

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether CT model has been built with VFP support

Type

bool

Default value

0x1

dic-spi_count

Number of shared peripheral interrupts implemented

Type

int

Default value

0x40

disable_periph_decoder

Disable memory mapped access to gic system registers

Type

bool

Default value

0x0

internal_vgic

Configures whether the model of the processor contains a Virtualized Generic Interrupt Controller (VGIC)

Type

bool

Default value

0x1

l1_dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. l1_dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-state_modelled

Set whether L1 D-cache has stateful implementation

Type

bool

Default value

0x0

l1_dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. l1_dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. l1_icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-state_modelled

Set whether L1 I-cache has stateful implementation

Type

bool

Default value

0x0

l2-data-slice

L2 data RAM slice

Type

int

Default value

0x0

l2-tag-slice

L2 tag RAM slice

Type

int

Default value

0x0

l2_cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond

to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2_cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-size

Set L2 cache size in bytes

Type

int

Default value

0x80000

l2_cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2_cache-state_modelled

Set whether L2 cache has stateful implementation

Type

bool

Default value

0x0

l2_cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

3.5.11 ARMCortexA17x1CT

ARMCortexA17x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-214: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA17x1CT

This model has the following Iris instances:

Table 3-215: ARMCortexA17x1CT Iris instances

InstanceName	ComponentName
ARMCortexA17x1CT	Cluster_ARM_Cortex-A17
ARMCortexA17x1CT.acp_mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexA17x1CT.cpu0	ARM_Cortex-A17
ARMCortexA17x1CT.cpu0.DTLB	TLB
ARMCortexA17x1CT.cpu0.ITLB	TLB
ARMCortexA17x1CT.cpu0.dtlb	TlbCadi
ARMCortexA17x1CT.cpu0.itlb	TlbCadi
ARMCortexA17x1CT.cpu0.l1dcache	PVCache
ARMCortexA17x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA17x1CT.cpu0.l1licache	PVCache
ARMCortexA17x1CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA17x1CT.ext_bus	PVBusLogger
ARMCortexA17x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA17x1CT.l2_cache	PVCache
ARMCortexA17x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[11]	PVBusSlave

ARMCortexA17x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA17x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA17x1CT contains the following CADI targets:

- ARM_Cortex-A17
- Cluster_ARM_Cortex-A17
- PVCache
- TlbCadi

About ARMCortexA17x1CT

- The following components also exist:
 - ARMCortexA17x2CT.
 - ARMCortexA17x3CT.
 - ARMCortexA17x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

NEON and VFPv4-D32 are supported.

vfp present and ase not present

VFPv4-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to `true` so model has NEON and VFPv4-D32 support.

vfp not present and ase not present

Model has neither NEON nor VFPv4-D32 support.

- This model exposes the `BROADCASTCACHEMAINT`, `BROADCASTINNER`, and `BROADCASTOUTER` parameters at the CPU level, rather than at the cluster level. To achieve correct behavior, set the same value for all CPUs in the cluster.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC support is hardware-specific so is not modeled.

Ports for ARMCortexA17x1CT**Table 3-217: Ports**

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
<code>broadcastinner</code>	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
<code>broadcastouter</code>	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
<code>CFGADDRFILTEENDNS</code>	Value_64	Slave	NS end address (only bits 39:20 are used).
<code>CFGADDRFILTEENDS</code>	Value_64	Slave	S end address (only bits 39:20 are used).
<code>CFGADDRFILTEENNS</code>	Signal	Slave	Enable periph port filtering for NS accesses.
<code>CFGADDRFILTEENS</code>	Signal	Slave	Enable periph port filtering for S accesses.
<code>CFGADDRFILTESTARTNS</code>	Value_64	Slave	NS start address (only bits 39:20 are used).
<code>CFGADDRFILTESTARTS</code>	Value_64	Slave	S start address (only bits 39:20 are used).
<code>cfgend[4]</code>	Signal	Slave	This signal controls the SCTL.R.EE bit.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clusterid</code>	Value	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
<code>CNTHPIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>CNTPSIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>cp15sdisable[4]</code>	Signal	Slave	This signal disables write access to some secure system control processor registers.
<code>cpuporeset[4]</code>	Signal	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.

Name	Protocol	Type	Description
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq[4]	Signal	Slave	This signal drives the CPU's interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	This signal resets the shared L2 memory system and timer logic.
peripheral_m	PVBus	Master	The core's peripheral port. Controlled by filter registers.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
pvbush_m0	PVBus	Master	The core will generate bus requests on this port.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
teinit[4]	Signal	Slave	This signal enables Thumb exceptions (controls the SCTLR.TE bit).
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	Signal	Slave	Virtual FIQ inputs.
vinithi[4]	Signal	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ inputs.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Parameters for ARMCortexA17x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CFGADDRFILTEENDNS

Peripheral port NS end address

Type

int

Default value

0x0

CFGADDRFILTEENDS

Peripheral port S end address

Type

int

Default value

0x0

CFGADDRFILTEENNS

Peripheral port NS address filtering enabled

Type

bool

Default value

0x0

CFGADDRFILTEENS

Peripheral port S address filtering enabled

Type

bool

Default value

0x0

CFGADDRFILTSTARTNS

Peripheral port NS start address

Type

int

Default value

0x0

CFGADDRFILTSTARTS

Peripheral port S start address

Type

int

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

IMINLN

Instruction cache minimum line size: false=32 bytes, true=64 bytes

Type

bool

Default value

0x1

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Initialize to BE8 endianness

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.DBGROMADDR

This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address

Type

int

Default value

0x12000003

cpuX.DBGROMADDRV

If true, this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

cpuX.DBGSELFADDR

This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address

Type

int

Default value

0x10003

cpuX.DBGSELFADDRV

If true, this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid

Type

bool

Default value

0x1

cpuX.TEINIT

T32 exception enable. The default has exceptions including reset handled in A32 state

Type

bool

Default value

0x0

cpuX.VINITHI

Initialize with high vectors enabled

Type

bool

Default value

0x0

cpuX.ase-present

Set whether CT model has been built with NEON support

Type

bool

Default value

0x1

cpuX.l1_icode-size

Size of L1 I-cache

Type

int

Default value

0x8000

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-ARM_HLT

ARM HLT number for semihosting

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

ARM SVC number for semihosting

Type

int

Default value

0x123456

cpuX.semihosting-Thumb_HLT

Thumb HLT number for semihosting

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

Thumb SVC number for semihosting

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting SVC calls

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap

Type

int

Default value

0xf000000

cpuX.semihosting-hlt-enable

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true

Type

bool

Default value

0x0

cpuX.semihosting-prefix

Prefix semihosting output with target instance name

Type

bool

Default value

0x0

cpuX.semihosting-stack_base

Virtual address of base of descending stack

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit

Type

int

Default value

0xf000000

cpuX.vfp-enable_at_reset

Enable coprocessor access and VFP at reset

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether CT model has been built with VFP support

Type

bool

Default value

0x1

l1_dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. l1_dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-state_modelled

Set whether L1 D-cache has stateful implementation

Type

bool

Default value

0x0

l1_dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. l1_dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_icache-

read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. l1_icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l1_icache-state_modelled

Set whether L1 I-cache has stateful implementation

Type

bool

Default value

0x0

l2-data-slice

L2 data RAM slice

Type

int

Default value

0x0

l2-tag-slice

L2 tag RAM slice

Type

int

Default value

0x0

l2_cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2_cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-size

Set L2 cache size in bytes

Type

int

Default value

0x40000

l2_cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-state_modelled

Set whether L2 cache has stateful implementation

Type

bool

Default value

0x0

l2_cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2_cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed.

l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

3.5.12 ARMCortexA32x1CT

ARMCortexA32x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-218: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA32x1CT

This model has the following Iris instances:

ARMCortexA32x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA32x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA32x1CT contains the following CADI targets:

- ARM_Cortex-A32
- Cluster_ARM_Cortex-A32
- PVCache
- TlbCadi

About ARMCortexA32x1CT

- The following components also exist:

- ARMCortexA32x2CT.
- ARMCortexA32x3CT.
- ARMCortexA32x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon™ support is optional for the Arm® Cortex®-A32 processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA32x1CT

Table 3-221: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastinner</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal if for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.

Name	Protocol	Type	Description
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cp15sdisable2[4]	Signal	Slave	-
cpuporeset[4]	Signal	Slave	CPU power on reset.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port
ctidbgirq[4]	Signal	Master	Cross trigger matrix port.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Level2 reset.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Debug reset.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt
reset[4]	Signal	Slave	Reset.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state
standbywfi2	Signal	Master	This signal indicated all cores and L2 are idles and in low power state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA32x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x22000000

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CP15SDISABLE2

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit

or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`dcache-read_latency`

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`dcache-size`

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

`dcache-snoop_data_transfer_latency`

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`dcache-state_modelled`

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.13 ARMCortexA34x1CT

ARMCortexA34x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-222: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA34x1CT

This model has the following Iris instances:

Table 3-223: ARMCortexA34x1CT Iris instances

InstanceName	ComponentName
ARMCortexA34x1CT	Cluster_ARM_Cortex-A34
ARMCortexA34x1CT.AMU	PVBusLogger

ARMCortexA34x1CT contains the following CADI targets:

- ARM_Cortex-A34
- Cluster_ARM_Cortex-A34
- PVCache
- TlbCadi

About ARMCortexA34x1CT

The model has the following features:

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon™ support is optional for this processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.
- The following components also exist:
 - `ARMCortexA34x2CT`
 - `ARMCortexA34x3CT`
 - `ARMCortexA34x4CT`

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

Ports for ARMCortexA34x1CT

Table 3-225: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcasttinner</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clrexmonack</code>	Signal	Master	Acknowledge handshake signal for the <code>clrexmonreq</code> signal
<code>clrexmonreq</code>	Signal	Slave	Signals the clearing of an external global exclusive monitor
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[4]</code>	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	This signal resets the shared L2 memory system, interrupt controller and timer logic.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.

Name	Protocol	Type	Description
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfi12	Signal	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A34x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CP15SDISABLE2

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.14 ARMCortexA35x1CT

ARMCortexA35x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-226: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.**Iris and MTI instances for ARMCortexA35x1CT**

This model has the following Iris instances:

Table 3-227: ARMCortexA35x1CT Iris instances

InstanceName	ComponentName
ARMCortexA35x1CT	Cluster_ARM_Cortex-A35
ARMCortexA35x1CT.AMU	PVBusLogger
ARMCortexA35x1CT.AMU.mapper	PVBusMapper
ARMCortexA35x1CT.DAP	PVBusLogger
ARMCortexA35x1CT.DAP.mapper	PVBusMapper
ARMCortexA35x1CT.DSU	DSU
ARMCortexA35x1CT.DSU.mpam_busslave	PVBusSlave

ARMCortexA35x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA35x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA35x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA35x1CT contains the following CADI targets:

- ARM_Cortex-A35
- Cluster_ARM_Cortex-A35
- PVCache
- TlbCadi

About ARMCortexA35x1CT

The model has the following features:

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.

- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon™ support is optional for this processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.
- The following components also exist:
 - `ARMCortexA35x2CT`.
 - `ARMCortexA35x3CT`.
 - `ARMCortexA35x4CT`.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

Ports for ARMCortexA35x1CT

Table 3-229: Ports

Name	Protocol	Type	Description
<code>aa64naa32[4]</code>	Signal	Slave	Register width after reset.
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastinner</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clrexmonack</code>	Signal	Master	Acknowledge handshake signal for the <code>clrexmonreq</code> signal

Name	Protocol	Type	Description
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cp15sdisable2[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	CPU power on reset.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross trigger matrix port.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Level2 reset.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.

Name	Protocol	Type	Description
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Debug reset.
pvbusr_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt
reset[4]	Signal	Slave	Reset.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state
standbywfil2	Signal	Master	This signal indicated all cores and L2 are idles and in low power state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA35x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CP15SDISABLE2

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.15 **ARMCortexA53x1CT**

ARMCortexA53x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-230: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA53x1CT

This model has the following Iris instances:

Table 3-231: ARMCortexA53x1CT Iris instances

InstanceName	ComponentName
ARMCortexA53x1CT	Cluster_ARM_Cortex-A53
ARMCortexA53x1CT.AMU	PVBusLogger
ARMCortexA53x1CT.AMU.mapper	PVBusMapper
ARMCortexA53x1CT.DAP	PVBusLogger
ARMCortexA53x1CT.DAP.mapper	PVBusMapper
ARMCortexA53x1CT.DSU	DSU
ARMCortexA53x1CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA53x1CT.MMAP	PVBusLogger
ARMCortexA53x1CT.MMAP.mapper	PVBusMapper
ARMCortexA53x1CT.acp_mapper	PVBusMapper
ARMCortexA53x1CT.cpu0	ARM_Cortex-A53
ARMCortexA53x1CT.cpu0.UTLB	TLB
ARMCortexA53x1CT.cpu0.dtlb	TlbCadi
ARMCortexA53x1CT.cpu0.l1dcache	PVCache
ARMCortexA53x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA53x1CT.cpu0.l1licache	PVCache
ARMCortexA53x1CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA53x1CT.ext_bus	PVBusLogger
ARMCortexA53x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA53x1CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA53x1CT.l2_cache	PVCache
ARMCortexA53x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA53x1CT.l2_cache.upstream[10]	PVBusSlave

ARMCortexA53x1CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexA53x1CT.l2_cache.upstream[6]	PVBusSlave

InstanceName	ComponentName
ARMCortexA53x1CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexA53x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA53x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA53x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA53x1CT contains the following CADI targets:

- ARM_Cortex-A53
- Cluster_ARM_Cortex-A53
- PVCache
- TlbCadi

About ARMCortexA53x1CT

- The following components also exist:
 - ARMCortexA53x2CT.
 - ARMCortexA53x3CT.
 - ARMCortexA53x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.

Differences between the CT model and RTL implementations

This component has the following differences from the corresponding revision of the RTL implementation:

- The value of the AArch64 PMCEID0_ELO register, and the AArch32 alias of this register, differs in the model from the TRM value. The model value reflects the model counters.
- The mechanisms for setting the affinity fields of the MPIDR. The RTL has two ports:
 - CLUSTERIDAFF1[7:0].
 - CLUSTERIDAFF2[7:0].

AFF1 sets the value of MPIDR bits[15:8] and AFF2 sets the value of MPIDR bits[23:16]. In contrast, the model has a single `CLUSTER_ID` port. This difference allows the setting of bits[23:8] of the MPIDR using bits[15:0] of the `CLUSTER_ID` value.

- The memory mapped debug registers have a view for cores and a view for external debug agents. In the model, these views require two PVBus ports. In hardware, the system designer decides how the implementation differentiates the views.

- In the model, a single `peer` event port combines the functionality of the `eventi` and `evento` signals in the RTL.
- The Generic Timers are Programmer's View (PV)-level abstractions: a model-specific protocol connects the `cntvalueb` port to the `MemoryMappedCounterModule`.
- The GIC CPU Interface is a PV-level abstraction: a model-specific protocol connects the GIC CPU Interface to the GIC Distributor.
- The Coresight™ *Cross Trigger Interface* (CTI) is a PV-level abstraction: the interface is a model specific one.
- The model has no mechanism to read the internal memory that the Cache and TLB structures use, through the implementation defined region of the system coprocessor interface. This memory includes the RAM Index Register, IL1DATA Registers, DL1DATA Registers, and associated functionality.
- The model does not implement:
 - ETM registers.
 - The PMUEVENT bus.
 - The WARMRESETREQ signal. However, the warm reset code sequence (see the section *Code sequence to request a Warm reset as a result of RMR_ELx.RR* in the [Arm Architecture Reference Manual for A-profile architecture](#)) makes the model simulate a warm reset of the core.
 - The PMUSNAPSHOTREQ and PMUSNAPSHOTACK signals.
 - The EXTERRIRQ and INTERRIRQ signals.
 - Processor dynamic-retention signals.
 - The SYSBARDISABLE signal.
 - The DBGPWRDUP, DBGPWRUPREQ, DBGNOPWRDWN, and DBGRSTREQ debug power management signals.
 - The RTL synthesis option to remove FP and ASE.
 - The RTL synthesis option for a Arm® Cortex®-A15 style debug memory map.
 - Although NEON support is optional for the Cortex-A53 processor, this model does not implement the `ase-present` parameter. This means it is not possible to configure the model to not support NEON.
 - ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA53x1CT

Table 3-233: Ports

Name	Protocol	Type	Description
<code>aa64naa32[4]</code>	Signal	Slave	Register width after reset.
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
<code>broadcastinner</code>	Signal	Slave	Enable broadcasting of Inner Shareable transactions.

Name	Protocol	Type	Description
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SoC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SoC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SoC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SoC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commr[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgllrstdisable	Signal	Slave	Control ram clear on reset
dbgnopwrdown[4]	Signal	Master	This signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	This signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.

Name	Protocol	Type	Description
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Reset the shared L2 memory system controller.
l2rstdisable	Signal	Slave	-
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfi12	Signal	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtual FIQ.

Name	Protocol	Type	Description
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Processor Virtual System Error Interrupt request.

Parameters for ARM Cortex A53x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

patch_level

Patch level of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Revision field in MIDR/MIDR_EL1. Corresponds to the patch number Y in rXpY.

Type

int

Default value

0x1

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.16 ARMCortexA55CT

ARMCortexA55CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-234: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA55CT

This model has the following Iris instances:

Table 3-235: ARMCortexA55CT Iris instances

InstanceName	ComponentName
ARMCortexA55CT	Cluster_ARM_Cortex-A55
ARMCortexA55CT.AMU	PVBusLogger
ARMCortexA55CT.AMU.mapper	PVBusMapper
ARMCortexA55CT.DAP	PVBusLogger
ARMCortexA55CT.DAP.mapper	PVBusMapper
ARMCortexA55CT.DSU	DSU
ARMCortexA55CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA55CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA55CT.DSU.shared_cache	PVCache
ARMCortexA55CT.DSU.shared_cache.upstream[0]	PVBusSlave

InstanceName	ComponentName
ARMCortexA55CT.DSU.shared_cache.upstream[1]	PVBusSlave

ARMCortexA55CT.ext_bus.mapper	PVBusMapper
ARMCortexA55CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexA55CT contains the following CADI targets:

- ARM_Cortex-A55
- Cluster_ARM_Cortex-A55
- PVCache
- TlbCadi

About ARMCortexA55CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.

- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGIRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Dual ACE masters.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMCortexA55x1CT.
- ARMCortexA55x2CT.
- ARMCortexA55x3CT.
- ARMCortexA55x4CT.
- ARMCortexA55x8CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-7).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA55CT

Table 3-237: Ports

Name	Protocol	Type	Description
<code>aa64naa32[8]</code>	Signal	Slave	Register width after reset.
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[8]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[8]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.

Name	Protocol	Type	Description
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[8]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[8]	Signal	Master	Timer signals to SOC.
commirq[8]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[8]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	Signal	Slave	Disable cryptography extensions after reset.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[8]	Signal	Master	No power-down request.
dbgpwrupreq[8]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.

Name	Protocol	Type	Description
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[8]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	Signal	Slave	Virtualised FIQ.
vinithi[8]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA55CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x40000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.17 ARMCortexA55CT_CortexA75CT

ARMCortexA55CT_CortexA75CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-238: IP revisions support

Revision	Quality level
CortexA55 r1p0	Full support
CortexA75 r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled

Iris and MTI instances for ARMCortexA55CT_CortexA75CT

This model has the following Iris instances:

Table 3-239: ARMCortexA55CT_CortexA75CT Iris instances

InstanceName	ComponentName
ARMCortexA55CT_CortexA75CT	Cluster_ARM_Cortex-A55_Cortex-A75
ARMCortexA55CT_CortexA75CT.AMU	PVBusLogger
ARMCortexA55CT_CortexA75CT.AMU.mapper	PVBusMapper
ARMCortexA55CT_CortexA75CT.DAP	PVBusLogger
ARMCortexA55CT_CortexA75CT.DAP.mapper	PVBusMapper
ARMCortexA55CT_CortexA75CT.DSU	DSU
ARMCortexA55CT_CortexA75CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA55CT_CortexA75CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA55CT_CortexA75CT.DSU.shared_cache	PVCache
ARMCortexA55CT_CortexA75CT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA75CT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMCortexA55CT_CortexA75CT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMCortexA55CT_CortexA75CT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMCortexA55CT_CortexA75CT.DSU.shared_cache.upstream[4]	PVBusSlave
ARMCortexA55CT_CortexA75CT.DSU.shared_cache.upstream[5]	PVBusSlave
ARMCortexA55CT_CortexA75CT.MMAP	PVBusLogger
ARMCortexA55CT_CortexA75CT.MMAP.mapper	PVBusMapper
ARMCortexA55CT_CortexA75CT.ext_bus	PVBusLogger
ARMCortexA55CT_CortexA75CT.ext_bus.mapper	PVBusMapper
ARMCortexA55CT_CortexA75CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA55CT_CortexA75CT.subcluster0	Subcluster_ARM_Cortex-A55
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0	ARM_Cortex-A55
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.UTLB	TLB
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.dtlb	TlbCadi
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.l1dcache	PVCache
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.l1icache	PVCache
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.l2cache	PVCache
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA75CT.subcluster0.cpu0.l2cache.upstream[1]	PVBusSlave

ARMCortexA55CT_CortexA75CT contains the following CADI targets:

- ARM_Cortex-A55
- ARM_Cortex-A75
- Cluster_ARM_Cortex-A55_Cortex-A75
- PVCache
- Subcluster_ARM_Cortex-A55
- Subcluster_ARM_Cortex-A75
- TlbCadi

About ARMCortexA55CT_CortexA75CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-7 (ARMCortexA55CT).

subcluster1.NUM_CORES

Possible values are 1-4 (ARMCortexA75CT).

The total number of cores in the cluster cannot exceed 8.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-6]` for cores in subcluster0.
- `<port_name>[7-10]` for cores in subcluster1.

All instances in the Master cross trigger matrix port array, `cti[11]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu6` identify cores in subcluster0.
- `subcluster1.cpu0` to `subcluster1.cpu3` identify cores in subcluster1.

For information about the cores in this model, see:

- [3.5.16 ARMCortexA55CT](#) on page 970.
- [3.5.26 ARMCortexA75CT](#) on page 1239.

See also [Arm DynamIQ Shared Unit Technical Reference Manual](#).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA55CT_CortexA75CT

Table 3-241: Ports

Name	Protocol	Type	Description
aa64naa32[11]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port
AENDMP	Value_64	Slave	DynamIQ port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	DynamIQ port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[11]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[11]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamIQ pmu irq
CNTHPIRQ[11]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[11]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[11]	Signal	Master	Timer signals to SOC.
commirq[11]	Signal	Master	Interrupt signal from debug communications channel.

Name	Protocol	Type	Description
core_clk_in[11]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[11]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[11]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[11]	Signal	Slave	Disable cryptography extensions after reset.
cti[11]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[11]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[11]	Signal	Master	No power-down request.
dbgprupreq[11]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[11]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[11]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[11]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[11]	PChannel	Slave	PChannels for cores
pmuirq[11]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[11]	Signal	Slave	Per core RAM Error Interrupt.
reset[11]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[11]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[11]	Signal	Slave	Per core System Error physical pins.

Name	Protocol	Type	Description
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[11]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[11]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[11]	Signal	Slave	Virtualised FIQ.
vinithi[11]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[11]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[11]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA55CT_CortexA75CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

subcluster0.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster0.cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.VINITHI

Reset value of SCTL.R.V.

Type

bool

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x40000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster0.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.CCSIDR-L1D_override

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

subcluster1.CCSIDR-L1I_override

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

subcluster1.CCSIDR-L2_override

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster1.cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.18 ARM CortexA55CT_CortexA76CT

ARM CortexA55CT_CortexA76CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-242: IP revisions support

Revision	Quality level
CortexA55 r1p0	Full support
CortexA76 r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled

Iris and MTI instances for ARM CortexA55CT_CortexA76CT

This model has the following Iris instances:

Table 3-243: ARM CortexA55CT_CortexA76CT Iris instances

InstanceName	ComponentName
ARM CortexA55CT_CortexA76CT	Cluster_ARM_Cortex-A55_Cortex-A76

ARMCortexA55CT_CortexA76CT.subcluster1.cpu0.l2cache.upstream[1]	PVBusSlave

ARMCortexA55CT_CortexA76CT contains the following CADI targets:

- ARM_Cortex-A55
- ARM_Cortex-A76
- Cluster_ARM_Cortex-A55_Cortex-A76

- PVCache
- Subcluster_ARM_Cortex-A55
- Subcluster_ARM_Cortex-A76
- TlbCadi

About ARMCortexA55CT_CortexA76CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-7 (ARMCortexA55CT).

subcluster1.NUM_CORES

Possible values are 1-4 (ARMCortexA76CT).

The total number of cores in the cluster cannot exceed 8.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-6]` for cores in `subcluster0`.
- `<port_name>[7-10]` for cores in `subcluster1`.

All instances in the Master cross trigger matrix port array, `cti[11]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu6` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu3` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [3.5.16 ARMCortexA55CT](#) on page 970.
- [3.5.28 ARMCortexA76CT](#) on page 1285.

Ports for ARMCortexA55CT_CortexA76CT

Table 3-245: Ports

Name	Protocol	Type	Description
aa64naa32[11]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port
AENDMP	Value_64	Slave	DynamiQ port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	DynamiQ port to obtain start address of valid peripheral address range (inclusive).

Name	Protocol	Type	Description
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[11]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[11]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[11]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[11]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[11]	Signal	Master	Timer signals to SOC.
commirq[11]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[11]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[11]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[11]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[11]	Signal	Slave	Disable cryptography extensions after reset.
cti[11]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[11]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[11]	Signal	Master	No power-down request.
dbgpwrupreq[11]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[11]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.

Name	Protocol	Type	Description
gicv3_redistributor_s[11]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[11]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[11]	PChannel	Slave	PChannels for cores
pmbirq[11]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[11]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[11]	Signal	Slave	Per core RAM Error Interrupt.
reset[11]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[11]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[11]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[11]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[11]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[11]	Signal	Slave	Virtualised FIQ.
vinithi[11]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[11]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[11]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA55CT_CortexA76CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

subcluster0.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster0.cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.VINITHI

Reset value of SCTL.R.V.

Type

bool

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x40000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster0.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.VINITHI

Reset value of SCTL.R.V.

Type

bool

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x1

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.19 ARM CortexA55CT_CortexA78CT

ARM CortexA55CT_CortexA78CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-246: IP revisions support

Revision	Quality level
CortexA55 r1p0	Full support
CortexA78 r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- `subcluster0.tlbi_stall_enabled`
- `subcluster1.tlbi_stall_enabled`

Iris and MTI instances for ARMCortexA55CT_CortexA78CT

This model has the following Iris instances:

ARMCortexA55CT_CortexA78CT.subcluster1.cpu0.l2cache.upstream[1]	PVBusSlave

ARMCortexA55CT_CortexA78CT contains the following CADI targets:

- ARM_Cortex-A55
- ARM_Cortex-A78
- Cluster_ARM_Cortex-A55_Cortex-A78
- PVCache
- Subcluster_ARM_Cortex-A55
- Subcluster_ARM_Cortex-A78
- TlbCadi

About ARMCortexA55CT_CortexA78CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-7 (ARMCortexA55CT).

subcluster1.NUM_CORES

Possible values are 1-4 (ARMCortexA78CT).

The total number of cores in the cluster cannot exceed 8.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-6]` for cores in `subcluster0`.
- `<port_name>[7-10]` for cores in `subcluster1`.

All instances in the Master cross trigger matrix port array, `cti[11]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu6` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu3` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [3.5.16 ARMCortexA55CT](#) on page 970.
- [3.5.32 ARMCortexA78CT](#) on page 1378.

Ports for ARMCortexA55CT_CortexA78CT

Table 3-249: Ports

Name	Protocol	Type	Description
<code>aa64naa32[11]</code>	Signal	Slave	Register width after reset.
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port
<code>AENDMP</code>	Value_64	Slave	DynamlQ port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	DynamlQ port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[11]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[11]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:14] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq

Name	Protocol	Type	Description
CNTHPIRQ[11]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[11]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[11]	Signal	Master	Timer signals to SOC.
commirq[11]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[11]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[11]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[11]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[11]	Signal	Slave	Disable cryptography extensions after reset.
cti[11]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[11]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[11]	Signal	Master	No power-down request.
dbgpwrupreq[11]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[11]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[11]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[11]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[11]	PChannel	Slave	PChannels for cores
pmbirq[11]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[11]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.

Name	Protocol	Type	Description
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[11]	Signal	Slave	Per core RAM Error Interrupt.
reset[11]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[11]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[11]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[11]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[11]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[11]	Signal	Slave	Virtualised FIQ.
vinithi[11]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[11]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[11]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA55CT_CortexA78CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

subcluster0.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster0.cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x40000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster0.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.VINITHI

Reset value of SCTL.R.V.

Type

bool

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x0

subcluster1.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.20 ARMCortexA57x1CT

ARMCortexA57x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-250: IP revisions support

Revision	Quality level
r1p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA57x1CT

This model has the following Iris instances:

Table 3-251: ARMCortexA57x1CT Iris instances

InstanceName	ComponentName
ARMCortexA57x1CT	Cluster_ARM_Cortex-A57
ARMCortexA57x1CT.AMU	PVBusLogger
ARMCortexA57x1CT.AMU.mapper	PVBusMapper
ARMCortexA57x1CT.DAP	PVBusLogger
ARMCortexA57x1CT.DAP.mapper	PVBusMapper
ARMCortexA57x1CT.DSU	DSU
ARMCortexA57x1CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA57x1CT.MMAP	PVBusLogger
ARMCortexA57x1CT.MMAP.mapper	PVBusMapper
ARMCortexA57x1CT.acp_mapper	PVBusMapper
ARMCortexA57x1CT.cpu0	ARM_Cortex-A57
ARMCortexA57x1CT.cpu0.UTLB	TLB
ARMCortexA57x1CT.cpu0.dtlb	TlbCadi
ARMCortexA57x1CT.cpu0.l1dcache	PVCache
ARMCortexA57x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA57x1CT.cpu0.l1icache	PVCache
ARMCortexA57x1CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA57x1CT.ext_bus	PVBusLogger
ARMCortexA57x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA57x1CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA57x1CT.l2_cache	PVCache

ARMCortexA57x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA57x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA57x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA57x1CT contains the following CADI targets:

- ARM_Cortex-A57
- Cluster_ARM_Cortex-A57
- PVCache
- TlbCadi

About ARMCortexA57x1CT

- The following components also exist:
 - ARMCortexA57x2CT.
 - ARMCortexA57x3CT.
 - ARMCortexA57x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.

- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The value of the AArch64 PMCEID0_ELO register, and the AArch32 alias of this register, differs in the model from the TRM value. The model value reflects the model counters.
- The mechanisms for setting the affinity fields of the MPIDR. The RTL has two ports:
 - `CLUSTERIDAFF1[7:0]`.
 - `CLUSTERIDAFF2[7:0]`.

AFF1 sets the value of MPIDR bits[15:8] and AFF2 sets the value of MPIDR bits[23:16]. In contrast, the model has a single `CLUSTER_ID` port. This difference allows the setting of bits[23:8] of the MPIDR using bits[15:0] of the `CLUSTER_ID` value.

- The memory mapped debug registers have a view for cores and a view for external debug agents. In the model, these views require two PVBus ports. In hardware, the system designer decides how the implementation differentiates the views.
- In the model, a single `peer` event port combines the functionality of the `eventi` and `evento` signals in the RTL.
- The Generic Timers are Programmer's View (PV)-level abstractions: a model-specific protocol connects the `cntvalueb` port to the MemoryMappedCounterModule.
- The GIC CPU Interface is a PV-level abstraction: a model-specific protocol connects the GIC CPU Interface to the GIC Distributor.
- The Coresight™ *Cross Trigger Interface* (CTI) is a PV-level abstraction: the interface is a model-specific one.
- The model has no mechanism to read the internal memory that the Cache and TLB structures use, through the implementation defined region of the system coprocessor interface. This memory includes the RAM Index Register, IL1DATA Registers, DL1DATA Registers, and associated functionality.
- The model does not implement:
 - ETM registers.
 - The PMUEVENT bus.
 - The WARMRESETREQ signal. However, the warm reset code sequence (see the section *Code sequence to request a Warm reset as a result of RMR_ELx.RR* in the [Arm Architecture Reference Manual for A-profile architecture](#)) makes the model simulate a warm reset of the core.
 - The PMUSNAPSHOTREQ and PMUSNAPSHOTACK signals.

- The EXTERRIRQ and INTERRIRQ signals.
- Processor dynamic-retention signals.
- The SYSBARDISABLE signal.
- The DBGPWRDUP, DBGPWRUPREQ, DBGNOPWRDWN, and DBGRSTREQ debug power management signals.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA57x1CT

Table 3-253: Ports

Name	Protocol	Type	Description
aa64naa32[4]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	The per-EL counter signal.
CNTPNSIRQ[4]	Signal	Master	The per-EL counter signal.
CNTPSIRQ[4]	Signal	Master	The per-EL counter signal.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	The per-EL counter signal.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.

Name	Protocol	Type	Description
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	These signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Reset the shared L2 memory system controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.

Name	Protocol	Type	Description
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfi12	Signal	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtual FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Processor Virtual System Error Interrupt request.

Parameters for ARM Cortex A57x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x22000000

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

ptw_latency	Page table walker latency for TA (Timing Annotation), expressed in simulation ticks
Type	int
Default value	0x0
tlb_latency	TLB latency for TA (Timing Annotation), expressed in simulation ticks
Type	int
Default value	0x0
tlbi_stall_enabled	If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.
Type	bool
Default value	0x0
walk_cache_latency	Walk cache latency for TA (Timing Annotation), expressed in simulation ticks
Type	int
Default value	0x0

3.5.21 ARMCortexA65AECT

ARMCortexA65AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-254: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- `tlbi_stall_enabled`

Iris and MTI instances for ARM Cortex-A65AE

This model has the following Iris instances:

Table 3-255: ARM Cortex-A65AE Iris instances

InstanceName	ComponentName
ARM Cortex-A65AE	Cluster_ARM_Cortex-A65AE

ARMCortexA65AECT contains the following CADI targets:

- ARM_Cortex-A65AE
- Cluster_ARM_Cortex-A65AE
- PVCache
- TlbCadi

About ARMCortexA65AECT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGIRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.
- Split/Lock is supported but with the limitations described in the AE-specific features implemented section.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- `ARMCortexA65AECTx2CT`.
- `ARMCortexA65AECTx4CT`.
- `ARMCortexA65AECTx6CT`.
- `ARMCortexA65AECTx8CT`.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-7).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA65AECT

Table 3-257: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[16]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgte[16]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>commirq[16]</code>	Signal	Master	Interrupt signal from debug communications channel.
<code>core_clk_in[8]</code>	ClockSignal	Slave	The clock signal connected to the <code>core_clk_in</code> port is used to determine the rate at which each core executes instructions.
<code>cpuporeset[8]</code>	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
<code>cryptodisable[16]</code>	Signal	Slave	Disable cryptography extensions after reset.
<code>cti[16]</code>	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
<code>ctidbgirq[16]</code>	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.

Name	Protocol	Type	Description
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[16]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[16]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	GICv3Comms	Slave	GICv3 AXI-stream port per thread.
irq[16]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmuirq[16]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	Signal	Slave	Virtualised FIQ.

Name	Protocol	Type	Description
vinithi[16]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA65AECT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x2

cluster_patch_level

Cosmetic change to patch number in CLUSTERIDR. Corresponds to the Y in rXpY.

Type

int

Default value

0x0

cluster_revision_number

Cosmetic change to revision number in CLUSTERIDR, Corresponds to the X in rXpY.

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.enable_single_thread_at_reset

Enable single thread after reset and keep other thread in reset

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x40000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.threadY.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.threadY.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.threadY.MPIDR-override

Override MPIDR value. A nonzero value will override the MT,cluster,cpu,thread ID bits in MPIDR.

Type

int

Default value

0x0

cpuX.threadY.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.threadY.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_lock_step

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS)

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit

or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`l3cache-read_latency`

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`l3cache-size`

L3 Cache size in bytes.

Type

int

Default value

0x400000

`l3cache-snoop_data_transfer_latency`

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`l3cache-snoop_issue_latency`

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.22 ARM CortexA65AECT_CortexA76AECT

ARM CortexA65AECT_CortexA76AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-258: IP revisions support

Revision	Quality level
CortexA65AE r0p0	Full support
CortexA76AE r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled

Iris and MTI instances for ARM CortexA65AECT_CortexA76AECT

This model has the following Iris instances:

Table 3-259: ARM CortexA65AECT_CortexA76AECT Iris instances

ARMCortexA65AECT_CortexA76AECT contains the following CADI targets:

- ARM_Cortex-A65AE
- ARM_Cortex-A76AE
- Cluster_ARM_Cortex-A65AE_Cortex-A76AE
- PVCache
- Subcluster_ARM_Cortex-A65AE
- Subcluster_ARM_Cortex-A76AE
- TlbCadi

About ARMCortexA65AECT_CortexA76AECT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 2-6 (ARMCortexA65AECT).

subcluster1.NUM_CORES

Possible values are 2-4 (ARMCortexA76AECT).

The total number of cores in the cluster cannot exceed 8.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-11]` for threads in `subcluster0`. For example:
 - `<port_name>[0]` is a port for `subcluster0.cpu0.thread0`.
 - `<port_name>[1]` is a port for `subcluster0.cpu0.thread1`.
 - `<port_name>[2]` is a port for `subcluster0.cpu1.thread0`.

- `<port_name>[12-15]` for cores in `subcluster1`.

All instances in the Master cross trigger matrix port array `cti[16]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu5` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu3` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [3.5.21 ARMCortexA65AECT](#) on page 1116.
- [3.5.27 ARMCortexA76AECT](#) on page 1261.

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA65AECT_CortexA76AECT

Table 3-261: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port
<code>AENDMP</code>	Value_64	Slave	DynamlQ port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	DynamlQ port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[16]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgte[16]</code>	Signal	Slave	This signal provides default exception handling state.

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[16]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[16]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[16]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[16]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[16]	Signal	Master	Timer signals to SOC.
commirq[16]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[10]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[10]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	Signal	Slave	Disable cryptography extensions after reset.
cti[16]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[16]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[16]	Signal	Master	No power-down request.
dbgprupreq[16]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[16]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[10]	PChannel	Slave	PChannels for cores
pmbirq[16]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[16]	Signal	Master	Interrupt signal from performance monitoring unit.

Name	Protocol	Type	Description
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	Signal	Slave	Per core RAM Error Interrupt.
reset[10]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	Signal	Slave	Virtualised FIQ.
vinithi[16]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA65AECT_CortexA76AECT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_lock_step

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS)

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x100000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x2

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.enable_single_thread_at_reset

Enable single thread after reset and keep other thread in reset

Type

bool

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x40000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value

subcluster0.cpuX.semihosting-enable

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.threadY.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.threadY.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster0.cpuX.threadY.MPIDR-override

Override MPIDR value. A nonzero value will override the MT,cluster,cpu,thread ID bits in MPIDR.

Type

int

Default value

0x0

subcluster0.cpuX.threadY.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.threadY.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be

used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

subcluster0.reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x2

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.VINITHI

Reset value of SCTL.R.V.

Type

bool

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster1.has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x1

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

subcluster1.reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.23 ARMCortexA65CT

ARMCortexA65CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-262: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- `tlbi_stall_enabled`

Iris and MTI instances for ARM Cortex-A65CT

This model has the following Iris instances:

Table 3-263: ARM Cortex-A65CT Iris instances

InstanceName	ComponentName
ARM Cortex-A65CT	Cluster_ARM_Cortex-A65
ARM Cortex-A65CT.AMU	PVBusLogger
ARM Cortex-A65CT.AMU.mapper	PVBusMapper
ARM Cortex-A65CT.DAP	PVBusLogger
ARM Cortex-A65CT.DAP.mapper	PVBusMapper

ARMCortexA65CT contains the following CADI targets:

- ARM_Cortex-A65
- Cluster_ARM_Cortex-A65
- PVCache
- TlbCadi

About ARMCortexA65CT

The model supports the following features:

- DynamiQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamiQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGWRUP and DBGRSTREQ are not implemented, but DBGWRUPREQ and DBGNOFWRDWN are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This component has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following components also exist, with a fixed number of cores per cluster:

- ARMCortexA65x1CT.
- ARMCortexA65x2CT.
- ARMCortexA65x3CT.
- ARMCortexA65x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA65CT

Table 3-265: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[16]	Signal	Slave	This signal is for EE bit initialisation.
cfgte[16]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[16]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[16]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[16]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[16]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[16]	Signal	Master	Timer signals to SOC.
commirq[16]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	Signal	Slave	Disable cryptography extensions after reset.
cti[16]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[16]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[16]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[16]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.

Name	Protocol	Type	Description
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[16]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmuirq[16]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynaMLQ.
ticks[16]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	Signal	Slave	Virtualised FIQ.
vinithi[16]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	Signal	Slave	Virtualised IRQ.

Name	Protocol	Type	Description
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A65CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAIN

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

cluster_patch_level

Cosmetic change to patch number in CLUSTERIDR. Corresponds to the Y in rXpY.

Type

int

Default value

0x0

cluster_revision_number

Cosmetic change to revision number in CLUSTERIDR, Corresponds to the X in rXpY.

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.enable_single_thread_at_reset

Enable single thread after reset and keep other thread in reset

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x40000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.threadY.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.threadY.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.threadY.MPIDR-override

Override MPIDR value. A nonzero value will override the MT,cluster,cpu,thread ID bits in MPIDR.

Type

int

Default value

0x0

cpuX.threadY.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.threadY.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x400000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.24 ARMCortexA72x1CT

ARMCortexA72x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-266: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA72x1CT

This model has the following Iris instances:

Table 3-267: ARMCortexA72x1CT Iris instances

InstanceName	ComponentName
ARMCortexA72x1CT	Cluster_ARM_Cortex-A72
ARMCortexA72x1CT.AMU	PVBusLogger
ARMCortexA72x1CT.AMU.mapper	PVBusMapper
ARMCortexA72x1CT.DAP	PVBusLogger
ARMCortexA72x1CT.DAP.mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexA72x1CT.DSU	DSU
ARMCortexA72x1CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA72x1CT.MMAP	PVBusLogger
ARMCortexA72x1CT.MMAP.mapper	PVBusMapper
ARMCortexA72x1CT.acp_mapper	PVBusMapper
ARMCortexA72x1CT.cpu0	ARM_Cortex-A72
ARMCortexA72x1CT.cpu0.UTLB	TLB
ARMCortexA72x1CT.cpu0.dtlb	TlbCadi
ARMCortexA72x1CT.cpu0.l1dcache	PVCache
ARMCortexA72x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA72x1CT.cpu0.l1licache	PVCache
ARMCortexA72x1CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA72x1CT.ext_bus	PVBusLogger
ARMCortexA72x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA72x1CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA72x1CT.l2_cache	PVCache
ARMCortexA72x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[4]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[6]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA72x1CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-268: ARMCortexA72x1CT MTI instances

ARMCortexA72x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA72x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA72x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA72x1CT contains the following CADI targets:

- ARM_Cortex-A72
- Cluster_ARM_Cortex-A72
- PVCache
- TlbCadi

About ARM Cortex A72x1CT

- The following components also exist:
 - ARM Cortex A72x2CT.
 - ARM Cortex A72x3CT.
 - ARM Cortex A72x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The cache latency cluster parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the cache and TLB models.
- ECC and parity schemes are hardware-specific so are not supported.
- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARM Cortex A72x1CT

Table 3-269: Ports

Name	Protocol	Type	Description
aa64naa32[4]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the <code>clrexmonreq</code> signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor

Name	Protocol	Type	Description
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	The per-EL counter signal.
CNTPNSIRQ[4]	Signal	Master	The per-EL counter signal.
CNTPSIRQ[4]	Signal	Master	The per-EL counter signal.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module
CNTVIRQ[4]	Signal	Master	The per-EL counter signal.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	These signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Reset the shared L2 memory system controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.

Name	Protocol	Type	Description
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtual FIQ
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Processor Virtual System Error Interrupt request.

Parameters for ARM Cortex A72x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x22000000

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpu_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.25 ARMCortexA73x1CT

ARMCortexA73x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-270: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA73x1CT

This model has the following Iris instances:

Table 3-271: ARMCortexA73x1CT Iris instances

InstanceName	ComponentName
ARMCortexA73x1CT	Cluster_ARM_Cortex-A73
ARMCortexA73x1CT.AMU	PVBusLogger
ARMCortexA73x1CT.AMU.mapper	PVBusMapper
ARMCortexA73x1CT.DAP	PVBusLogger
ARMCortexA73x1CT.DAP.mapper	PVBusMapper
ARMCortexA73x1CT.DSU	DSU
ARMCortexA73x1CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA73x1CT.MMAP	PVBusLogger
ARMCortexA73x1CT.MMAP.mapper	PVBusMapper
ARMCortexA73x1CT.acp_mapper	PVBusMapper
ARMCortexA73x1CT.cpu0	ARM_Cortex-A73
ARMCortexA73x1CT.cpu0.UTLB	TLB
ARMCortexA73x1CT.cpu0.dtlb	TlbCadi
ARMCortexA73x1CT.cpu0.l1dcache	PVCache
ARMCortexA73x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA73x1CT.cpu0.l1licache	PVCache
ARMCortexA73x1CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA73x1CT.ext_bus	PVBusLogger
ARMCortexA73x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA73x1CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA73x1CT.l2_cache	PVCache
ARMCortexA73x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[12]	PVBusSlave

InstanceName	ComponentName
ARMCortexA73x1CT.l2_cache.upstream[13]	PVBusSlave

ARMCortexA73x1CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA73x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA73x1CT contains the following CADI targets:

- ARM_Cortex-A73
- Cluster_ARM_Cortex-A73
- PVCache
- TlbCadi

About ARMCortexA73x1CT

- The following components also exist:
 - ARMCortexA73x2CT.
 - ARMCortexA73x3CT.
 - ARMCortexA73x4CT.
- The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).
- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.

- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` Or `memorymapped_debug_s`.
- ECC support is hardware-specific so is not modeled.

Ports for ARMCortexA73x1CT

Table 3-273: Ports

Name	Protocol	Type	Description
aa64naa32[4]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastinner	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
cfgend[4]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commr[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	CPU power on reset.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross trigger matrix port.
dbgack[4]	Signal	Master	External debug interface.

Name	Protocol	Type	Description
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Level2 reset.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Debug reset.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt
reset[4]	Signal	Slave	Reset.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state
standbywfi12	Signal	Master	This signal indicates all cores and L2 are idle and in low power state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.

Name	Protocol	Type	Description
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A73x1CT

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTINNER

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

CCSIDR-L1D_override

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L1I_override

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L2_override

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

PERIPHBASE

Base address of peripheral memory space

Type

int

Default value

0x13080000

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.SMPEN

Enable broadcast messages necessary for correct SMP operation at reset.

Type

bool

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type

int

Default value

0x0

`icache-state_modelled`

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

`l2cache-hit_latency`

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`l2cache-maintenance_latency`

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`l2cache-miss_latency`

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`l2cache-read_access_latency`

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond

to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.26 ARMCortexA75CT

ARMCortexA75CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-274: IP revisions support

Revision	Quality level
r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Iris and MTI instances for ARMCortexA75CT

This model has the following Iris instances:

Table 3-275: ARMCortexA75CT Iris instances

InstanceName	ComponentName
ARMCortexA75CT	Cluster_ARM_Cortex-A75
ARMCortexA75CT.AMU	PVBusLogger
ARMCortexA75CT.AMU.mapper	PVBusMapper
ARMCortexA75CT.DAP	PVBusLogger
ARMCortexA75CT.DAP.mapper	PVBusMapper
ARMCortexA75CT.DSU	DSU
ARMCortexA75CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA75CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA75CT.DSU.shared_cache	PVCache
ARMCortexA75CT.DSU.shared_cache.upstream[0]	PVBusSlave

InstanceName	ComponentName
ARMCortexA75CT.DSU.shared_cache.upstream[1]	PVBusSlave

ARMCortexA75CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexA75CT contains the following CADI targets:

- ARM_Cortex-A75
- Cluster_ARM_Cortex-A75
- PVCache
- TlbCadi

About ARMCortexA75CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.

- Debug power management signals `DBGPWRDUP` and `DBGIRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Dual ACE masters.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- `ARMCortexA75x1CT`.
- `ARMCortexA75x2CT`.
- `ARMCortexA75x3CT`.
- `ARMCortexA75x4CT`.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA75CT

Table 3-277: Ports

Name	Protocol	Type	Description
<code>aa64naa32[4]</code>	Signal	Slave	Register width after reset.
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.

Name	Protocol	Type	Description
rei[4]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtual FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A75CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CCSIDR-L1D_override

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L1I_override

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CCSIDR-L2_override

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

Type

int

Default value

0x0

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpu_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.AA64nAA32

Register width configuration at reset. 0, AArch32. 1, AArch64.

Type

bool

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CP15SDISABLE

Initialize to disable access to some CP15 registers

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value

cpuX.semihosting-cwd

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.27 ARMCortexA76AECT

ARMCortexA76AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-278: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- tlbi_stall_enabled

Iris and MTI instances for ARMCortexA76AECT

This model has the following Iris instances:

ARMCortexA76AECT contains the following CADI targets:

- ARM_Cortex-A76AE
- Cluster_ARM_Cortex-A76AE
- PVCache
- TlbCadi

About ARMCortexA76AECT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.
- Split/Lock is supported but with the limitations described in the AE-specific features implemented section.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMCortexA76AEx2CT.
- ARMCortexA76AEx4CT.
- ARMCortexA76AEx6CT.
- ARMCortexA76AEx8CT.

The per-core parameters are preceded by `cpu n .`, where n identifies the core (0-7).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA76AECT

Table 3-281: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	<code>Value_64</code>	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgprupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.

Name	Protocol	Type	Description
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A76 AECT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x2

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_lock_step

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS)

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x100000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.28 **ARMCortexA76CT**

ARMCortexA76CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-282: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- tlbi_stall_enabled

Iris and MTI instances for ARM Cortex-A76CT

This model has the following Iris instances:

Table 3-283: ARM Cortex-A76CT Iris instances

InstanceName	ComponentName
ARM Cortex-A76CT	Cluster_ARM_Cortex-A76
ARM Cortex-A76CT.AMU	PVBusLogger
ARM Cortex-A76CT.AMU.mapper	PVBusMapper
ARM Cortex-A76CT.DAP	PVBusLogger
ARM Cortex-A76CT.DAP.mapper	PVBusMapper
ARM Cortex-A76CT.DSU	DSU
ARM Cortex-A76CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARM Cortex-A76CT.DSU.mpam_busslave	PVBusSlave
ARM Cortex-A76CT.DSU.shared_cache	PVCache

ARMCortexA76CT contains the following CADI targets:

- ARM_Cortex-A76
- Cluster_ARM_Cortex-A76
- PVCache
- TlbCadi

About ARMCortexA76CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.

- Per-core clock.
- `BROADCASTPERSIST` pin.

The model does not support the following features:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGIRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.

This component has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following components also exist, with a fixed number of cores per cluster:

- `ARMCortexA76x1CT`.
- `ARMCortexA76x2CT`.
- `ARMCortexA76x3CT`.
- `ARMCortexA76x4CT`.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA76CT

Table 3-285: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	<code>Value_64</code>	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.

Name	Protocol	Type	Description
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.

Name	Protocol	Type	Description
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA76CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`dcache-snoop_data_transfer_latency`

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`dcache-state_modelled`

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

`dcache-write_access_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`dcache-write_latency`

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x100000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.29 ARMCortexA77CT

ARMCortexA77CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-286: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- `tlbi_stall_enabled`

Iris and MTI instances for ARMCortexA77CT

This model has the following Iris instances:

Table 3-287: ARMCortexA77CT Iris instances

InstanceName	ComponentName
ARMCortexA77CT	Cluster_ARM_Cortex-A77
ARMCortexA77CT.AMU	PVBusLogger
ARMCortexA77CT.AMU.mapper	PVBusMapper

ARMCortexA77CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexA77CT contains the following CADI targets:

- ARM_Cortex-A77
- Cluster_ARM_Cortex-A77
- PVCache
- TlbCadi

About ARMCortexA77CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGWRDUP and DBGRSTREQ are not implemented, but DBGWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMCortexA77x1CT.

- ARMCortexA77x2CT.
- ARMCortexA77x3CT.
- ARMCortexA77x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA77CT

Table 3-289: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal if for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>commirq[4]</code>	Signal	Master	Interrupt signal from debug communications channel.
<code>core_clk_in[4]</code>	ClockSignal	Slave	The clock signal connected to the <code>core_clk_in</code> port is used to determine the rate at which each core executes instructions.

Name	Protocol	Type	Description
cpuporeset[4]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.

Name	Protocol	Type	Description
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A77CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

cpu_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpu_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond

to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`cpuX.l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`cpuX.l2cache-size`

L2 Cache size in bytes.

Type

int

Default value

0x80000

`cpuX.l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`cpuX.l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x100000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.30 ARM Cortex A78AECT

ARM Cortex A78AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-290: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- tlbi_stall_enabled

Iris and MTI instances for ARM Cortex A78AECT

This model has the following Iris instances:

Table 3-291: ARM Cortex A78AECT Iris instances

InstanceName	ComponentName
ARM Cortex A78AECT	Cluster_ARM_Cortex-A78AE
ARM Cortex A78AECT.AMU	PVBusLogger
ARM Cortex A78AECT.AMU.mapper	PVBusMapper
ARM Cortex A78AECT.DAP	PVBusLogger
ARM Cortex A78AECT.DAP.mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexA78AECT.DSU	DSU
ARMCortexA78AECT.DSU.l3_flusher	AsyncCacheFlushUnit

ARMCortexA78AECT contains the following CADI targets:

- ARM_Cortex-A78AE
- Cluster_ARM_Cortex-A78AE
- PVCache
- TlbCadi

About ARMCortexA78AECT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOFWRDWN are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.
- Split/Lock is supported but with the limitations described in the AE-specific features implemented section.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMCortexA78AEx2CT.
- ARMCortexA78AEx4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA78AECT

Table 3-293: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal if for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.

Name	Protocol	Type	Description
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.

Name	Protocol	Type	Description
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA78AECT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x2

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_lock_step

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS)

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x0

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x1

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or

miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type

int

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x100000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.31 ARM Cortex A78CCT

ARM Cortex A78CCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-294: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- `tlbi_stall_enabled`

Iris and MTI instances for ARM Cortex-A78CCT

This model has the following Iris instances:

Table 3-295: ARM Cortex-A78CCT Iris instances

InstanceName	ComponentName
ARM Cortex-A78CCT	Cluster_ARM_Cortex-A78C
ARM Cortex-A78CCT.AMU	PVBusLogger
ARM Cortex-A78CCT.AMU.mapper	PVBusMapper

ARMCortexA78CCT contains the following CADI targets:

- ARM_Cortex-A78C
- Cluster_ARM_Cortex-A78C
- PVCache

- TlbCadi

About ARMCortexA78CCT

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWDUP and DBGSTREQ are not implemented, but DBGWRUPREQ and DBGNOPWRDN are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following models also exist, with a fixed number of cores per cluster:

- ARMCortexA78x1CCT.
- ARMCortexA78x2CCT.
- ARMCortexA78x4CCT.
- ARMCortexA78x6CCT.
- ARMCortexA78x8CCT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-7).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA78CCT

Table 3-297: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[8]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[8]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[8]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[8]	Signal	Master	Timer signals to SOC.
commirq[8]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	Signal	Slave	Disable cryptography extensions after reset.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.

Name	Protocol	Type	Description
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[8]	Signal	Master	No power-down request.
dbgpwrupreq[8]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmbirq[8]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[8]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynaMIQ.
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.

Name	Protocol	Type	Description
vfiq[8]	Signal	Slave	Virtualised FIQ.
vinithi[8]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A78CCT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpu_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x0

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x100000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.32 ARMCortexA78CT

ARMCortexA78CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-298: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Parameters added:

- `tlbi_stall_enabled`

Iris and MTI instances for ARMCortexA78CT

This model has the following Iris instances:

Table 3-299: ARMCortexA78CT Iris instances

InstanceName	ComponentName
ARMCortexA78CT	Cluster_ARM_Cortex-A78
ARMCortexA78CT.AMU	PVBusLogger
ARMCortexA78CT.AMU.mapper	PVBusMapper
ARMCortexA78CT.DAP	PVBusLogger
ARMCortexA78CT.DAP.mapper	PVBusMapper
ARMCortexA78CT.DSU	DSU
ARMCortexA78CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA78CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA78CT.DSU.shared_cache	PVCache
ARMCortexA78CT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMCortexA78CT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMCortexA78CT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMCortexA78CT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMCortexA78CT.MMAP	PVBusLogger
ARMCortexA78CT.MMAP.mapper	PVBusMapper
ARMCortexA78CT.cpu0	ARM_Cortex-A78
ARMCortexA78CT.cpu0.UTLB	TLB
ARMCortexA78CT.cpu0.dtlb	TlbCadi

InstanceName	ComponentName
ARMCortexA78CT.cpu0.l1dcache	PVCache
ARMCortexA78CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA78CT.cpu0.l1icache	PVCache
ARMCortexA78CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA78CT.cpu0.l2cache	PVCache
ARMCortexA78CT.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexA78CT.cpu0.l2cache.upstream[1]	PVBusSlave
ARMCortexA78CT.ext_bus	PVBusLogger
ARMCortexA78CT.ext_bus.mapper	PVBusMapper
ARMCortexA78CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

This model has the following MTI trace components:

Table 3-300: ARMCortexA78CT MTI instances

InstanceName	ComponentName
ARMCortexA78CT	ARMv8Cluster
ARMCortexA78CT.AMU	PVBusLogger
ARMCortexA78CT.AMU.mapper	PVBusMapper

ARMCortexA78CT contains the following CADI targets:

- ARM_Cortex-A78
- Cluster_ARM_Cortex-A78
- PVCache
- TlbCadi

About ARMCortexA78CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPRWDUP and DBGRSTREQ are not implemented, but DBGPRWRUPREQ and DBGNOFWRDWN are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This component has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The following components also exist, with a fixed number of cores per cluster:

- ARMCortexA78x1CT.
- ARMCortexA78x2CT.
- ARMCortexA78x3CT.
- ARMCortexA78x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA78CT

Table 3-301: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[4]</code>	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain

Name	Protocol	Type	Description
sei[4]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A78CT

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

cpu_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpu_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.VINITHI

Reset value of SCTLR.V.

Type

bool

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value

cpuX.semihosting-cwd

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x0

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_peripheral_port

If true, additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x100000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.33 ARM Cortex A510CT

ARM Cortex A510CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-302: IP revisions support

Revision	Quality level
r0p0	Full support
r1p3	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Table 3-303: Model quality changes

From	To
r0p0=rel	r0p0=rel
r1p0=rel	r1p3=rel

Parameters added:

- `mpmm_accumulator_multiplier`
- `tlbi_stall_enabled`

Iris and MTI instances for ARM Cortex A510CT

This model has the following Iris instances:

Table 3-304: ARM Cortex A510CT Iris instances

InstanceName	ComponentName
ARM Cortex A510CT	Cluster_ARM_Cortex-A510
ARM Cortex A510CT.AMU	PVBusLogger
ARM Cortex A510CT.AMU.mapper	PVBusMapper

ARMCortexA510CT contains the following CADI targets:

- ARM_Cortex-A510
- Cluster_ARM_Cortex-A510
- PVCache
- TlbCadi

About ARMCortexA510CT

The model supports the following features:

- DynamIQ™ Shared Unit-110 (DSU-110) system registers.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- PChannel for the cluster and for each core.
- BROADCASTPERSIST pin.

- Optional peripheral port.
- L3Cache partition.
- Per-core clock.
- Utility bus.
- Revision R1 is the default configuration, with 32-bit support at ELO. R1 supports both configurations of ELO, with or without A32 support. For 64-bit only mode, set parameter `max_32bit_el=-1`.
- To configure revision R0, set parameter `revision_number=0`.

Support for the following features is planned for a future release:

- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (the Arm TLM2 extensions) bus protocols.
- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, and `nPMBIRQ` signals.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- Error correction or detection features.
- Self-test features (MBIST).
- Snoop filtering.
- Latency configuration.
- Cache stashing capability.

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA510CT

Table 3-306: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDOMP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[12]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[12]	Signal	Master	Timer signals to SOC
CNTHVIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[12]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[12]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[12]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[12]	Signal	Master	Timer signals to SOC.
commirq[12]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[12]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[12]	PChannel	Master	Core PCSM signals

Name	Protocol	Type	Description
core_powerdown_out[12]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[12]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[12]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[12]	Signal	Slave	Disable cryptography extensions after reset.
cti[12]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[12]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[12]	Signal	Master	No power-down request.
dbgprupreq[12]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[12]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[12]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[12]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[12]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[12]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[12]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.

Name	Protocol	Type	Description
rei[12]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[12]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[12]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[12]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[12]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[12]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[12]	Signal	Slave	Virtualised FIQ.
virq[12]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[12]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A510CT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type

int

Default value

0x0

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type

int

Default value

0x0

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type

int

Default value

0x0

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type

int

Default value

0x0

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type

int

Default value

0x0

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type

int

Default value

0x0

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type

int

Default value

0x0

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type

int

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU

Type

bool

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond

to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`cpuX.l2cache-read_bus_width_in_bytes`

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

`cpuX.l2cache-read_latency`

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`cpuX.l2cache-size`

L2 Cache size in bytes.

Type

int

Default value

0x80000

`cpuX.l2cache-snoop_data_transfer_latency`

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

`cpuX.l2cache-snoop_issue_latency`

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x8

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x20

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**ete.TRCSRSTA_FORCED_EXCEP**

TRCSRSTA value for a forcibly traced exception

Type

bool

Default value

0x0

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x1

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: ELO supports A32. This parameter is ignored in Rev0 i.e. when revision_number = 0

Type

int

Default value

0x0

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration

Type

int

Default value

0x1

patch_level

Patch level of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Revision field in MIDR/MIDR_EL1. Corresponds to the patch number Y in rXpY.

Type

int

Default value

0x3

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0xc

revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x1

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

- tlbi_stall_enabled**
If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.
Type
bool
Default value
0x0
- treat_PAC_as_NOP**
Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.
Type
bool
Default value
0x0
- walk_cache_latency**
Walk cache latency for TA (Timing Annotation), expressed in simulation ticks
Type
int
Default value
0x0

3.5.34 ARMCortexA510CT_CortexA710CT

ARMCortexA510CT_CortexA710CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-307: IP revisions support

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Table 3-308: Model quality changes

From	To
rel	CortexA510 r0p0=rel CortexA510 r1p3=rel CortexA710 r2p0=rel

Table 3-309: IP revision changes

From	To
CortexA510 r0p0	CortexA510 r0p0
CortexA510 r1p3	CortexA510 r1p3
CortexA710 r2p0	CortexA710 r2p0

Ports added:

- cluster_pcsn_pchannel
- core_pcsn_pchannel

Parameters added:

- mpmmm_accumulator_multiplier
- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled

Iris and MTI instances for ARMCortexA510CT_CortexA710CT

This model has the following Iris instances:

Table 3-310: ARMCortexA510CT_CortexA710CT Iris instances

InstanceName	ComponentName
ARMCortexA510CT_CortexA710CT	Cluster_ARM_Cortex510_CortexA710_Heterogeneous
ARMCortexA510CT_CortexA710CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA710CT.AMU.mapper	PVBusMapper

ARMCortexA510CT_CortexA710CT.subcluster1.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexA510CT_CortexA710CT.subcluster1.cpu0.l2cache.upstream[1]	PVBusSlave

ARMCortexA510CT_CortexA710CT contains the following CADI targets:

- ARM_Cortex-A510
- ARM_Cortex-A710
- Cluster_ARM_Cortex510_CortexA710_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A510
- Subcluster_ARM_Cortex-A710
- TlbCadi

About ARMCortexA510CT_CortexA710CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-11 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-11 (ARMCortexA710CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-10]` for cores in subcluster0.
- `<port_name>[11-21]` for cores in subcluster1.

All instances in the Master cross trigger matrix port array `cti[22]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu10` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu10` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [3.5.33 ARMCortexA510CT](#) on page 1401.
- [3.5.44 ARMCortexA710CT](#) on page 1964.

Ports for ARMCortexA510CT_CortexA710CT

Table 3-312: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTART0MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART2MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART3MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[22]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.

Name	Protocol	Type	Description
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[22]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[22]	Signal	Master	Timer signals to SOC
CNTHVIRQ[22]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[22]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[22]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[22]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[22]	Signal	Master	Timer signals to SOC.
commirq[22]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[22]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[22]	PChannel	Master	Core PCSM signals
core_powerdown_out[22]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[22]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[22]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[22]	Signal	Slave	Disable cryptography extensions after reset.
cti[22]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[22]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[22]	Signal	Master	No power-down request.
dbgpwrupreq[22]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.

Name	Protocol	Type	Description
fiq[22]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[22]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[22]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[22]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[22]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[22]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[22]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[22]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[22]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[22]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[22]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[22]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[22]	Signal	Slave	Virtualised FIQ.
virq[22]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Name	Protocol	Type	Description
vsei[22]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA510CT_CortexA710CT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type

int

Default value

0x0

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type

int

Default value

0x0

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type

int

Default value

0x0

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type

int

Default value

0x0

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type

int

Default value

0x0

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type

int

Default value

0x0

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type

int

Default value

0x0

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type

int

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU

Type

bool

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x0

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration

Type

int

Default value

0x1

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

subcluster0.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12

Type

int

Default value

0x1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x8

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x20

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster0.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster0.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster0.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster0.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster0.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster0.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster0.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

subcluster0.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster0.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster0.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: ELO supports A32. This parameter is ignored in Rev0 i.e. when revision_number = 0

Type

int

Default value

0x0

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0xc

subcluster0.revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x1

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12

Type

int

Default value

0x1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x20

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster1.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster1.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x1

subcluster1.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster1.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster1.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster1.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster1.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x2

subcluster1.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster1.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster1.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster1.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster1.ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster1.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

Type

int

Default value

0x2

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.35 ARMCortexA510CT_CortexA710CT_CortexX2CT

ARMCortexA510CT_CortexA710CT_CortexX2CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-313: IP revisions support

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support

Revision	Quality level
CortexA710 r2p0	Full support
CortexX2 r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Table 3-314: Model quality changes

From	To
rel	CortexA510 r0p0=rel CortexA510 r1p3=rel CortexA710 r2p0=rel CortexX2 r2p0=rel

Table 3-315: IP revision changes

From	To
CortexA510 r0p0	CortexA510 r0p0
CortexA510 r1p3	CortexA510 r1p3
CortexA710 r2p0	CortexA710 r2p0
CortexX2 r2p0	CortexX2 r2p0

Ports added:

- cluster_pcs_m_pchannel
- core_pcs_m_pchannel

Ports removed:

- pm_birq

Parameters added:

- mpm_accumulator_multiplier
- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled
- subcluster2.tlbi_stall_enabled

Iris and MTI instances for ARMCortexA510CT_CortexA710CT_CortexX2CT

This model has the following Iris instances:

ARMCortexA510CT_CortexA710CT_CortexX2CT contains the following CADI targets:

- ARM_Cortex-A510
- ARM_Cortex-A710
- ARM_Cortex-X2
- Cluster_ARM_CortexA510_CortexA710_CortexX2_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A510
- Subcluster_ARM_Cortex-A710
- Subcluster_ARM_Cortex-X2
- TlbCadi

About ARMCortexA510CT_CortexA710CT_CortexX2CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-10 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-10 (ARMCortexA710CT).

subcluster2.NUM_CORES

Possible values are 1-10 (ARMCortexX2CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-9]` for cores in subcluster0.
- `<port_name>[10-19]` for cores in subcluster1.
- `<port_name>[20-29]` for cores in subcluster2.

All instances in the Master cross trigger matrix port array, `cti[30]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu9` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu9` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu9` identify cores in `subcluster2`.

For information about the cores in this model, see:

- [3.5.33 ARMCortexA510CT](#) on page 1401.
- [3.5.44 ARMCortexA710CT](#) on page 1964.
- [3.5.71 ARMCortexX2CT](#) on page 2493.

Ports for ARMCortexA510CT_CortexA710CT_CortexX2CT

Table 3-318: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTART0MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART2MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART3MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[30]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[30]	Signal	Master	Timer signals to SOC
CNTHVIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[30]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[30]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[30]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[30]	Signal	Master	Timer signals to SOC.
commirq[30]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[30]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[30]	PChannel	Master	Core PCSM signals
core_powerdown_out[30]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[30]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[30]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[30]	Signal	Slave	Disable cryptography extensions after reset.
cti[30]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[30]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[30]	Signal	Master	No power-down request.
dbgprupreq[30]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.

Name	Protocol	Type	Description
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[30]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[30]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[30]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[30]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[30]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[30]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[30]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[30]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[30]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[30]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[30]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[30]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[30]	Signal	Slave	Virtualised FIQ.
virq[30]	Signal	Slave	Virtualised IRQ.

Name	Protocol	Type	Description
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[30]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A510CT_Cortex A710CT_Cortex X2CT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type

int

Default value

0x0

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type

int

Default value

0x0

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type

int

Default value

0x0

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type

int

Default value

0x0

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type

int

Default value

0x0

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type

int

Default value

0x0

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type

int

Default value

0x0

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type

int

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAJINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU

Type

bool

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x0

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases

where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration

Type

int

Default value

0x1

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

subcluster0.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12

Type

int

Default value

0x1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x8

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x20

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster0.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.etc.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster0.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster0.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster0.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster0.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster0.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster0.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

subcluster0.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster0.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster0.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: ELO supports A32. This parameter is ignored in Rev0 i.e. when revision_number = 0

Type

int

Default value

0x0

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0xc

subcluster0.revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x1

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12

Type

int

Default value

0x1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x20

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster1.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster1.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x1

subcluster1.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster1.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster1.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster1.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster1.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x2

subcluster1.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster1.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster1.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster1.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster1.ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster1.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

Type

int

Default value

0x2

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12

Type

int

Default value

0x1

subcluster2.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster2.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster2.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster2.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster2.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster2.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster2.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster2.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster2.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster2.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster2.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster2.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster2.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster2.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster2.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster2.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster2.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster2.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster2.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster2.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster2.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster2.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster2.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster2.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster2.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster2.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster2.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster2.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster2.etc.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x20

subcluster2.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster2.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster2.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster2.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster2.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster2.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster2.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster2.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster2.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x2

subcluster2.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster2.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster2.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster2.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster2.ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

subcluster2.ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

subcluster2.ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

subcluster2.ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster2.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster2.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster2.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster2.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster2.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster2.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

Type

int

Default value

0x2

subcluster2.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.tlbi_stall_enabled

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster2.treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

subcluster2.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.36 ARMCortexA510CT_CortexA710CT_CortexX3CT

ARMCortexA510CT_CortexA710CT_CortexX3CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-319: IP revisions support

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support
CortexX3 r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Table 3-320: Model quality changes

From	To
CortexA510 r1p3=rel	CortexA510 r0p0=rel
CortexA710 r2p0=rel	CortexA510 r1p3=rel
CortexX3 r0p0=rel	CortexA710 r2p0=rel
	CortexX3 r0p0=rel

Table 3-321: IP revision changes

From	To
CortexA510 r1p3	CortexA510 r0p0
CortexA710 r2p0	CortexA510 r1p3
CortexX3 r0p0	CortexA710 r2p0
	CortexX3 r0p0

Ports added:

- cluster_pcs_m_pchannel
- core_pcs_m_pchannel
- pmbirq

Parameters added:

- mpmmm_accumulator_multiplier
- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled
- subcluster2.tlbi_stall_enabled

Iris and MTI instances for ARMCortexA510CT_CortexA710CT_CortexX3CT

This model has the following Iris instances:

Table 3-322: ARMCortexA510CT_CortexA710CT_CortexX3CT Iris instances

InstanceName	ComponentName
ARMCortexA510CT_CortexA710CT_CortexX3CT	Cluster_ARM_CortexA510_CortexA710_CortexX3_Heterogeneous
ARMCortexA510CT_CortexA710CT_CortexX3CT.AMU	PVBusLogger

ARMCortexA510CT_CortexA710CT_CortexX3CT contains the following CADI targets:

- ARM_Cortex-A510
- ARM_Cortex-A710
- ARM_Cortex-X3
- Cluster_ARM_CortexA510_CortexA710_CortexX3_Heterogeneous
- PVMCache
- Subcluster_ARM_Cortex-A510
- Subcluster_ARM_Cortex-A710
- Subcluster_ARM_Cortex-X3
- TlbCadi

About ARMCortexA510CT_CortexA710CT_CortexX3CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-10 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-10 (ARMCortexA710CT).

subcluster2.NUM_CORES

Possible values are 1-10 (ARMCortexX3CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-9]` for cores in `subcluster0`.
- `<port_name>[10-19]` for cores in `subcluster1`.
- `<port_name>[20-29]` for cores in `subcluster2`.

All instances in the Master cross trigger matrix port array, `cti[30]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu9` identify cores in `subcluster0`.

- `subcluster1.cpu0` to `subcluster1.cpu9` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu9` identify cores in `subcluster2`.

For information about the cores in this model, see:

- [3.5.33 ARMCortexA510CT](#) on page 1401.
- [3.5.44 ARMCortexA710CT](#) on page 1964.
- [3.5.72 ARMCortexX3CT](#) on page 2520.

Ports for ARMCortexA510CT_CortexA710CT_CortexX3CT

Table 3-324: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTART0MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART2MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART3MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[30]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>cluster_pcs_m_pchannel</code>	PChannel	Master	Cluster PCSM signal
<code>cluster_powerdown_out</code>	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info

Name	Protocol	Type	Description
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[30]	Signal	Master	Timer signals to SOC
CNTHVIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[30]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[30]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[30]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[30]	Signal	Master	Timer signals to SOC.
commirq[30]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[30]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[30]	PChannel	Master	Core PCSM signals
core_powerdown_out[30]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[30]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[30]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[30]	Signal	Slave	Disable cryptography extensions after reset.
cti[30]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[30]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[30]	Signal	Master	No power-down request.
dbgpwrupreq[30]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[30]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components

Name	Protocol	Type	Description
gicv3_redistributor_s[30]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[30]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[30]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[30]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[30]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[30]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[30]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[30]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[30]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[30]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[30]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[30]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[30]	Signal	Slave	Virtualised FIQ.
virq[30]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[30]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA510CT_CortexA710CT_CortexX3CT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type

int

Default value

0x0

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type

int

Default value

0x0

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type

int

Default value

0x0

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type

int

Default value

0x0

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type

int

Default value

0x0

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type

int

Default value

0x0

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type

int

Default value

0x0

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type

int

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAJINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x1

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU

Type

bool

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_acp

If true, Accelerator Coherency Port is configured

Type

bool

Default value

0x0

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x0

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration

Type

int

Default value

0x1

pchannel_treat_simreset_as_poreset

Register core as ON state to cluster with simulation reset.

Type

bool

Default value

0x0

periph_address_end

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type

int

Default value

0x0

periph_address_start

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type

int

Default value

0x0

subcluster0.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12

Type

int

Default value

0x1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x8

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x20

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster0.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster0.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster0.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster0.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster0.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster0.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster0.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

subcluster0.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster0.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster0.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: ELO supports A32. This parameter is ignored in Rev0 i.e. when revision_number = 0

Type

int

Default value

0x0

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0xc

subcluster0.revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x1

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12

Type

int

Default value

0x1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type

int

Default value

0x0

subcluster1.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x20

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster1.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster1.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x1

subcluster1.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster1.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster1.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster1.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster1.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x2

subcluster1.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster1.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster1.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster1.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster1.ext_abort_device_read_is_sync

Synchronous reporting of device-nGnRE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_device_write_is_sync

Synchronous reporting of device-nGnRE write external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_read_is_sync

Synchronous reporting of device-nGnRnE read external aborts

Type

bool

Default value

0x0

subcluster1.ext_abort_so_write_is_sync

Synchronous reporting of device-nGnRnE write external aborts

Type

bool

Default value

0x0

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster1.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

Type

int

Default value

0x2

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.treat-dcache-cmos-to-pou-as-nop

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults

Type

int

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster2.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster2.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster2.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster2.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster2.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster2.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster2.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster2.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster2.cpuX.force-fpsid

Override the FPSID value

Type

bool

Default value

0x1

subcluster2.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x100000

subcluster2.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster2.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster2.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster2.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster2.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster2.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster2.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster2.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value

subcluster2.cpuX.semihosting-cwd

Base directory for semihosting file access.

Type

string

Default value**subcluster2.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster2.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster2.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster2.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster2.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster2.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster2.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster2.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster2.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster2.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster2.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.error_record_feature_register

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"

Type

string

```

{"ED":0x2,"IMPDEF_3_2":0x0,"UI":0x2,"FI":0x2,"UE":0x1,"CFI":0x2,"CEC":0x2,"RP":0x1,"DUI":0x0,"CEC":0x0,"Visibility":"Cluster"},
{"ED":0x2,"IMPDEF_3_2":0x0,"UI":0x2,"FI":0x2,"UE":0x1,"CFI":0x2,"CEC":0x2,"RP":0x1,"DUI":0x0,"CEC":0x0,"Visibility":"Cluster"}

```

Number of claim tags

int

0x20

Maximum limit for the number of instructions implied by a Q element

int

0x1

Number of resource selector pairs

int

0x8

TRCPIDR CMOD value

int

0x0

TRCPIDR REVAND value

int

0x0

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster2.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster2.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster2.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster2.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

subcluster2.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster2.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster2.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster2.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster2.ext_abort_normal_noncacheable_read_is_sync

Synchronous reporting of normal noncacheable-read external aborts

Type

bool

Default value

0x1

subcluster2.ext_abort_so_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x2

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster2.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster2.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster2.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster2.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster2.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster2.has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

subcluster2.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster2.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster2.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)

Type

int

Default value

0x0

subcluster2.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster2.pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x6

subcluster2.pseudo_fault_generation_feature_register

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

Type

string

Default value

```
[{"OF":true, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1,
"CE":0x1,"CI":true, "ER":false, "PN":true, "AV":false, "MV":true, "SYN":true,
```

```
"R":true},{ "OF":false, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1,
"CE":0x1,"CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":true}]
```

subcluster2.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.stage12_tlb_size

Number of stage1+2 tlb entries.

Type

int

Default value

0x80

subcluster2.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster2.trace_physical_registers_when_host_virtualisation_enabled

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers)

Type

int

Default value

0x1

subcluster2.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster2.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.37 ARMCortexA510CT_CortexA715CT_CortexX3CT

ARMCortexA510CT_CortexA715CT_CortexX3CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-325: IP revisions support

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA715 r1p2	Full support
CortexX3 r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Table 3-326: Model quality changes

From	To
CortexA510 r1p3=rel	CortexA510 r0p0=rel
CortexA715 r1p2=rel	CortexA510 r1p3=rel
CortexX3 r0p0=rel	CortexA715 r1p2=rel
	CortexX3 r0p0=rel

Table 3-327: IP revision changes

From	To
CortexA510 r1p3	CortexA510 r0p0
CortexA715 r1p2	CortexA510 r1p3
CortexX3 r0p0	CortexA715 r1p2
	CortexX3 r0p0

Ports added:

- cluster_pcs_m_pchannel
- core_pcs_m_pchannel

Parameters added:

- mpmmm_accumulator_multiplier
- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled
- subcluster2.tlbi_stall_enabled

Iris and MTI instances for ARMCortexA510CT_CortexA715CT_CortexX3CT

This model has the following Iris instances:

Table 3-328: ARMCortexA510CT_CortexA715CT_CortexX3CT Iris instances

InstanceName	ComponentName
ARMCortexA510CT_CortexA715CT_CortexX3CT	Cluster_ARM_CortexA510_CortexA715_CortexX3_Heterogeneous
ARMCortexA510CT_CortexA715CT_CortexX3CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.AMU.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.DAP	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU	DSU
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_core0	PPUv1
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_core0.busslave	PVBusSlave

ARMCortexA510CT_CortexA715CT_CortexX3CT contains the following CADI targets:

- ARM_Cortex-A510
- ARM_Cortex-A715
- ARM_Cortex-X3
- Cluster_ARM_CortexA510_CortexA715_CortexX3_Heterogeneous

- PVCache
- Subcluster_ARM_Cortex-A510
- Subcluster_ARM_Cortex-A715
- Subcluster_ARM_Cortex-X3
- TlbCadi

About ARMCortexA510CT_CortexA715CT_CortexX3CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-10 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-10 (ARMCortexA715CT).

subcluster2.NUM_CORES

Possible values are 1-10 (ARMCortexX3CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-9]` for cores in `subcluster0`.
- `<port_name>[10-19]` for cores in `subcluster1`.
- `<port_name>[20-29]` for cores in `subcluster2`.

All instances in the Master cross trigger matrix port array, `cti[30]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu9` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu9` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu9` identify cores in `subcluster2`.

For information about the cores in this model, see:

- [3.5.33 ARMCortexA510CT](#) on page 1401.
- [3.5.45 ARMCortexA715CT](#) on page 1992.
- [3.5.72 ARMCortexX3CT](#) on page 2520.

Ports for ARMCortexA510CT_CortexA715CT_CortexX3CT

Table 3-330: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[30]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsn_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[30]	Signal	Master	Timer signals to SOC
CNTHVIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[30]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[30]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[30]	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[30]	Signal	Master	Timer signals to SOC.
commirq[30]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[30]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[30]	PChannel	Master	Core PCSM signals
core_powerdown_out[30]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[30]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[30]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[30]	Signal	Slave	Disable cryptography extensions after reset.
cti[30]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[30]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[30]	Signal	Master	No power-down request.
dbgpwrupreq[30]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[30]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s[30]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[30]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[30]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[30]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.

Name	Protocol	Type	Description
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[30]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[30]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[30]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[30]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[30]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[30]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[30]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[30]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[30]	Signal	Slave	Virtualised FIQ.
virq[30]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[30]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA510CT_CortexA715CT_CortexX3CT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type

int

Default value

0x0

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type

int

Default value

0x0

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type

int

Default value

0x0

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type

int

Default value

0x0

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type

int

Default value

0x0

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type

int

Default value

0x0

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type

int

Default value

0x0

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type

int

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU

Type

bool

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

default_opmode

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON

Type

int

Default value

0x4

diagnostics

Enable DynamIQ diagnostic messages

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration

Type

int

Default value

0x1

subcluster0.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12

Type

int

Default value

0x1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x8

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x20

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster0.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster0.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster0.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster0.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster0.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster0.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster0.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

subcluster0.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster0.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster0.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x10000

subcluster0.max_32bit_el

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: ELO supports A32. This parameter is ignored in Rev0 i.e. when revision_number = 0

Type

int

Default value

0x0

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0xc

subcluster0.revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x1

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.force-fpsid

Override the FPSID value

Type

bool

Default value

0x1

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.error_record_feature_register

RAS feature register values. An array of JSON objects. The JSON schema for the array is:
[{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values].
Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and
DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4.
RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values
of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"

Type

string

Default value

[{"ED":0x2,"IMPDEF_3_2":0x1,"UI":0x2,"FI":0x2,"UE":0x1,"CFI":0x2,"CEC":0x2,"RP":0x1,"DUI":0x0,"CE":0x0,"Visibility":"Cluster"},
{"ED":0x2,"UI":0x2,"FI":0x2,"UE":0x1,"CFI":0x2,"CEC":0x2,"RP":0x1,"DUI":0x0,"CEO":0x0,"INJ":0x1,"CI":0x0,"TS":0x0,"FRX":0x0,"UC":0x0,"UEU":0x0,"UER":0x0,"UEO":0x0,"DE":0x0,"CE":0x0}],other_feature_register_values]

subcluster1.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster1.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster1.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster1.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster1.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster1.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster1.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster1.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x1

subcluster1.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster1.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster1.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster1.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster1.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster1.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster1.has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

subcluster1.has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x0

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)

Type

int

Default value

0x0

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster1.pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x6

subcluster1.pseudo_fault_generation_feature_register

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

Type

string

Default value

```
[{"OF":true, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1,
"CE":0x1,"CI":true, "ER":false, "PN":true, "AV":false, "MV":true, "SYN":true,
"R":true},{ "OF":false, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1,
"CE":0x1,"CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":true}]
```

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.stage12_tlb_size

Number of stage1+2 tlb entries.

Type

int

Default value

0x80

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster2.NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

subcluster2.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster2.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster2.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster2.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster2.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster2.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster2.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster2.cpuX.force-fpsid

Override the FPSID value

Type

bool

Default value

0x1

subcluster2.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x100000

subcluster2.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster2.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster2.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster2.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster2.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster2.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster2.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster2.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster2.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster2.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster2.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster2.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster2.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster2.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster2.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster2.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster2.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster2.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster2.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster2.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.error_record_feature_register

RAS feature register values. An array of JSON objects. The JSON schema for the array is:

```
[{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values].
```

Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and

DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4.

RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster"

Type

string

Default value

```
[{"ED":0x2,"IMPDEF_3_2":0x0,"UI":0x2,"FI":0x2,"UE":0x1,"CFI":0x2,"CEC":0x2,"RP":0x1,"DUI":0x0,"CE":0x0,"Visibility":"Cluster"},
{"ED":0x2,"IMPDEF_3_2":0x0,"UI":0x2,"FI":0x2,"UE":0x1,"CFI":0x2,"CEC":0x2,"RP":0x1,"DUI":0x0,"CE":0x0,"Visibility":"Cluster"}]
```

subcluster2.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x20

subcluster2.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster2.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster2.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster2.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster2.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster2.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster2.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster2.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster2.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

subcluster2.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster2.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster2.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster2.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster2.ext_abort_normal_noncacheable_read_is_sync

Synchronous reporting of normal noncacheable-read external aborts

Type

bool

Default value

0x1

subcluster2.ext_abort_so_write_ras_type

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type

int

Default value

0x2

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster2.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster2.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster2.has_coherent_icache

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required

Type

bool

Default value

0x1

subcluster2.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster2.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster2.has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

subcluster2.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster2.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster2.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied.

This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type

int

Default value

0x0

subcluster2.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster2.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)

Type

int

Default value

0x0

subcluster2.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster2.pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x6

subcluster2.pseudo_fault_generation_feature_register

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC,

UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

Type

string

Default value

```
[{"OF":true, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1,
"CE":0x1,"CI":true, "ER":false, "PN":true, "AV":false, "MV":true, "SYN":true,
"R":true},{ "OF":false, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1,
"CE":0x1,"CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":true}]
```

subcluster2.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.stage12_tlb_size

Number of stage1+2 tlb entries.

Type

int

Default value

0x80

subcluster2.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster2.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster2.trace_physical_registers_when_host_virtualisation_enabled

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers)

Type

int

Default value

0x1

subcluster2.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster2.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.38 **ARMCortexA520AECT**

ARMCortexA520AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-331: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Ports added:

- cluster_pcs_m_pchannel
- core_pcs_m_pchannel

Parameters added:

- core_complex_mapping
- mpmu_accumulator_multiplier
- tlbi_stall_enabled

Iris and MTI instances for ARM Cortex-A520AECT

This model has the following Iris instances:

Table 3-332: ARM Cortex-A520AECT Iris instances

InstanceName	ComponentName
ARM Cortex-A520AECT	Cluster_ARM_Cortex-A520AE
ARM Cortex-A520AECT.AMU	PVBusLogger
ARM Cortex-A520AECT.AMU.mapper	PVBusMapper
ARM Cortex-A520AECT.DAP	PVBusLogger
ARM Cortex-A520AECT.DAP.mapper	PVBusMapper
ARM Cortex-A520AECT.DSU	DSU
ARM Cortex-A520AECT.DSU.PPU_cluster	PPUv1
ARM Cortex-A520AECT.DSU.PPU_cluster.busslave	PVBusSlave
ARM Cortex-A520AECT.DSU.PPU_core0	PPUv1
ARM Cortex-A520AECT.DSU.PPU_core0.busslave	PVBusSlave
ARM Cortex-A520AECT.DSU.l3_flusher	AsyncCacheFlushUnit
ARM Cortex-A520AECT.DSU.mpam_busslave	PVBusSlave
ARM Cortex-A520AECT.DSU.shared_cache	PVCache
ARM Cortex-A520AECT.DSU.shared_cache.upstream[0]	PVBusSlave
ARM Cortex-A520AECT.DSU.shared_cache.upstream[1]	PVBusSlave
ARM Cortex-A520AECT.DSU.shared_cache.upstream[2]	PVBusSlave
ARM Cortex-A520AECT.DSU.shared_cache.upstream[3]	PVBusSlave

ARMCortexA520AECT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l1licache	PVCache
ARMCortexA520AECT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l2cache	PVCache
ARMCortexA520AECT.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l2cache.upstream[1]	PVBusSlave
ARMCortexA520AECT.ext_bus	PVBusLogger

InstanceName	ComponentName
ARMCortexA520AECT.ext_bus.mapper	PVBusMapper
ARMCortexA520AECT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexA520AECT contains the following CADI targets:

- ARM_Cortex-A520AE
- Cluster_ARM_Cortex-A520AE
- PVCache
- TlbCadi

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA520AECT

Table 3-334: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.

Name	Protocol	Type	Description
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[14]	PChannel	Master	Core PCSM signals
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.

Name	Protocol	Type	Description
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgpwrupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA520AECT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type

int

Default value

0x0

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type

int

Default value

0x0

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type

int

Default value

0x0

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type

int

Default value

0x0

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type

int

Default value

0x0

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type

int

Default value

0x0

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type

int

Default value

0x0

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type

int

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance

of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x0

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

cluster_split_lock_config

Default SPLIT/LOCKED config. The valid values are: 1 - Only LOCKED mode support, 4 - Only SPLIT mode support, 5 - SPLIT or MIXED mode support. Valid only when enable_ae_features is true.

Type

int

Default value

0x1

core_cache_protection

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled

Type

int

Default value

0x1

core_complex_mapping

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" : {"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type

string

Default value

```
{"complex0": { "cores": [0, 1], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex1":
{ "cores": [2, 3], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex2": { "cores": [4, 5], "l2-
cache" : {"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" : {"exists":1,
"size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" : {"exists":1, "size":"16MB"}},
```

```
"complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex6":
{ "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"}} }
```

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU

Type

bool

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x8

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x20

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_lock_step

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS)

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**ete.TRCSRSTA_FORCED_EXCEP**

TRCSRSTA value for a forcibly traced exception

Type

bool

Default value

0x0

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

has_actlr2

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32]

Type

bool

Default value

0x1

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

has_impdef_transient_fault_protection

Support the Transient Fault Protection (TFP) flop parity errors through RAS registers (FEAT_TFP)

Type

bool

Default value

0x1

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x1

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_bus_width_in_bytes

L3 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use $(n * \text{accumulator value})$ to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

num_acp

Number of ACP ports

Type

int

Default value

0x0

num_nodes

Number of transport nodes. Zero implies direct-connect configuration

Type

int

Default value

0x1

pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x6

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

ras_extra_configurations

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields,

ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN_EL1. E.g.
 [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}]

Type

string

Default value

```
[ { "Index": 1, "ERXMISCO_mask": 0xFFFFc0003fc3, "ERXMISC1_mask": 0x03F870003FF30f07, "ERXPFGCTL_reset": 0x1000 }, { "Index": 2, "ERXMISCO_mask": 0xFFFFe007ffc0, "ERXMISCO_reset": 0x2, "ERXSTATUS_IERR_mask": 0x300 , "ERXMISC1_mask": 0x0FF8700fFFF31f0f, "ERXPFGCTL_reset": 0x1000 } ]
```

ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0xc

reported_patch_level

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

reported_revision_number

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type

int

Default value

0xffffffffffffffff

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.39 **ARMCortexA520CT**

ARMCortexA520CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-335: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Ports added:

- cluster_pcs_m_pchannel
- core_pcs_m_pchannel

Parameters added:

- core_complex_mapping
- mpm_accumulator_multiplier
- tlbi_stall_enabled

Iris and MTI instances for ARMCortexA520CT

This model has the following Iris instances:

Table 3-336: ARMCortexA520CT Iris instances

InstanceName	ComponentName
ARMCortexA520CT	Cluster_ARM_Cortex-A520
ARMCortexA520CT.AMU	PVBusLogger

ARMCortexA520CT contains the following CADI targets:

- ARM_Cortex-A520
- Cluster_ARM_Cortex-A520
- PVCache
- TlbCadi

About ARMCortexA520CT

The model supports the following features:

- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- Internal PPU support is present.
- A P-Channel for the cluster and for each core.
- BROADCASTPERSIST pin.
- Optional peripheral port.
- Memory-mapped register access to MPAM.
- Per-core clock.
- Utility bus.

Support for the following features is planned for a future release:

- DSU-120 system features are not fully implemented.
- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols.
- Core-Complex.
- BROADCASTCACHEMAINTPOU pin
- COREINSTRRET andCOREINSTRRUN signals.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not supported but signals are implemented.

The following features will not be implemented:

- DynamiQ™ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Cache stashing capability.

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA520CT

Table 3-338: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[14]	PChannel	Master	Core PCSM signals
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgprupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.

Name	Protocol	Type	Description
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.

Name	Protocol	Type	Description
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A520CT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type

int

Default value

0x0

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type

int

Default value

0x0

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type

int

Default value

0x0

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type

int

Default value

0x0

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type

int

Default value

0x0

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type

int

Default value

0x0

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type

int

Default value

0x0

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type

int

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAIN

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x0

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

NUM_CORES

Number of cores per cluster

Type

int

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

core_cache_protection

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled

Type

int

Default value

0x1

core_complex_mapping

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" : {"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type

string

Default value

```
{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1":
{ "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4, 5], "l2-
cache" :{"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" :{"exists":1,
"size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists":1, "size":"16MB"}},
"complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex6":
{ "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"}} }
```

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU

Type

bool

Default value

0x0

cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x8

cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x20

cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

has_actlr2

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32]

Type

bool

Default value

0x1

has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x1

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_bus_width_in_bytes

L3 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

num_acp

Number of ACP ports

Type

int

Default value

0x0

num_nodes

Number of transport nodes. Zero implies direct-connect configuration

Type

int

Default value

0x1

pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x6

ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

ras_extra_configurations

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}]

Type

string

Default value

[{ "Index": 1, "ERXMISCO_mask": 0xFFFFc0003fc3, "ERXMISC1_mask": 0x03F870003FF30f07, "ERXPFGCTL_reset": 0x1000 }, { "Index": 2, "ERXMISCO_mask": 0xFFFFe007ffc0, "ERXMISCO_reset": 0x2, "ERXSTATUS_IERR_mask": 0x300 , "ERXMISC1_mask": 0x0FF8700fFFF31f0f, "ERXPFGCTL_reset": 0x1000 }]

ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0xc

revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x0

tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.40 ARMCortexA520CT_CortexA720CT

ARMCortexA520CT_CortexA720CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-339: IP revisions support

Revision	Quality level
CortexA520 r0p1	Full support
CortexA720 r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Table 3-340: Model quality changes

From	To
CortexA520 r0p0=rel	CortexA520 r0p1=rel
CortexA720 r0p0=rel	CortexA720 r0p1=rel

Table 3-341: IP revision changes

From	To
CortexA520 r0p1	CortexA520 r0p1
CortexA720 r0p1	CortexA720 r0p1

Ports added:

- cluster_pcs_m_pchannel
- core_pcs_m_pchannel

Parameters added:

- core_complex_mapping
- mpm_accumulator_multiplier
- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled

Iris and MTI instances for ARMCortexA520CT_CortexA720CT

This model has the following Iris instances:

Table 3-342: ARMCortexA520CT_CortexA720CT Iris instances

InstanceName	ComponentName
ARMCortexA520CT_CortexA720CT	Cluster_ARM_CortexA520_CortexA720_Heterogeneous
ARMCortexA520CT_CortexA720CT.AMU	PVBusLogger

InstanceName	ComponentName
ARMCortexA520CT_CortexA720CT.AMU.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT.DAP	PVBusLogger
ARMCortexA520CT_CortexA720CT.DAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT.DSU	DSU
ARMCortexA520CT_CortexA720CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT_CortexA720CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.PPU_core0	PPUv1
ARMCortexA520CT_CortexA720CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.PPU_core1	PPUv1
ARMCortexA520CT_CortexA720CT.DSU.PPU_core1.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.l3_flusher	AsyncCacheFlushUnit

ARMCortexA520CT_CortexA720CT.subcluster1.cpu0.l2cache	PVCache
ARMCortexA520CT_CortexA720CT.subcluster1.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexA520CT_CortexA720CT.subcluster1.cpu0.l2cache.upstream[1]	PVBusSlave

ARMCortexA520CT_CortexA720CT contains the following CADI targets:

- ARM_Cortex-A520
- ARM_Cortex-A720
- Cluster_ARM_CortexA520_CortexA720_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A520
- Subcluster_ARM_Cortex-A720
- TlbCadi

About ARMCortexA520CT_CortexA720CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-13 (ARMCortexA520CT).

subcluster1.NUM_CORES

Possible values are 1-13 (ARMCortexA720CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-12]` for cores in `subcluster0`.
- `<port_name>[13-25]` for cores in `subcluster1`.

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [3.5.39 ARMCortexA520CT](#) on page 1703.
- [3.5.47 ARMCortexA720CT](#) on page 2054.

Ports for ARMCortexA520CT_CortexA720CT

Table 3-344: Ports

Name	Protocol	Type	Description
<code>acp_s[2]</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	<code>Value_64</code>	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTART0MP</code>	<code>Value_64</code>	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	<code>Value_64</code>	Slave	Port to obtain start address of valid peripheral address range (inclusive).

Name	Protocol	Type	Description
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[26]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmp_channel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[26]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[26]	Signal	Master	Timer signals to SOC
CNTHVIRQ[26]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[26]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[26]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[26]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[26]	Signal	Master	Timer signals to SOC.
commirq[26]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[26]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmp_channel[26]	PChannel	Master	Core PCSM signals
core_powerdown_out[26]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[26]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[26]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error

Name	Protocol	Type	Description
cryptodisable[26]	Signal	Slave	Disable cryptography extensions after reset.
cti[26]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[26]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[26]	Signal	Master	No power-down request.
dbgpwrupreq[26]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[26]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[26]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[26]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[26]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[26]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[26]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[26]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[26]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[26]	Value_64	Slave	Reset vector base address.

Name	Protocol	Type	Description
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[26]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[26]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[26]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[26]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[26]	Signal	Slave	Virtualised FIQ.
virq[26]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[26]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA520CT_CortexA720CT

AEND0_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type

int

Default value

0x0

AEND1_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type

int

Default value

0x0

AEND2_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type

int

Default value

0x0

AEND3_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type

int

Default value

0x0

ASTART0_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type

int

Default value

0x0

ASTART1_DEFAULT

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type

int

Default value

0x0

ASTART2_DEFAULT

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type

int

Default value

0x0

ASTART3_DEFAULT

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type

int

Default value

0x0

BROADCASTATOMIC

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used

Type

bool

Default value

0x1

BROADCASTCACHEMAINT

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTOUTER

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type

bool

Default value

0x0

BROADCASTPERSIST

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used

Type

bool

Default value

0x1

CLUSTER_ID

Processor cluster ID value

Type

int

Default value

0x0

CMO_broadcast_when_cache_state_modelling_disabled

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance

of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required

Type

int

Default value

0x1

DBGROMADDR

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type

int

Default value

0x0

DBGROMADDRV

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid

Type

bool

Default value

0x0

GICDISABLE

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3)

Type

bool

Default value

0x1

bus_type

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI

Type

int

Default value

0x0

core_complex_mapping

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" : {"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type

string

Default value

```
{"complex0": { "cores": [0, 1], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex1":  
{ "cores": [2, 3], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex2": { "cores": [4, 5], "l2-  
cache" : {"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" : {"exists":1,  
"size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" : {"exists":1, "size":"16MB"}},  
"complex5": { "cores": [10, 11], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex6":  
{ "cores": [12, 13], "l2-cache" : {"exists":1, "size":"16MB"} }
```

core_power_on_by_default

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU

Type

bool

Default value

0x0

dcache-state_modelled

Set whether D-cache has stateful implementation

Type

bool

Default value

0x0

enable_simulation_performance_optimizations

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

Type

bool

Default value

0x1

has_peripheral_port

If true, an additional AXI peripheral port is configured.

Type

bool

Default value

0x0

icache-state_modelled

Set whether I-cache has stateful implementation

Type

bool

Default value

0x0

l3cache-has_mpam

L3 Cache has MPAM support

Type

bool

Default value

0x0

l3cache-hit_latency

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-maintenance_latency

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-miss_latency

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_access_latency

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-read_bus_width_in_bytes

L3 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

l3cache-read_latency

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-size

L3 Cache size in bytes.

Type

int

Default value

0x80000

l3cache-snoop_data_transfer_latency

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-snoop_issue_latency

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-ways

L3 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x10

l3cache-write_access_latency

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

l3cache-write_bus_width_in_bytes

L3 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

l3cache-write_latency

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

mpmm_accumulator_multiplier

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type

int

Default value

0x1

num_nodes

Number of transport nodes. Zero implies direct-connect configuration

Type

int

Default value

0x1

revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x0

subcluster0.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster0.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type

int

Default value

0x1

subcluster0.core_cache_protection

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled

Type

int

Default value

0x1

subcluster0.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster0.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster0.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster0.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster0.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster0.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-read_bus_width_in_bytes

L2 Cache read bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x10

subcluster0.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster0.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-ways

L2 Cache number of ways (sets are implicit from size).

Type

int

Default value

0x8

subcluster0.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.l2cache-write_bus_width_in_bytes

L2 Cache write bus width in bytes used to calculate per-access timing annotations

Type

int

Default value

0x20

subcluster0.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster0.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster0.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster0.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster0.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster0.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster0.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster0.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster0.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster0.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster0.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster0.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster0.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster0.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster0.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster0.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster0.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster0.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

subcluster0.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster0.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster0.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster0.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster0.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster0.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster0.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

subcluster0.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster0.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster0.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster0.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster0.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster0.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance

of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster0.has_actlr2

If true ACTLR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32]

Type

bool

Default value

0x1

subcluster0.has_dot_product

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster0.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster0.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster0.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster0.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster0.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster0.pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x6

subcluster0.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.ras_extra_configurations

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCn masks - these are 64 bit masks covering the 64 bit registers ERXMISCn_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}]

Type

string

Default value

```
[ { "Index": 1, "EXMISCO_mask": 0xFFFFc0003fc3, "EXMISC1_mask":
0x03F870003FF30f07, "ERXPFGCTL_reset": 0x1000 }, { "Index":
2, "EXMISCO_mask": 0xFFFFe007ffc0, "EXMISCO_reset": 0x2,
"ERXSTATUS_IERR_mask": 0x300 , "EXMISC1_mask": 0x0FF8700fFFF31f0f,
"ERXPFGCTL_reset": 0x1000 } ]
```

subcluster0.ras_pfg_clock_mhz

RAS Pseudo-Fault generation clock rate in MHz

Type

int

Default value

0xc

subcluster0.revision_number

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

Type

int

Default value

0x0

subcluster0.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster0.tlbi_stall_enabled

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster0.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster0.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.CPUCFR

Value of CPU Configuration Register

Type

int

Default value

0x0

subcluster1.NUM_CORES

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type

int

Default value

0x1

subcluster1.cpi_div

Divider for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpi_mul

Multiplier for calculating CPI (Cycles Per Instruction)

Type

int

Default value

0x1

subcluster1.cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian.

Type

bool

Default value

0x0

subcluster1.cpuX.CFGTE

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type

bool

Default value

0x0

subcluster1.cpuX.CRYPTODISABLE

Disable cryptographic features.

Type

bool

Default value

0x0

subcluster1.cpuX.RVBARADDR

Value of RVBAR_ELx register.

Type

int

Default value

0x0

subcluster1.cpuX.enable_trace_special_hlt_imm16

Enable usage of parameter trace_special_hlt_imm16

Type

bool

Default value

0x0

subcluster1.cpuX.force-fpsid

Override the FPSID value

Type

bool

Default value

0x1

subcluster1.cpuX.l2cache-hit_latency

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-maintenance_latency

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-miss_latency

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_access_latency

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-read_latency

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-size

L2 Cache size in bytes.

Type

int

Default value

0x80000

subcluster1.cpuX.l2cache-snoop_data_transfer_latency

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-snoop_issue_latency

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_access_latency

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.l2cache-write_latency

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.cpuX.max_code_cache_mb

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores)

Type

int

Default value

0x100

subcluster1.cpuX.min_sync_level

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll)

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-A32_HLT

A32 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-A64_HLT

A64 HLT number for semihosting calls.

Type

int

Default value

0xf000

subcluster1.cpuX.semihosting-ARM_SVC

A32 SVC number for semihosting calls.

Type

int

Default value

0x123456

subcluster1.cpuX.semihosting-T32_HLT

T32 HLT number for semihosting calls.

Type

int

Default value

0x3c

subcluster1.cpuX.semihosting-Thumb_SVC

T32 SVC number for semihosting calls.

Type

int

Default value

0xab

subcluster1.cpuX.semihosting-cmd_line

Command line available to semihosting calls.

Type

string

Default value**subcluster1.cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type

string

Default value**subcluster1.cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type

bool

Default value

0x1

subcluster1.cpuX.semihosting-heap_base

Virtual address of heap base.

Type

int

Default value

0x0

subcluster1.cpuX.semihosting-heap_limit

Virtual address of top of heap.

Type

int

Default value

0xf000000

subcluster1.cpuX.semihosting-stack_base

Virtual address of base of descending stack.

Type

int

Default value

0x10000000

subcluster1.cpuX.semihosting-stack_limit

Virtual address of stack limit.

Type

int

Default value

0xf000000

subcluster1.cpuX.trace_special_hlt_imm16

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered

Type

int

Default value

0xf000

subcluster1.cpuX.vfp-enable_at_reset

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!

Type

bool

Default value

0x0

subcluster1.cpuX.vfp-present

Set whether the model has VFP support

Type

bool

Default value

0x1

subcluster1.dcache-hit_latency

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-maintenance_latency

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-miss_latency

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-prefetch_enabled

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true

Type

bool

Default value

0x0

subcluster1.dcache-read_access_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-read_latency

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-size

L1 D-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.dcache-snoop_data_transfer_latency

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_access_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.dcache-write_latency

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.ete.CLAIMTAGS

Number of claim tags

Type

int

Default value

0x4

subcluster1.ete.ETE_REVISION

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3

Type

int

Default value

0x1

subcluster1.ete.MAX_INST_PER_Q

Maximum limit for the number of instructions implied by a Q element

Type

int

Default value

0x1

subcluster1.ete.NumberOfRSPairs

Number of resource selector pairs

Type

int

Default value

0x8

subcluster1.ete.PIDR_CM0D

TRCPIDR CM0D value

Type

int

Default value

0x0

subcluster1.ete.PIDR_REVAND

TRCPIDR REVAND value

Type

int

Default value

0x0

subcluster1.ete.PIDR_REVISION

TRCPIDR REVISION value

Type

int

Default value

0x0

subcluster1.ete.Q_CADENCE

Number of instruction blocks traced between two Q elements

Type

int

Default value

0x1

subcluster1.ete.RES0_STATEFUL

Whether RES0 bits are stateful or RAZ/WI

Type

bool

Default value

0x0

subcluster1.ete.RETSTACK

Return stack depth

Type

int

Default value

0x3

subcluster1.ete.REVISION

TRCIDR1 revision value

Type

int

Default value

0x0

subcluster1.ete.SIM_OVERFLOW_GRANULARITY

Number of instruction blocks in each granule, for simulated overflow

Type

int

Default value

0x64

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE

Percentage of instruction blocks lost in each granule, for simulated overflow

Type

int

Default value

0x0

subcluster1.ete.SOURCE_ADDRESS

Allow generation of source address elements

Type

bool

Default value

0x0

subcluster1.ete.TRACE_OUTPUT

File to which to write trace byte stream

Type

string

Default value**subcluster1.ete.TRCRSRTA_FORCED_EXCEP**

TRCRSR.TA value for a forcibly traced exception

Type

bool

Default value

0x0

subcluster1.ete.TSMARK

Whether timestamp markers are supported

Type

bool

Default value

0x1

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces

Type

bool

Default value

0x0

subcluster1.force_zero_PSTATE_PAN

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type

bool

Default value

0x0

subcluster1.force_zero_mpam_partid_and_pmg

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

Type

int

Default value

0x0

subcluster1.has_enhanced_pan

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3)

Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

Type

int

Default value

0x2

subcluster1.has_ete

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P)

Type

bool

Default value

0x0

subcluster1.has_large_va

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA).

Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type

int

Default value

0x0

subcluster1.has_statistical_profiling

Whether Statistical Based Profiling is implemented (FEAT_SPE).

Type

bool

Default value

0x0

subcluster1.icache-hit_latency

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-maintenance_latency

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-miss_latency

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-prefetch_enabled

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

Type

bool

Default value

0x0

subcluster1.icache-read_access_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-read_latency

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

Type

int

Default value

0x0

subcluster1.icache-size

L1 I-Cache size in bytes.

Type

int

Default value

0x8000

subcluster1.instruction_tlb_size

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB)

Type

int

Default value

0x0

subcluster1.memory_tagging_support_level

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

Type

int

Default value

0x3

subcluster1.pmu-num_counters

Number of PMU counters implemented

Type

int

Default value

0x6

subcluster1.ptw_latency

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.stage12_tlb_size

Number of stage1+2 tlb entries.

Type

int

Default value

0x80

subcluster1.tlb_latency

TLB latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

subcluster1.tlbi_stall_enabled

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type

bool

Default value

0x0

subcluster1.treat_PAC_as_NOP

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

Type

bool

Default value

0x0

subcluster1.walk_cache_latency

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks

Type

int

Default value

0x0

3.5.41 ARMCortexA520CT_CortexA720CT_CortexX4CT

ARMCortexA520CT_CortexA720CT_CortexX4CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-345: IP revisions support

Revision	Quality level
CortexA520 r0p1	Full support
CortexA720 r0p1	Full support
CortexX4 r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 22.

Changes in 11.26.8

Table 3-346: Model quality changes

From	To
CortexA520 r0p0=rel	CortexA520 r0p1=rel
Hunter r0p0=pre	CortexA720 r0p1=rel
CortexX4 r0p0=pre	CortexX4 r0p0=pre

Table 3-347: IP revision changes

From	To
CortexA520 r0p1	CortexA520 r0p1
CortexA720 r0p1	CortexA720 r0p1
CortexX4 r0p0	CortexX4 r0p0

Ports added:

- cluster_pcs_m_pchannel
- core_pcs_m_pchannel

Parameters added:

- core_complex_mapping
- mpmm_accumulator_multiplier
- subcluster0.tlbi_stall_enabled
- subcluster1.tlbi_stall_enabled
- subcluster2.tlbi_stall_enabled

Iris and MTI instances for ARMCortexA520CT_CortexA720CT_CortexX4CT

This model has the following Iris instances:

Table 3-348: ARMCortexA520CT_CortexA720CT_CortexX4CT Iris instances

InstanceName	ComponentName
ARMCortexA520CT_CortexA720CT_CortexX4CT	Cluster_ARM_CortexA520_CortexA720_CortexX4_Heterogeneous

ARMCortexA520CT_CortexA720CT_CortexX4CT contains the following CADI targets:

- ARM_Cortex-A520
- ARM_Cortex-A720
- ARM_Cortex-X4
- Cluster_ARM_CortexA520_CortexA720_CortexX4_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A520
- Subcluster_ARM_Cortex-A720
- Subcluster_ARM_Cortex-X4
- TlbCadi

About ARMCortexA520CT_CortexA720CT_CortexX4CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-12 (ARMCortexA520CT).

subcluster1.NUM_CORES

Possible values are 1-12 (ARMCortexA720CT).

subcluster2.NUM_CORES

Possible values are 1-12 (ARMCortexX4CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-11]` for cores in subcluster0.
- `<port_name>[12-23]` for cores in subcluster1.
- `<port_name>[24-35]` for cores in subcluster2.

Note

All instances in the Master cross trigger matrix port array, `cti[36]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu11` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu11` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu11` identify cores in `subcluster2`.

For information about the cores in this model, see:

- [3.5.39 ARMCortexA520CT](#) on page 1703.
- [3.5.47 ARMCortexA720CT](#) on page 2054.
- [3.5.73 ARMCortexX4CT](#) on page 2551.

Ports for ARMCortexA520CT_CortexA720CT_CortexX4CT

Table 3-350: Ports

Name	Protocol	Type	Description
<code>acp_s[2]</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDOMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTOMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART2MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART3MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[36]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>cluster_pcsn_pchannel</code>	PChannel	Master	Cluster PCSM signal
<code>cluster_powerdown_out</code>	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info

Name	Protocol	Type	Description
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[36]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[36]	Signal	Master	Timer signals to SOC
CNTHVIRQ[36]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[36]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[36]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[36]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[36]	Signal	Master	Timer signals to SOC.
commirq[36]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[36]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[36]	PChannel	Master	Core PCSM signals
core_powerdown_out[36]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[36]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[36]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[36]	Signal	Slave	Disable cryptography extensions after reset.
cti[36]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[36]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[36]	Signal	Master	No power-down request.
dbgpwrupreq[36]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[36]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components

Name	Protocol	Type	Description
gicv3_redistributor_s[36]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[36]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[36]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[36]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[36]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[36]	Signal	Slave	PPU core wake request signal.
