ppi21_in_29[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 29.
ppi21_in_3[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 3.
ppi21_in_30[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 30.
ppi21_in_31[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 31.
ppi21_in_4[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 4.
ppi21_in_5[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 5.
ppi21_in_6[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 6.
ppi21_in_7[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 7.
ppi21_in_8[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 8.
ppi21_in_9[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 9.
ppi22_in_0[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 0.
ppi22_in_1[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 1.
ppi22_in_10[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 10.

Name	Protocol	Type	Description
ppi22_in_11[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 11.
ppi22_in_12[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 12.
ppi22_in_13[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 13.
ppi22_in_14[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 14.
ppi22_in_15[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 15.
ppi22_in_16[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 16.
ppi22_in_17[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 17.
ppi22_in_18[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 18.
ppi22_in_19[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 19.
ppi22_in_2[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 2.
ppi22_in_20[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 20.
ppi22_in_21[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 21.
ppi22_in_22[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 22.
ppi22_in_23[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 23.
ppi22_in_24[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 24.
ppi22_in_25[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 25.
ppi22_in_26[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 26.
ppi22_in_27[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 27.
ppi22_in_28[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 28.
ppi22_in_29[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 29.
ppi22_in_3[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 3.
ppi22_in_30[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 30.
ppi22_in_31[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 31.

Name	Protocol	Type	Description
ppi22_in_4[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 4.
ppi22_in_5[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 5.
ppi22_in_6[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 6.
ppi22_in_7[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 7.
ppi22_in_8[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 8.
ppi22_in_9[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 9.
ppi23_in_0[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 0.
ppi23_in_1[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 1.
ppi23_in_10[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 10.
ppi23_in_11[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 11.
ppi23_in_12[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 12.
ppi23_in_13[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 13.
ppi23_in_14[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 14.
ppi23_in_15[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 15.
ppi23_in_16[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 16.
ppi23_in_17[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 17.
ppi23_in_18[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 18.
ppi23_in_19[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 19.
ppi23_in_2[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 2.
ppi23_in_20[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 20.
ppi23_in_21[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 21.
ppi23_in_22[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 22.
ppi23_in_23[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 23.

Name	Protocol	Type	Description
ppi23_in_24[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 24.
ppi23_in_25[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 25.
ppi23_in_26[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 26.
ppi23_in_27[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 27.
ppi23_in_28[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 28.
ppi23_in_29[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 29.
ppi23_in_3[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 3.
ppi23_in_30[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 30.
ppi23_in_31[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 31.
ppi23_in_4[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 4.
ppi23_in_5[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 5.
ppi23_in_6[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 6.
ppi23_in_7[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 7.
ppi23_in_8[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 8.
ppi23_in_9[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 9.
ppi24_in_0[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 0.
ppi24_in_1[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 1.
ppi24_in_10[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 10.
ppi24_in_11[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 11.
ppi24_in_12[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 12.
ppi24_in_13[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 13.
ppi24_in_14[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 14.
ppi24_in_15[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 15.

Name	Protocol	Type	Description
ppi24_in_16[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 16.
ppi24_in_17[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 17.
ppi24_in_18[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 18.
ppi24_in_19[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 19.
ppi24_in_2[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 2.
ppi24_in_20[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 20.
ppi24_in_21[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 21.
ppi24_in_22[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 22.
ppi24_in_23[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 23.
ppi24_in_24[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 24.
ppi24_in_25[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 25.
ppi24_in_26[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 26.
ppi24_in_27[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 27.
ppi24_in_28[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 28.
ppi24_in_29[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 29.
ppi24_in_3[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 3.
ppi24_in_30[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 30.
ppi24_in_31[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 31.
ppi24_in_4[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 4.
ppi24_in_5[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 5.
ppi24_in_6[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 6.
ppi24_in_7[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 7.
ppi24_in_8[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 8.

Name	Protocol	Type	Description
ppi24_in_9[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 9.
ppi25_in_0[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 0.
ppi25_in_1[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 1.
ppi25_in_10[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 10.
ppi25_in_11[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 11.
ppi25_in_12[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 12.
ppi25_in_13[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 13.
ppi25_in_14[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 14.
ppi25_in_15[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 15.
ppi25_in_16[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 16.
ppi25_in_17[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 17.
ppi25_in_18[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 18.
ppi25_in_19[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 19.
ppi25_in_2[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 2.
ppi25_in_20[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 20.
ppi25_in_21[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 21.
ppi25_in_22[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 22.
ppi25_in_23[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 23.
ppi25_in_24[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 24.
ppi25_in_25[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 25.
ppi25_in_26[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 26.
ppi25_in_27[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 27.
ppi25_in_28[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 28.

Name	Protocol	Type	Description
ppi25_in_29[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 29.
ppi25_in_3[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 3.
ppi25_in_30[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 30.
ppi25_in_31[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 31.
ppi25_in_4[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 4.
ppi25_in_5[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 5.
ppi25_in_6[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 6.
ppi25_in_7[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 7.
ppi25_in_8[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 8.
ppi25_in_9[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 9.
ppi26_in_0[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 0.
ppi26_in_1[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 1.
ppi26_in_10[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 10.
ppi26_in_11[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 11.
ppi26_in_12[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 12.
ppi26_in_13[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 13.
ppi26_in_14[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 14.
ppi26_in_15[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 15.
ppi26_in_16[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 16.
ppi26_in_17[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 17.
ppi26_in_18[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 18.
ppi26_in_19[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 19.
ppi26_in_2[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 2.
ppi26_in_20[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 20.
ppi26_in_21[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 21.
ppi26_in_22[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 22.
ppi26_in_23[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 23.
ppi26_in_24[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 24.
ppi26_in_25[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 25.
ppi26_in_26[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 26.
ppi26_in_27[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 27.
ppi26_in_28[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 28.

Name	Protocol	Type	Description
ppi26_in_29[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 29.
ppi26_in_3[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 3.
ppi26_in_30[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 30.
ppi26_in_31[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 31.
ppi26_in_4[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 4.
ppi26_in_5[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 5.
ppi26_in_6[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 6.
ppi26_in_7[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 7.
ppi26_in_8[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 8.
ppi26_in_9[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 9.
ppi27_in_0[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 0.
ppi27_in_1[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 1.
ppi27_in_10[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 10.
ppi27_in_11[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 11.
ppi27_in_12[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 12.
ppi27_in_13[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 13.
ppi27_in_14[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 14.
ppi27_in_15[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 15.
ppi27_in_16[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 16.
ppi27_in_17[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 17.
ppi27_in_18[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 18.
ppi27_in_19[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 19.
ppi27_in_2[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 2.
ppi27_in_20[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 20.
ppi27_in_21[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 21.
ppi27_in_22[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 22.
ppi27_in_23[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 23.
ppi27_in_24[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 24.
ppi27_in_25[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 25.
ppi27_in_26[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 26.
ppi27_in_27[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 27.
ppi27_in_28[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 28.
ppi27_in_29[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 29.
ppi27_in_3[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 3.
ppi27_in_30[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 30.
ppi27_in_31[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 31.
ppi27_in_4[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 4.
ppi27_in_5[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 5.
ppi27_in_6[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 6.

Name	Protocol	Type	Description
ppi27_in_7[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 7.
ppi27_in_8[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 8.
ppi27_in_9[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 9.
ppi28_in_0[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 0.
ppi28_in_1[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 1.
ppi28_in_10[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 10.
ppi28_in_11[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 11.
ppi28_in_12[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 12.
ppi28_in_13[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 13.
ppi28_in_14[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 14.
ppi28_in_15[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 15.
ppi28_in_16[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 16.
ppi28_in_17[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 17.
ppi28_in_18[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 18.
ppi28_in_19[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 19.
ppi28_in_2[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 2.
ppi28_in_20[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 20.
ppi28_in_21[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 21.
ppi28_in_22[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 22.
ppi28_in_23[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 23.
ppi28_in_24[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 24.
ppi28_in_25[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 25.
ppi28_in_26[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 26.
ppi28_in_27[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 27.
ppi28_in_28[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 28.
ppi28_in_29[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 29.
ppi28_in_3[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 3.
ppi28_in_30[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 30.
ppi28_in_31[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 31.
ppi28_in_4[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 4.
ppi28_in_5[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 5.
ppi28_in_6[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 6.
ppi28_in_7[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 7.
ppi28_in_8[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 8.
ppi28_in_9[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 9.
ppi29_in_0[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 0.
ppi29_in_1[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 1.
ppi29_in_10[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 10.
ppi29_in_11[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 11.

Name	Protocol	Type	Description
ppi29_in_12[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 12.
ppi29_in_13[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 13.
ppi29_in_14[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 14.
ppi29_in_15[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 15.
ppi29_in_16[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 16.
ppi29_in_17[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 17.
ppi29_in_18[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 18.
ppi29_in_19[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 19.
ppi29_in_2[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 2.
ppi29_in_20[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 20.
ppi29_in_21[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 21.
ppi29_in_22[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 22.
ppi29_in_23[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 23.
ppi29_in_24[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 24.
ppi29_in_25[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 25.
ppi29_in_26[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 26.
ppi29_in_27[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 27.
ppi29_in_28[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 28.
ppi29_in_29[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 29.
ppi29_in_3[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 3.
ppi29_in_30[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 30.
ppi29_in_31[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 31.
ppi29_in_4[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 4.
ppi29_in_5[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 5.
ppi29_in_6[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 6.
ppi29_in_7[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 7.
ppi29_in_8[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 8.
ppi29_in_9[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 9.
ppi30_in_0[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 0.
ppi30_in_1[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 1.
ppi30_in_10[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 10.
ppi30_in_11[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 11.
ppi30_in_12[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 12.
ppi30_in_13[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 13.

Name	Protocol	Type	Description
ppi30_in_14[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 14.
ppi30_in_15[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 15.
ppi30_in_16[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 16.
ppi30_in_17[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 17.
ppi30_in_18[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 18.
ppi30_in_19[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 19.
ppi30_in_2[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 2.
ppi30_in_20[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 20.
ppi30_in_21[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 21.
ppi30_in_22[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 22.
ppi30_in_23[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 23.
ppi30_in_24[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 24.
ppi30_in_25[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 25.
ppi30_in_26[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 26.
ppi30_in_27[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 27.
ppi30_in_28[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 28.
ppi30_in_29[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 29.
ppi30_in_3[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 3.
ppi30_in_30[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 30.
ppi30_in_31[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 31.
ppi30_in_4[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 4.
ppi30_in_5[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 5.
ppi30_in_6[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 6.

Name	Protocol	Type	Description
ppi30_in_7[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 7.
ppi30_in_8[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 8.
ppi30_in_9[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 9.
ppi31_in_0[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 0.
ppi31_in_1[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 1.
ppi31_in_10[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 10.
ppi31_in_11[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 11.
ppi31_in_12[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 12.
ppi31_in_13[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 13.
ppi31_in_14[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 14.
ppi31_in_15[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 15.
ppi31_in_16[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 16.
ppi31_in_17[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 17.
ppi31_in_18[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 18.
ppi31_in_19[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 19.
ppi31_in_2[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 2.
ppi31_in_20[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 20.
ppi31_in_21[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 21.
ppi31_in_22[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 22.
ppi31_in_23[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 23.
ppi31_in_24[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 24.
ppi31_in_25[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 25.
ppi31_in_26[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 26.
ppi31_in_27[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 27.
ppi31_in_28[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 28.
ppi31_in_29[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 29.
ppi31_in_3[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 3.
ppi31_in_30[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 30.
ppi31_in_31[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 31.
ppi31_in_4[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 4.
ppi31_in_5[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 5.
ppi31_in_6[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 6.
ppi31_in_7[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 7.
ppi31_in_8[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 8.
ppi31_in_9[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 9.
pvbuse_filtermiss_m	PVBus	Master	passthrough for transactions not targetting one of the pages associated with the IRI.
pvbuse_m	PVBus	Master	Memory bus out: transactions generated by the IRI.

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Reset.
spi_in[988]	Signal	Slave	Shared peripheral interrupts.
wake_request_0[8]	Signal	Master	Power management outputs of cluster 0.
wake_request_1[8]	Signal	Master	Power management outputs of cluster 1.
wake_request_10[8]	Signal	Master	Power management outputs of cluster 10.
wake_request_11[8]	Signal	Master	Power management outputs of cluster 11.
wake_request_12[8]	Signal	Master	Power management outputs of cluster 12.
wake_request_13[8]	Signal	Master	Power management outputs of cluster 13.
wake_request_14[8]	Signal	Master	Power management outputs of cluster 14.
wake_request_15[8]	Signal	Master	Power management outputs of cluster 15.
wake_request_16[8]	Signal	Master	Power management outputs of cluster 16.
wake_request_17[8]	Signal	Master	Power management outputs of cluster 17.
wake_request_18[8]	Signal	Master	Power management outputs of cluster 18.
wake_request_19[8]	Signal	Master	Power management outputs of cluster 19.
wake_request_2[8]	Signal	Master	Power management outputs of cluster 2.
wake_request_20[8]	Signal	Master	Power management outputs of cluster 20.
wake_request_21[8]	Signal	Master	Power management outputs of cluster 21.
wake_request_22[8]	Signal	Master	Power management outputs of cluster 22.
wake_request_23[8]	Signal	Master	Power management outputs of cluster 23.
wake_request_24[8]	Signal	Master	Power management outputs of cluster 24.
wake_request_25[8]	Signal	Master	Power management outputs of cluster 25.
wake_request_26[8]	Signal	Master	Power management outputs of cluster 26.
wake_request_27[8]	Signal	Master	Power management outputs of cluster 27.
wake_request_28[8]	Signal	Master	Power management outputs of cluster 28.
wake_request_29[8]	Signal	Master	Power management outputs of cluster 29.
wake_request_3[8]	Signal	Master	Power management outputs of cluster 3.
wake_request_30[8]	Signal	Master	Power management outputs of cluster 30.
wake_request_31[8]	Signal	Master	Power management outputs of cluster 31.
wake_request_4[8]	Signal	Master	Power management outputs of cluster 4.
wake_request_5[8]	Signal	Master	Power management outputs of cluster 5.
wake_request_6[8]	Signal	Master	Power management outputs of cluster 6.
wake_request_7[8]	Signal	Master	Power management outputs of cluster 7.
wake_request_8[8]	Signal	Master	Power management outputs of cluster 8.
wake_request_9[8]	Signal	Master	Power management outputs of cluster 9.

Parameters for GIC500_Filter

GICD_ITARGETSR-RAZWI

Type

bool

Default value

0x0

If true, the GICD_ITARGETS registers are RAZ/WI.

ITS-count

Type

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits

Type

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-threaded-command-queue

Type

bool

Default value

0x1

Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation.

SPI-count

Type

int

Default value

0xe0

Number of SPIs that are implemented.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

cpus_per_cluster_0**Type**

int

Default value

0x1

Number of cores within cluster 0.

cpus_per_cluster_1**Type**

int

Default value

0x1

Number of cores within cluster 1.

cpus_per_cluster_10**Type**

int

Default value

0x1

Number of cores within cluster 10.

cpus_per_cluster_11**Type**

int

Default value

0x1

Number of cores within cluster 11.

cpus_per_cluster_12**Type**

int

Default value

0x1

Number of cores within cluster 12.

cpus_per_cluster_13**Type**

int

Default value

0x1

Number of cores within cluster 13.

cpus_per_cluster_14**Type**

int

Default value

0x1

Number of cores within cluster 14.

cpus_per_cluster_15**Type**

int

Default value

0x1

Number of cores within cluster 15.

cpus_per_cluster_16**Type**

int

Default value

0x1

Number of cores within cluster 16.

cpus_per_cluster_17**Type**

int

Default value

0x1

Number of cores within cluster 17.

cpus_per_cluster_18**Type**

int

Default value

0x1

Number of cores within cluster 18.

cpus_per_cluster_19**Type**

int

Default value

0x1

Number of cores within cluster 19.

cpus_per_cluster_2**Type**

int

Default value

0x1

Number of cores within cluster 2.

cpus_per_cluster_20**Type**

int

Default value

0x1

Number of cores within cluster 20.

cpus_per_cluster_21**Type**

int

Default value

0x1

Number of cores within cluster 21.

cpus_per_cluster_22**Type**

int

Default value

0x1

Number of cores within cluster 22.

cpus_per_cluster_23**Type**

int

Default value

0x1

Number of cores within cluster 23.

cpus_per_cluster_24**Type**

int

Default value

0x1

Number of cores within cluster 24.

cpus_per_cluster_25**Type**

int

Default value

0x1

Number of cores within cluster 25.

cpus_per_cluster_26**Type**

int

Default value

0x1

Number of cores within cluster 26.

cpus_per_cluster_27**Type**

int

Default value

0x1

Number of cores within cluster 27.

cpus_per_cluster_28**Type**

int

Default value

0x1

Number of cores within cluster 28.

cpus_per_cluster_29**Type**

int

Default value

0x1

Number of cores within cluster 29.

cpus_per_cluster_3**Type**

int

Default value

0x1

Number of cores within cluster 3.

cpus_per_cluster_30**Type**

int

Default value

0x1

Number of cores within cluster 30.

cpus_per_cluster_31**Type**

int

Default value

0x1

Number of cores within cluster 31.

cpus_per_cluster_4**Type**

int

Default value

0x1

Number of cores within cluster 4.

cpus_per_cluster_5**Type**

int

Default value

0x1

Number of cores within cluster 5.

cpus_per_cluster_6**Type**

int

Default value

0x1

Number of cores within cluster 6.

cpus_per_cluster_7**Type**

int

Default value

0x1

Number of cores within cluster 7.

cpus_per_cluster_8**Type**

int

Default value

0x1

Number of cores within cluster 8.

cpus_per_cluster_9**Type**

int

Default value

0x1

Number of cores within cluster 9.

delay-ITS-accesses**Type**

bool

Default value

0x1

Delay accesses from the ITS until GICR_SYNCRR is read.

delay-redistributor-accesses**Type**

bool

Default value

0x1

Delay memory accesses from the redistributor until GICR_SYNCRR is read.

enable_protocol_checking**Type**

bool

Default value

0x0

Enable/disable protocol checking at cpu interface.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

num_clusters**Type**

int

Default value

0x1

Number of implemented affinity level1 clusters.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-threaded-sync**Type**

bool

Default value

0x1

Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation.

reg-base**Type**

int

Default value

0x10000000

GIC500 base address.

using-generated-memorymap**Type**

bool

Default value

0x1

Use the generated memorymap for the GIC500 and warn if superfluous parameters are passed.

wakeup-on-reset**Type**

bool

Default value

0x0

Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.10.31 GIC600

GIC-600 IRI implementation: Single chip validation/filter component variant limited to 265 PE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1008: IP revisions support

Revision	Quality level
r1p6	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- `gicp-allow-ns-reset`

Iris and MTI instances for GIC600

This model has the following Iris instances:

Table 3-1009: GIC600 Iris instances

InstanceName	ComponentName
GIC600	GIC_IRI
GIC600.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC600.ITS0	GICv3InterruptTranslationService
GIC600.rd_0	GICv3RedistributorInternal
GIC600.rd_0_0	GICv3RedistributorInternal
GIC600.rd_0_0_0	GICv3RedistributorInternal
GIC600.rd_0_0_0_0	GICv3Redistributor
GIC600.rd_t1	GICv3Distributor

This model has the following MTI trace components:

Table 3-1010: GIC600 MTI instances

InstanceName	ComponentName
GIC600	GICv3IRI
GIC600.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC600.ITS0	GICv3InterruptTranslationService
GIC600.rd_0	GICv3RedistributorInternal
GIC600.rd_0_0	GICv3RedistributorInternal
GIC600.rd_0_0_0	GICv3RedistributorInternal
GIC600.rd_0_0_0_0	GICv3Redistributor
GIC600.rd_t1	GICv3Distributor

GIC600 contains the following CADI targets:

- GIC600

About GIC600

GIC600 and GIC600_Filter are minimal models of an Arm GIC-600 Generic Interrupt Controller, suitable for single-chip or multichip systems, where multichip operation has been tested, with the following exceptions:

- LPI/LPI command is implemented but untested.
- Power operation is unimplemented.

They provide a simple configuration interface that allows designers to introduce GIC600-like functionality to their systems, while only implementing the architectural behavior, as defined by the GICv3 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC600 and GIC600_Filter have a `pvbuss_s` port for register accesses and a `pvbuss_m` port for the LPI-related traffic from redistributors and the ITS. The `pvbuss_m` port is also used to compose multichip operation.

In addition, the GIC600_Filter variant has a `pvbuss_filtermiss_m` port, to which any transactions on the `pvbuss_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC600 variant.

It is recommended to use the GIC600 variant in most cases.

Also, the RAS register is implemented and various RAS errors are reported through status registers. Not all the RAS errors are available because Fast Models does not model errors that can cause ECC errors. Fast Models supports error record 0 and error record 13+.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the MSIRewriter component can be used to create the correct data transactions based on the device ID. For more details about `GITS_TRANSLATE64R`, see [MSIRewriter](#).

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

PVBus attribute	Bits used	Property encoded	Notes
MasterID	31:0	Master ID that invoked the register access	–
ExtendedID	–	–	Not used
UserFlags	–	–	Not used

The pvbus_m port does not use MasterID, ExtendedID, Or UserFlags.

Ports for GIC600

Table 3-1012: Ports

Name	Protocol	Type	Description
chip_id	Value	Slave	chip_id port which is valid from GIC600 r1p2. Writing to this port for prior GIC600 version will be ignored.
cpu_active_s[256]	Signal	Slave	CPUActive pins.
po_reset	Signal	Slave	Resets.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100.
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101.
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102.
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103.
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104.
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105.
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106.
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107.
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108.
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109.
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110.
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111.
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112.
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113.
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114.
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115.
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116.
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117.
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118.
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119.
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120.
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121.
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122.

Name	Protocol	Type	Description
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123.
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124.
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125.
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126.
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127.
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128.
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129.
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130.
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131.
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132.
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133.
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134.
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135.
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136.
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137.
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138.
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139.
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140.
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141.
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142.
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143.
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144.
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145.
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146.
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147.
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148.
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149.
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150.
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151.
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152.
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153.
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154.
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155.
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156.
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157.
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158.

Name	Protocol	Type	Description
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159.
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160.
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161.
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162.
ppi_in_163[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163.
ppi_in_164[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164.
ppi_in_165[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165.
ppi_in_166[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166.
ppi_in_167[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167.
ppi_in_168[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168.
ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169.
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170.
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171.
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172.
ppi_in_173[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173.
ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174.
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175.
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176.
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177.
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178.
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179.
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180.
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181.
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182.
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183.
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184.
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185.
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186.
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187.
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188.
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189.
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190.
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191.
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192.
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193.

Name	Protocol	Type	Description
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194.
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195.
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196.
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197.
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198.
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199.
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200.
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201.
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202.
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203.
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204.
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205.
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206.
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207.
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208.
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209.
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210.
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211.
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212.
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213.
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214.
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215.
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216.
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217.
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218.
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219.
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220.
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221.
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222.
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223.
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224.
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225.
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226.
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227.
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228.

Name	Protocol	Type	Description
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229.
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230.
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231.
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232.
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233.
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234.
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235.
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236.
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237.
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238.
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239.
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240.
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241.
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242.
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243.
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244.
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245.
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246.
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247.
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248.
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249.
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250.
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251.
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252.
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253.
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254.
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255.
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.

Name	Protocol	Type	Description
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.

Name	Protocol	Type	Description
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74.
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75.
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76.
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77.
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78.
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79.
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80.
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81.
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82.
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83.
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84.
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85.
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86.
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87.
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88.
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89.
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90.
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91.
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92.
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93.
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94.
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95.
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96.
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97.
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98.
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Resets.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.

Parameters for GIC600

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DS-behaviour

Type

int

Default value

2

GICD_CTLR.DS field behaviour

0 :RAZ/WI

1 :RAO/WI

2 :RW

IIDR

Type

int

Default value

0x0

GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-collection-ID-bits**Type**

int

Default value

0x8

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0).

ITS-count**Type**

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

PPI-count**Type**

int

Default value

16

Selects the number of PPI available for each PE:

8

id22-27,29,30

12

id 20-31

16

id 16-31

RAS-CFI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.

RAS-FI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt is supported. Not supported otherwise.

RAS-UE-support**Type**

bool

Default value

0x0

If true, In-band uncorrected error reporting is supported. Not supported otherwise.

RAS-UI-support**Type**

bool

Default value

0x0

If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.

SPI-blocks**Type**

int

Default value

0x1e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

affinity-width

Type

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

chip-id

Type

int

Default value

0x0

Chip ID when multichip operation is enabled.

chip-select-affinity-level

Type

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged

Type

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

direct-lpi-support

Type

bool

Default value

0x0

Enable support for LPI operations through GICR registers.

enable-multichip-operation**Type**

bool

Default value

0x0

Enables multi-chip operation between Distributors in distributed GIC IRI.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

gicp-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICP register is allowed at reset. Not allowed otherwise. This emulates gicp_allow_ns tie-off signal.

gict-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

max-pe-on-chip**Type**

int

Default value

0x4

Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.

multichip-threaded-dgi**Type**

bool

Default value

0x1

Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-group**Type**

string

Default value

•

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [
    "0.0.1.0",
    "0.0.1.1"
  ]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file**Type**

string

Default value

•

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr**Type**

bool

Default value

0x1

GIC600 dedistributor power management is done by updating GICR_PWRR register.

reg-base**Type**

int

Default value

0x2c010000

GIC-600 base address.

reg-base-per-redistributor**Type**

string

Default value

""

Base address for each redistributor in the form:

```
0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000
```

All redistributors must be specified and this overrides the `reg-base` parameter (except that `reg-base` will still be used for the top-level redistributor). If `reg-base-per-redistributor-file` is specified, this parameter is ignored.

3.10.32 GIC600AE

GIC-600AE IRI implementation: Single chip validation/filter component variant limited to 265 PE.
This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1013: IP revisions support

Revision	Quality level
r0p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- `gicp-allow-ns-reset`

Iris and MTI instances for GIC600AE

This model has the following Iris instances:

Table 3-1014: GIC600AE Iris instances

InstanceName	ComponentName
GIC600AE	GIC_IRI
GIC600AE.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC600AE.ITS0	GICv3InterruptTranslationService
GIC600AE.rd_0	GICv3RedistributorInternal
GIC600AE.rd_0_0	GICv3RedistributorInternal
GIC600AE.rd_0_0_0	GICv3RedistributorInternal
GIC600AE.rd_0_0_0_0	GICv3Redistributor
GIC600AE.rd_t1	GICv3Distributor

This model has the following MTI trace components:

Table 3-1015: GIC600AE MTI instances

InstanceName	ComponentName
GIC600AE	GICv3IRI
GIC600AE.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC600AE.ITS0	GICv3InterruptTranslationService
GIC600AE.rd_0	GICv3RedistributorInternal
GIC600AE.rd_0_0	GICv3RedistributorInternal
GIC600AE.rd_0_0_0	GICv3RedistributorInternal
GIC600AE.rd_0_0_0_0	GICv3Redistributor
GIC600AE.rd_t1	GICv3Distributor

GIC600AE contains the following CADI targets:

- GIC600AE

About GIC600AE

GIC600AE and GIC600AE_Filter are minimal models of an Arm GIC-600AE Generic Interrupt Controller, suitable for single-chip or multichip systems, where multichip operation has been tested, with the following exceptions:

- LPI/LPI command is implemented but untested.
- Power operation is unimplemented.

They provide a simple configuration interface that allows designers to introduce GIC600AE-like functionality to their systems, while only implementing the architectural behavior, as defined by the GICv3 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC600AE and GIC600AE_Filter have a `pvbus_s` port for register accesses and a `pvbus_m` port for the LPI-related traffic from redistributors and the ITS. The `pvbus_m` port is also used to compose multichip operation.

In addition, the GIC600AE_Filter variant has a `pvbus_filtermiss_m` port, to which any transactions on the `pvbus_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC600AE variant.

It is recommended to use the GIC600AE variant in most cases.

Also, the RAS register is implemented and various RAS errors are reported through status registers. Not all the RAS errors are available because Fast Models does not model errors that can cause ECC errors. Fast Models supports error record 0 and error record 13+. FMU registers are also implemented and are accessible by software.

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the MSIRewriter component can be used to create the correct data transactions based on the device ID. For more details about `GITS_TRANSLATE64R`, see [MSIRewriter](#).

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

PVBus attribute	Bits used	Property encoded	Notes
MasterID	31:0	Master ID that invoked the register access	–

PVBus attribute	Bits used	Property encoded	Notes
ExtendedID	–	–	Not used
UserFlags	–	–	Not used

The pvbus_m port does not use MasterID, ExtendedID, Or UserFlags.

AE-specific features implemented

GIC600AE is a Functional Safety (FuSa) variant of GIC600. It has the following differences from GIC600:

- Both GIC600AE and GIC600 support RAS, but only GIC600AE supports the Fault Management Unit (FMU). This support is controlled by the `has-fmu` parameter which is true by default. The FMU resides in the Distributor and processes faults that are detected by the Safety Mechanisms from all blocks.
- In GIC600AE, the GIC reset pin is connected to FMU reset. Only reset changes the error record registers and FMU_ERRGSR to their reset values.
- In GIC600AE, the Safety Mechanism detects faults and forwards them to the FMU. The FMU forwards all errors to the Safety Island.
- The APB port has been added to GIC600AE for FuSa purposes. It does not exist on the GIC600.
- GIC600AE supports both Error Recovery Interrupt (ERI) and Fault Handling Interrupt (FHI).
- GIC600AE has the limitation that it only supports error injection through the FMU_SMINJERR register.

Ports for GIC600AE

Table 3-1017: Ports

Name	Protocol	Type	Description
apb_bus	PVBus	Slave	APB4 port to FMU, which will be connected from safety island for FuSa
chip_id	Value	Slave	chip_id port used for multichip operation
cpu_active_s[256]	Signal	Slave	CPUActive pins.
fmu_error_int	Signal	Master	FuSa FMU error interrupt signal
fmu_fault_int	Signal	Master	FuSa FMU fault interrupt signal
po_reset	Signal	Slave	Resets. This is used as a dbg_reset in TRM, and also be used for cold reset for PMU and FMU.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100.
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101.
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102.

Name	Protocol	Type	Description
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103.
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104.
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105.
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106.
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107.
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108.
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109.
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110.
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111.
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112.
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113.
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114.
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115.
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116.
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117.
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118.
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119.
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120.
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121.
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122.
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123.
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124.
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125.
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126.
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127.
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128.
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129.
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130.
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131.
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132.
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133.
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134.
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135.
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136.
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137.
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138.

Name	Protocol	Type	Description
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139.
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140.
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141.
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142.
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143.
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144.
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145.
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146.
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147.
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148.
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149.
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150.
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151.
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152.
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153.
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154.
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155.
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156.
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157.
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158.
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159.
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160.
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161.
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162.
ppi_in_163[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163.
ppi_in_164[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164.
ppi_in_165[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165.
ppi_in_166[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166.
ppi_in_167[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167.
ppi_in_168[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168.
ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169.
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170.
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171.
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172.
ppi_in_173[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173.

Name	Protocol	Type	Description
ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174.
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175.
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176.
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177.
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178.
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179.
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180.
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181.
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182.
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183.
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184.
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185.
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186.
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187.
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188.
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189.
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190.
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191.
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192.
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193.
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194.
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195.
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196.
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197.
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198.
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199.
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200.
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201.
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202.
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203.
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204.
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205.
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206.
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207.
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208.

Name	Protocol	Type	Description
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209.
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210.
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211.
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212.
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213.
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214.
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215.
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216.
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217.
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218.
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219.
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220.
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221.
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222.
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223.
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224.
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225.
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226.
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227.
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228.
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229.
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230.
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231.
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232.
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233.
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234.
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235.
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236.
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237.
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238.
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239.
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240.
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241.
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242.
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243.

Name	Protocol	Type	Description
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244.
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245.
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246.
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247.
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248.
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249.
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250.
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251.
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252.
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253.
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254.
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255.
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.

Name	Protocol	Type	Description
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74.
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75.
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76.
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77.
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78.
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79.
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80.
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81.
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82.
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83.
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84.

Name	Protocol	Type	Description
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85.
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86.
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87.
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88.
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89.
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90.
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91.
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92.
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93.
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94.
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95.
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96.
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97.
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98.
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Resets.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.

Parameters for GIC600AE

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRL. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DS-behaviour

Type

int

Default value

2

GICD_CTLR.DS field behaviour

0 :RAZ/WI

1 :RAO/WI

2 :RW

IIDR

Type

int

Default value

0x0

GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.

ITS-ID-bits

Type

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-collection-ID-bits

Type

int

Default value

0x8

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0).

ITS-count**Type**

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

PPI-count**Type**

int

Default value

16

Selects the number of PPI available for each PE

8

id22-27,29,30

12

id 20-31

16

id 16-31

RAS-CFI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.

RAS-FI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt is supported. Not supported otherwise.

RAS-UE-support**Type**

bool

Default value

0x0

If true, In-band uncorrected error reporting is supported. Not supported otherwise.

RAS-UI-support**Type**

bool

Default value

0x0

If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.

SPI-blocks**Type**

int

Default value

0x1e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

chip-id**Type**

int

Default value

0x0

Chip ID when multichip operation is enabled.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

direct-lpi-support**Type**

bool

Default value

0x0

Enable support for LPI operations through GICR registers.

enable-multichip-operation**Type**

bool

Default value

0x0

Enables multi-chip operation between Distributors in distributed GIC IRI.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

gicp-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICP register is allowed at reset. Not allowed otherwise. This emulates gicp_allow_ns tie-off signal.

gict-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

max-pe-on-chip**Type**

int

Default value

0x4

Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.

multichip-threaded-dgi**Type**

bool

Default value

0x1

Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-group**Type**

string

Default value

-

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [
    "0.0.1.0",
    "0.0.1.1"
  ]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file**Type**

string

Default value

-

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr**Type**

bool

Default value

0x1

GIC600 dedistributor power management is done by updating GICR_PWRR register.

reg-base

Type
int

Default value
0x2c010000

GIC-600 base address.

reg-base-per-redistributor

Type
string

Default value
""

Base address for each redistributor in the form:

```
0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000
```

All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.

3.10.33 GIC600AE_Filter

GIC-600AE IRI implementation: Single chip validation/filter component variant limited to 265 PE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1018: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- gicp-allow-ns-reset

Iris and MTI instances for GIC600AE_Filter

This model has the following Iris instances:

Table 3-1019: GIC600AE_Filter Iris instances

InstanceName	ComponentName
GIC600AE_Filter	GIC_IRI
GIC600AE_Filter.GICv3_ProtocolChecker	GICv3ProtocolChecker
GIC600AE_Filter.ITS0	GICv3InterruptTranslationService
GIC600AE_Filter.rd_0	GICv3RedistributorInternal
GIC600AE_Filter.rd_0_0	GICv3RedistributorInternal
GIC600AE_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC600AE_Filter.rd_0_0_0_0	GICv3Redistributor
GIC600AE_Filter.rd_tl	GICv3Distributor

This model has the following MTI trace components:

Table 3-1020: GIC600AE_Filter MTI instances

InstanceName	ComponentName
GIC600AE_Filter	GICv3IRI
GIC600AE_Filter.GICv3_ProtocolChecker	GICv3ProtocolChecker
GIC600AE_Filter.ITS0	GICv3InterruptTranslationService
GIC600AE_Filter.rd_0	GICv3RedistributorInternal
GIC600AE_Filter.rd_0_0	GICv3RedistributorInternal
GIC600AE_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC600AE_Filter.rd_0_0_0_0	GICv3Redistributor
GIC600AE_Filter.rd_tl	GICv3Distributor

GIC600AE_Filter contains the following CADI targets:

- GIC600AE

About GIC600AE_Filter

GIC600AE and GIC600AE_Filter are minimal models of an Arm GIC-600AE Generic Interrupt Controller, suitable for single-chip or multichip systems, where multichip operation has been tested, with the following exceptions:

- LPI/LPI command is implemented but untested.
- Power operation is unimplemented.

They provide a simple configuration interface that allows designers to introduce GIC600AE-like functionality to their systems, while only implementing the architectural behavior, as defined by the GICv3 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC600AE and GIC600AE_Filter have a `pvbuss_s` port for register

accesses and a `pvbus_m` port for the LPI-related traffic from redistributors and the ITS. The `pvbus_m` port is also used to compose multichip operation.

In addition, the `GIC600AE_Filter` variant has a `pvbus_filtermiss_m` port, to which any transactions on the `pvbus_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the `GIC600AE` variant.

It is recommended to use the `GIC600AE` variant in most cases.

Also, the RAS register is implemented and various RAS errors are reported through status registers. Not all the RAS errors are available because Fast Models does not model errors that can cause ECC errors. Fast Models supports error record 0 and error record 13+. FMU registers are also implemented and are accessible by software.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the `MSIRewriter` component can be used to create the correct data transactions based on the device ID. For more details about `GITS_TRANSLATE64R`, see [MSIRewriter](#).

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

PVBus attribute	Bits used	Property encoded	Notes
MasterID	31:0	Master ID that invoked the register access	–
ExtendedID	–	–	Not used
UserFlags	–	–	Not used

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

AE-specific features implemented

`GIC600AE_Filter` is a Functional Safety (FuSa) variant of `GIC600_Filter`. It has the following differences from `GIC600_Filter`:

- Both `GIC600AE_Filter` and `GIC600_Filter` support RAS, but only `GIC600AE_Filter` supports the Fault Management Unit (FMU). This support is controlled by the `has-fmu` parameter which is true by default. The FMU resides in the Distributor and processes faults that are detected by the Safety Mechanisms from all blocks.
- In `GIC600AE_Filter`, the GIC reset pin is connected to FMU reset. Only reset changes the error record registers and `FMU_ERRGSR` to their reset values.

- In GIC600AE_Filter, the Safety Mechanism detects faults and forwards them to the FMU. The FMU forwards all errors to the Safety Island.
- The APB port has been added to GIC600AE_Filter for FuSa purposes. It does not exist on the GIC600_Filter.
- GIC600AE_Filter supports both Error Recovery Interrupt (ERI) and Fault Handling Interrupt (FHI).
- GIC600AE_Filter has the limitation that it only supports error injection through the FMU_SMINJERR register.

Ports for GIC600AE_Filter

Table 3-1022: Ports

Name	Protocol	Type	Description
apb_bus	PVBus	Slave	APB4 port to FMU, which will be connected from safety island for FuSa
chip_id	Value	Slave	chip_id port used for multichip operation
cpu_active_s[256]	Signal	Slave	CPUActive pins.
fm_u_error_int	Signal	Master	FuSa FMU error interrupt signal
fm_u_fault_int	Signal	Master	FuSa FMU fault interrupt signal
po_reset	Signal	Slave	Reset.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100.
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101.
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102.
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103.
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104.
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105.
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106.
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107.
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108.
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109.
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110.
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111.
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112.
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113.
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114.
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115.
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116.
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117.
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118.

Name	Protocol	Type	Description
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119.
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120.
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121.
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122.
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123.
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124.
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125.
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126.
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127.
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128.
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129.
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130.
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131.
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132.
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133.
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134.
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135.
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136.
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137.
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138.
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139.
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140.
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141.
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142.
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143.
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144.
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145.
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146.
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147.
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148.
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149.
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150.
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151.
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152.
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153.

Name	Protocol	Type	Description
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154.
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155.
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156.
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157.
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158.
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159.
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160.
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161.
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162.
ppi_in_163[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163.
ppi_in_164[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164.
ppi_in_165[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165.
ppi_in_166[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166.
ppi_in_167[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167.
ppi_in_168[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168.
ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169.
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170.
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171.
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172.
ppi_in_173[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173.
ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174.
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175.
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176.
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177.
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178.
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179.
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180.
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181.
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182.
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183.
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184.
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185.
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186.
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187.
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188.
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189.

Name	Protocol	Type	Description
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190.
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191.
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192.
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193.
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194.
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195.
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196.
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197.
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198.
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199.
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200.
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201.
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202.
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203.
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204.
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205.
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206.
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207.
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208.
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209.
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210.
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211.
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212.
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213.
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214.
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215.
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216.
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217.
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218.
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219.
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220.
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221.
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222.
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223.

Name	Protocol	Type	Description
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224.
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225.
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226.
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227.
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228.
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229.
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230.
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231.
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232.
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233.
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234.
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235.
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236.
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237.
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238.
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239.
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240.
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241.
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242.
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243.
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244.
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245.
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246.
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247.
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248.
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249.
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250.
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251.
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252.
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253.
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254.
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255.
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.

Name	Protocol	Type	Description
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.

Name	Protocol	Type	Description
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74.
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75.
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76.
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77.
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78.
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79.
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80.
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81.
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82.
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83.
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84.
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85.
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86.
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87.
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88.
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89.
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90.
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91.
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92.
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93.
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94.
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95.
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96.
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97.
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98.
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99.
pvbus_filtermiss_m	PVBus	Master	Memory bus out. Transactions not filtered by the component.

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Reset.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.

Parameters for GIC600AE_Filter

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DS-behaviour

Type

int

Default value

2

GICD_CTLR.DS field behaviour

0 :RAZ/WI

1 :RAO/WI

2 :RW

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-collection-ID-bits**Type**

int

Default value

0x8

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0).

ITS-count**Type**

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

PPI-count**Type**

int

Default value

16

Selects the number of PPI available for each PE

8

id22-27,29,30

12

id 20-31

16

id 16-31

RAS-CFI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.

RAS-FI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt is supported. Not supported otherwise.

RAS-UE-support**Type**

bool

Default value

0x0

If true, In-band uncorrected error reporting is supported. Not supported otherwise.

RAS-UI-support**Type**

bool

Default value

0x0

If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.

SPI-blocks**Type**

int

Default value

0x1e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

chip-id**Type**

int

Default value

0x0

Chip ID when multichip operation is enabled.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

direct-lpi-support**Type**

bool

Default value

0x0

Enable support for LPI operations through GICR registers.

enable-multichip-operation**Type**

bool

Default value

0x0

Enables multi-chip operation between Distributors in distributed GIC IRI.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

gicp-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICP register is allowed at reset. Not allowed otherwise. This emulates gicp_allow_ns tie-off signal.

gict-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

max-pe-on-chip**Type**

int

Default value

0x4

Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.

multichip-threaded-dgi**Type**

bool

Default value

0x1

Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-group**Type**

string

Default value

-

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [
    "0.0.1.0",
    "0.0.1.1"
  ]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file

Type

string

Default value

•

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr

Type

bool

Default value

0x1

GIC600 redistributor power management is done by updating GICR_PWRR register.

reg-base

Type

int

Default value

0x2c010000

GIC-600 base address.

reg-base-per-redistributor

Type

string

Default value

""

Base address for each redistributor in the form:

```
0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000
```

All redistributors must be specified and this overrides the `reg-base` parameter (except that `reg-base` will still be used for the top-level redistributor). If `reg-base-per-redistributor-file` is specified, this parameter is ignored.

3.10.34 GIC600_Filter

GIC-600 IRI implementation: Single chip validation/filter component variant limited to 265 PE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1023: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- `gicp-allow-ns-reset`

Iris and MTI instances for GIC600_Filter

This model has the following Iris instances:

Table 3-1024: GIC600_Filter Iris instances

InstanceName	ComponentName
GIC600_Filter	GIC_IRI
GIC600_Filter.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC600_Filter.ITS0	GICv3InterruptTranslationService
GIC600_Filter.rd_0	GICv3RedistributorInternal
GIC600_Filter.rd_0_0	GICv3RedistributorInternal
GIC600_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC600_Filter.rd_0_0_0_0	GICv3Redistributor
GIC600_Filter.rd_tl	GICv3Distributor

This model has the following MTI trace components:

Table 3-1025: GIC600_Filter MTI instances

InstanceName	ComponentName
GIC600_Filter	GICv3IRI
GIC600_Filter.GICv3_ProtocolChecker	GICv3ProtocolChecker
GIC600_Filter.ITS0	GICv3InterruptTranslationService
GIC600_Filter.rd_0	GICv3RedistributorInternal
GIC600_Filter.rd_0_0	GICv3RedistributorInternal
GIC600_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC600_Filter.rd_0_0_0_0	GICv3Redistributor
GIC600_Filter.rd_t1	GICv3Distributor

GIC600_Filter contains the following CADI targets:

- GIC600

About GIC600_Filter

GIC600 and GIC600_Filter are minimal models of an Arm GIC-600 Generic Interrupt Controller, suitable for single-chip or multichip systems, where multichip operation has been tested, with the following exceptions:

- LPI/LPI command is implemented but untested.
- Power operation is unimplemented.

They provide a simple configuration interface that allows designers to introduce GIC600-like functionality to their systems, while only implementing the architectural behavior, as defined by the GICv3 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC600 and GIC600_Filter have a `pvbus_s` port for register accesses and a `pvbus_m` port for the LPI-related traffic from redistributors and the ITS. The `pvbus_m` port is also used to compose multichip operation.

In addition, the GIC600_Filter variant has a `pvbus_filtermiss_m` port, to which any transactions on the `pvbus_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC600 variant.

It is recommended to use the GIC600 variant in most cases.

Also, the RAS register is implemented and various RAS errors are reported through status registers. Not all the RAS errors are available because Fast Models does not model errors that can cause ECC errors. Fast Models supports error record 0 and error record 13+.

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the MSIRewriter component can be used to create the correct data transactions based on the device ID. For more details about `GITS_TRANSLATE64R`, see [MSIRewriter](#).

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

PVBus attribute	Bits used	Property encoded	Notes
MasterID	31:0	Master ID that invoked the register access	–
ExtendedID	–	–	Not used
UserFlags	–	–	Not used

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Ports for GIC600_Filter

Table 3-1027: Ports

Name	Protocol	Type	Description
<code>chip_id</code>	Value	Slave	<code>chip_id</code> port which is valid from GIC600 r1p2. Writing to this port for prior GIC600 version will be ignored.
<code>cpu_active_s[256]</code>	Signal	Slave	CPUActive pins.
<code>po_reset</code>	Signal	Slave	Reset.
<code>ppi_in_0[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
<code>ppi_in_1[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
<code>ppi_in_10[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
<code>ppi_in_100[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100.
<code>ppi_in_101[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101.
<code>ppi_in_102[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102.
<code>ppi_in_103[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103.
<code>ppi_in_104[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104.
<code>ppi_in_105[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105.
<code>ppi_in_106[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106.
<code>ppi_in_107[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107.
<code>ppi_in_108[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108.
<code>ppi_in_109[16]</code>	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109.

Name	Protocol	Type	Description
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110.
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111.
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112.
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113.
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114.
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115.
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116.
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117.
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118.
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119.
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120.
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121.
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122.
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123.
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124.
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125.
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126.
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127.
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128.
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129.
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130.
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131.
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132.
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133.
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134.
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135.
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136.
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137.
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138.
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139.
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140.
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141.
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142.
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143.
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144.

Name	Protocol	Type	Description
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145.
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146.
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147.
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148.
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149.
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150.
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151.
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152.
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153.
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154.
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155.
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156.
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157.
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158.
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159.
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160.
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161.
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162.
ppi_in_163[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163.
ppi_in_164[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164.
ppi_in_165[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165.
ppi_in_166[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166.
ppi_in_167[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167.
ppi_in_168[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168.
ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169.
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170.
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171.
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172.
ppi_in_173[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173.
ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174.
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175.
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176.
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177.
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178.
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179.
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.

Name	Protocol	Type	Description
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180.
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181.
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182.
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183.
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184.
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185.
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186.
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187.
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188.
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189.
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190.
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191.
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192.
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193.
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194.
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195.
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196.
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197.
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198.
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199.
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200.
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201.
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202.
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203.
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204.
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205.
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206.
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207.
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208.
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209.
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210.
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211.
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212.
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213.
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214.

Name	Protocol	Type	Description
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215.
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216.
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217.
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218.
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219.
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220.
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221.
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222.
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223.
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224.
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225.
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226.
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227.
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228.
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229.
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230.
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231.
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232.
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233.
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234.
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235.
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236.
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237.
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238.
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239.
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240.
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241.
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242.
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243.
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244.
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245.
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246.
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247.
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248.
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249.
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.

Name	Protocol	Type	Description
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250.
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251.
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252.
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253.
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254.
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255.
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.

Name	Protocol	Type	Description
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74.
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75.
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76.
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77.
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78.
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79.
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80.
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81.
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82.
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83.
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84.
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85.
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86.
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87.
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88.
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89.
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90.

Name	Protocol	Type	Description
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91.
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92.
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93.
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94.
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95.
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96.
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97.
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98.
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99.
pvbus_filtermiss_m	PVBus	Master	Memory bus out. Transactions not filtered by the component.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Reset.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.

Parameters for GIC600_Filter

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DS-behaviour

Type

int

Default value

2

GICD_CTLR.DS field behaviour

0 :RAZ/WI

1 :RAO/WI

2 :RW

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-collection-ID-bits**Type**

int

Default value

0x8

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0).

ITS-count**Type**

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

PPI-count**Type**

int

Default value

16

Selects the number of PPI available for each PE

8 :id22-27,29,30

12

id 20-31

16

id 16-31

RAS-CFI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.

RAS-FI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt is supported. Not supported otherwise.

RAS-UE-support**Type**

bool

Default value

0x0

If true, In-band uncorrected error reporing is supported. Not supported otherwise.

RAS-UI-support**Type**

bool

Default value

0x0

If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.

SPI-blocks**Type**

int

Default value

0x1e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

chip-id**Type**

int

Default value

0x0

Chip ID when multichip operation is enabled.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged

Type

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

direct-lpi-support

Type

bool

Default value

0x0

Enable support for LPI operations through GICR registers.

enable-multichip-operation

Type

bool

Default value

0x0

Enables multi-chip operation between Distributors in distributed GIC IRI.

enabled

Type

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

gicp-allow-ns-reset

Type

bool

Default value

0x1

If true, non-secure read/write access to GICP register is allowed at reset. Not allowed otherwise. This emulates gicp_allow_ns tie-off signal.

gict-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

max-pe-on-chip**Type**

int

Default value

0x4

Maximum number of cores on any single chip. This will be used to identify the target chip and core when multichip operation is enabled.

multichip-threaded-dgi**Type**

bool

Default value

0x1

Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-group**Type**

string

Default value

•

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [
    "0.0.1.0",
    "0.0.1.1"
  ]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file**Type**

string

Default value

•

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr**Type**

bool

Default value

0x1

GIC600 redistributor power management is done by updating GICR_PWRR register.

reg-base**Type**

int

Default value

0x2c010000

GIC-600 base address.

reg-base-per-redistributor

Type
string
Default value
""

Base address for each redistributor in the form:

```
0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000
```

All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.

3.10.35 GIC625

GIC-625 IRI implementation: Single chip validation/filter component variant limited to 8 PE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1028: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- gicp-allow-ns-reset
- has-two-security-states

Parameters removed:

- DS-behaviour

Iris and MTI instances for GIC625

This model has the following Iris instances:

Table 3-1029: GIC625 Iris instances

InstanceName	ComponentName
GIC625	GIC_IRI
GIC625.GICV3_ProtocolChecker	GICv3ProtocolChecker

GIC625.rd_0_0_0_0	GICv3Redistributor
GIC625.rd_t1	GICv3Distributor

GIC625 contains the following CADI targets:

- GIC625

About GIC625

GIC625 and GIC625_Filter are Generic Interrupt Controllers that handle interrupts from peripherals to cores and interrupts between cores in a single cluster of up to 8 cores. They support the GICv3 and GICv3.1 architectures.

GIC625 supports the following features:

- Grouping cores in GCI.
- LPI is disabled.
- Power Management updates such as:
 - GCI grouping.
 - GCI RDPowerDown support
 - Updating the GCI ID for the cluster.
 - GCI GICR_PWRR register updates.
- Inversion of SPI and PPI inputs.
- Extended PPI.

Note

- Extended SPI is not supported.
- All implementation-specific registers and functionality are implemented.

Ports for GIC625

Table 3-1031: Ports

Name	Protocol	Type	Description
chip_id	Value	Slave	chip_id port used for multichip operation
cpu_active_s[8]	Signal	Slave	CPUActive pins.
po_reset	Signal	Slave	Resets. This is used as a dbg_reset in TRM, and also be used for cold reset for PMU and FMU.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[8]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Resets.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[8]	Signal	Master	Power management outputs.

Parameters for GIC625

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.

PPI-count**Type**

int

Default value

16

Selects the number of PPI available for each PE

8

id22-27,29,30

12

id 20-31

16

id 16-31

RAS-CFI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.

RAS-FI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt is supported. Not supported otherwise.

RAS-UE-support**Type**

bool

Default value

0x0

If true, In-band uncorrected error reporting is supported. Not supported otherwise.

RAS-UI-support**Type**

bool

Default value

0x0

If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.

SPI-blocks**Type**

int

Default value

0x1e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

gicp-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICP register is allowed at reset. Not allowed otherwise. This emulates gicp_allow_ns tie-off signal.

gict-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-group**Type**

string

Default value

-

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [
    "0.0.1.0",
    "0.0.1.1"
  ]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file**Type**

string

Default value

-

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr

Type
bool
Default value
0x1

GIC600 dedistributor power management is done by updating GICR_PWRR register.

reg-base

Type
int
Default value
0x2c010000

GIC-600 base address.

reg-base-per-redistributor

Type
string
Default value
""

Base address for each redistributor in the form:

```
0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000
```

All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.

3.10.36 GIC625_Filter

GIC-625 IRI implementation: Single chip validation/filter component variant limited to 8 PE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1032: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- `gicp-allow-ns-reset`
- `has-two-security-states`

Parameters removed:

- `DS-behaviour`

Iris and MTI instances for GIC625_Filter

This model has the following Iris instances:

Table 3-1033: GIC625_Filter Iris instances

InstanceName	ComponentName
GIC625_Filter	GIC_IRI
GIC625_Filter.GICV3_ProtocolChecker	GICv3ProtocolChecker

GIC625_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC625_Filter.rd_0_0_0_0	GICv3Redistributor
GIC625_Filter.rd_t1	GICv3Distributor

This model has the following MTI trace components:

Table 3-1034: GIC625_Filter MTI instances

InstanceName	ComponentName
GIC625_Filter	GICv3IRI
GIC625_Filter.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC625_Filter.rd_0	GICv3RedistributorInternal
GIC625_Filter.rd_0_0	GICv3RedistributorInternal
GIC625_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC625_Filter.rd_0_0_0_0	GICv3Redistributor
GIC625_Filter.rd_t1	GICv3Distributor

GIC625_Filter contains the following CADI targets:

- GIC625

About GIC625_Filter

GIC625 and GIC625_Filter are Generic Interrupt Controllers that handle interrupts from peripherals to cores and interrupts between cores in a single cluster of up to 8 cores. They support the GICv3 and GICv3.1 architectures.

GIC625_Filter supports the following features:

- Grouping cores in GCI.
- LPI is disabled.
- Power Management updates such as:
 - GCI grouping.
 - GCI RDPowerDown support
 - Updating the GCI ID for the cluster.
 - GCI GICR_PWRR register updates.
- Inversion of SPI and PPI inputs.
- Extended PPI.

- Extended SPI is not supported.
- All implementation-specific registers and functionality are implemented.

Ports for GIC625_Filter

Table 3-1035: Ports

Name	Protocol	Type	Description
chip_id	Value	Slave	chip_id port used for multichip operation
cpu_active_s[8]	Signal	Slave	CPUActive pins.
po_reset	Signal	Slave	Reset.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
pvbus_filtermiss_m	PVBus	Master	Memory bus out. Transactions not filtered by the component.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[8]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Reset.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[8]	Signal	Master	Power management outputs.

Parameters for GIC625_Filter

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

IIDR

Type

int

Default value

0x0

GICD_IIDR and GICR_IIDR value. When the parameter is not given or is set to zero, the GIC600 model is configured to have the latest revision.

PPI-count

Type

int

Default value

16

Selects the number of PPI available for each PE

8

id22-27,29,30

12

id 20-31

16

id 16-31

RAS-CFI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt for corrected errors is supported. Not supported otherwise.

RAS-FI-support**Type**

bool

Default value

0x0

If true, fault handling interrupt is supported. Not supported otherwise.

RAS-UE-support**Type**

bool

Default value

0x0

If true, In-band uncorrected error reporting is supported. Not supported otherwise.

RAS-UI-support**Type**

bool

Default value

0x0

If true, error recovery interrupt for uncorrected errors is supported. Not supported otherwise.

SPI-blocks**Type**

int

Default value

0x1e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

gicp-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICP register is allowed at reset. Not allowed otherwise. This emulates gicp_allow_ns tie-off signal.

gict-allow-ns-reset**Type**

bool

Default value

0x1

If true, non-secure read/write access to GICT register is allowed at reset. Not allowed otherwise. This emulates gict_allow_ns tie-off signal.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-group**Type**

string

Default value

•

Redistributor grouping information with affinity as JSON :

```
{  
  "0":
```

```
[ "0.0.0.0",
  "0.0.0.1"],
"1": [ "0.0.1.0",
        "0.0.1.1"]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file

Type

string

Default value

•

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr

Type

bool

Default value

0x1

GIC600 dedistributor power management is done by updating GICR_PWRR register.

reg-base

Type

int

Default value

0x2c010000

GIC-600 base address.

reg-base-per-redistributor

Type

string

Default value

""

Base address for each redistributor in the form:

```
0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000
```

All redistributors must be specified and this overrides the `reg-base` parameter (except that `reg-base` will still be used for the top-level redistributor). If `reg-base-per-redistributor-file` is specified, this parameter is ignored.

3.10.37 GIC700

GIC-700 IRI implementation: Single/multi chip validation/filter component variant limited to 64 PE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1036: IP revisions support

Revision	Quality level
r0p0	Full support
r1p0	Full support
r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters removed:

- `direct-lpi-support`
- `extended-spi-count`

Iris and MTI instances for GIC700

This model has the following Iris instances:

Table 3-1037: GIC700 Iris instances

InstanceName	ComponentName
GIC700	GIC_IRI
GIC700.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC700.ITS0	GICv4InterruptTranslationService
GIC700.ITS0.bus_subordinate	PVBusSlave
GIC700.rd_0	GICv4RedistributorInternal
GIC700.rd_0_0	GICv4RedistributorInternal
GIC700.rd_0_0_0	GICv4RedistributorInternal
GIC700.rd_0_0_0_0	GICv3Redistributor
GIC700.rd_t1	GICv3Distributor

This model has the following MTI trace components:

Table 3-1038: GIC700 MTI instances

InstanceName	ComponentName
GIC700	GICv3IRI
GIC700.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC700.ITS0	GICv4InterruptTranslationService
GIC700.ITS0.bus_subordinate	PVBusSlave
GIC700.rd_0	GICv4RedistributorInternal
GIC700.rd_0_0	GICv4RedistributorInternal
GIC700.rd_0_0_0	GICv4RedistributorInternal
GIC700.rd_0_0_0_0	GICv3Redistributor
GIC700.rd_tl	GICv3Distributor

GIC700 contains the following CADI targets:

- GIC700

About GIC700

GIC700 and GIC700_Filter are minimal models of an Arm® GIC-700 Generic Interrupt Controller, suitable for single-chip or multichip systems. They support the following multichip operations:

- Multichip configuration through distributor registers
- SPI
- SGI
- Physical LPI
- Physical LPI command
- Virtual LPI
- Virtual LPI command

The models provide a simple configuration interface that allows designers to introduce GIC700-like functionality to systems, while only implementing the architectural behavior, as defined by the GICv3/GICv4 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC700 and GIC700_Filter have a `pvbuss` port for register accesses and a `pvbuss_m` port for the LPI-related traffic from redistributors and the ITS.

In addition, the GIC700_Filter variant has a `pvbuss_filtermiss_m` port, to which any transactions on the `pvbuss` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC700 variant.

GIC700 and GIC700_Filter support an extended interrupt range, with 64 more PPIs and 1024 more SPIs. To program additional interrupts, refer to the GICv3/GICv4 specification.

GIC700 and GIC700_Filter support direct injection of virtual interrupts. This reduces the overhead of trapping to hypervisor for the generation of virtual interrupts. In the GICv3/GICv4 specification, direct injection is supported in two different versions, GICv4.0 and GICv4.1. GIC700 and GIC700_Filter support GICv4.1.

It is recommended to use GIC700 instead of GIC700_Filter in most cases.

The GIC700 model supports multiple revisions of the IP. By default, its behavior is set to the latest revision supported. Parameters can be used to enable or disable features that are specific to earlier revisions. The LCA (Local Cross-chip Addressing) feature which is added in r2p0 is disabled by default and is enabled by setting the parameter `enable-local-cross-chip-addressing` to true. The model's registers follow the specification for the latest IP revision supported.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the MSIRewriter component can be used to create the correct data transactions based on the device ID. For more details about `GITS_TRANSLATE64R`, see [MSIRewriter](#).

Limitations

- The following multichip operations are not yet supported:
 - vPE control.
 - Power control.
- There is no support for the VMOV command.
- Limited testing has been performed for multichip LPI operations, so the model might contain defects.
- One ITS is supported for each GIC for multichip operations.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

PVBus attribute	Bits used	Property encoded	Notes
MasterID	31:0	Master ID that invoked the register access	–
ExtendedID	–	–	Not used
UserFlags	–	–	Not used

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Ports for GIC700

Table 3-1040: Ports

Name	Protocol	Type	Description
axi_stream_msi_s[32]	PVBus	Slave	AXI Stream Interface ports for MSI (message-signalled interrupt) translation, in GIC-700. Typically the SMMU's TCU connects to this port for MSI.
chip_id	Value	Slave	chip_id port for multichip operation
cpu_active_s[256]	Signal	Slave	CPUActive pins.
cpu_wake_request[256]	Signal	Master	-
extended_ppi_in_0[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 0.
extended_ppi_in_1[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 1.
extended_ppi_in_10[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 10.
extended_ppi_in_100[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 100
extended_ppi_in_101[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 101
extended_ppi_in_102[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 102
extended_ppi_in_103[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 103
extended_ppi_in_104[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 104
extended_ppi_in_105[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 105
extended_ppi_in_106[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 106
extended_ppi_in_107[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 107
extended_ppi_in_108[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 108
extended_ppi_in_109[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 109
extended_ppi_in_11[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 11.
extended_ppi_in_110[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 110
extended_ppi_in_111[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 111
extended_ppi_in_112[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 112
extended_ppi_in_113[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 113
extended_ppi_in_114[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 114

Name	Protocol	Type	Description
extended_ppi_in_115[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 115
extended_ppi_in_116[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 116
extended_ppi_in_117[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 117
extended_ppi_in_118[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 118
extended_ppi_in_119[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 119
extended_ppi_in_12[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 12.
extended_ppi_in_120[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 120
extended_ppi_in_121[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 121
extended_ppi_in_122[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 122
extended_ppi_in_123[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 123
extended_ppi_in_124[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 124
extended_ppi_in_125[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 125
extended_ppi_in_126[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 126
extended_ppi_in_127[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 127
extended_ppi_in_128[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 128
extended_ppi_in_129[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 129
extended_ppi_in_13[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 13.
extended_ppi_in_130[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 130
extended_ppi_in_131[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 131
extended_ppi_in_132[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 132
extended_ppi_in_133[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 133
extended_ppi_in_134[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 134
extended_ppi_in_135[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 135

Name	Protocol	Type	Description
extended_ppi_in_136[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 136
extended_ppi_in_137[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 137
extended_ppi_in_138[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 138
extended_ppi_in_139[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 139
extended_ppi_in_14[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 14.
extended_ppi_in_140[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 140
extended_ppi_in_141[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 141
extended_ppi_in_142[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 142
extended_ppi_in_143[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 143
extended_ppi_in_144[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 144
extended_ppi_in_145[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 145
extended_ppi_in_146[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 146
extended_ppi_in_147[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 147
extended_ppi_in_148[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 148
extended_ppi_in_149[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 149
extended_ppi_in_15[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 15.
extended_ppi_in_150[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 150
extended_ppi_in_151[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 151
extended_ppi_in_152[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 152
extended_ppi_in_153[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 153
extended_ppi_in_154[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 154
extended_ppi_in_155[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 155
extended_ppi_in_156[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 156

Name	Protocol	Type	Description
extended_ppi_in_157[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 157
extended_ppi_in_158[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 158
extended_ppi_in_159[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 159
extended_ppi_in_16[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 16.
extended_ppi_in_160[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 160
extended_ppi_in_161[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 161
extended_ppi_in_162[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 162
extended_ppi_in_163[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 163
extended_ppi_in_164[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 164
extended_ppi_in_165[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 165
extended_ppi_in_166[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 166
extended_ppi_in_167[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 167
extended_ppi_in_168[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 168
extended_ppi_in_169[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 169
extended_ppi_in_17[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 17.
extended_ppi_in_170[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 170
extended_ppi_in_171[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 171
extended_ppi_in_172[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 172
extended_ppi_in_173[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 173
extended_ppi_in_174[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 174
extended_ppi_in_175[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 175
extended_ppi_in_176[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 176
extended_ppi_in_177[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 177

Name	Protocol	Type	Description
extended_ppi_in_178[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 178
extended_ppi_in_179[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 179
extended_ppi_in_18[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 18.
extended_ppi_in_180[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 180
extended_ppi_in_181[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 181
extended_ppi_in_182[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 182
extended_ppi_in_183[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 183
extended_ppi_in_184[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 184
extended_ppi_in_185[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 185
extended_ppi_in_186[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 186
extended_ppi_in_187[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 187
extended_ppi_in_188[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 188
extended_ppi_in_189[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 189
extended_ppi_in_19[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 19.
extended_ppi_in_190[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 190
extended_ppi_in_191[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 191
extended_ppi_in_192[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 192
extended_ppi_in_193[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 193
extended_ppi_in_194[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 194
extended_ppi_in_195[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 195
extended_ppi_in_196[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 196
extended_ppi_in_197[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 197
extended_ppi_in_198[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 198

Name	Protocol	Type	Description
extended_ppi_in_199[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 199
extended_ppi_in_2[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 2.
extended_ppi_in_20[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 20.
extended_ppi_in_200[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 200
extended_ppi_in_201[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 201
extended_ppi_in_202[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 202
extended_ppi_in_203[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 203
extended_ppi_in_204[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 204
extended_ppi_in_205[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 205
extended_ppi_in_206[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 206
extended_ppi_in_207[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 207
extended_ppi_in_208[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 208
extended_ppi_in_209[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 209
extended_ppi_in_21[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 21.
extended_ppi_in_210[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 210
extended_ppi_in_211[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 211
extended_ppi_in_212[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 212
extended_ppi_in_213[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 213
extended_ppi_in_214[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 214
extended_ppi_in_215[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 215
extended_ppi_in_216[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 216
extended_ppi_in_217[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 217
extended_ppi_in_218[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 218

Name	Protocol	Type	Description
extended_ppi_in_219[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 219
extended_ppi_in_22[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 22.
extended_ppi_in_220[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 220
extended_ppi_in_221[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 221
extended_ppi_in_222[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 222
extended_ppi_in_223[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 223
extended_ppi_in_224[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 224
extended_ppi_in_225[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 225
extended_ppi_in_226[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 226
extended_ppi_in_227[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 227
extended_ppi_in_228[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 228
extended_ppi_in_229[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 229
extended_ppi_in_23[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 23.
extended_ppi_in_230[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 230
extended_ppi_in_231[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 231
extended_ppi_in_232[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 232
extended_ppi_in_233[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 233
extended_ppi_in_234[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 234
extended_ppi_in_235[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 235
extended_ppi_in_236[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 236
extended_ppi_in_237[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 237
extended_ppi_in_238[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 238
extended_ppi_in_239[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 239

Name	Protocol	Type	Description
extended_ppi_in_24[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 24.
extended_ppi_in_240[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 240
extended_ppi_in_241[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 241
extended_ppi_in_242[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 242
extended_ppi_in_243[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 243
extended_ppi_in_244[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 244
extended_ppi_in_245[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 245
extended_ppi_in_246[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 246
extended_ppi_in_247[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 247
extended_ppi_in_248[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 248
extended_ppi_in_249[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 249
extended_ppi_in_25[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 25.
extended_ppi_in_250[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 250
extended_ppi_in_251[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 251
extended_ppi_in_252[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 252
extended_ppi_in_253[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 253
extended_ppi_in_254[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 254
extended_ppi_in_255[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 255
extended_ppi_in_26[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 26.
extended_ppi_in_27[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 27.
extended_ppi_in_28[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 28.
extended_ppi_in_29[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 29.
extended_ppi_in_3[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 3.

Name	Protocol	Type	Description
extended_ppi_in_30[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 30.
extended_ppi_in_31[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 31.
extended_ppi_in_32[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 32.
extended_ppi_in_33[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 33.
extended_ppi_in_34[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 34.
extended_ppi_in_35[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 35.
extended_ppi_in_36[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 36.
extended_ppi_in_37[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 37.
extended_ppi_in_38[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 38.
extended_ppi_in_39[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 39.
extended_ppi_in_4[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 4.
extended_ppi_in_40[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 40.
extended_ppi_in_41[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 41.
extended_ppi_in_42[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 42.
extended_ppi_in_43[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 43.
extended_ppi_in_44[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 44.
extended_ppi_in_45[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 45.
extended_ppi_in_46[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 46.
extended_ppi_in_47[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 47.
extended_ppi_in_48[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 48.
extended_ppi_in_49[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 49.
extended_ppi_in_5[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 5.
extended_ppi_in_50[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 50.

Name	Protocol	Type	Description
extended_ppi_in_51[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 51.
extended_ppi_in_52[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 52.
extended_ppi_in_53[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 53.
extended_ppi_in_54[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 54.
extended_ppi_in_55[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 55.
extended_ppi_in_56[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 56.
extended_ppi_in_57[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 57.
extended_ppi_in_58[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 58.
extended_ppi_in_59[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 59.
extended_ppi_in_6[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 6.
extended_ppi_in_60[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 60.
extended_ppi_in_61[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 61.
extended_ppi_in_62[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 62.
extended_ppi_in_63[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 63.
extended_ppi_in_64[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 64
extended_ppi_in_65[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 65
extended_ppi_in_66[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 66
extended_ppi_in_67[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 67
extended_ppi_in_68[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 68
extended_ppi_in_69[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 69
extended_ppi_in_7[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 7.
extended_ppi_in_70[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 70
extended_ppi_in_71[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 71

Name	Protocol	Type	Description
extended_ppi_in_72[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 72
extended_ppi_in_73[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 73
extended_ppi_in_74[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 74
extended_ppi_in_75[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 75
extended_ppi_in_76[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 76
extended_ppi_in_77[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 77
extended_ppi_in_78[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 78
extended_ppi_in_79[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 79
extended_ppi_in_8[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 8.
extended_ppi_in_80[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 80
extended_ppi_in_81[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 81
extended_ppi_in_82[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 82
extended_ppi_in_83[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 83
extended_ppi_in_84[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 84
extended_ppi_in_85[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 85
extended_ppi_in_86[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 86
extended_ppi_in_87[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 87
extended_ppi_in_88[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 88
extended_ppi_in_89[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 89
extended_ppi_in_9[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 9.
extended_ppi_in_90[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 90
extended_ppi_in_91[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 91
extended_ppi_in_92[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 92

Name	Protocol	Type	Description
extended_ppi_in_93[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 93
extended_ppi_in_94[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 94
extended_ppi_in_95[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 95
extended_ppi_in_96[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 96
extended_ppi_in_97[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 97
extended_ppi_in_98[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 98
extended_ppi_in_99[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 99
extended_spi_in[1024]	Signal	Slave	Extended Shared peripheral interrupts.
icdrt_out	PVBus	Master	AXI Stream Interface. This is used only when local cross chip addressing is enabled at the moment
icrdt_in	PVBus	Slave	-
po_reset	Signal	Slave	Resets.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117

Name	Protocol	Type	Description
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152

Name	Protocol	Type	Description
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162

ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172
ppi_in_173[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173
ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188

Name	Protocol	Type	Description
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222

Name	Protocol	Type	Description
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.

Name	Protocol	Type	Description
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.

Name	Protocol	Type	Description
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Resets.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.

Parameters for GIC700

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DS-behaviour

Type

int

Default value

2

GICD_CTLR.DS field behaviour

0 :RAZ/WI

1 :RAO/WI

2 :RW

GICD_CTLR-DS-1-means-secure-only**Type**

bool

Default value

0x0

If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.

GICD_TYPER2**Type**

int

Default value

0x0

GICD_TYPER2 value containing VID and VIL to define the width of vPEID for GICv4.1.

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-collection-ID-bits**Type**

int

Default value

0x8

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0.

ITS-count**Type**

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-enable-itt-address-verification**Type**

bool

Default value

0x0

If true, a transaction will be sent to ITT Address for verification.

ITS-hardware-collection-count**Type**

int

Default value

0x0

Number of hardware collections held exclusively in the ITS.

ITS-shared-vPE-table**Type**

int

Default value

0x0

Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.

ITS-vmovp-bit**Type**

bool

Default value

0x0

Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.

PPI-count**Type**

int

Default value

16

Selects the number of PPI available for each PE

8

id22-27,29,30

12

id 20-31

16

id 16-31

SPI-blocks**Type**

int

Default value

0x3e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

add-output-cpu-wake-request-signal-from-redistributor**Type**

bool

Default value

0x0

if true, the redistributor will have the output signal cpu_wake_request from GIC to DSU and if false, the signals are not added to the redistributor.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

allow-LPIEN-clear**Type**

bool

Default value

0x1

Allow RW behaviour on GICR_CTLR.LPIEN instead of set once.

chip-count**Type**

int

Default value

0x10

The total number of chips supported.

chip-id**Type**

int

Default value

0x0

Chip ID when multichip operation is enabled.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

common-vPE-table-affinity**Type**

string

Default value

""

Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.

consolidators**Type**

string

Default value

""

Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form:

```
'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1'
```

For example:

```
'0x3f100000:64:4096, 0x3f200000:64:4224'
```

The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.

cross-chip-AMBA-is-ACE**Type**

bool

Default value

0x0

Indicates the AMBA protocol that the cross-chip interface uses. If true, the cross-chip interface uses the ACE5-Lite protocol. Otherwise, it uses the AXI5-Stream protocol. This parameter is meaningful only if enable-multichip-operation is set.

enable-local-cross-chip-addressing

Type

bool

Default value

0x0

If true, each distributor in a multichip system will use routing table address (ADDR) values programmed by local software, and will not be overwritten by the default chip. Otherwise, all the distributors will share the same routing table address values programmed in the default chip. This parameter is valid only if enable-multichip-operation is set.

enabled

Type

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

extended-ppi-count

Type

int

Default value

0x40

Number of extended PPI supported.

has-gicv4.1

Type

bool

Default value

0x1

Enable GICv4.1 functionality; when false the component is inactive.

has-two-security-states

Type

bool

Default value

0x1

If true, has two security states.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

max-pe-on-chip**Type**

int

Default value

0x4

Maximum number of cores on any single chip. This will be used to identify the target chip and core.

multichip-threaded-dgi**Type**

bool

Default value

0x1

Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.

output_attributes**Type**

string

Default value

"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS"

User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

prog-mpidr**Type**

unsigned

Default value

0

Whether software or hardware can remove cores from a GIC configuration.

0

none

1

prog - Secure software to remove cores during the boot up of a system.

2

strap - enables hardware to remove cores as GIC exits reset

redistributor-group**Type**

string

Default value

•

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [

```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file**Type**

string

Default value

•

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr

Type

bool

Default value

0x1

GIC-700 dedistributor power management is done by updating GICR_PWRR register.

reg-base

Type

int

Default value

0x2c010000

GIC-700 base address.

3.10.38 GIC700_Filter

GIC-700 IRI implementation: Single/multi chip validation/filter component variant limited to 64 PE.
This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1041: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters removed:

- `direct-lpi-support`
- `extended-spi-count`

Iris and MTI instances for GIC700_Filter

This model has the following Iris instances:

Table 3-1042: GIC700_Filter Iris instances

InstanceName	ComponentName
GIC700_Filter	GIC_IRI
GIC700_Filter.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC700_Filter.ITS0	GICv4InterruptTranslationService
GIC700_Filter.ITS0.bus_subordinate	PVBusSlave
GIC700_Filter.rd_0	GICv4RedistributorInternal
GIC700_Filter.rd_0_0	GICv4RedistributorInternal
GIC700_Filter.rd_0_0_0	GICv4RedistributorInternal
GIC700_Filter.rd_0_0_0_0	GICv3Redistributor
GIC700_Filter.rd_t1	GICv3Distributor

This model has the following MTI trace components:

Table 3-1043: GIC700_Filter MTI instances

InstanceName	ComponentName
GIC700_Filter	GICv3IRI
GIC700_Filter.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC700_Filter.ITS0	GICv4InterruptTranslationService
GIC700_Filter.ITS0.bus_subordinate	PVBusSlave
GIC700_Filter.rd_0	GICv4RedistributorInternal
GIC700_Filter.rd_0_0	GICv4RedistributorInternal
GIC700_Filter.rd_0_0_0	GICv4RedistributorInternal
GIC700_Filter.rd_0_0_0_0	GICv3Redistributor
GIC700_Filter.rd_t1	GICv3Distributor

GIC700_Filter contains the following CADI targets:

- GIC700

About GIC700_Filter

GIC700 and GIC700_Filter are minimal models of an Arm® GIC-700 Generic Interrupt Controller, suitable for single-chip or multichip systems. They support the following multichip operations:

- Multichip configuration through distributor registers.
- SPI.
- SGI.
- Physical LPI.
- Physical LPI command.
- Virtual LPI.
- Virtual LPI command.

The models provide a simple configuration interface that allows designers to introduce GIC700-like functionality to systems, while only implementing the architectural behavior, as defined by the GICv3/GICv4 architecture.

All implementation-specific registers and functionality are implemented.

As with the other GIC components, there are two variants of the model with slightly different memory interfaces. Both GIC700 and GIC700_Filter have a `pvbus_s` port for register accesses and a `pvbus_m` port for the LPI-related traffic from redistributors and the ITS.

In addition, the GIC700_Filter variant has a `pvbus_filtermiss_m` port, to which any transactions on the `pvbus_s` port and not directed to a 4K page used by the GIC are forwarded unmodified. Such transactions are terminated in the component when using the GIC700 variant.

GIC700 and GIC700_Filter support an extended interrupt range, with 64 more PPIs and 1024 more SPIs. To program additional interrupts, refer to the GICv3/GICv4 specification.

GIC700 and GIC700_Filter support direct injection of virtual interrupts. This reduces the overhead of trapping to hypervisor for the generation of virtual interrupts. In the GICv3/GICv4 specification, direct injection is supported in two different versions, GICv4.0 and GICv4.1. GIC700 and GIC700_Filter support GICv4.1.

It is recommended to use GIC700 instead of GIC700_Filter in most cases.

The GIC700 model supports multiple revisions of the IP. By default, its behavior is set to the latest revision supported. Parameters can be used to enable or disable features that are specific to earlier revisions. The LCA (Local Cross-chip Addressing) feature which is added in r2p0 is disabled by default and is enabled by setting the parameter `enable-local-cross-chip-addressing` to true. The model's registers follow the specification for the latest IP revision supported.

:::Note - Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run. - For writes to `GITS_TRANSLATE64R`, the `MSIRewriter` component can be used to create the correct data transactions based on the device ID. For more details about `GITS_TRANSLATE64R`, see [MSIRewriter](#).

Limitations

- The following multichip operations are not yet supported:
 - vPE control.
 - Power control.
- There is no support for the VMOV command.
- Limited testing has been performed for multichip LPI operations, so the model might contain defects.
- One ITS is supported for each GIC for multichip operations.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

PVBus attribute	Bits used	Property encoded	Notes
MasterID	31:0	Master ID that invoked the register access	–
ExtendedID	–	–	Not used
UserFlags	–	–	Not used

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Ports for GIC700_Filter

Table 3-1045: Ports

Name	Protocol	Type	Description
<code>axi_stream_msi_s[32]</code>	PVBus	Slave	AXI Stream Interface ports for MSI (message-signalled interrupt) translation, in GIC-700. Typically the SMMU's TCU connects to this port for MSI.
<code>chip_id</code>	Value	Slave	<code>chip_id</code> port for multichip operation
<code>cpu_active_s[256]</code>	Signal	Slave	CPUActive pins.
<code>extended_ppi_in_0[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 0.
<code>extended_ppi_in_1[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 1.
<code>extended_ppi_in_10[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 10.
<code>extended_ppi_in_100[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 100
<code>extended_ppi_in_101[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 101
<code>extended_ppi_in_102[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 102
<code>extended_ppi_in_103[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 103
<code>extended_ppi_in_104[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 104
<code>extended_ppi_in_105[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 105
<code>extended_ppi_in_106[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 106
<code>extended_ppi_in_107[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 107
<code>extended_ppi_in_108[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 108

Name	Protocol	Type	Description
extended_ppi_in_109[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 109
extended_ppi_in_11[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 11.
extended_ppi_in_110[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 110
extended_ppi_in_111[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 111
extended_ppi_in_112[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 112
extended_ppi_in_113[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 113
extended_ppi_in_114[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 114
extended_ppi_in_115[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 115
extended_ppi_in_116[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 116
extended_ppi_in_117[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 117
extended_ppi_in_118[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 118
extended_ppi_in_119[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 119
extended_ppi_in_12[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 12.
extended_ppi_in_120[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 120
extended_ppi_in_121[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 121
extended_ppi_in_122[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 122
extended_ppi_in_123[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 123
extended_ppi_in_124[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 124
extended_ppi_in_125[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 125
extended_ppi_in_126[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 126
extended_ppi_in_127[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 127
extended_ppi_in_128[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 128
extended_ppi_in_129[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 129

Name	Protocol	Type	Description
extended_ppi_in_13[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 13.
extended_ppi_in_130[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 130
extended_ppi_in_131[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 131
extended_ppi_in_132[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 132
extended_ppi_in_133[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 133
extended_ppi_in_134[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 134
extended_ppi_in_135[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 135
extended_ppi_in_136[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 136
extended_ppi_in_137[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 137
extended_ppi_in_138[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 138
extended_ppi_in_139[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 139
extended_ppi_in_14[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 14.
extended_ppi_in_140[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 140
extended_ppi_in_141[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 141
extended_ppi_in_142[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 142
extended_ppi_in_143[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 143
extended_ppi_in_144[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 144
extended_ppi_in_145[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 145
extended_ppi_in_146[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 146
extended_ppi_in_147[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 147
extended_ppi_in_148[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 148
extended_ppi_in_149[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 149
extended_ppi_in_15[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 15.

Name	Protocol	Type	Description
extended_ppi_in_150[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 150
extended_ppi_in_151[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 151
extended_ppi_in_152[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 152
extended_ppi_in_153[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 153
extended_ppi_in_154[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 154
extended_ppi_in_155[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 155
extended_ppi_in_156[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 156
extended_ppi_in_157[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 157
extended_ppi_in_158[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 158
extended_ppi_in_159[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 159
extended_ppi_in_16[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 16.
extended_ppi_in_160[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 160
extended_ppi_in_161[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 161
extended_ppi_in_162[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 162
extended_ppi_in_163[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 163
extended_ppi_in_164[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 164
extended_ppi_in_165[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 165
extended_ppi_in_166[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 166
extended_ppi_in_167[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 167
extended_ppi_in_168[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 168
extended_ppi_in_169[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 169
extended_ppi_in_17[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 17.
extended_ppi_in_170[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 170

Name	Protocol	Type	Description
extended_ppi_in_171[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 171
extended_ppi_in_172[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 172
extended_ppi_in_173[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 173
extended_ppi_in_174[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 174
extended_ppi_in_175[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 175
extended_ppi_in_176[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 176
extended_ppi_in_177[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 177
extended_ppi_in_178[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 178
extended_ppi_in_179[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 179
extended_ppi_in_18[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 18.
extended_ppi_in_180[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 180
extended_ppi_in_181[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 181
extended_ppi_in_182[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 182
extended_ppi_in_183[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 183
extended_ppi_in_184[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 184
extended_ppi_in_185[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 185
extended_ppi_in_186[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 186
extended_ppi_in_187[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 187
extended_ppi_in_188[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 188
extended_ppi_in_189[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 189
extended_ppi_in_19[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 19.
extended_ppi_in_190[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 190
extended_ppi_in_191[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 191

Name	Protocol	Type	Description
extended_ppi_in_192[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 192
extended_ppi_in_193[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 193
extended_ppi_in_194[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 194
extended_ppi_in_195[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 195
extended_ppi_in_196[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 196
extended_ppi_in_197[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 197
extended_ppi_in_198[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 198
extended_ppi_in_199[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 199
extended_ppi_in_2[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 2.
extended_ppi_in_20[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 20.
extended_ppi_in_200[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 200
extended_ppi_in_201[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 201
extended_ppi_in_202[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 202
extended_ppi_in_203[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 203
extended_ppi_in_204[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 204
extended_ppi_in_205[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 205
extended_ppi_in_206[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 206
extended_ppi_in_207[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 207
extended_ppi_in_208[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 208
extended_ppi_in_209[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 209
extended_ppi_in_21[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 21.
extended_ppi_in_210[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 210
extended_ppi_in_211[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 211

Name	Protocol	Type	Description
extended_ppi_in_212[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 212
extended_ppi_in_213[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 213
extended_ppi_in_214[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 214
extended_ppi_in_215[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 215
extended_ppi_in_216[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 216
extended_ppi_in_217[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 217
extended_ppi_in_218[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 218
extended_ppi_in_219[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 219
extended_ppi_in_22[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 22.
extended_ppi_in_220[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 220
extended_ppi_in_221[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 221
extended_ppi_in_222[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 222
extended_ppi_in_223[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 223
extended_ppi_in_224[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 224
extended_ppi_in_225[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 225
extended_ppi_in_226[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 226
extended_ppi_in_227[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 227
extended_ppi_in_228[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 228
extended_ppi_in_229[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 229
extended_ppi_in_23[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 23.
extended_ppi_in_230[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 230
extended_ppi_in_231[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 231
extended_ppi_in_232[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 232

Name	Protocol	Type	Description
extended_ppi_in_233[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 233
extended_ppi_in_234[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 234
extended_ppi_in_235[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 235
extended_ppi_in_236[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 236
extended_ppi_in_237[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 237
extended_ppi_in_238[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 238
extended_ppi_in_239[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 239
extended_ppi_in_24[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 24.
extended_ppi_in_240[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 240
extended_ppi_in_241[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 241
extended_ppi_in_242[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 242
extended_ppi_in_243[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 243
extended_ppi_in_244[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 244
extended_ppi_in_245[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 245
extended_ppi_in_246[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 246
extended_ppi_in_247[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 247
extended_ppi_in_248[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 248
extended_ppi_in_249[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 249
extended_ppi_in_25[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 25.
extended_ppi_in_250[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 250
extended_ppi_in_251[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 251
extended_ppi_in_252[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 252
extended_ppi_in_253[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 253

Name	Protocol	Type	Description
extended_ppi_in_254[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 254
extended_ppi_in_255[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 255
extended_ppi_in_26[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 26.
extended_ppi_in_27[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 27.
extended_ppi_in_28[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 28.
extended_ppi_in_29[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 29.
extended_ppi_in_3[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 3.
extended_ppi_in_30[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 30.
extended_ppi_in_31[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 31.
extended_ppi_in_32[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 32.
extended_ppi_in_33[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 33.
extended_ppi_in_34[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 34.
extended_ppi_in_35[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 35.
extended_ppi_in_36[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 36.
extended_ppi_in_37[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 37.
extended_ppi_in_38[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 38.
extended_ppi_in_39[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 39.
extended_ppi_in_4[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 4.
extended_ppi_in_40[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 40.
extended_ppi_in_41[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 41.
extended_ppi_in_42[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 42.
extended_ppi_in_43[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 43.
extended_ppi_in_44[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 44.

Name	Protocol	Type	Description
extended_ppi_in_45[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 45.
extended_ppi_in_46[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 46.
extended_ppi_in_47[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 47.
extended_ppi_in_48[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 48.
extended_ppi_in_49[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 49.
extended_ppi_in_5[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 5.
extended_ppi_in_50[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 50.
extended_ppi_in_51[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 51.
extended_ppi_in_52[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 52.
extended_ppi_in_53[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 53.
extended_ppi_in_54[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 54.
extended_ppi_in_55[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 55.
extended_ppi_in_56[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 56.
extended_ppi_in_57[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 57.
extended_ppi_in_58[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 58.
extended_ppi_in_59[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 59.
extended_ppi_in_6[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 6.
extended_ppi_in_60[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 60.
extended_ppi_in_61[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 61.
extended_ppi_in_62[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 62.
extended_ppi_in_63[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 63.
extended_ppi_in_64[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 64.
extended_ppi_in_65[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 65.

Name	Protocol	Type	Description
extended_ppi_in_66[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 66
extended_ppi_in_67[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 67
extended_ppi_in_68[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 68
extended_ppi_in_69[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 69
extended_ppi_in_7[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 7.
extended_ppi_in_70[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 70
extended_ppi_in_71[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 71
extended_ppi_in_72[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 72
extended_ppi_in_73[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 73
extended_ppi_in_74[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 74
extended_ppi_in_75[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 75
extended_ppi_in_76[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 76
extended_ppi_in_77[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 77
extended_ppi_in_78[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 78
extended_ppi_in_79[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 79
extended_ppi_in_8[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 8.
extended_ppi_in_80[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 80
extended_ppi_in_81[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 81
extended_ppi_in_82[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 82
extended_ppi_in_83[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 83
extended_ppi_in_84[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 84
extended_ppi_in_85[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 85
extended_ppi_in_86[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 86

Name	Protocol	Type	Description
extended_ppi_in_87[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 87
extended_ppi_in_88[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 88
extended_ppi_in_89[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 89
extended_ppi_in_9[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 9.
extended_ppi_in_90[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 90
extended_ppi_in_91[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 91
extended_ppi_in_92[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 92
extended_ppi_in_93[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 93
extended_ppi_in_94[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 94
extended_ppi_in_95[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 95
extended_ppi_in_96[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 96
extended_ppi_in_97[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 97
extended_ppi_in_98[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 98
extended_ppi_in_99[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 99
extended_spi_in[1024]	Signal	Slave	Extended Shared peripheral interrupts.
icdrt_out	PVBus	Master	AXI Stream Interface. This is used only when local cross chip addressing is enabled at the moment
icrdt_in	PVBus	Slave	-
po_reset	Signal	Slave	Reset.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106

Name	Protocol	Type	Description
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141

Name	Protocol	Type	Description
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155

ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177

Name	Protocol	Type	Description
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211

Name	Protocol	Type	Description
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247

Name	Protocol	Type	Description
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.

Name	Protocol	Type	Description
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74.
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75.
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76.
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77.
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78.
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79.
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80.
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81.
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82.
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83.
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84.
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85.
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86.
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87.
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88.

Name	Protocol	Type	Description
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99
pvbuss_filtermiss_m	PVBus	Master	Memory bus out. Transactions not filtered by the component.
pvbuss_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbuss_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Reset.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.

Parameters for GIC700_Filter

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DS-behaviour**Type**

int

Default value

2

GICD_CTLR.DS field behaviour

0 :RAZ/WI

1 :RAO/WI

2 :RW

GICD_CTLR-DS-1-means-secure-only**Type**

bool

Default value

0x0

If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.

GICD_TYPER2**Type**

int

Default value

0x0

GICD_TYPER2 value containing VID and VIL to define the width of vPEID for GICv4.1.

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-collection-ID-bits**Type**

int

Default value

0x8

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0).

ITS-count**Type**

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-enable-itt-address-verification**Type**

bool

Default value

0x0

If true, a transaction will be sent to ITT Address for verification.

ITS-hardware-collection-count**Type**

int

Default value

0x0

Number of hardware collections held exclusively in the ITS.

ITS-shared-vPE-table

Type
int
Default value
0x0

Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.

ITS-vmovp-bit

Type
bool
Default value
0x0

Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.

PPI-count

Type
int
Default value
16

Selects the number of PPI available for each PE

- 8
id22-27,29,30
- 12
id 20-31
- 16
id 16-31

SPI-blocks

Type
int
Default value
0x3e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

add-output-cpu-wake-request-signal-from-redistributor**Type**

bool

Default value

0x0

if true, the redistributor will have the output signal `cpu_wake_request` from GIC to DSU and if false, the signals are not added to the redistributor.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

allow-LPIEN-clear**Type**

bool

Default value

0x1

Allow RW behaviour on `GICR_CTLR.LPIEN` instead of set once.

chip-count**Type**

int

Default value

0x10

The total number of chips supported.

chip-id**Type**

int

Default value

0x0

Chip ID when multichip operation is enabled.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

common-vPE-table-affinity**Type**

string

Default value

""

Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.

consolidators**Type**

string

Default value

""

Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form:

```
'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1'
```

For example:

```
'0x3f100000:64:4096, 0x3f200000:64:4224'
```

The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.

cross-chip-AMBA-is-ACE**Type**

bool

Default value

0x0

Indicates the AMBA protocol that the cross-chip interface uses. If true, the cross-chip interface uses the ACE5-Lite protocol. Otherwise, it uses the AXI5-Stream protocol. This parameter is meaningful only if enable-multichip-operation is set.

enable-local-cross-chip-addressing**Type**

bool

Default value

0x0

If true, each distributor in a multichip system will use routing table address (ADDR) values programmed by local software, and will not be overwritten by the default chip. Otherwise, all the distributors will share the same routing table address values programmed in the default chip. This parameter is valid only if enable-multichip-operation is set.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

extended-ppi-count**Type**

int

Default value

0x40

Number of extended PPI supported.

has-gicv4.1**Type**

bool

Default value

0x1

Enable GICv4.1 functionality; when false the component is inactive.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

max-pe-on-chip**Type**

int

Default value

0x4

Maximum number of cores on any single chip. This will be used to identify the target chip and core.

multichip-threaded-dgi**Type**

bool

Default value

0x1

Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.

output_attributes**Type**

string

Default value

"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS"

User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags.
Currently, only works for MPAM Attributes encoding into bus attributes.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

prog-mpidr**Type**

unsigned

Default value

0

Whether software or hardware can remove cores from a GIC configuration.

0

none

1

prog - Secure software to remove cores during the boot up of a system.

2

strap - enables hardware to remove cores as GIC exits reset

redistributor-group**Type**

string

Default value

•

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [
    "0.0.1.0",
    "0.0.1.1"
  ]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file

Type
string

Default value
•

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr

Type
bool

Default value
0x1

GIC-700 dedistributor power management is done by updating GICR_PWRR register.

reg-base

Type
int

Default value
0x2c010000

GIC-700 base address.

3.10.39 GIC720AE

GIC-720AE IRI implementation: Single/multi chip validation/filter component variant limited to 64 PE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1046: IP revisions support

Revision	Quality level
N/A	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters removed:

- `direct-lpi-support`
- `extended-spi-count`

Iris and MTI instances for GIC720AE

This model has the following Iris instances:

Table 3-1047: GIC720AE Iris instances

InstanceName	ComponentName
GIC720AE	GIC_IRI
GIC720AE.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC720AE.ITS0	GICv4InterruptTranslationService
GIC720AE.ITS0.bus_subordinate	PVBusSlave
GIC720AE.fmu	ExportTest.GIC720AEfmu
GIC720AE.fmu.pvbus_slave	PVBusSlave
GIC720AE.rd_0	GICv4RedistributorInternal
GIC720AE.rd_0_0	GICv4RedistributorInternal
GIC720AE.rd_0_0_0	GICv4RedistributorInternal
GIC720AE.rd_0_0_0_0	GICv3Redistributor
GIC720AE.rd_tl	GICv3Distributor

This model has the following MTI trace components:

Table 3-1048: GIC720AE MTI instances

InstanceName	ComponentName
GIC720AE	GICv3IRI
GIC720AE.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC720AE.ITS0	GICv4InterruptTranslationService
GIC720AE.ITS0.bus_subordinate	PVBusSlave
GIC720AE.fmu	ExportTest.GIC720AEfmu
GIC720AE.fmu.pvbus_slave	PVBusSlave
GIC720AE.rd_0	GICv4RedistributorInternal
GIC720AE.rd_0_0	GICv4RedistributorInternal
GIC720AE.rd_0_0_0	GICv4RedistributorInternal
GIC720AE.rd_0_0_0_0	GICv3Redistributor
GIC720AE.rd_tl	GICv3Distributor

GIC720AE contains the following CADI targets:

- GIC720AE

About GIC720AE

The model has the same functionality as GIC700, but in addition supports the following AE-specific features:

- GIC FMU
- Multiple views

It has the same limitations as [GIC700](#).

Ports for GIC720AE

Table 3-1049: Ports

Name	Protocol	Type	Description
apb_bus	PVBus	Slave	FMU signals
axi_stream_msi_s[32]	PVBus	Slave	AXI Stream Interface ports for MSI (message-signalled interrupt) translation, in GIC-720AE. Typically the SMMU's TCU connects to this port for MSI.
chip_id	Value	Slave	chip_id port for multichip operation
cpu_active_s[256]	Signal	Slave	CPUActive pins.
cpu_wake_request[256]	Signal	Master	-
extended_ppi_in_0[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 0.
extended_ppi_in_1[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 1.
extended_ppi_in_10[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 10.
extended_ppi_in_100[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 100
extended_ppi_in_101[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 101
extended_ppi_in_102[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 102
extended_ppi_in_103[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 103
extended_ppi_in_104[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 104
extended_ppi_in_105[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 105
extended_ppi_in_106[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 106
extended_ppi_in_107[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 107
extended_ppi_in_108[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 108
extended_ppi_in_109[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 109

Name	Protocol	Type	Description
extended_ppi_in_11[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 11.
extended_ppi_in_110[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 110
extended_ppi_in_111[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 111
extended_ppi_in_112[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 112
extended_ppi_in_113[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 113
extended_ppi_in_114[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 114
extended_ppi_in_115[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 115
extended_ppi_in_116[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 116
extended_ppi_in_117[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 117
extended_ppi_in_118[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 118
extended_ppi_in_119[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 119
extended_ppi_in_12[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 12.
extended_ppi_in_120[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 120
extended_ppi_in_121[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 121
extended_ppi_in_122[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 122
extended_ppi_in_123[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 123
extended_ppi_in_124[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 124
extended_ppi_in_125[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 125
extended_ppi_in_126[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 126
extended_ppi_in_127[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 127
extended_ppi_in_128[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 128
extended_ppi_in_129[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 129
extended_ppi_in_13[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 13.

Name	Protocol	Type	Description
extended_ppi_in_130[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 130
extended_ppi_in_131[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 131
extended_ppi_in_132[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 132
extended_ppi_in_133[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 133
extended_ppi_in_134[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 134
extended_ppi_in_135[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 135
extended_ppi_in_136[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 136
extended_ppi_in_137[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 137
extended_ppi_in_138[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 138
extended_ppi_in_139[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 139
extended_ppi_in_14[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 14.
extended_ppi_in_140[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 140
extended_ppi_in_141[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 141
extended_ppi_in_142[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 142
extended_ppi_in_143[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 143
extended_ppi_in_144[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 144
extended_ppi_in_145[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 145
extended_ppi_in_146[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 146
extended_ppi_in_147[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 147
extended_ppi_in_148[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 148
extended_ppi_in_149[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 149
extended_ppi_in_15[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 15.
extended_ppi_in_150[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 150

Name	Protocol	Type	Description
extended_ppi_in_151[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 151
extended_ppi_in_152[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 152
extended_ppi_in_153[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 153
extended_ppi_in_154[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 154
extended_ppi_in_155[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 155
extended_ppi_in_156[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 156
extended_ppi_in_157[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 157
extended_ppi_in_158[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 158
extended_ppi_in_159[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 159
extended_ppi_in_16[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 16.
extended_ppi_in_160[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 160
extended_ppi_in_161[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 161
extended_ppi_in_162[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 162
extended_ppi_in_163[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 163
extended_ppi_in_164[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 164
extended_ppi_in_165[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 165
extended_ppi_in_166[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 166
extended_ppi_in_167[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 167
extended_ppi_in_168[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 168
extended_ppi_in_169[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 169
extended_ppi_in_17[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 17.
extended_ppi_in_170[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 170
extended_ppi_in_171[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 171

Name	Protocol	Type	Description
extended_ppi_in_172[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 172
extended_ppi_in_173[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 173
extended_ppi_in_174[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 174
extended_ppi_in_175[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 175
extended_ppi_in_176[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 176
extended_ppi_in_177[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 177
extended_ppi_in_178[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 178
extended_ppi_in_179[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 179
extended_ppi_in_18[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 18.
extended_ppi_in_180[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 180
extended_ppi_in_181[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 181
extended_ppi_in_182[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 182
extended_ppi_in_183[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 183
extended_ppi_in_184[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 184
extended_ppi_in_185[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 185
extended_ppi_in_186[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 186
extended_ppi_in_187[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 187
extended_ppi_in_188[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 188
extended_ppi_in_189[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 189
extended_ppi_in_19[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 19.
extended_ppi_in_190[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 190
extended_ppi_in_191[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 191
extended_ppi_in_192[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 192

Name	Protocol	Type	Description
extended_ppi_in_193[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 193
extended_ppi_in_194[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 194
extended_ppi_in_195[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 195
extended_ppi_in_196[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 196
extended_ppi_in_197[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 197
extended_ppi_in_198[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 198
extended_ppi_in_199[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 199
extended_ppi_in_2[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 2.
extended_ppi_in_20[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 20.
extended_ppi_in_200[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 200
extended_ppi_in_201[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 201
extended_ppi_in_202[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 202
extended_ppi_in_203[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 203
extended_ppi_in_204[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 204
extended_ppi_in_205[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 205
extended_ppi_in_206[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 206
extended_ppi_in_207[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 207
extended_ppi_in_208[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 208
extended_ppi_in_209[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 209
extended_ppi_in_21[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 21.
extended_ppi_in_210[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 210
extended_ppi_in_211[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 211
extended_ppi_in_212[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 212

Name	Protocol	Type	Description
extended_ppi_in_213[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 213
extended_ppi_in_214[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 214
extended_ppi_in_215[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 215
extended_ppi_in_216[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 216
extended_ppi_in_217[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 217
extended_ppi_in_218[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 218
extended_ppi_in_219[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 219
extended_ppi_in_22[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 22.
extended_ppi_in_220[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 220
extended_ppi_in_221[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 221
extended_ppi_in_222[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 222
extended_ppi_in_223[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 223
extended_ppi_in_224[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 224
extended_ppi_in_225[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 225
extended_ppi_in_226[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 226
extended_ppi_in_227[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 227
extended_ppi_in_228[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 228
extended_ppi_in_229[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 229
extended_ppi_in_23[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 23.
extended_ppi_in_230[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 230
extended_ppi_in_231[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 231
extended_ppi_in_232[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 232
extended_ppi_in_233[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 233

Name	Protocol	Type	Description
extended_ppi_in_234[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 234
extended_ppi_in_235[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 235
extended_ppi_in_236[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 236
extended_ppi_in_237[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 237
extended_ppi_in_238[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 238
extended_ppi_in_239[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 239
extended_ppi_in_24[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 24.
extended_ppi_in_240[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 240
extended_ppi_in_241[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 241
extended_ppi_in_242[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 242
extended_ppi_in_243[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 243
extended_ppi_in_244[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 244
extended_ppi_in_245[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 245
extended_ppi_in_246[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 246
extended_ppi_in_247[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 247
extended_ppi_in_248[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 248
extended_ppi_in_249[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 249
extended_ppi_in_25[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 25.
extended_ppi_in_250[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 250
extended_ppi_in_251[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 251
extended_ppi_in_252[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 252
extended_ppi_in_253[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 253
extended_ppi_in_254[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 254

Name	Protocol	Type	Description
extended_ppi_in_255[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 255
extended_ppi_in_26[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 26.
extended_ppi_in_27[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 27.
extended_ppi_in_28[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 28.
extended_ppi_in_29[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 29.
extended_ppi_in_3[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 3.
extended_ppi_in_30[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 30.
extended_ppi_in_31[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 31.
extended_ppi_in_32[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 32.
extended_ppi_in_33[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 33.
extended_ppi_in_34[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 34.
extended_ppi_in_35[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 35.
extended_ppi_in_36[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 36.
extended_ppi_in_37[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 37.
extended_ppi_in_38[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 38.
extended_ppi_in_39[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 39.
extended_ppi_in_4[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 4.
extended_ppi_in_40[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 40.
extended_ppi_in_41[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 41.
extended_ppi_in_42[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 42.
extended_ppi_in_43[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 43.
extended_ppi_in_44[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 44.
extended_ppi_in_45[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 45.

Name	Protocol	Type	Description
extended_ppi_in_46[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 46.
extended_ppi_in_47[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 47.
extended_ppi_in_48[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 48.
extended_ppi_in_49[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 49.
extended_ppi_in_5[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 5.
extended_ppi_in_50[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 50.
extended_ppi_in_51[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 51.
extended_ppi_in_52[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 52.
extended_ppi_in_53[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 53.
extended_ppi_in_54[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 54.
extended_ppi_in_55[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 55.
extended_ppi_in_56[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 56.
extended_ppi_in_57[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 57.
extended_ppi_in_58[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 58.
extended_ppi_in_59[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 59.
extended_ppi_in_6[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 6.
extended_ppi_in_60[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 60.
extended_ppi_in_61[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 61.
extended_ppi_in_62[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 62.
extended_ppi_in_63[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 63.
extended_ppi_in_64[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 64
extended_ppi_in_65[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 65
extended_ppi_in_66[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 66

Name	Protocol	Type	Description
extended_ppi_in_67[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 67
extended_ppi_in_68[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 68
extended_ppi_in_69[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 69
extended_ppi_in_7[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 7.
extended_ppi_in_70[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 70
extended_ppi_in_71[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 71
extended_ppi_in_72[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 72
extended_ppi_in_73[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 73
extended_ppi_in_74[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 74
extended_ppi_in_75[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 75
extended_ppi_in_76[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 76
extended_ppi_in_77[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 77
extended_ppi_in_78[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 78
extended_ppi_in_79[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 79
extended_ppi_in_8[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 8.
extended_ppi_in_80[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 80
extended_ppi_in_81[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 81
extended_ppi_in_82[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 82
extended_ppi_in_83[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 83
extended_ppi_in_84[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 84
extended_ppi_in_85[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 85
extended_ppi_in_86[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 86
extended_ppi_in_87[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 87

Name	Protocol	Type	Description
extended_ppi_in_88[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 88
extended_ppi_in_89[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 89
extended_ppi_in_9[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 9.
extended_ppi_in_90[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 90
extended_ppi_in_91[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 91
extended_ppi_in_92[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 92
extended_ppi_in_93[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 93
extended_ppi_in_94[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 94
extended_ppi_in_95[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 95
extended_ppi_in_96[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 96
extended_ppi_in_97[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 97
extended_ppi_in_98[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 98
extended_ppi_in_99[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 99
extended_spi_in[1024]	Signal	Slave	Extended Shared peripheral interrupts.
fmu_cri	Signal	Master	Critical Interrupt
fmu_eri	Signal	Master	Error recovery Interrupt
icdrt_out	PVBus	Master	AXI Stream Interface. This is used only when local cross chip addressing is enabled at the moment
icrdt_in	PVBus	Slave	-
po_reset	Signal	Slave	Resets.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106

Name	Protocol	Type	Description
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141

Name	Protocol	Type	Description
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162
ppi_in_163[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163
ppi_in_164[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164
ppi_in_165[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165
ppi_in_166[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166
ppi_in_167[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167
ppi_in_168[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168
ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172
ppi_in_173[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173
ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177

Name	Protocol	Type	Description
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211

Name	Protocol	Type	Description
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247

Name	Protocol	Type	Description
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.

Name	Protocol	Type	Description
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74.
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75.
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76.
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77.
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78.
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79.
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80.
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81.
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82.
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83.
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84.
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85.
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86.
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87.
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88.

Name	Protocol	Type	Description
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Resets.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.

Parameters for GIC720AE

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DS-behaviour**Type**

int

Default value

2

GICD_CTLR.DS field behaviour

0 :RAZ/WI

1 :RAO/WI

2 :RW

GICD_CTLR-DS-1-means-secure-only**Type**

bool

Default value

0x0

If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.

GICD_TYPER2**Type**

int

Default value

0x0

GICD_TYPER2 value containing VID and VIL to define the width of vPEID for GICv4.1.

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-collection-ID-bits**Type**

int

Default value

0x8

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0).

ITS-count**Type**

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-enable-itt-address-verification**Type**

bool

Default value

0x0

If true, a transaction will be sent to ITT Address for verification.

ITS-hardware-collection-count**Type**

int

Default value

0x0

Number of hardware collections held exclusively in the ITS.

ITS-shared-vPE-table

Type

int

Default value

0x0

Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.

ITS-vmovp-bit

Type

bool

Default value

0x0

Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.

PPI-count

Type

int

Default value

16

Selects the number of PPI available for each PE

8

id22-27,29,30

12

id 20-31

16

id 16-31

SPI-blocks

Type

int

Default value

0x3e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

add-output-cpu-wake-request-signal-from-redistributor**Type**

bool

Default value

0x0

if true, the redistributor will have the output signal `cpu_wake_request` from GIC to DSU and if false, the signals are not added to the redistributor.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

allow-LPIEN-clear**Type**

bool

Default value

0x1

Allow RW behaviour on `GICR_CTLR.LPIEN` instead of set once.

chip-count**Type**

int

Default value

0x10

The total number of chips supported.

chip-id**Type**

int

Default value

0x0

Chip ID when multichip operation is enabled.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

common-vPE-table-affinity**Type**

string

Default value

""

Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.

consolidators**Type**

string

Default value

""

Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form:

```
'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1'
```

For example:

```
'0x3f100000:64:4096, 0x3f200000:64:4224'
```

The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.

cross-chip-AMBA-is-ACE

Type

bool

Default value

0x0

Indicates the AMBA protocol that the cross-chip interface uses. If true, the cross-chip interface uses the ACE5-Lite protocol. Otherwise, it uses the AXI5-Stream protocol. This parameter is meaningful only if enable-multichip-operation is set.

enable-local-cross-chip-addressing

Type

bool

Default value

0x0

If true, each distributor in a multichip system will use routing table address (ADDR) values programmed by local software, and will not be overwritten by the default chip. Otherwise, all the distributors will share the same routing table address values programmed in the default chip. This parameter is valid only if enable-multichip-operation is set.

enable-multiple-views-feature

Type

bool

Default value

0x0

If true, multiple view feature will provide multiple programming views which can be used by multiple hypervisors.

enabled

Type

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

extended-ppi-count**Type**

int

Default value

0x40

Number of extended PPI supported.

fmu-blktype-num**Type**

int

Default value

0x6

Number of stakeholder block types for FMU.

has-gicv4.1**Type**

bool

Default value

0x1

Enable GICv4.1 functionality; when false the component is inactive.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

max-pe-on-chip**Type**

int

Default value

0x4

Maximum number of cores on any single chip. This will be used to identify the target chip and core.

multichip-threaded-dgi**Type**

bool

Default value

0x1

Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.

output_attributes**Type**

string

Default value

"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS"

User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

prog-mpidr**Type**

unsigned

Default value

0

Whether software or hardware can remove cores from a GIC configuration.

0

none

1

prog - Secure software to remove cores during the boot up of a system.

2

strap - enables hardware to remove cores as GIC exits reset

redistributor-group**Type**

string

Default value

•

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [
    "0.0.1.0",
    "0.0.1.1"
  ]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file**Type**

string

Default value

•

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr**Type**

bool

Default value

0x1

GIC-700 dedistributor power management is done by updating GICR_PWRR register.

reg-base**Type**

int

Default value

0x2c010000

GIC-700 base address.

3.10.40 GIC720AE_Filter

GIC-720AE IRI implementation: Single/multi chip validation/filter component variant limited to 64 PE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1050: IP revisions support

Revision	Quality level
N/A	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters removed:

- direct-lpi-support
- extended-spi-count

Iris and MTI instances for GIC720AE_Filter

This model has the following Iris instances:

Table 3-1051: GIC720AE_Filter Iris instances

InstanceName	ComponentName
GIC720AE_Filter	GIC_IRI
GIC720AE_Filter.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC720AE_Filter.ITS0	GICv4InterruptTranslationService
GIC720AE_Filter.ITS0.bus_subordinate	PVBusSlave
GIC720AE_Filter.fmu	ExportTest.GIC720AE_Filterfmu
GIC720AE_Filter.fmu.pvbus_slave	PVBusSlave
GIC720AE_Filter.rd_0	GICv4RedistributorInternal
GIC720AE_Filter.rd_0_0	GICv4RedistributorInternal
GIC720AE_Filter.rd_0_0_0	GICv4RedistributorInternal
GIC720AE_Filter.rd_0_0_0_0	GICv3Redistributor
GIC720AE_Filter.rd_t1	GICv3Distributor

This model has the following MTI trace components:

Table 3-1052: GIC720AE_Filter MTI instances

InstanceName	ComponentName
GIC720AE_Filter	GICv3IRI
GIC720AE_Filter.GICV3_ProtocolChecker	GICv3ProtocolChecker
GIC720AE_Filter.ITS0	GICv4InterruptTranslationService
GIC720AE_Filter.ITS0.bus_subordinate	PVBusSlave
GIC720AE_Filter.fmu	ExportTest.GIC720AE_Filterfmu
GIC720AE_Filter.fmu.pvbus_slave	PVBusSlave
GIC720AE_Filter.rd_0	GICv4RedistributorInternal
GIC720AE_Filter.rd_0_0	GICv4RedistributorInternal
GIC720AE_Filter.rd_0_0_0	GICv4RedistributorInternal
GIC720AE_Filter.rd_0_0_0_0	GICv3Redistributor
GIC720AE_Filter.rd_tl	GICv3Distributor

GIC720AE_Filter contains the following CADI targets:

- GIC720AE

About GIC720AE_Filter

The model has the same functionality as GIC700, but in addition supports the following AE-specific features:

- GIC FMU
- Multiple views

It has the same limitations as [GIC700_Filter](#).

Ports for GIC720AE_Filter

Table 3-1053: Ports

Name	Protocol	Type	Description
apb_bus	PVBus	Slave	FMU signals
axi_stream_msi_s[32]	PVBus	Slave	AXI Stream Interface ports for MSI (message-signalled interrupt) translation, in GIC-720AE. Typically the SMMU's TCU connects to this port for MSI.
chip_id	Value	Slave	chip_id port for multichip operation
cpu_active_s[256]	Signal	Slave	CPUActive pins.
extended_ppi_in_0[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 0.
extended_ppi_in_1[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 1.
extended_ppi_in_10[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 10.
extended_ppi_in_100[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 100

Name	Protocol	Type	Description
extended_ppi_in_101[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 101
extended_ppi_in_102[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 102
extended_ppi_in_103[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 103
extended_ppi_in_104[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 104
extended_ppi_in_105[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 105
extended_ppi_in_106[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 106
extended_ppi_in_107[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 107
extended_ppi_in_108[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 108
extended_ppi_in_109[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 109
extended_ppi_in_11[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 11.
extended_ppi_in_110[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 110
extended_ppi_in_111[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 111
extended_ppi_in_112[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 112
extended_ppi_in_113[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 113
extended_ppi_in_114[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 114
extended_ppi_in_115[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 115
extended_ppi_in_116[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 116
extended_ppi_in_117[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 117
extended_ppi_in_118[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 118
extended_ppi_in_119[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 119
extended_ppi_in_12[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 12.
extended_ppi_in_120[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 120
extended_ppi_in_121[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 121

Name	Protocol	Type	Description
extended_ppi_in_122[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 122
extended_ppi_in_123[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 123
extended_ppi_in_124[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 124
extended_ppi_in_125[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 125
extended_ppi_in_126[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 126
extended_ppi_in_127[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 127
extended_ppi_in_128[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 128
extended_ppi_in_129[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 129
extended_ppi_in_13[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 13.
extended_ppi_in_130[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 130
extended_ppi_in_131[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 131
extended_ppi_in_132[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 132
extended_ppi_in_133[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 133
extended_ppi_in_134[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 134
extended_ppi_in_135[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 135
extended_ppi_in_136[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 136
extended_ppi_in_137[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 137
extended_ppi_in_138[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 138
extended_ppi_in_139[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 139
extended_ppi_in_14[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 14.
extended_ppi_in_140[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 140
extended_ppi_in_141[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 141
extended_ppi_in_142[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 142

Name	Protocol	Type	Description
extended_ppi_in_143[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 143
extended_ppi_in_144[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 144
extended_ppi_in_145[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 145
extended_ppi_in_146[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 146
extended_ppi_in_147[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 147
extended_ppi_in_148[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 148
extended_ppi_in_149[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 149
extended_ppi_in_15[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 15.
extended_ppi_in_150[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 150
extended_ppi_in_151[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 151
extended_ppi_in_152[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 152
extended_ppi_in_153[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 153
extended_ppi_in_154[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 154
extended_ppi_in_155[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 155
extended_ppi_in_156[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 156
extended_ppi_in_157[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 157
extended_ppi_in_158[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 158
extended_ppi_in_159[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 159
extended_ppi_in_16[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 16.
extended_ppi_in_160[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 160
extended_ppi_in_161[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 161
extended_ppi_in_162[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 162
extended_ppi_in_163[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 163

Name	Protocol	Type	Description
extended_ppi_in_164[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 164
extended_ppi_in_165[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 165
extended_ppi_in_166[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 166
extended_ppi_in_167[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 167
extended_ppi_in_168[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 168
extended_ppi_in_169[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 169
extended_ppi_in_17[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 17.
extended_ppi_in_170[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 170
extended_ppi_in_171[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 171
extended_ppi_in_172[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 172
extended_ppi_in_173[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 173
extended_ppi_in_174[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 174
extended_ppi_in_175[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 175
extended_ppi_in_176[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 176
extended_ppi_in_177[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 177
extended_ppi_in_178[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 178
extended_ppi_in_179[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 179
extended_ppi_in_18[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 18.
extended_ppi_in_180[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 180
extended_ppi_in_181[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 181
extended_ppi_in_182[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 182
extended_ppi_in_183[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 183
extended_ppi_in_184[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 184

Name	Protocol	Type	Description
extended_ppi_in_185[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 185
extended_ppi_in_186[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 186
extended_ppi_in_187[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 187
extended_ppi_in_188[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 188
extended_ppi_in_189[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 189
extended_ppi_in_19[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 19.
extended_ppi_in_190[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 190
extended_ppi_in_191[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 191
extended_ppi_in_192[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 192
extended_ppi_in_193[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 193
extended_ppi_in_194[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 194
extended_ppi_in_195[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 195
extended_ppi_in_196[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 196
extended_ppi_in_197[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 197
extended_ppi_in_198[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 198
extended_ppi_in_199[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 199
extended_ppi_in_2[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 2.
extended_ppi_in_20[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 20.
extended_ppi_in_200[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 200
extended_ppi_in_201[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 201
extended_ppi_in_202[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 202
extended_ppi_in_203[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 203
extended_ppi_in_204[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 204

Name	Protocol	Type	Description
extended_ppi_in_205[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 205
extended_ppi_in_206[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 206
extended_ppi_in_207[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 207
extended_ppi_in_208[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 208
extended_ppi_in_209[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 209
extended_ppi_in_21[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 21.
extended_ppi_in_210[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 210
extended_ppi_in_211[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 211
extended_ppi_in_212[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 212
extended_ppi_in_213[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 213
extended_ppi_in_214[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 214
extended_ppi_in_215[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 215
extended_ppi_in_216[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 216
extended_ppi_in_217[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 217
extended_ppi_in_218[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 218
extended_ppi_in_219[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 219
extended_ppi_in_22[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 22.
extended_ppi_in_220[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 220
extended_ppi_in_221[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 221
extended_ppi_in_222[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 222
extended_ppi_in_223[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 223
extended_ppi_in_224[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 224
extended_ppi_in_225[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 225

Name	Protocol	Type	Description
extended_ppi_in_226[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 226
extended_ppi_in_227[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 227
extended_ppi_in_228[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 228
extended_ppi_in_229[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 229
extended_ppi_in_23[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 23.
extended_ppi_in_230[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 230
extended_ppi_in_231[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 231
extended_ppi_in_232[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 232
extended_ppi_in_233[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 233
extended_ppi_in_234[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 234
extended_ppi_in_235[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 235
extended_ppi_in_236[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 236
extended_ppi_in_237[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 237
extended_ppi_in_238[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 238
extended_ppi_in_239[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 239
extended_ppi_in_24[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 24.
extended_ppi_in_240[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 240
extended_ppi_in_241[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 241
extended_ppi_in_242[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 242
extended_ppi_in_243[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 243
extended_ppi_in_244[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 244
extended_ppi_in_245[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 245
extended_ppi_in_246[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 246

Name	Protocol	Type	Description
extended_ppi_in_247[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 247
extended_ppi_in_248[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 248
extended_ppi_in_249[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 249
extended_ppi_in_25[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 25.
extended_ppi_in_250[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 250
extended_ppi_in_251[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 251
extended_ppi_in_252[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 252
extended_ppi_in_253[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 253
extended_ppi_in_254[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 254
extended_ppi_in_255[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 255
extended_ppi_in_26[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 26.
extended_ppi_in_27[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 27.
extended_ppi_in_28[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 28.
extended_ppi_in_29[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 29.
extended_ppi_in_3[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 3.
extended_ppi_in_30[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 30.
extended_ppi_in_31[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 31.
extended_ppi_in_32[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 32.
extended_ppi_in_33[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 33.
extended_ppi_in_34[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 34.
extended_ppi_in_35[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 35.
extended_ppi_in_36[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 36.
extended_ppi_in_37[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 37.

Name	Protocol	Type	Description
extended_ppi_in_38[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 38.
extended_ppi_in_39[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 39.
extended_ppi_in_4[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 4.
extended_ppi_in_40[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 40.
extended_ppi_in_41[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 41.
extended_ppi_in_42[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 42.
extended_ppi_in_43[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 43.
extended_ppi_in_44[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 44.
extended_ppi_in_45[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 45.
extended_ppi_in_46[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 46.
extended_ppi_in_47[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 47.
extended_ppi_in_48[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 48.
extended_ppi_in_49[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 49.
extended_ppi_in_5[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 5.
extended_ppi_in_50[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 50.
extended_ppi_in_51[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 51.
extended_ppi_in_52[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 52.
extended_ppi_in_53[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 53.
extended_ppi_in_54[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 54.
extended_ppi_in_55[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 55.
extended_ppi_in_56[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 56.
extended_ppi_in_57[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 57.
extended_ppi_in_58[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 58.

Name	Protocol	Type	Description
extended_ppi_in_59[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 59.
extended_ppi_in_6[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 6.
extended_ppi_in_60[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 60.
extended_ppi_in_61[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 61.
extended_ppi_in_62[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 62.
extended_ppi_in_63[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 63.
extended_ppi_in_64[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 64
extended_ppi_in_65[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 65
extended_ppi_in_66[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 66
extended_ppi_in_67[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 67
extended_ppi_in_68[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 68
extended_ppi_in_69[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 69
extended_ppi_in_7[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 7.
extended_ppi_in_70[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 70
extended_ppi_in_71[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 71
extended_ppi_in_72[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 72
extended_ppi_in_73[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 73
extended_ppi_in_74[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 74
extended_ppi_in_75[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 75
extended_ppi_in_76[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 76
extended_ppi_in_77[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 77
extended_ppi_in_78[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 78
extended_ppi_in_79[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 79

Name	Protocol	Type	Description
extended_ppi_in_8[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 8.
extended_ppi_in_80[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 80
extended_ppi_in_81[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 81
extended_ppi_in_82[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 82
extended_ppi_in_83[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 83
extended_ppi_in_84[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 84
extended_ppi_in_85[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 85
extended_ppi_in_86[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 86
extended_ppi_in_87[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 87
extended_ppi_in_88[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 88
extended_ppi_in_89[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 89
extended_ppi_in_9[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 9.
extended_ppi_in_90[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 90
extended_ppi_in_91[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 91
extended_ppi_in_92[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 92
extended_ppi_in_93[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 93
extended_ppi_in_94[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 94
extended_ppi_in_95[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 95
extended_ppi_in_96[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 96
extended_ppi_in_97[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 97
extended_ppi_in_98[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 98
extended_ppi_in_99[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 99
extended_spi_in[1024]	Signal	Slave	Extended Shared peripheral interrupts.

Name	Protocol	Type	Description
fmu_cri	Signal	Master	Critical Interrupt
fmu_eri	Signal	Master	Error recovery Interrupt
icdrdt_out	PVBus	Master	AXI Stream Interface. This is used only when local cross chip addressing is enabled at the moment
icrdtd_in	PVBus	Slave	-
po_reset	Signal	Slave	Reset.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127

Name	Protocol	Type	Description
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162

Name	Protocol	Type	Description
ppi_in_163[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163
ppi_in_164[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164
ppi_in_165[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165
ppi_in_166[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166
ppi_in_167[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167
ppi_in_168[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168
ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172

ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198

Name	Protocol	Type	Description
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232

Name	Protocol	Type	Description
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.

Name	Protocol	Type	Description
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.

Name	Protocol	Type	Description
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99
pvbus_filtermiss_m	PVBus	Master	Memory bus out. Transactions not filtered by the component.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Reset.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.

Parameters for GIC720AE_Filter

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DS-behaviour

Type

int

Default value

2

GICD_CTLR.DS field behaviour

0 :RAZ/WI

1 :RAO/WI

2 :RW

GICD_CTLR-DS-1-means-secure-only

Type

bool

Default value

0x0

If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.

GICD_TYPER2**Type**

int

Default value

0x0

GICD_TYPER2 value containing VID and VIL to define the width of vPEID for GICv4.1.

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-collection-ID-bits**Type**

int

Default value

0x8

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0).

ITS-count**Type**

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-enable-itt-address-verification**Type**

bool

Default value

0x0

If true, a transaction will be sent to ITT Address for verification.

ITS-hardware-collection-count**Type**

int

Default value

0x0

Number of hardware collections held exclusively in the ITS.

ITS-shared-vPE-table**Type**

int

Default value

0x0

Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.

ITS-vmovp-bit**Type**

bool

Default value

0x0

Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.

PPI-count**Type**

int

Default value

16

Selects the number of PPI available for each PE

8

id22-27,29,30

12

id 20-31

16

id 16-31

SPI-blocks**Type**

int

Default value

0x3e

Number of SPI blocks supported by the IRI, each block contains 32 SPIs.

add-output-cpu-wake-request-signal-from-redistributor**Type**

bool

Default value

0x0

if true, the redistributor will have the output signal `cpu_wake_request` from GIC to DSU and if false, the signals are not added to the redistributor.

affinity-width**Type**

string

Default value

"4.8.8.8"

A dotted quad indicating the bitwidth of fields at each affinity level.

allow-LPIEN-clear**Type**

bool

Default value

0x1

Allow RW behaviour on GICR_CTLR.LPIEN instead of set once.

chip-count**Type**

int

Default value

0x10

The total number of chips supported.

chip-id**Type**

int

Default value

0x0

Chip ID when multichip operation is enabled.

chip-select-affinity-level**Type**

int

Default value

0x3

Affinity level 2 or 3 can be used for chip select.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

common-vPE-table-affinity**Type**

string

Default value

""

Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.

consolidators**Type**

string

Default value

""

Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form:

```
'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1'
```

For example:

```
'0x3f100000:64:4096, 0x3f200000:64:4224'
```

The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.

cross-chip-AMBA-is-ACE**Type**

bool

Default value

0x0

Indicates the AMBA protocol that the cross-chip interface uses. If true, the cross-chip interface uses the ACE5-Lite protocol. Otherwise, it uses the AXI5-Stream protocol. This parameter is meaningful only if enable-multichip-operation is set.

enable-local-cross-chip-addressing**Type**

bool

Default value

0x0

If true, each distributor in a multichip system will use routing table address (ADDR) values programmed by local software, and will not be overwritten by the default chip. Otherwise, all the distributors will share the same routing table address values programmed in the default chip. This parameter is valid only if enable-multichip-operation is set.

enable-multiple-views-feature

Type

bool

Default value

0x0

If true, multiple view feature will provide multiple programming views which can be used by multiple hypervisors.

enabled

Type

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

extended-ppi-count

Type

int

Default value

0x40

Number of extended PPI supported.

fmu-blktype-num

Type

int

Default value

0x6

Number of stakeholder block types for FMU.

has-gicv4.1

Type

bool

Default value

0x1

Enable GICv4.1 functionality; when false the component is inactive.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

max-cores-supported-by-GCI**Type**

int

Default value

0x8

GCI can support 1-64 cores. Maximum supported cores in GCI is configurable by device.

max-pe-on-chip**Type**

int

Default value

0x4

Maximum number of cores on any single chip. This will be used to identify the target chip and core.

multichip-threaded-dgi**Type**

bool

Default value

0x1

Enable sending multichip DGI messages in a separate thread. This parameter is valid only if enable-multichip-operation is set.

output_attributes**Type**

string

Default value

"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS"

User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.

print-memory-map

Type

bool

Default value

0x0

Print memory map to stdout.

prog-mpidr

Type

unsigned

Default value

0

Whether software or hardware can remove cores from a GIC configuration.

0

none

1

prog - Secure software to remove cores during the boot up of a system.

2

strap - enables hardware to remove cores as GIC exits reset

redistributor-group

Type

string

Default value

•

Redistributor grouping information with affinity as JSON :

```
{
  "0": [
    "0.0.0.0",
    "0.0.0.1"
  ],
  "1": [
    "0.0.1.0",
    "0.0.1.1"
  ]
}
```

where RD with quad 0.0.0.0 and 0.0.0.1 belongs to RD group 0. All the RDs belong to one group when this parameter is not given.

redistributor-group-file

Type
string

Default value
•

File path to redistributor grouping information with affinity as JSON.

The file uses the same format as `redistributor-group` parameter.

redistributor-power-managed-by-pwrr

Type
bool

Default value
0x1

GIC-700 dedistributor power management is done by updating GICR_PWRR register.

reg-base

Type
int

Default value
0x2c010000

GIC-700 base address.

3.10.41 GIC_400

This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1054: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for GIC_400

This model has the following Iris instances:

Table 3-1055: GIC_400 Iris instances

InstanceName	ComponentName
GIC_400	GIC_400
GIC_400.vgic_bus_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-1056: GIC_400 MTI instances

InstanceName	ComponentName
GIC_400	GIC_400
GIC_400.vgic_bus_slave	PVBusSlave

GIC_400 contains the following CADI targets:

- GIC_400

About GIC_400

This component is a wrapper that permits easier configuration of the v7_VGIC component that supports parameterized configuration.

The GIC-400 has several memory-mapped interfaces at the same address. The processor that is communicating with the GIC-400 banks them. The GIC-400 must be able to identify which processor a transaction originates from. In the hardware, the AUSER fields on AXI supply this information to the GIC-400. In the model, there is no exact equivalent to this field. However, each transaction has a `master_id` that the model can use to identify the originating processor.

Arm clusters assign the `master_id` as follows:

Bits[31:16]

SBZ, which the GIC-400 ignores.

Bits[5:2]

CLUSTERID.

Bits[1:0]

`cpu_id` within the cluster.

CLUSTERID is the 4-bit field that either a parameter on the processor sets or a value that the `clusterid` port drives. CPUID is the core number within the cluster. CLUSTERID appears in the CP15 register space as part of the MPIDR register.

The Arm architecture suggests that each cluster in the system is given a different CLUSTERID. This distinction is essential for the VGIC to identify the cluster. The parameters in the GIC-400 component permit it to construct the map of `master_id` to interface number.

Processor interfaces that the GIC-400 supports have these parameters:

- `interfaceN.cluster_id`
- `interfaceN.core_id`

- `interfaceN.inout_port_number_to_use`

N is the interface number (0-7). The `cluster_id` and `core_id` tell the GIC-400 to map that cluster or core combination to interface N.

By using `inout_port_number_to_use`, the GIC-400 has some input and output ports that pair with a particular processor interface. For example:

- The `irqcpu[]` pin wires to the `irq` port of the corresponding processor.
- The `cntpnsirq` pin from the processor wires to a `cntpnsirq[]` pin on GIC-400 to transport a Private Peripheral Interrupt (PPI) from the processor to the GIC-400.

The `interfaceN.inout_port_number_to_use` parameter supports clusters that can have variable numbers of cores. It tells the GIC-400 that to send to or receive a signal from the processor that is attached to interface N, it must use these pins:

- `irqout[interfaceN.inout_port_number_to_use]`
- `fiqout[interfaceN.inout_port_number_to_use]`
- `virqout[interfaceN.inout_port_number_to_use]`
- `vfiqout[interfaceN.inout_port_number_to_use]`
- `legacyirq[interfaceN.inout_port_number_to_use]`
- `cntpnsirq[interfaceN.inout_port_number_to_use]`
- `cntpsirq[interfaceN.inout_port_number_to_use]`
- `legacyfiq[interfaceN.inout_port_number_to_use]`
- `cntvirq[interfaceN.inout_port_number_to_use]`
- `cnthpirq[interfaceN.inout_port_number_to_use]`
- ...

`legacyirq` and `legacyfiq` are not signals from the processor but are signals into the GIC-400 from the legacy interrupt system. They are wired to PPIs. If the control registers of the GIC-400 are set up in particular ways, they can also bypass the GIC-400. See [ARM Generic Interrupt Controller Architecture version 2.0 Architecture Specification](#) for more information.

The fabric between the clusters and the GIC might remap the `master_id` of a transaction. If so, then the GIC might lose the ability to identify the originating processor. The fabrics that Arm ships in Fast Models perform no such transformation.

The comparison that the GIC-400 performs on the `master_id` is only on the bottom 6 bits of the `master_id`. It ignores the rest. If you are writing your own fabric and do not properly propagate the `master_id` or transform it, the GIC-400 might not be able to identify the processor. The source code for the GIC_400 component can be examined to see how it might be adapted for it to understand different `master_id` schemes.

Differences between the model and the RTL

The GIC-400 model has these limitations:

- Reads and writes to GICD_ISACTIVER_n, GICD_ICACTIVER_n, GICD_ISPENDR_n, or GICD_ICPENDR_n might not work as expected unless there is a configured target in GICD_ICFGR_m.
- Some of the interaction between GICD_CTLR.EnableGrpX and level-sensitive interrupts might not work correctly.
- It does not model the nIRQOUT or nFIQOUT signals.
- It models interrupts with positive logic, rather than the negative logic that the hardware uses. So, the signal pins omit the 'n' prefix in their names.

Ports for GIC_400

Table 3-1057: Ports

Name	Protocol	Type	Description
cfgsdisable	Signal	Slave	Disable write access to some GIC registers.
cnthpirq[8]	Signal	Slave	Secure physical timer event. PPI interrupt id 26.
cntpnsirq[8]	Signal	Slave	Non-secure physical timer event. PPI interrupt id 30.
cntpsirq[8]	Signal	Slave	Secure physical timer event. PPI interrupt id 29.
cntvirq[8]	Signal	Slave	Virtual timer event. PPI interrupt id 27.
fiqcpu[8]	Signal	Master	FIQ signal to the corresponding processor.
fiqout[8]	Signal	Master	FIQOUT signal to the corresponding processor.
irqcpu[8]	Signal	Master	IRQ signal to the corresponding processor.
irqout[8]	Signal	Master	IRQOUT signal to the corresponding processor.
irqs[480]	Signal	Slave	Interrupt request input lines for the GIC.
legacyfiq[8]	Signal	Slave	Signal into the GIC-400 from the legacy interrupt system. PPI interrupt id 28.
legacyirq[8]	Signal	Slave	Signal into the GIC-400 from the legacy interrupt system. PPI interrupt id 31.
pvbus_s	PVBus	Slave	Handles incoming transactions from PVBus masters.
reset_signal	Signal	Slave	Reset signal input.
vfiqcpu[8]	Signal	Master	Virtual FIQ signal to the processor.
virqcpu[8]	Signal	Master	Virtual IRQ signal to the processor.

Parameters for GIC_400

NUM_CPUS

Type

int

Default value

0x1

Number of interfaces to support.

NUM_SPIS

Type

int

Default value

0xe0

Number of interrupt pins.

enable_log_errors**Type**

bool

Default value

0x0

.

enable_log_fatal**Type**

bool

Default value

0x0

.

enable_log_warnings**Type**

bool

Default value

0x0

.

interface0.cluster_id**Type**

int

Default value

0x0

The CLUSTERID of the interface you want to appear as interface0 in the VGIC.

interface0.core_id**Type**

int

Default value

0x0

The core id of interface0 in the cluster.

interface0.inout_port_number_to_use**Type**

int

Default value

0x0

Which ppiN port is used for this interface.

interface1.cluster_id**Type**

int

Default value

0x0

The CLUSTERID of the interface you want to appear as interface1 in the VGIC.

interface1.core_id**Type**

int

Default value

0x0

The core id of interface1 in the cluster.

interface1.inout_port_number_to_use**Type**

int

Default value

0x1

Which ppiN port is used for this interface.

interface2.cluster_id**Type**

int

Default value

0x0

The CLUSTERID of the interface you want to appear as interface2 in the VGIC.

interface2.core_id**Type**

int

Default value

0x0

The core id of interface2 in the cluster.

interface2.inout_port_number_to_use**Type**

int

Default value

0x2

Which ppiN port is used for this interface.

interface3.cluster_id**Type**

int

Default value

0x0

The CLUSTERID of the interface you want to appear as interface3 in the VGIC.

interface3.core_id**Type**

int

Default value

0x0

The core id of interface3 in the cluster.

interface3.inout_port_number_to_use**Type**

int

Default value

0x3

Which ppiN port is used for this interface.

interface4.cluster_id**Type**

int

Default value

0x0

The CLUSTERID of the interface you want to appear as interface4 in the VGIC.

interface4.core_id**Type**

int

Default value

0x0

The core id of interface4 in the cluster.

interface4.inout_port_number_to_use**Type**

int

Default value

0x4

Which ppiN port is used for this interface.

interface5.cluster_id**Type**

int

Default value

0x0

The CLUSTERID of the interface you want to appear as interface5 in the VGIC.

interface5.core_id**Type**

int

Default value

0x0

The core id of interface5 in the cluster.

interface5.inout_port_number_to_use**Type**

int

Default value

0x5

Which ppiN port is used for this interface.

interface6.cluster_id**Type**

int

Default value

0x0

The CLUSTERID of the interface you want to appear as interface6 in the VGIC.

interface6.core_id**Type**

int

Default value

0x0

The core id of interface6 in the cluster.

interface6.inout_port_number_to_use**Type**

int

Default value

0x6

Which ppiN port is used for this interface.

interface7.cluster_id**Type**

int

Default value

0x0

The CLUSTERID of the interface you want to appear as interface7 in the VGIC.

interface7.core_id

Type
int

Default value
0x0

The core id of interface7 in the cluster.

interface7.inout_port_number_to_use

Type
int

Default value
0x7

Which ppiN port is used for this interface.

3.10.42 GIC_IRI

GIC metacomponent for redistribution of interrupts. Contains a Distributor and a configurable number of ITSs and Redistributors. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1058: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for GIC_IRI

This model has the following Iris instances:

Table 3-1059: GIC_IRI Iris instances

InstanceName	ComponentName
GIC_IRI	GIC_IRI
GIC_IRI.rd_0	GICv3RedistributorInternal
GIC_IRI.rd_0_0	GICv3RedistributorInternal
GIC_IRI.rd_0_0_0	GICv3RedistributorInternal
GIC_IRI.rd_0_0_0_0	GICv3Redistributor
GIC_IRI.rd_t1	GICv3Distributor

This model has the following MTI trace components:

Table 3-1060: GIC_IRI MTI instances

InstanceName	ComponentName
GIC_IRI	GICv3IRI
GIC_IRI.rd_0	GICv3RedistributorInternal
GIC_IRI.rd_0_0	GICv3RedistributorInternal
GIC_IRI.rd_0_0_0	GICv3RedistributorInternal
GIC_IRI.rd_0_0_0_0	GICv3Redistributor
GIC_IRI.rd_t1	GICv3Distributor

GIC_IRI contains the following CADI targets:

- GIC_IRI

About GIC_IRI

The GIC_IRI has one slave PVBUS interface and one master PVBUS interface. It behaves in a similar manner to a GICv3-compatible device, with the slave interface, `pvbuss_s`, granting access to the register banks used by the configuration and operation of MSIs and the master interface, `pvbuss_m`, issuing transactions that are required by the ITS and the redistributors in LPI-related operations. All transactions that are routed to the slave port terminate in the component. Accesses to unmapped space are **RAZ/WI**.

An instance of GICv3 requires a small set of parameters to be configured to be useful. For example:

```
gic_iri : GIC_IRI(
    "reg-base" = 0xF0020000, //Base address for GICD_* REGISTERS, 64K aligned
    "CPU-affinities" = "0.0.0.0, 0.0.1.0, 0.0.1.1",
        //A comma-separated list of affinity addresses corresponding to
        //cpu affinities in the system
    "reg-base-per-redistributor"="0.0.0.0=0xF0040000,0.0.1.0=0xF0060000,
    0.0.0.0=0xF0080000",
        //Base addresses for each redistributor in a comma-separated list of
        //affinity=address
);
```

To use LPIs, an ITS must be configured. A minimal configuration might consist of, for example:

```
"ITS-count" = 1, //The number of ITSs in the IRI. Defaults to zero.
"ITS0-base" = 0xF0100000,
"GITS_BASER0-type" = 1, //Type 1 is Devices. A device table is always needed.
"GITS_BASER2-type" = 4, //Type 4 is Collections.
                        //A collection table is needed if GITS_TYPER.HCC is 0.
```

To use GICv4 functionality, one or more ITSs must be configured, as shown in the previous example. In addition, the following parameters are required:

```
"virtual-lpi-support"=true,
"GITS_BASER4-type"=2 //Type 2 is Virtual PEs.
                    //Such a table is needed for GICv4 functionality.
```

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run.
- Set the `GICD_ITARGETSR-RAZWI` parameter to true for legacy, GICv2-style routing, where interrupts are routed to the first processor in the system.

Ports for GIC_IRI

Table 3-1061: Ports

Name	Protocol	Type	Description
<code>cfgsdisable</code>	Signal	Slave	Disable some SPIs signal.
<code>extended_ppi_in_0[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 0.
<code>extended_ppi_in_1[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 1.
<code>extended_ppi_in_10[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 10.
<code>extended_ppi_in_100[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 100.
<code>extended_ppi_in_101[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 101.
<code>extended_ppi_in_102[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 102.
<code>extended_ppi_in_103[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 103.
<code>extended_ppi_in_104[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 104.
<code>extended_ppi_in_105[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 105.
<code>extended_ppi_in_106[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 106.
<code>extended_ppi_in_107[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 107.
<code>extended_ppi_in_108[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 108.
<code>extended_ppi_in_109[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 109.
<code>extended_ppi_in_11[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 11.
<code>extended_ppi_in_110[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 110.
<code>extended_ppi_in_111[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 111.
<code>extended_ppi_in_112[64]</code>	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 112.

Name	Protocol	Type	Description
extended_ppi_in_113[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 113.
extended_ppi_in_114[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 114.
extended_ppi_in_115[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 115.
extended_ppi_in_116[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 116.
extended_ppi_in_117[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 117.
extended_ppi_in_118[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 118.
extended_ppi_in_119[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 119.
extended_ppi_in_12[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 12.
extended_ppi_in_120[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 120.
extended_ppi_in_121[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 121.
extended_ppi_in_122[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 122.
extended_ppi_in_123[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 123.
extended_ppi_in_124[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 124.
extended_ppi_in_125[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 125.
extended_ppi_in_126[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 126.
extended_ppi_in_127[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 127.
extended_ppi_in_128[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 128.
extended_ppi_in_129[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 129.
extended_ppi_in_13[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 13.
extended_ppi_in_130[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 130.
extended_ppi_in_131[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 131.
extended_ppi_in_132[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 132.
extended_ppi_in_133[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 133.

Name	Protocol	Type	Description
extended_ppi_in_134[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 134.
extended_ppi_in_135[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 135.
extended_ppi_in_136[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 136.
extended_ppi_in_137[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 137.
extended_ppi_in_138[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 138.
extended_ppi_in_139[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 139.
extended_ppi_in_14[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 14.
extended_ppi_in_140[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 140.
extended_ppi_in_141[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 141.
extended_ppi_in_142[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 142.
extended_ppi_in_143[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 143.
extended_ppi_in_144[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 144.
extended_ppi_in_145[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 145.
extended_ppi_in_146[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 146.
extended_ppi_in_147[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 147.
extended_ppi_in_148[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 148.
extended_ppi_in_149[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 149.
extended_ppi_in_15[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 15.
extended_ppi_in_150[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 150.
extended_ppi_in_151[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 151.
extended_ppi_in_152[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 152.
extended_ppi_in_153[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 153.
extended_ppi_in_154[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 154.

Name	Protocol	Type	Description
extended_ppi_in_155[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 155.
extended_ppi_in_156[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 156.
extended_ppi_in_157[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 157.
extended_ppi_in_158[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 158.
extended_ppi_in_159[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 159.
extended_ppi_in_16[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 16.
extended_ppi_in_160[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 160.
extended_ppi_in_161[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 161.
extended_ppi_in_162[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 162.
extended_ppi_in_163[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 163.
extended_ppi_in_164[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 164.
extended_ppi_in_165[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 165.
extended_ppi_in_166[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 166.
extended_ppi_in_167[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 167.
extended_ppi_in_168[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 168.
extended_ppi_in_169[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 169.
extended_ppi_in_17[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 17.
extended_ppi_in_170[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 170.
extended_ppi_in_171[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 171.
extended_ppi_in_172[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 172.
extended_ppi_in_173[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 173.
extended_ppi_in_174[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 174.
extended_ppi_in_175[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 175.

Name	Protocol	Type	Description
extended_ppi_in_176[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 176.
extended_ppi_in_177[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 177.
extended_ppi_in_178[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 178.
extended_ppi_in_179[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 179.
extended_ppi_in_18[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 18.
extended_ppi_in_180[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 180.
extended_ppi_in_181[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 181.
extended_ppi_in_182[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 182.
extended_ppi_in_183[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 183.
extended_ppi_in_184[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 184.
extended_ppi_in_185[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 185.
extended_ppi_in_186[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 186.
extended_ppi_in_187[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 187.
extended_ppi_in_188[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 188.
extended_ppi_in_189[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 189.
extended_ppi_in_19[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 19.
extended_ppi_in_190[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 190.
extended_ppi_in_191[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 191.
extended_ppi_in_192[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 192.
extended_ppi_in_193[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 193.
extended_ppi_in_194[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 194.
extended_ppi_in_195[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 195.
extended_ppi_in_196[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 196.

Name	Protocol	Type	Description
extended_ppi_in_197[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 197.
extended_ppi_in_198[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 198.
extended_ppi_in_199[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 199.
extended_ppi_in_2[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 2.
extended_ppi_in_20[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 20.
extended_ppi_in_200[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 200.
extended_ppi_in_201[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 201.
extended_ppi_in_202[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 202.
extended_ppi_in_203[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 203.
extended_ppi_in_204[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 204.
extended_ppi_in_205[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 205.
extended_ppi_in_206[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 206.
extended_ppi_in_207[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 207.
extended_ppi_in_208[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 208.
extended_ppi_in_209[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 209.
extended_ppi_in_21[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 21.
extended_ppi_in_210[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 210.
extended_ppi_in_211[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 211.
extended_ppi_in_212[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 212.
extended_ppi_in_213[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 213.
extended_ppi_in_214[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 214.
extended_ppi_in_215[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 215.
extended_ppi_in_216[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 216.

Name	Protocol	Type	Description
extended_ppi_in_217[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 217.
extended_ppi_in_218[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 218.
extended_ppi_in_219[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 219.
extended_ppi_in_22[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 22.
extended_ppi_in_220[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 220.
extended_ppi_in_221[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 221.
extended_ppi_in_222[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 222.
extended_ppi_in_223[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 223.
extended_ppi_in_224[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 224.
extended_ppi_in_225[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 225.
extended_ppi_in_226[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 226.
extended_ppi_in_227[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 227.
extended_ppi_in_228[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 228.
extended_ppi_in_229[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 229.
extended_ppi_in_23[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 23.
extended_ppi_in_230[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 230.
extended_ppi_in_231[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 231.
extended_ppi_in_232[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 232.
extended_ppi_in_233[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 233.
extended_ppi_in_234[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 234.
extended_ppi_in_235[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 235.
extended_ppi_in_236[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 236.
extended_ppi_in_237[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 237.

Name	Protocol	Type	Description
extended_ppi_in_238[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 238.
extended_ppi_in_239[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 239.
extended_ppi_in_24[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 24.
extended_ppi_in_240[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 240.
extended_ppi_in_241[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 241.
extended_ppi_in_242[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 242.
extended_ppi_in_243[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 243.
extended_ppi_in_244[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 244.
extended_ppi_in_245[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 245.
extended_ppi_in_246[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 246.
extended_ppi_in_247[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 247.
extended_ppi_in_248[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 248.
extended_ppi_in_249[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 249.
extended_ppi_in_25[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 25.
extended_ppi_in_250[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 250.
extended_ppi_in_251[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 251.
extended_ppi_in_252[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 252.
extended_ppi_in_253[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 253.
extended_ppi_in_254[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 254.
extended_ppi_in_255[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 255.
extended_ppi_in_26[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 26.
extended_ppi_in_27[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 27.
extended_ppi_in_28[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 28.

Name	Protocol	Type	Description
extended_ppi_in_29[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 29.
extended_ppi_in_3[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 3.
extended_ppi_in_30[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 30.
extended_ppi_in_31[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 31.
extended_ppi_in_32[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 32.
extended_ppi_in_33[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 33.
extended_ppi_in_34[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 34.
extended_ppi_in_35[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 35.
extended_ppi_in_36[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 36.
extended_ppi_in_37[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 37.
extended_ppi_in_38[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 38.
extended_ppi_in_39[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 39.
extended_ppi_in_4[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 4.
extended_ppi_in_40[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 40.
extended_ppi_in_41[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 41.
extended_ppi_in_42[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 42.
extended_ppi_in_43[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 43.
extended_ppi_in_44[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 44.
extended_ppi_in_45[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 45.
extended_ppi_in_46[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 46.
extended_ppi_in_47[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 47.
extended_ppi_in_48[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 48.
extended_ppi_in_49[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 49.

Name	Protocol	Type	Description
extended_ppi_in_5[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 5.
extended_ppi_in_50[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 50.
extended_ppi_in_51[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 51.
extended_ppi_in_52[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 52.
extended_ppi_in_53[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 53.
extended_ppi_in_54[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 54.
extended_ppi_in_55[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 55.
extended_ppi_in_56[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 56.
extended_ppi_in_57[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 57.
extended_ppi_in_58[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 58.
extended_ppi_in_59[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 59.
extended_ppi_in_6[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 6.
extended_ppi_in_60[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 60.
extended_ppi_in_61[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 61.
extended_ppi_in_62[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 62.
extended_ppi_in_63[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 63.
extended_ppi_in_64[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 64.
extended_ppi_in_65[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 65.
extended_ppi_in_66[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 66.
extended_ppi_in_67[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 67.
extended_ppi_in_68[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 68.
extended_ppi_in_69[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 69.
extended_ppi_in_7[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 7.

Name	Protocol	Type	Description
extended_ppi_in_70[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 70.
extended_ppi_in_71[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 71.
extended_ppi_in_72[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 72.
extended_ppi_in_73[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 73.
extended_ppi_in_74[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 74.
extended_ppi_in_75[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 75.
extended_ppi_in_76[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 76.
extended_ppi_in_77[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 77.
extended_ppi_in_78[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 78.
extended_ppi_in_79[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 79.
extended_ppi_in_8[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 8.
extended_ppi_in_80[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 80.
extended_ppi_in_81[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 81.
extended_ppi_in_82[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 82.
extended_ppi_in_83[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 83.
extended_ppi_in_84[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 84.
extended_ppi_in_85[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 85.
extended_ppi_in_86[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 86.
extended_ppi_in_87[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 87.
extended_ppi_in_88[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 88.
extended_ppi_in_89[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 89.
extended_ppi_in_9[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 9.
extended_ppi_in_90[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 90.

Name	Protocol	Type	Description
extended_ppi_in_91[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 91.
extended_ppi_in_92[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 92.
extended_ppi_in_93[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 93.
extended_ppi_in_94[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 94.
extended_ppi_in_95[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 95.
extended_ppi_in_96[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 96.
extended_ppi_in_97[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 97.
extended_ppi_in_98[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 98.
extended_ppi_in_99[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 99.
extended_spi_in[1024]	Signal	Slave	Extended Shared peripheral interrupts.
msi_error_interrupt	Signal	Master	When report of MSI error allowed through interrupt, loop-back this signal to relevant IRQ input signal
po_reset	Signal	Slave	Resets.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100.
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101.
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102.
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103.
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104.
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105.
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106.
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107.
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108.
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109.
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110.
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111.
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112.
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113.
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114.
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115.

Name	Protocol	Type	Description
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116.
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117.
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118.
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119.
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120.
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121.
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122.
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123.
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124.
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125.
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126.
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127.
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128.
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129.
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130.
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131.
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132.
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133.
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134.
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135.
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136.
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137.
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138.
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139.
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140.
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141.
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142.
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143.
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144.
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145.
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146.
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147.
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148.
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149.
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150.

Name	Protocol	Type	Description
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151.
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152.
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153.
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154.
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155.
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156.
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157.
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158.
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159.
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160.
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161.
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162.
ppi_in_163[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163.
ppi_in_164[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164.
ppi_in_165[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165.
ppi_in_166[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166.
ppi_in_167[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167.
ppi_in_168[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168.
ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169.
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170.
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171.
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172.
ppi_in_173[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173.
ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174.
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175.
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176.
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177.
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178.
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179.
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180.
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181.
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182.
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183.
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184.
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185.
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186.

Name	Protocol	Type	Description
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187.
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188.
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189.
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190.
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191.
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192.
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193.
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194.
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195.
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196.
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197.
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198.
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199.
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200.
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201.
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202.
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203.
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204.
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205.
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206.
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207.
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208.
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209.
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210.
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211.
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212.
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213.
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214.
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215.
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216.
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217.
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218.
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219.
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220.

Name	Protocol	Type	Description
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221.
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222.
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223.
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224.
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225.
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226.
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227.
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228.
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229.
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230.
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231.
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232.
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233.
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234.
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235.
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236.
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237.
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238.
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239.
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240.
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241.
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242.
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243.
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244.
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245.
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246.
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247.
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248.
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249.
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250.
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251.
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252.
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253.
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254.
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255.
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.

Name	Protocol	Type	Description
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.

Name	Protocol	Type	Description
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74.
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75.
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76.
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77.
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78.
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79.
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80.
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81.
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82.
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83.
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84.
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85.
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86.
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87.
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88.
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89.
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90.
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91.
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92.
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93.
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94.
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95.
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96.
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97.

Name	Protocol	Type	Description
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98.
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99.
pvbus_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbus_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Resets.
spi_in[988]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.
wire_to_msi_in_0[1024]	Signal	Slave	Wire-to-MSI interrupts for architectural consolidator 0.
wire_to_msi_in_1[1024]	Signal	Slave	Wire-to-MSI interrupts for architectural consolidator 1.
wire_to_msi_in_2[1024]	Signal	Slave	Wire-to-MSI interrupts for architectural consolidator 2.
wire_to_msi_in_3[1024]	Signal	Slave	Wire-to-MSI interrupts for architectural consolidator 3.

Parameters for GIC_IRI

A3-affinity-supported

Type

bool

Default value

0x0

Device supports affinity level 3 values that are non-zero.

ARE-fixed-to-one

Type

bool

Default value

0x0

GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one.

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file**Type**

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DPG-ARE-only**Type**

bool

Default value

0x0

Limit application of DPG bits to interrupt groups for which ARE=1.

DPG-bits-implemented**Type**

bool

Default value

0x0

Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR.

DS-fixed-to-zero**Type**

bool

Default value

0x0

Enable/disable support of single security state.

GICD-alias**Type**

int

Default value

0x0

In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode: the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled).

GICD-legacy-registers-as-reserved

Type

bool

Default value

0x0

When ARE is RAO/WI, makes superfluous registers in GICD reserved (including for the purpose of STATUSR updates).

GICD_CTLR-DS-1-means-secure-only

Type

bool

Default value

0x0

If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.

GICD_ITARGETSR-RAZWI

Type

bool

Default value

0x0

If true, the GICD_ITARGETS registers are RAZ/WI.

GICD_PIDR

Type

int

Default value

0x0

The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

GICD_TYPER2

Type

int

Default value

0x0

GICD_TYPER2 value containing VID and VIL to define the width of vPEID for GICv4.1.

GICR-clear-enable-supported**Type**

bool

Default value

0x0

When true, this sets the value of the RO bit GICR_CTLR.CES with the value of the parameter allow-LPIEN-clear, making it visible to software.

GICR-invalidate-registers-implemented**Type**

bool

Default value

0x0

When true, the registers GICR_INVLPIR, GICR_INVALLR and GICR_SYNCRR are implemented.

GICR_PIDR**Type**

int

Default value

0x0

The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

GICR_PROPBASER-read-only**Type**

bool

Default value

0x0

GICR_PROPBASER register is read-only.

GICR_PROPBASER-reset-value**Type**

int

Default value

0x0

Value of GICR_PROPBASER on reset.

GITS_BASER0-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER0 register.

GITS_BASER0-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER0 register is RAZ/WI.

GITS_BASER0-type**Type**

int

Default value

0x0

Type field for GITS_BASER0 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER1-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER1 register.

GITS_BASER1-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER1 register is RAZ/WI.

GITS_BASER1-type**Type**

int

Default value

0x0

Type field for GITS_BASER1 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER2-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER2 register.

GITS_BASER2-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER2 register is RAZ/WI.

GITS_BASER2-type**Type**

int

Default value

0x0

Type field for GITS_BASER2 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER3-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER3 register.

GITS_BASER3-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER3 register is RAZ/WI.

GITS_BASER3-type**Type**

int

Default value

0x0

Type field for GITS_BASER3 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER4-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER4 register.

GITS_BASER4-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER4 register is RAZ/WI.

GITS_BASER4-type**Type**

int

Default value

0x0

Type field for GITS_BASER4 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER5-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER5 register.

GITS_BASER5-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER5 register is RAZ/WI.

GITS_BASER5-type**Type**

int

Default value

0x0

Type field for GITS_BASER5 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER6-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER6 register.

GITS_BASER6-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER6 register is RAZ/WI.

GITS_BASER6-type**Type**

int

Default value

0x0

Type field for GITS_BASER6 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER7-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER7 register.

GITS_BASER7-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER7 register is RAZ/WI.

GITS_BASER7-type**Type**

int

Default value

0x0

Type field for GITS_BASER7 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_PIDR**Type**

int

Default value

0x0

The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

ICFGR-PPI-mask**Type**

int

Default value

0xaaaaaaaa

Mask for writes to ICFGR registers that configure PPIs.

ICFGR-PPI-reset**Type**

int

Default value

0x0

Reset value for ICFGR registers that configure PPIs.

ICFGR-SGI-mask**Type**

int

Default value

0x0

Mask for writes to ICFGR registers that configure SGIs.

ICFGR-SGI-reset**Type**

int

Default value

0xaaaaaaaa

Reset value for ICFGR registers that configure SGIs.

ICFGR-SPI-mask**Type**

int

Default value

0xaaaaaaaa

Mask for writes to ICFGR registers that configure SPIs.

ICFGR-SPI-reset**Type**

int

Default value

0x0

Reset value for ICFGR registers that configure SPIs.

ICFGR-rsvd-bit**Type**

bool

Default value

0x0

If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGR_n for n>0.

IGROUP-PPI-mask**Type**

int

Default value

0xffff

Mask for writes to PPI bits in IGROUP registers.

IGROUP-PPI-reset**Type**

int

Default value

0x0

Reset value for SGI bits in IGROUP registers.

IGROUP-SGI-mask**Type**

int

Default value

0xffff

Mask for writes to SGI bits in IGROUP registers.

IGROUP-SGI-reset**Type**

int

Default value

0x0

Reset value for SGI bits in IGROUP registers.

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value.

IRI-ID-bits**Type**

int

Default value

0x10

Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported.

IROUTER-IRM-RAZ-WI**Type**

bool

Default value

0x0

GICD_IROUTERn.InterruptRoutingMode is RAZ/WI.

ITS-BASER-force-page-alignment**Type**

bool

Default value

0x1

Force alignment of address written to a GITS_BASER register to the page size configured.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-MOVALL-update-collections**Type**

bool

Default value

0x0

Whether MOVALL command updates the collection entires.

ITS-TRANSLATE64R**Type**

bool

Default value

0x0

Add an implementation specific register at 0x10008 supporting 64 bit TRANSLATER (dev[63:32], interrupt[31:0]).

ITS-cache-invalidate-on-disable**Type**

bool

Default value

0x0

Sets the RO bit GITS_TYPER.INV. When true, after the following sequence: 1) GITS_CTLR.Enabled written 1-->0, 2) GITS_CTLR.Quirescent observed as 1, 3) GITS_BASER<n>.Valid written 1-->0, there is no cached information from the ITS memory structure pointed to by GITS_BASER<n>.

ITS-collection-ID-bits**Type**

int

Default value

0x0

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0.

ITS-count**Type**

int

Default value

0x0

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-cumulative-collection-tables**Type**

bool

Default value

0x1

When true, the supported amount of collections is the sum of GITS_TYPER.HCC and the number of collections supported in memory, otherwise, simply the number supported in memory only. Irrelevant when HCC=0.

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-enable-itt-address-verification**Type**

bool

Default value

0x0

If true, a transaction will be sent to ITT Address for verification.

ITS-entry-size**Type**

int

Default value

0x8

Number of bytes required to store each entry in the ITT tables.

ITS-hardware-collection-count**Type**

int

Default value

0x0

Number of hardware collections held exclusively in the ITS.

ITS-legacy-iidr-typer-offset**Type**

bool

Default value

0x0

Put the GITS_IIDR and GITS_TYPER registers at their older offset of 0x8 and 0x4 respectively.

ITS-shared-vPE-table**Type**

int

Default value

0x0

Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.

ITS-threaded-command-queue**Type**

bool

Default value

0x1

Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation.

ITS-use-physical-target-addresses**Type**

bool

Default value

0x1

Use physical hardware addresses for targets in ITS commands -- must be true for distributed implementations.

ITS-vmovp-bit**Type**

bool

Default value

0x0

Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.

ITS0-base**Type**

int

Default value

0x0

Register base address for ITS0 (automatic if 0).

ITS1-base**Type**

int

Default value

0x0

Register base address for ITS1 (automatic if 0).

ITS2-base**Type**

int

Default value

0x0

Register base address for ITS2 (automatic if 0).

ITS3-base**Type**

int

Default value

0x0

Register base address for ITS3 (automatic if 0).

LPI-cache-check-data**Type**

bool

Default value

0x0

Enable Cached LPI data against memory checking when available for cache type.

LPI-cache-type**Type**

int

Default value

0x1

Cache type for LPIs, 0:No caching, 1:Full caching.

MSI_IIDR**Type**

int

Default value

0x0

Value returned in MSI_IIDR registers.

MSI_NS-frame0-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 0 registers.

MSI_NS-frame0-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.

MSI_NS-frame0-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.

MSI_NS-frame1-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 1 registers.

MSI_NS-frame1-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.

MSI_NS-frame1-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.

MSI_NS-frame2-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 2 registers.

MSI_NS-frame2-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.

MSI_NS-frame2-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.

MSI_NS-frame3-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 3 registers.

MSI_NS-frame3-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.

MSI_NS-frame3-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.

MSI_NS-frame4-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 4 registers.

MSI_NS-frame4-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.

MSI_NS-frame4-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.

MSI_NS-frame5-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 5 registers.

MSI_NS-frame5-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.

MSI_NS-frame5-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.

MSI_NS-frame6-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 6 registers.

MSI_NS-frame6-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.

MSI_NS-frame6-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.

MSI_NS-frame7-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 7 registers.

MSI_NS-frame7-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.

MSI_NS-frame7-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.

MSI_PIDR**Type**

int

Default value

0x0

The value for the MSI_PIDR registers, if non-zero and distributor supports GICv2m. Note: fixed fields (device type etc.) will be overridden in this value.

MSI_S-frame0-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 0 registers.

MSI_S-frame0-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.

MSI_S-frame0-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.

MSI_S-frame1-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 1 registers.

MSI_S-frame1-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.

MSI_S-frame1-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.

MSI_S-frame2-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 2 registers.

MSI_S-frame2-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.

MSI_S-frame2-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.

MSI_S-frame3-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 3 registers.

MSI_S-frame3-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.

MSI_S-frame3-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.

MSI_S-frame4-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 4 registers.

MSI_S-frame4-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.

MSI_S-frame4-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.

MSI_S-frame5-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 5 registers.

MSI_S-frame5-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.

MSI_S-frame5-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.

MSI_S-frame6-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 6 registers.

MSI_S-frame6-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.

MSI_S-frame6-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.

MSI_S-frame7-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 7 registers.

MSI_S-frame7-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.

MSI_S-frame7-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.

PA_SIZE**Type**

int

Default value

0x30

Number of valid bits in physical address.

PPI-implemented-mask**Type**

int

Default value

0xffff

Mask of PPIs that are implemented. One bit per PPI bit 0 == PPI 16 (first PPI). This will affect other masks.

SPI-count**Type**

int

Default value

0xe0

Number of SPIs that are implemented.

SPI-message-based-support**Type**

bool

Default value

0x1

Distributor supports message based signaling of SPI.

SPI-unimplemented**Type**

string

Default value

""

A comma separated list of unimplemented SPIs ranges for sparse SPI definition(for ex: '35, 39-42, 73').

STATUSR-implemented**Type**

bool

Default value

0x1

Determines whether the GICR_STATUSR register is implemented.

add-output-cpu-wake-request-signal-from-redistributor**Type**

bool

Default value

0x0

if true, the redistributor will have the output signal cpu_wake_request from GIC to DSU and if false, the signals are not added to the redistributor.

allow-LPIEN-clear**Type**

bool

Default value

0x0

Allow RW behaviour on GICR_CTLR.LPIEN instead of set once.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

common-lpi-configuration**Type**

int

Default value

0x0

Describes which re-distributors share (and must be configured with the same) LPI configuration table as described in GICR_TYPER(0:All, 1:A.x.x.x, 2:A.B.x.x, 3:A.B.C.x).

common-vPE-table-affinity**Type**

string

Default value

""

Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.

consolidators**Type**

string

Default value

""

Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form 'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1, [etc]' (eg '0x3f100000:64:4096, 0x3f200000:64:4224'). The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.

delay-ITS-accesses**Type**

bool

Default value

0x1

Delay accesses from the ITS until GICR_SYNCNR is read.

delay-redistributor-accesses**Type**

bool

Default value

0x1

Delay memory accesses from the redistributor until GICR_SYNCNR is read.

direct-lpi-support**Type**

bool

Default value

0x0

Enable support for LPI operations through GICR registers.

enable_protocol_checking**Type**

bool

Default value

0x0

Enable/disable protocol checking at cpu interface.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

extended-ppi-count**Type**

int

Default value

0x0

Number of extended PPI supported.

extended-spi-count

Type

int

Default value

0x0

Number of extended SPI supported.

fixed-routed-spis

Type

string

Default value

""

Value of IROUTER[n] register in the form 'n=a.b.c.d, n=*'. The RM bit of IROUTER is 0 when n=a.b.c.d is used else 1 when n=* is used. n can be >= 32 and <= 1019.

gicr-icfgr-extended-count

Type

int

Default value

0x4

Number of extended GICR_ICFGR registers supported.

gicv2-only

Type

bool

Default value

0x0

If true, when using the GICv3 model, pretend to be a GICv2 system.

group-enables-control-doorbell

Type

bool

Default value

0x0

When true, GICR_VPENDBASER.{VGrp0En,VGrp1En} are cached to allow GIC to check group enables when virtual interrupt targeting this VCPU which is non-resident reaches Redistributor.

has-gicv4.1**Type**

bool

Default value

0x0

Enable GICv4.1 functionality; when false the component is inactive.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

has_VPENDBASER-dirty-flag-on-load**Type**

bool

Default value

0x0

GICR_VPENDBASER.Dirty reflects transient loading state when valid=1.

has_mpam**Type**

bool

Default value

0x0

Enable MPAM support on ITS and RDs.

has_nmi**Type**

bool

Default value

0x0

Enable support for Non-maskable Interrupts (NMIs). (FEAT_GICv3_NMI).

ignore-generate-sgi-when-no-are**Type**

bool

Default value

0x0

Ignore GenerateSGI packets coming from the CPU interface if both ARE_S and ARE_NS are 0.

individual-doorbell-not-supported**Type**

bool

Default value

0x0

For IRI with support of virtual interrupt, individual doorbell is not supported when true.

irouter-default-mask**Type**

string

Default value

""

Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'.

irouter-default-reset**Type**

string

Default value

""

Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or '*'.

irouter-mask-values**Type**

string

Default value

""

Mask Value of IROUTER[n] register in the form 'n=a.b.c.d'. n can be ≥ 32 and ≤ 1019 .

irouter-reset-values**Type**

string

Default value

""

Reset Value of IROUTER[n] register in the form 'n=a.b.c.d or n=*.n can be ≥ 32 and ≤ 1019 .

legacy-sgi-enable-rao**Type**

bool

Default value

0x0

Enables for SGI associated with an ARE=0 regime are RAO/WI.

local-SEIs**Type**

bool

Default value

0x0

Generate SEI to signal internal issues.

local-VSEIs**Type**

bool

Default value

0x0

Generate VSEI to signal internal issues.

lockable-SPI-count**Type**

int

Default value

0x0

Number of SPIs that are locked down when CFGSDISABLE signal is asserted. Only applies for GICv2.

monolithic**Type**

bool

Default value

0x0

Indicate that the implementation is not distributed.

mpam_max_partid**Type**

int

Default value

0xffff

Maximum valid PARTID.

mpam_max_pmg**Type**

int

Default value

0xff

Maximum valid PMG.

non-ARE-core-count**Type**

int

Default value

0x8

Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.

outer-cacheability-support**Type**

bool

Default value

0x0

Allow configuration of outer cachability attributes in ITS and Redistributor.

output_attributes**Type**

string

Default value

```
"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,  
ExtendedID[38]=MPAM_NS"
```

User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

priority-bits**Type**

int

Default value

0x5

Number of implemented priority bits.

processor-numbers**Type**

string

Default value

""

Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.) If not specified, will number processors starting at 0.

redistributor-threaded-sync**Type**

bool

Default value

0x1

Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation.

reg-base**Type**

int

Default value

0x2c010000

Base for decoding GICv3 registers.

reg-base-per-redistributor**Type**

string

Default value

""

Base address for each redistributor in the form:

```
0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000
```

All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.

reg-base-per-redistributor-file**Type**

string

Default value

""

Path to file containing the base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If this parameter is specified, reg-base-per-redistributor parameter will be ignored even when it is given.

report-MSI-error-via-statusr**Type**

int

Default value

0x0

Report MSI error via GITS_STATUSR. (0:unsupported, 1:report by GITS_STATUSR, 2:report by GITS_STATUSR and interrupt as well).

rme_default_mecid_nonsecure**Type**

int

Default value

0x0

Default MECID value for NON-SECURE PAS.

sgi-range-selector-support**Type**

bool

Default value

0x0

Device has support for the Range Selector feature for SGI.

single-set-support**Type**

bool

Default value

0x0

When true, forces redistributors to recall interrupts with a clear rather than issue a second Set command.

supports-shareability**Type**

bool

Default value

0x1

Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).

trace-speculative-lpi-property-update**Type**

bool

Default value

0x0

Trace LPI property updates performed on speculative accesses (useful for debugging LPI).

vPE-table-entry-size-in-doubleword**Type**

int

Default value

0x5

The size of one entry of a vPE configuration table in double word. The value decremented by one is shown at GICR_VPROPBASER.Entry_Size. Current model mandates the minimum entry size to be 4 doublewords. When lower value is given, it is truncated to 4.

virtual-lpi-support**Type**

bool

Default value

0x0

GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported.

virtual-priority-bits**Type**

int

Default value

0x5

Number of implemented virtual priority bits.

wakeup-on-reset**Type**

bool

Default value

0x0

Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.10.43 GIC_IRI_Filter

GIC metacomponent for redistribution of interrupts. Contains a Distributor and a configurable number of ITSs and Redistributors. Validation only version. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1062: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for GIC_IRI_Filter

This model has the following Iris instances:

Table 3-1063: GIC_IRI_Filter Iris instances

InstanceName	ComponentName
GIC_IRI_Filter	GIC_IRI
GIC_IRI_Filter.rd_0	GICv3RedistributorInternal
GIC_IRI_Filter.rd_0_0	GICv3RedistributorInternal
GIC_IRI_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC_IRI_Filter.rd_0_0_0_0	GICv3Redistributor
GIC_IRI_Filter.rd_tl	GICv3Distributor

This model has the following MTI trace components:

Table 3-1064: GIC_IRI_Filter MTI instances

InstanceName	ComponentName
GIC_IRI_Filter	GICv3IRI
GIC_IRI_Filter.rd_0	GICv3RedistributorInternal
GIC_IRI_Filter.rd_0_0	GICv3RedistributorInternal
GIC_IRI_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC_IRI_Filter.rd_0_0_0_0	GICv3Redistributor
GIC_IRI_Filter.rd_tl	GICv3Distributor

GIC_IRI_Filter contains the following CADI targets:

- GIC_IRI

About GIC_IRI_Filter

The GIC_IRI_Filter has similar behavior to the GIC_IRI, except for the slave interface. Any transaction accessing a 4 KB page that is not used by the GIC, as configurable through the parameters, is forwarded to the `pvcus_filtermiss_m` port, which is only present in this variant.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run.
- Set the `GICD_ITARGETSR-RAZWI` parameter to true for legacy, GICv2-style routing, where interrupts are routed to the first processor in the system.

Ports for GIC_IRI_Filter

Table 3-1065: Ports

Name	Protocol	Type	Description
cfgsdisable	Signal	Slave	Disable some SPIs signal.
extended_ppi_in_0[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 0.
extended_ppi_in_1[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 1.
extended_ppi_in_10[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 10.
extended_ppi_in_100[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 100.
extended_ppi_in_101[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 101.
extended_ppi_in_102[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 102.
extended_ppi_in_103[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 103.
extended_ppi_in_104[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 104.
extended_ppi_in_105[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 105.
extended_ppi_in_106[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 106.
extended_ppi_in_107[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 107.
extended_ppi_in_108[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 108.
extended_ppi_in_109[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 109.
extended_ppi_in_11[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 11.
extended_ppi_in_110[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 110.
extended_ppi_in_111[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 111.
extended_ppi_in_112[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 112.
extended_ppi_in_113[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 113.
extended_ppi_in_114[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 114.
extended_ppi_in_115[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 115.
extended_ppi_in_116[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 116.

Name	Protocol	Type	Description
extended_ppi_in_117[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 117.
extended_ppi_in_118[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 118.
extended_ppi_in_119[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 119.
extended_ppi_in_12[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 12.
extended_ppi_in_120[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 120.
extended_ppi_in_121[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 121.
extended_ppi_in_122[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 122.
extended_ppi_in_123[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 123.
extended_ppi_in_124[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 124.
extended_ppi_in_125[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 125.
extended_ppi_in_126[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 126.
extended_ppi_in_127[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 127.
extended_ppi_in_128[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 128.
extended_ppi_in_129[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 129.
extended_ppi_in_13[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 13.
extended_ppi_in_130[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 130.
extended_ppi_in_131[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 131.
extended_ppi_in_132[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 132.
extended_ppi_in_133[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 133.
extended_ppi_in_134[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 134.
extended_ppi_in_135[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 135.
extended_ppi_in_136[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 136.
extended_ppi_in_137[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 137.

Name	Protocol	Type	Description
extended_ppi_in_138[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 138.
extended_ppi_in_139[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 139.
extended_ppi_in_14[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 14.
extended_ppi_in_140[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 140.
extended_ppi_in_141[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 141.
extended_ppi_in_142[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 142.
extended_ppi_in_143[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 143.
extended_ppi_in_144[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 144.
extended_ppi_in_145[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 145.
extended_ppi_in_146[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 146.
extended_ppi_in_147[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 147.
extended_ppi_in_148[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 148.
extended_ppi_in_149[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 149.
extended_ppi_in_15[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 15.
extended_ppi_in_150[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 150.
extended_ppi_in_151[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 151.
extended_ppi_in_152[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 152.
extended_ppi_in_153[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 153.
extended_ppi_in_154[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 154.
extended_ppi_in_155[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 155.
extended_ppi_in_156[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 156.
extended_ppi_in_157[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 157.
extended_ppi_in_158[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 158.

Name	Protocol	Type	Description
extended_ppi_in_159[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 159.
extended_ppi_in_16[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 16.
extended_ppi_in_160[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 160.
extended_ppi_in_161[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 161.
extended_ppi_in_162[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 162.
extended_ppi_in_163[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 163.
extended_ppi_in_164[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 164.
extended_ppi_in_165[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 165.
extended_ppi_in_166[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 166.
extended_ppi_in_167[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 167.
extended_ppi_in_168[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 168.
extended_ppi_in_169[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 169.
extended_ppi_in_17[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 17.
extended_ppi_in_170[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 170.
extended_ppi_in_171[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 171.
extended_ppi_in_172[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 172.
extended_ppi_in_173[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 173.
extended_ppi_in_174[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 174.
extended_ppi_in_175[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 175.
extended_ppi_in_176[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 176.
extended_ppi_in_177[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 177.
extended_ppi_in_178[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 178.
extended_ppi_in_179[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 179.

Name	Protocol	Type	Description
extended_ppi_in_18[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 18.
extended_ppi_in_180[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 180.
extended_ppi_in_181[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 181.
extended_ppi_in_182[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 182.
extended_ppi_in_183[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 183.
extended_ppi_in_184[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 184.
extended_ppi_in_185[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 185.
extended_ppi_in_186[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 186.
extended_ppi_in_187[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 187.
extended_ppi_in_188[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 188.
extended_ppi_in_189[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 189.
extended_ppi_in_19[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 19.
extended_ppi_in_190[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 190.
extended_ppi_in_191[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 191.
extended_ppi_in_192[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 192.
extended_ppi_in_193[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 193.
extended_ppi_in_194[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 194.
extended_ppi_in_195[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 195.
extended_ppi_in_196[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 196.
extended_ppi_in_197[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 197.
extended_ppi_in_198[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 198.
extended_ppi_in_199[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 199.
extended_ppi_in_2[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 2.

Name	Protocol	Type	Description
extended_ppi_in_20[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 20.
extended_ppi_in_200[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 200.
extended_ppi_in_201[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 201.
extended_ppi_in_202[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 202.
extended_ppi_in_203[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 203.
extended_ppi_in_204[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 204.
extended_ppi_in_205[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 205.
extended_ppi_in_206[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 206.
extended_ppi_in_207[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 207.
extended_ppi_in_208[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 208.
extended_ppi_in_209[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 209.
extended_ppi_in_21[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 21.
extended_ppi_in_210[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 210.
extended_ppi_in_211[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 211.
extended_ppi_in_212[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 212.
extended_ppi_in_213[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 213.
extended_ppi_in_214[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 214.
extended_ppi_in_215[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 215.
extended_ppi_in_216[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 216.
extended_ppi_in_217[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 217.
extended_ppi_in_218[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 218.
extended_ppi_in_219[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 219.
extended_ppi_in_22[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 22.

Name	Protocol	Type	Description
extended_ppi_in_220[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 220.
extended_ppi_in_221[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 221.
extended_ppi_in_222[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 222.
extended_ppi_in_223[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 223.
extended_ppi_in_224[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 224.
extended_ppi_in_225[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 225.
extended_ppi_in_226[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 226.
extended_ppi_in_227[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 227.
extended_ppi_in_228[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 228.
extended_ppi_in_229[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 229.
extended_ppi_in_23[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 23.
extended_ppi_in_230[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 230.
extended_ppi_in_231[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 231.
extended_ppi_in_232[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 232.
extended_ppi_in_233[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 233.
extended_ppi_in_234[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 234.
extended_ppi_in_235[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 235.
extended_ppi_in_236[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 236.
extended_ppi_in_237[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 237.
extended_ppi_in_238[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 238.
extended_ppi_in_239[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 239.
extended_ppi_in_24[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 24.
extended_ppi_in_240[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 240.

Name	Protocol	Type	Description
extended_ppi_in_241[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 241.
extended_ppi_in_242[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 242.
extended_ppi_in_243[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 243.
extended_ppi_in_244[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 244.
extended_ppi_in_245[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 245.
extended_ppi_in_246[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 246.
extended_ppi_in_247[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 247.
extended_ppi_in_248[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 248.
extended_ppi_in_249[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 249.
extended_ppi_in_25[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 25.
extended_ppi_in_250[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 250.
extended_ppi_in_251[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 251.
extended_ppi_in_252[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 252.
extended_ppi_in_253[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 253.
extended_ppi_in_254[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 254.
extended_ppi_in_255[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 255.
extended_ppi_in_26[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 26.
extended_ppi_in_27[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 27.
extended_ppi_in_28[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 28.
extended_ppi_in_29[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 29.
extended_ppi_in_3[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 3.
extended_ppi_in_30[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 30.
extended_ppi_in_31[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 31.

Name	Protocol	Type	Description
extended_ppi_in_32[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 32.
extended_ppi_in_33[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 33.
extended_ppi_in_34[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 34.
extended_ppi_in_35[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 35.
extended_ppi_in_36[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 36.
extended_ppi_in_37[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 37.
extended_ppi_in_38[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 38.
extended_ppi_in_39[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 39.
extended_ppi_in_4[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 4.
extended_ppi_in_40[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 40.
extended_ppi_in_41[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 41.
extended_ppi_in_42[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 42.
extended_ppi_in_43[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 43.
extended_ppi_in_44[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 44.
extended_ppi_in_45[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 45.
extended_ppi_in_46[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 46.
extended_ppi_in_47[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 47.
extended_ppi_in_48[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 48.
extended_ppi_in_49[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 49.
extended_ppi_in_5[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 5.
extended_ppi_in_50[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 50.
extended_ppi_in_51[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 51.
extended_ppi_in_52[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 52.

Name	Protocol	Type	Description
extended_ppi_in_53[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 53.
extended_ppi_in_54[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 54.
extended_ppi_in_55[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 55.
extended_ppi_in_56[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 56.
extended_ppi_in_57[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 57.
extended_ppi_in_58[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 58.
extended_ppi_in_59[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 59.
extended_ppi_in_6[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 6.
extended_ppi_in_60[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 60.
extended_ppi_in_61[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 61.
extended_ppi_in_62[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 62.
extended_ppi_in_63[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 63.
extended_ppi_in_64[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 64.
extended_ppi_in_65[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 65.
extended_ppi_in_66[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 66.
extended_ppi_in_67[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 67.
extended_ppi_in_68[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 68.
extended_ppi_in_69[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 69.
extended_ppi_in_7[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 7.
extended_ppi_in_70[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 70.
extended_ppi_in_71[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 71.
extended_ppi_in_72[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 72.
extended_ppi_in_73[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 73.

Name	Protocol	Type	Description
extended_ppi_in_74[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 74.
extended_ppi_in_75[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 75.
extended_ppi_in_76[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 76.
extended_ppi_in_77[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 77.
extended_ppi_in_78[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 78.
extended_ppi_in_79[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 79.
extended_ppi_in_8[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 8.
extended_ppi_in_80[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 80.
extended_ppi_in_81[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 81.
extended_ppi_in_82[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 82.
extended_ppi_in_83[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 83.
extended_ppi_in_84[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 84.
extended_ppi_in_85[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 85.
extended_ppi_in_86[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 86.
extended_ppi_in_87[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 87.
extended_ppi_in_88[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 88.
extended_ppi_in_89[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 89.
extended_ppi_in_9[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 9.
extended_ppi_in_90[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 90.
extended_ppi_in_91[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 91.
extended_ppi_in_92[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 92.
extended_ppi_in_93[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 93.
extended_ppi_in_94[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 94.

Name	Protocol	Type	Description
extended_ppi_in_95[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 95.
extended_ppi_in_96[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 96.
extended_ppi_in_97[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 97.
extended_ppi_in_98[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 98.
extended_ppi_in_99[64]	Signal	Slave	Extended private peripheral interrupts (ID1056-ID1119) for cpu 99.
extended_spi_in[1024]	Signal	Slave	Extended Shared peripheral interrupts.
msi_error_interrupt	Signal	Master	When report of MSI error allowed through interrupt, loop-back this signal to relevant IRQ input signal
po_reset	Signal	Slave	Resets.
ppi_in_0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_in_1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_in_10[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 10.
ppi_in_100[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 100.
ppi_in_101[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 101.
ppi_in_102[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 102.
ppi_in_103[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 103.
ppi_in_104[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 104.
ppi_in_105[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 105.
ppi_in_106[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 106.
ppi_in_107[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 107.
ppi_in_108[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 108.
ppi_in_109[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 109.
ppi_in_11[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 11.
ppi_in_110[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 110.
ppi_in_111[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 111.
ppi_in_112[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 112.
ppi_in_113[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 113.
ppi_in_114[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 114.
ppi_in_115[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 115.
ppi_in_116[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 116.
ppi_in_117[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 117.
ppi_in_118[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 118.
ppi_in_119[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 119.
ppi_in_12[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 12.
ppi_in_120[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 120.

Name	Protocol	Type	Description
ppi_in_121[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 121.
ppi_in_122[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 122.
ppi_in_123[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 123.
ppi_in_124[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 124.
ppi_in_125[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 125.
ppi_in_126[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 126.
ppi_in_127[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 127.
ppi_in_128[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 128.
ppi_in_129[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 129.
ppi_in_13[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 13.
ppi_in_130[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 130.
ppi_in_131[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 131.
ppi_in_132[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 132.
ppi_in_133[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 133.
ppi_in_134[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 134.
ppi_in_135[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 135.
ppi_in_136[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 136.
ppi_in_137[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 137.
ppi_in_138[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 138.
ppi_in_139[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 139.
ppi_in_14[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 14.
ppi_in_140[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 140.
ppi_in_141[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 141.
ppi_in_142[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 142.
ppi_in_143[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 143.
ppi_in_144[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 144.
ppi_in_145[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 145.
ppi_in_146[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 146.
ppi_in_147[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 147.
ppi_in_148[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 148.
ppi_in_149[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 149.
ppi_in_15[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 15.
ppi_in_150[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 150.
ppi_in_151[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 151.
ppi_in_152[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 152.
ppi_in_153[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 153.
ppi_in_154[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 154.
ppi_in_155[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 155.
ppi_in_156[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 156.

Name	Protocol	Type	Description
ppi_in_157[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 157.
ppi_in_158[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 158.
ppi_in_159[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 159.
ppi_in_16[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 16.
ppi_in_160[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 160.
ppi_in_161[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 161.
ppi_in_162[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 162.
ppi_in_163[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 163.
ppi_in_164[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 164.
ppi_in_165[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 165.
ppi_in_166[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 166.
ppi_in_167[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 167.
ppi_in_168[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 168.
ppi_in_169[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 169.
ppi_in_17[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 17.
ppi_in_170[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 170.
ppi_in_171[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 171.
ppi_in_172[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 172.
ppi_in_173[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 173.
ppi_in_174[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 174.
ppi_in_175[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 175.
ppi_in_176[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 176.
ppi_in_177[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 177.
ppi_in_178[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 178.
ppi_in_179[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 179.
ppi_in_18[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 18.
ppi_in_180[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 180.
ppi_in_181[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 181.
ppi_in_182[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 182.
ppi_in_183[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 183.
ppi_in_184[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 184.
ppi_in_185[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 185.
ppi_in_186[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 186.
ppi_in_187[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 187.
ppi_in_188[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 188.
ppi_in_189[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 189.
ppi_in_19[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 19.
ppi_in_190[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 190.
ppi_in_191[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 191.

Name	Protocol	Type	Description
ppi_in_192[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 192.
ppi_in_193[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 193.
ppi_in_194[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 194.
ppi_in_195[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 195.
ppi_in_196[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 196.
ppi_in_197[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 197.
ppi_in_198[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 198.
ppi_in_199[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 199.
ppi_in_2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_in_20[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 20.
ppi_in_200[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 200.
ppi_in_201[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 201.
ppi_in_202[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 202.
ppi_in_203[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 203.
ppi_in_204[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 204.
ppi_in_205[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 205.
ppi_in_206[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 206.
ppi_in_207[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 207.
ppi_in_208[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 208.
ppi_in_209[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 209.
ppi_in_21[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 21.
ppi_in_210[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 210.
ppi_in_211[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 211.
ppi_in_212[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 212.
ppi_in_213[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 213.
ppi_in_214[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 214.
ppi_in_215[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 215.
ppi_in_216[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 216.
ppi_in_217[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 217.
ppi_in_218[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 218.
ppi_in_219[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 219.
ppi_in_22[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 22.
ppi_in_220[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 220.
ppi_in_221[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 221.
ppi_in_222[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 222.
ppi_in_223[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 223.
ppi_in_224[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 224.
ppi_in_225[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 225.
ppi_in_226[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 226.

Name	Protocol	Type	Description
ppi_in_227[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 227.
ppi_in_228[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 228.
ppi_in_229[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 229.
ppi_in_23[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 23.
ppi_in_230[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 230.
ppi_in_231[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 231.
ppi_in_232[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 232.
ppi_in_233[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 233.
ppi_in_234[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 234.
ppi_in_235[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 235.
ppi_in_236[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 236.
ppi_in_237[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 237.
ppi_in_238[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 238.
ppi_in_239[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 239.
ppi_in_24[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 24.
ppi_in_240[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 240.
ppi_in_241[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 241.
ppi_in_242[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 242.
ppi_in_243[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 243.
ppi_in_244[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 244.
ppi_in_245[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 245.
ppi_in_246[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 246.
ppi_in_247[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 247.
ppi_in_248[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 248.
ppi_in_249[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 249.
ppi_in_25[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 25.
ppi_in_250[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 250.
ppi_in_251[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 251.
ppi_in_252[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 252.
ppi_in_253[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 253.
ppi_in_254[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 254.
ppi_in_255[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 255.
ppi_in_26[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 26.
ppi_in_27[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 27.
ppi_in_28[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 28.
ppi_in_29[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 29.
ppi_in_3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_in_30[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 30.
ppi_in_31[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 31.

Name	Protocol	Type	Description
ppi_in_32[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 32.
ppi_in_33[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 33.
ppi_in_34[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 34.
ppi_in_35[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 35.
ppi_in_36[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 36.
ppi_in_37[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 37.
ppi_in_38[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 38.
ppi_in_39[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 39.
ppi_in_4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_in_40[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 40.
ppi_in_41[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 41.
ppi_in_42[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 42.
ppi_in_43[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 43.
ppi_in_44[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 44.
ppi_in_45[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 45.
ppi_in_46[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 46.
ppi_in_47[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 47.
ppi_in_48[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 48.
ppi_in_49[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 49.
ppi_in_5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_in_50[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 50.
ppi_in_51[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 51.
ppi_in_52[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 52.
ppi_in_53[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 53.
ppi_in_54[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 54.
ppi_in_55[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 55.
ppi_in_56[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 56.
ppi_in_57[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 57.
ppi_in_58[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 58.
ppi_in_59[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 59.
ppi_in_6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_in_60[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 60.
ppi_in_61[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 61.
ppi_in_62[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 62.
ppi_in_63[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 63.
ppi_in_64[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 64.
ppi_in_65[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 65.
ppi_in_66[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 66.
ppi_in_67[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 67.

Name	Protocol	Type	Description
ppi_in_68[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 68.
ppi_in_69[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 69.
ppi_in_7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
ppi_in_70[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 70.
ppi_in_71[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 71.
ppi_in_72[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 72.
ppi_in_73[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 73.
ppi_in_74[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 74.
ppi_in_75[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 75.
ppi_in_76[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 76.
ppi_in_77[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 77.
ppi_in_78[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 78.
ppi_in_79[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 79.
ppi_in_8[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 8.
ppi_in_80[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 80.
ppi_in_81[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 81.
ppi_in_82[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 82.
ppi_in_83[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 83.
ppi_in_84[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 84.
ppi_in_85[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 85.
ppi_in_86[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 86.
ppi_in_87[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 87.
ppi_in_88[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 88.
ppi_in_89[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 89.
ppi_in_9[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 9.
ppi_in_90[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 90.
ppi_in_91[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 91.
ppi_in_92[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 92.
ppi_in_93[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 93.
ppi_in_94[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 94.
ppi_in_95[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 95.
ppi_in_96[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 96.
ppi_in_97[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 97.
ppi_in_98[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 98.
ppi_in_99[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 99.
pvbuss_filtermiss_m	PVBus	Master	Passthrough for accesses to pages not used by the GIC IRI.
pvbuss_m	PVBus	Master	Memory bus for transactions generated by the GIC.
pvbuss_s	PVBus	Slave	Memory bus in.
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.

Name	Protocol	Type	Description
reset	Signal	Slave	Resets.
spi_in[988]	Signal	Slave	Shared peripheral interrupts.
wake_request[256]	Signal	Master	Power management outputs.
wire_to_msi_in_0[1024]	Signal	Slave	Wire-to-MSI interrupts for architectural consolidator 0.
wire_to_msi_in_1[1024]	Signal	Slave	Wire-to-MSI interrupts for architectural consolidator 1.
wire_to_msi_in_2[1024]	Signal	Slave	Wire-to-MSI interrupts for architectural consolidator 2.
wire_to_msi_in_3[1024]	Signal	Slave	Wire-to-MSI interrupts for architectural consolidator 3.

Parameters for GIC_IRI_Filter

A3-affinity-supported

Type

bool

Default value

0x0

Device supports affinity level 3 values that are non-zero.

ARE-fixed-to-one

Type

bool

Default value

0x0

GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one.

CPU-affinities

Type

string

Default value

0.0.0.0

A comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If CPU-affinities-file is specified, this parameter is ignored.

CPU-affinities-file

Type

string

Default value

""

A file containing comma separated list of dotted quads containing the affinities of all PEs connected to this IRI. If this parameter is specified, CPU-affinities parameter will be ignored even when it is given.

DPG-ARE-only**Type**

bool

Default value

0x0

Limit application of DPG bits to interrupt groups for which ARE=1.

DPG-bits-implemented**Type**

bool

Default value

0x0

Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR.

DS-fixed-to-zero**Type**

bool

Default value

0x0

Enable/disable support of single security state.

GICD-alias**Type**

int

Default value

0x0

In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode. the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled).

GICD-legacy-registers-as-reserved**Type**

bool

Default value

0x0

When ARE is RAO/WI, makes superfluous registers in GICD reserved (including for the purpose of STATUSR updates).

GICD_CTLR-DS-1-means-secure-only**Type**

bool

Default value

0x0

If GICD_CTLR.DS=1, GICD supports a single security state which is secure if this is true, otherwise is non-secure.

GICD_ITARGETSR-RAZWI**Type**

bool

Default value

0x0

If true, the GICD_ITARGETS registers are RAZ/WI.

GICD_PIDR**Type**

int

Default value

0x0

The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

GICD_TYPER2**Type**

int

Default value

0x0

GICD_TYPER2 value containing VID and VIL to define the width of vPEID for GICv4.1.

GICR-clear-enable-supported**Type**

bool

Default value

0x0

When true, this sets the value of the RO bit GICR_CTLR.CES with the value of the parameter allow-LPIEN-clear, making it visible to software.

GICR-invalidate-registers-implemented**Type**

bool

Default value

0x0

When true, the registers GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented.

GICR_PIDR**Type**

int

Default value

0x0

The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

GICR_PROPBASER-read-only**Type**

bool

Default value

0x0

GICR_PROPBASER register is read-only.

GICR_PROPBASER-reset-value**Type**

int

Default value

0x0

Value of GICR_PROPBASER on reset.

GITS_BASER0-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER0 register.

GITS_BASER0-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER0 register is RAZ/WI.

GITS_BASER0-type**Type**

int

Default value

0x0

Type field for GITS_BASER0 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER1-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER1 register.

GITS_BASER1-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER1 register is RAZ/WI.

GITS_BASER1-type**Type**

int

Default value

0x0

Type field for GITS_BASER1 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER2-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER2 register.

GITS_BASER2-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER2 register is RAZ/WI.

GITS_BASER2-type**Type**

int

Default value

0x0

Type field for GITS_BASER2 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER3-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER3 register.

GITS_BASER3-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER3 register is RAZ/WI.

GITS_BASER3-type**Type**

int

Default value

0x0

Type field for GITS_BASER3 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER4-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER4 register.

GITS_BASER4-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER4 register is RAZ/WI.

GITS_BASER4-type**Type**

int

Default value

0x0

Type field for GITS_BASER4 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER5-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER5 register.

GITS_BASER5-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER5 register is RAZ/WI.

GITS_BASER5-type**Type**

int

Default value

0x0

Type field for GITS_BASER5 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER6-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER6 register.

GITS_BASER6-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER6 register is RAZ/WI.

GITS_BASER6-type**Type**

int

Default value

0x0

Type field for GITS_BASER6 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_BASER7-entry-bytes**Type**

int

Default value

0x8

Number of bytes required per entry for GITS_BASER7 register.

GITS_BASER7-indirect-RAZ**Type**

bool

Default value

0x0

Indirect field for GITS_BASER7 register is RAZ/WI.

GITS_BASER7-type**Type**

int

Default value

0x0

Type field for GITS_BASER7 register. 0 = Unimplemented; 1 = Devices; 2 = Virtual Processors; 3 = Physical Processors; 4 = Collections.

GITS_PIDR**Type**

int

Default value

0x0

The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

ICFGR-PPI-mask**Type**

int

Default value

0xaaaaaaaa

Mask for writes to ICFGR registers that configure PPIs.

ICFGR-PPI-reset**Type**

int

Default value

0x0

Reset value for ICFGR registers that configure PPIs.

ICFGR-SGI-mask**Type**

int

Default value

0x0

Mask for writes to ICFGR registers that configure SGIs.

ICFGR-SGI-reset**Type**

int

Default value

0xaaaaaaaa

Reset value for ICFGR registers that configure SGIs.

ICFGR-SPI-mask**Type**

int

Default value

0xaaaaaaaa

Mask for writes to ICFGR registers that configure SPIs.

ICFGR-SPI-reset**Type**

int

Default value

0x0

Reset value for ICFGR registers that configure SPIs.

ICFGR-rsvd-bit**Type**

bool

Default value

0x0

If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGR_n for n>0.

IGROUP-PPI-mask**Type**

int

Default value

0xffff

Mask for writes to PPI bits in IGROUP registers.

IGROUP-PPI-reset**Type**

int

Default value

0x0

Reset value for SGI bits in IGROUP registers.

IGROUP-SGI-mask**Type**

int

Default value

0xffff

Mask for writes to SGI bits in IGROUP registers.

IGROUP-SGI-reset**Type**

int

Default value

0x0

Reset value for SGI bits in IGROUP registers.

IIDR**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value.

IRI-ID-bits**Type**

int

Default value

0x10

Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported.

IROUTER-IRM-RAZ-WI**Type**

bool

Default value

0x0

GICD_IROUTERn.InterruptRoutingMode is RAZ/WI.

ITS-BASER-force-page-alignment**Type**

bool

Default value

0x1

Force alignment of address written to a GITS_BASER register to the page size configured.

ITS-ID-bits**Type**

int

Default value

0x10

Number of interrupt bits supported by ITS.

ITS-MOVALL-update-collections**Type**

bool

Default value

0x0

Whether MOVALL command updates the collection entires.

ITS-TRANSLATE64R**Type**

bool

Default value

0x0

Add an implementation specific register at 0x10008 supporting 64 bit TRANSLATER (dev[63:32], interupt[31:0]).

ITS-cache-invalidate-on-disable**Type**

bool

Default value

0x0

Sets the RO bit GITS_TYPER.INV. When true, after the following sequence: 1) GITS_CTLR.Enabled written 1-->0, 2) GITS_CTLR.Quirescent observed as 1, 3) GITS_BASER<n>.Valid written 1-->0, there is no cached information from the ITS memory structure pointed to by GITS_BASER<n>.

ITS-collection-ID-bits**Type**

int

Default value

0x0

Number of collection bits supported by ITS (optional parameter, 0 => 16bits support and GITS_TYPER.CIL=0.

ITS-count**Type**

int

Default value

0x0

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-cumulative-collection-tables**Type**

bool

Default value

0x1

When true, the supported amount of collections is the sum of GITS_TYPER.HCC and the number of collections supported in memory, otherwise, simply the number supported in memory only. Irrelevant when HCC=0.

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-enable-itt-address-verification**Type**

bool

Default value

0x0

If true, a transaction will be sent to ITT Address for verification.

ITS-entry-size**Type**

int

Default value

0x8

Number of bytes required to store each entry in the ITT tables.

ITS-hardware-collection-count**Type**

int

Default value

0x0

Number of hardware collections held exclusively in the ITS.

ITS-legacy-iidr-typer-offset**Type**

bool

Default value

0x0

Put the GITS_IIDR and GITS_TYPER registers at their older offset of 0x8 and 0x4 respectively.

ITS-shared-vPE-table**Type**

int

Default value

0x0

Number of affinity levels to which the vPE configuration table is shared. This parameter is valid when has-gicv4.1 is true.

ITS-threaded-command-queue**Type**

bool

Default value

0x1

Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation.

ITS-use-physical-target-addresses**Type**

bool

Default value

0x1

Use physical hardware addresses for targets in ITS commands -- must be true for distributed implementations.

ITS-vmovp-bit**Type**

bool

Default value

0x0

Device supports software issuing a VMOVP to only one of the ITSs that has a mapping for a vPE. The device itself ensures synchronization of the VMOVP command across all ITSs that have mapping for that vPE.

ITS0-base**Type**

int

Default value

0x0

Register base address for ITS0 (automatic if 0).

ITS1-base**Type**

int

Default value

0x0

Register base address for ITS1 (automatic if 0).

ITS2-base**Type**

int

Default value

0x0

Register base address for ITS2 (automatic if 0).

ITS3-base**Type**

int

Default value

0x0

Register base address for ITS3 (automatic if 0).

LPI-cache-check-data**Type**

bool

Default value

0x0

Enable Cached LPI data against memory checking when available for cache type.

LPI-cache-type**Type**

int

Default value

0x1

Cache type for LPIs, 0:No caching, 1:Full caching.

MSI_IIDR**Type**

int

Default value

0x0

Value returned in MSI_IIDR registers.

MSI_NS-frame0-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 0 registers.

MSI_NS-frame0-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.

MSI_NS-frame0-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 0. Set to 0 to disable frame.

MSI_NS-frame1-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 1 registers.

MSI_NS-frame1-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.

MSI_NS-frame1-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 1. Set to 0 to disable frame.

MSI_NS-frame2-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 2 registers.

MSI_NS-frame2-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.

MSI_NS-frame2-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 2. Set to 0 to disable frame.

MSI_NS-frame3-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 3 registers.

MSI_NS-frame3-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.

MSI_NS-frame3-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 3. Set to 0 to disable frame.

MSI_NS-frame4-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 4 registers.

MSI_NS-frame4-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.

MSI_NS-frame4-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 4. Set to 0 to disable frame.

MSI_NS-frame5-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 5 registers.

MSI_NS-frame5-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.

MSI_NS-frame5-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 5. Set to 0 to disable frame.

MSI_NS-frame6-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 6 registers.

MSI_NS-frame6-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.

MSI_NS-frame6-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 6. Set to 0 to disable frame.

MSI_NS-frame7-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for non-secure MSI frame 7 registers.

MSI_NS-frame7-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.

MSI_NS-frame7-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by non-secure MSI frame 7. Set to 0 to disable frame.

MSI_PIDR**Type**

int

Default value

0x0

The value for the MSI_PIDR registers, if non-zero and distributor supports GICv2m. Note: fixed fields (device type etc.) will be overridden in this value.

MSI_S-frame0-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 0 registers.

MSI_S-frame0-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.

MSI_S-frame0-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 0. Set to 0 to disable frame.

MSI_S-frame1-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 1 registers.

MSI_S-frame1-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.

MSI_S-frame1-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 1. Set to 0 to disable frame.

MSI_S-frame2-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 2 registers.

MSI_S-frame2-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.

MSI_S-frame2-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 2. Set to 0 to disable frame.

MSI_S-frame3-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 3 registers.

MSI_S-frame3-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.

MSI_S-frame3-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 3. Set to 0 to disable frame.

MSI_S-frame4-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 4 registers.

MSI_S-frame4-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.

MSI_S-frame4-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 4. Set to 0 to disable frame.

MSI_S-frame5-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 5 registers.

MSI_S-frame5-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.

MSI_S-frame5-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 5. Set to 0 to disable frame.

MSI_S-frame6-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 6 registers.

MSI_S-frame6-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.

MSI_S-frame6-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 6. Set to 0 to disable frame.

MSI_S-frame7-base**Type**

int

Default value

0x0

If non-zero, sets the base address used for secure MSI frame 7 registers.

MSI_S-frame7-max-SPI**Type**

int

Default value

0x0

Maximum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.

MSI_S-frame7-min-SPI**Type**

int

Default value

0x0

Minimum SPI ID supported by secure MSI frame 7. Set to 0 to disable frame.

PA_SIZE**Type**

int

Default value

0x30

Number of valid bits in physical address.

PPI-implemented-mask**Type**

int

Default value

0xffff

Mask of PPIs that are implemented. One bit per PPI bit 0 == PPI 16 (first PPI). This will affect other masks.

SPI-count**Type**

int

Default value

0xe0

Number of SPIs that are implemented.

SPI-message-based-support**Type**

bool

Default value

0x1

Distributor supports message based signaling of SPI.

SPI-unimplemented**Type**

string

Default value

""

A comma separated list of unimplemented SPIs ranges for sparse SPI definition(for ex: '35, 39-42, 73').

STATUSR-implemented**Type**

bool

Default value

0x1

Determines whether the GICR_STATUSR register is implemented.

add-output-cpu-wake-request-signal-from-redistributor**Type**

bool

Default value

0x0

if true, the redistributor will have the output signal cpu_wake_request from GIC to DSU and if false, the signals are not added to the redistributor.

allow-LPIEN-clear**Type**

bool

Default value

0x0

Allow RW behaviour on GICR_CTLR.LPIEN instead of set once.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

common-lpi-configuration**Type**

int

Default value

0x0

Describes which re-distributors share (and must be configured with the same) LPI configuration table as described in GICR_TYPER(0:All, 1:A.x.x.x, 2:A.B.x.x, 3:A.B.C.x).

common-vPE-table-affinity**Type**

string

Default value

""

Affinity value list in the form of 'a.b.c.d, e.f.g.h, etc' given to the ITS(s) (where a.b.c.d corresponds to ITS0, e.f.g.h corresponds to ITS1 and so on). Under an affinity value the vPE configuration table is shared among redistributors where the level to be shared is defined by ITS-shared-vPE-table. This parameter is valid when has-gicv4.1 is true.

consolidators**Type**

string

Default value

""

Specify consolidators' base addresses, interrupt line counts and base interrupt IDs, in the form 'baseAddr0:itlineCount0:baseINTID0, baseAddr1:itlineCount1:baseINTID1, [etc]' (eg '0x3f100000:64:4096, 0x3f200000:64:4224'). The consolidators' count is inferred from the list (maximum of 4). If not specified, the component contains no consolidators.

delay-ITS-accesses**Type**

bool

Default value

0x1

Delay accesses from the ITS until GICR_SYNCRR is read.

delay-redistributor-accesses**Type**

bool

Default value

0x1

Delay memory accesses from the redistributor until GICR_SYNCRR is read.

direct-lpi-support**Type**

bool

Default value

0x0

Enable support for LPI operations through GICR registers.

enable_protocol_checking**Type**

bool

Default value

0x0

Enable/disable protocol checking at cpu interface.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

extended-ppi-count**Type**

int

Default value

0x0

Number of extended PPI supported.

extended-spi-count

Type

int

Default value

0x0

Number of extended SPI supported.

fixed-routed-spis

Type

string

Default value

""

Value of IROUTER[n] register in the form 'n=a.b.c.d, n=*'. The RM bit of IROUTER is 0 when n=a.b.c.d is used else 1 when n=* is used. n can be >= 32 and <= 1019.

gicr-icfgr-extended-count

Type

int

Default value

0x4

Number of extended GICR_ICFGR registers supported.

gicv2-only

Type

bool

Default value

0x0

If true, when using the GICv3 model, pretend to be a GICv2 system.

group-enables-control-doorbell

Type

bool

Default value

0x0

When true, GICR_VPENDBASER.{VGrp0En,VGrp1En} are cached to allow GIC to check group enables when virtual interrupt targeting this VCPU which is non-resident reaches Redistributor.

has-gicv4.1**Type**

bool

Default value

0x0

Enable GICv4.1 functionality; when false the component is inactive.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

has_VPENDBASER-dirty-flag-on-load**Type**

bool

Default value

0x0

GICR_VPENDBASER.Dirty reflects transient loading state when valid=1.

has_mpam**Type**

bool

Default value

0x0

Enable MPAM support on ITS and RDs.

has_nmi**Type**

bool

Default value

0x0

Enable support for Non-maskable Interrupts (NMIs). (FEAT_GICv3_NMI).

ignore-generate-sgi-when-no-are**Type**

bool

Default value

0x0

Ignore GenerateSGI packets coming form the CPU interface if both ARE_S and ARE_NS are 0.

individual-doorbell-not-supported**Type**

bool

Default value

0x0

For IRI with support of virtual interrupt, individual doorbell is not supported when true.

irouter-default-mask**Type**

string

Default value

""

Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'.

irouter-default-reset**Type**

string

Default value

""

Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or *.

irouter-mask-values**Type**

string

Default value

""

Mask Value of IROUTER[n] register in the form 'n=a.b.c.d'.n can be >= 32 and <= 1019.

irouter-reset-values**Type**

string

Default value

""

Reset Value of IROUTER[n] register in the form 'n=a.b.c.d or n=*.n can be ≥ 32 and ≤ 1019 .

legacy-sgi-enable-rao**Type**

bool

Default value

0x0

Enables for SGI associated with an ARE=0 regime are RAO/WI.

local-SEIs**Type**

bool

Default value

0x0

Generate SEI to signal internal issues.

local-VSEIs**Type**

bool

Default value

0x0

Generate VSEI to signal internal issues.

lockable-SPI-count**Type**

int

Default value

0x0

Number of SPIs that are locked down when CFGSDISABLE signal is asserted. Only applies for GICv2.

monolithic**Type**

bool

Default value

0x0

Indicate that the implementation is not distributed.

mpam_max_partid**Type**

int

Default value

0xffff

Maximum valid PARTID.

mpam_max_pmg**Type**

int

Default value

0xff

Maximum valid PMG.

non-ARE-core-count**Type**

int

Default value

0x8

Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.

outer-cacheability-support**Type**

bool

Default value

0x0

Allow configuration of outer cachability attributes in ITS and Redistributor.

output_attributes**Type**

string

Default value

```
"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,  
ExtendedID[38]=MPAM_NS"
```

User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

priority-bits**Type**

int

Default value

0x5

Number of implemented priority bits.

processor-numbers**Type**

string

Default value

""

Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.) If not specified, will number processors starting at 0.

redistributor-threaded-sync**Type**

bool

Default value

0x1

Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation.

reg-base**Type**

int

Default value

0x2c010000

Base for decoding GICv3 registers.

reg-base-per-redistributor**Type**

string

Default value

""

Base address for each redistributor in the form:

```
0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000
```

All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If reg-base-per-redistributor-file is specified, this parameter is ignored.

reg-base-per-redistributor-file**Type**

string

Default value

""

Path to file containing the base address for each redistributor in the form '0.0.0.0=0x2c010000, 0.0.0.1=0x2c020000'. All redistributors must be specified and this overrides the reg-base parameter (except that reg-base will still be used for the top-level redistributor). If this parameter is specified, reg-base-per-redistributor parameter will be ignored even when it is given.

report-MSI-error-via-statusr**Type**

int

Default value

0x0

Report MSI error via GITS_STATUSR. (0:unsupported, 1:report by GITS_STATUSR, 2:report by GITS_STATUSR and interrupt as well).

rme_default_mecid_nonsecure**Type**

int

Default value

0x0

Default MECID value for NON-SECURE PAS.

sgi-range-selector-support**Type**

bool

Default value

0x0

Device has support for the Range Selector feature for SGI.

single-set-support**Type**

bool

Default value

0x0

When true, forces redistributors to recall interrupts with a clear rather than issue a second Set command.

supports-shareability**Type**

bool

Default value

0x1

Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).

trace-speculative-lpi-property-update**Type**

bool

Default value

0x0

Trace LPI property updates performed on speculative accesses (useful for debugging LPI).

vPE-table-entry-size-in-doubleword**Type**

int

Default value

0x5

The size of one entry of a vPE configuration table in double word. The value decremented by one is shown at GICR_VPROPBASER.Entry_Size. Current model mandates the minimum entry size to be 4 doublewords. When lower value is given, it is truncated to 4.

virtual-lpi-support**Type**

bool

Default value

0x0

GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported.

virtual-priority-bits**Type**

int

Default value

0x5

Number of implemented virtual priority bits.

wakeup-on-reset**Type**

bool

Default value

0x0

Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.10.44 ICS307

Serially Programmable Clock Source. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1066: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ICS307

This model has the following Iris instances:

Table 3-1067: ICS307 Iris instances

InstanceName	ComponentName
ICS307	ICS307
ICS307.clkdiv_clk1	ClockDivider

This model has the following MTI trace components:

Table 3-1068: ICS307 MTI instances

InstanceName	ComponentName
ICS307.clkdiv_clk1	ClockDivider

ICS307 contains the following CADI targets:

- ClockDivider
- ICS307

About ICS307

Use this component to convert the rate of one ClockSignal to another ClockSignal by using configurable multiplier, divider, and scale values. The divider ratio can be set by startup parameters or at runtime by a configuration port. Changes to the input ClockSignal rate and divider ratio are reflected immediately by the output ClockSignal ports.

Three values determine the divisor ratio:

- `vdw`
- `rdw`
- `od`

To calculate the divisor ratio, use:

```
Divisor = ((rdw+2) * scale) / (2 * (vdw+8))
```

where `scale` is derived from this table indexed by `od`:

Table 3-1069: od to scale conversion

od	scale
0	10
1	2
2	8
3	4
4	5
5	7
6	3
7	6

The default values of vdw, rdw and od are 4, 6, and 3 to give a default divisor rate of:

$$((6+2) * 4) / (2 * (4+8)) = 4/3$$

Ports for ICS307

Table 3-1070: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock rate.
clk_out_clk1	ClockSignal	Master	Modified clock rate.
clk_out_ref	ClockSignal	Master	Pass through of master clock rate for divider chaining.
configuration	ICS307Configuration	Slave	Configuration port for setting divider ratio dynamically.

Parameters for ICS307

clkdiv_clk1.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv_clk1.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

od
Type
int
Default value
0x3

OD.

rdr
Type
int
Default value
0x6

RDR.

vdw
Type
int
Default value
0x4

VDW.

3.10.45 IDAU

IDAU is a device that provides a Security attribute relating to the address passed to it. For each memory access (data and instruction), the CPU checks the IDAU and sets the security of its transactions based on it. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1071: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for IDAU

This model has the following Iris instances:

Table 3-1072: IDAU Iris instances

InstanceName	ComponentName
IDAU.bus_bridge	PVBusBridge

IDAU interface

- input `IDAUADDR` Address of the region
- output `IDAUNS` Non-secure region response
- output `IDAUNSC` Non-secure-callable region response
- output `IDAUID` Region number
- output `IDAUIDV` Region number valid
- output `IDAUNCHK` Region exempt from attribution check

The Implementation Defined Attribution Unit (IDAU) model uses the `pv::IDAUSignal` struct to return the Security attributes for the address passed to it. Unlike the hardware, the CPU Fast Model does not query the IDAU for each access. Communication is at a higher abstraction level to maintain simulation speed.

IDAU transaction level communication protocol

IDAU has the following ports:

- **slave port<PVBus> pvbus_s;**
PVBus memory-based slave port. Masters can read or write to this port as follows:
 - **Read**
Read returns IDAU region's `pv::IdauRegion` struct (32 byte), containing information about the IDAU region for the requested address. `pv::IdauRegion` contains the start address, end address, `pv::IDAUSignal`, and 8 bytes of padding (to make it 32 byte-aligned).
 - **Write**
This port only supports 32 byte Write operations to pass in an `pv::IdauRegion` struct for updating an internal IDAU region.
 - **DMI**
This port adds support for DMI requests and provides a pointer to a `pv::IdauRegion` for the requested address. An 'invalid DMI' call back occurs if the IDAU updates its regions.
- **master port<Value_64> invalidate_region;**
This port is used as a call back to inform masters that the IDAU has updated its region information.

To disable the IDAU, set the `NUM_IDAU_REGION` parameter to zero.

Ports for IDAU

Table 3-1073: Ports

Name	Protocol	Type	Description
invalidate_region	Value_64	Master	This port is used as a call back to inform masters that the IDAU has updated its region information.
pvbus_s	PVBus	Slave	-

Parameters for IDAU

IDAU_REGION0.BADDR

Type

int

Default value

0x0

Base address of IDAU region0.

IDAU_REGION0.ENABLE

Type

bool

Default value

0x0

Controls if region 0 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION0.EXEMPT

Type

bool

Default value

0x0

Mark IDAU region0 as exempt.

IDAU_REGION0.LADDR

Type

int

Default value

0x0

Limit address of IDAU region0.

IDAU_REGION0.NSC**Type**

bool

Default value

0x0

Controls if region 0 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION1.BADDR**Type**

int

Default value

0x0

Base address of IDAU region1.

IDAU_REGION1.ENABLE**Type**

bool

Default value

0x0

Controls if region 1 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION1.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region1 as exempt.

IDAU_REGION1.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region1.

IDAU_REGION1.NSC**Type**

bool

Default value

0x0

Controls if region 1 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION10.BADDR**Type**

int

Default value

0x0

Base address of IDAU region10.

IDAU_REGION10.ENABLE**Type**

bool

Default value

0x0

Controls if region 10 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION10.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region10 as exempt.

IDAU_REGION10.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region10.

IDAU_REGION10.NSC**Type**

bool

Default value

0x0

Controls if region 10 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION100.BADDR**Type**

int

Default value

0x0

Base address of IDAU region100.

IDAU_REGION100.ENABLE**Type**

bool

Default value

0x0

Controls if region 100 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION100.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region100 as exempt.

IDAU_REGION100.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region100.

IDAU_REGION100.NSC**Type**

bool

Default value

0x0

Controls if region 100 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION101.BADDR**Type**

int

Default value

0x0

Base address of IDAU region101.

IDAU_REGION101.ENABLE**Type**

bool

Default value

0x0

Controls if region 101 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION101.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region101 as exempt.

IDAU_REGION101.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region101.

IDAU_REGION101.NSC**Type**

bool

Default value

0x0

Controls if region 101 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION102.BADDR**Type**

int

Default value

0x0

Base address of IDAU region102.

IDAU_REGION102.ENABLE**Type**

bool

Default value

0x0

Controls if region 102 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION102.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region102 as exempt.

IDAU_REGION102.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region102.

IDAU_REGION102.NSC**Type**

bool

Default value

0x0

Controls if region 102 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION103.BADDR**Type**

int

Default value

0x0

Base address of IDAU region103.

IDAU_REGION103.ENABLE**Type**

bool

Default value

0x0

Controls if region 103 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION103.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region103 as exempt.

IDAU_REGION103.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region103.

IDAU_REGION103.NSC**Type**

bool

Default value

0x0

Controls if region 103 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION104.BADDR**Type**

int

Default value

0x0

Base address of IDAU region104.

IDAU_REGION104.ENABLE**Type**

bool

Default value

0x0

Controls if region 104 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION104.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region104 as exempt.

IDAU_REGION104.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region104.

IDAU_REGION104.NSC**Type**

bool

Default value

0x0

Controls if region 104 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION105.BADDR**Type**

int

Default value

0x0

Base address of IDAU region105.

IDAU_REGION105.ENABLE**Type**

bool

Default value

0x0

Controls if region 105 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION105.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region105 as exempt.

IDAU_REGION105.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region105.

IDAU_REGION105.NSC**Type**

bool

Default value

0x0

Controls if region 105 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION106.BADDR**Type**

int

Default value

0x0

Base address of IDAU region106.

IDAU_REGION106.ENABLE**Type**

bool

Default value

0x0

Controls if region 106 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION106.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region106 as exempt.

IDAU_REGION106.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region106.

IDAU_REGION106.NSC**Type**

bool

Default value

0x0

Controls if region 106 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION107.BADDR**Type**

int

Default value

0x0

Base address of IDAU region107.

IDAU_REGION107.ENABLE**Type**

bool

Default value

0x0

Controls if region 107 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION107.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region107 as exempt.

IDAU_REGION107.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region107.

IDAU_REGION107.NSC**Type**

bool

Default value

0x0

Controls if region 107 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION108.BADDR**Type**

int

Default value

0x0

Base address of IDAU region108.

IDAU_REGION108.ENABLE**Type**

bool

Default value

0x0

Controls if region 108 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION108.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region108 as exempt.

IDAU_REGION108.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region108.

IDAU_REGION108.NSC**Type**

bool

Default value

0x0

Controls if region 108 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION109.BADDR**Type**

int

Default value

0x0

Base address of IDAU region109.

IDAU_REGION109.ENABLE**Type**

bool

Default value

0x0

Controls if region 109 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION109.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region109 as exempt.

IDAU_REGION109.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region109.

IDAU_REGION109.NSC**Type**

bool

Default value

0x0

Controls if region 109 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION11.BADDR**Type**

int

Default value

0x0

Base address of IDAU region11.

IDAU_REGION11.ENABLE**Type**

bool

Default value

0x0

Controls if region 11 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION11.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region11 as exempt.

IDAU_REGION11.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region11.

IDAU_REGION11.NSC**Type**

bool

Default value

0x0

Controls if region 11 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION110.BADDR**Type**

int

Default value

0x0

Base address of IDAU region110.

IDAU_REGION110.ENABLE**Type**

bool

Default value

0x0

Controls if region 110 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION110.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region110 as exempt.

IDAU_REGION110.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region110.

IDAU_REGION110.NSC**Type**

bool

Default value

0x0

Controls if region 110 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION111.BADDR**Type**

int

Default value

0x0

Base address of IDAU region111.

IDAU_REGION111.ENABLE**Type**

bool

Default value

0x0

Controls if region 111 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION111.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region111 as exempt.

IDAU_REGION111.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region111.

IDAU_REGION111.NSC**Type**

bool

Default value

0x0

Controls if region 111 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION112.BADDR**Type**

int

Default value

0x0

Base address of IDAU region112.

IDAU_REGION112.ENABLE**Type**

bool

Default value

0x0

Controls if region 112 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION112.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region112 as exempt.

IDAU_REGION112.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region112.

IDAU_REGION112.NSC**Type**

bool

Default value

0x0

Controls if region 112 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION113.BADDR**Type**

int

Default value

0x0

Base address of IDAU region113.

IDAU_REGION113.ENABLE**Type**

bool

Default value

0x0

Controls if region 113 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION113.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region113 as exempt.

IDAU_REGION113.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region113.

IDAU_REGION113.NSC**Type**

bool

Default value

0x0

Controls if region 113 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION114.BADDR**Type**

int

Default value

0x0

Base address of IDAU region114.

IDAU_REGION114.ENABLE**Type**

bool

Default value

0x0

Controls if region 114 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION114.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region114 as exempt.

IDAU_REGION114.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region114.

IDAU_REGION114.NSC**Type**

bool

Default value

0x0

Controls if region 114 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION115.BADDR**Type**

int

Default value

0x0

Base address of IDAU region115.

IDAU_REGION115.ENABLE**Type**

bool

Default value

0x0

Controls if region 115 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION115.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region115 as exempt.

IDAU_REGION115.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region115.

IDAU_REGION115.NSC**Type**

bool

Default value

0x0

Controls if region 115 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION116.BADDR**Type**

int

Default value

0x0

Base address of IDAU region116.

IDAU_REGION116.ENABLE**Type**

bool

Default value

0x0

Controls if region 116 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION116.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region116 as exempt.

IDAU_REGION116.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region116.

IDAU_REGION116.NSC**Type**

bool

Default value

0x0

Controls if region 116 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION117.BADDR**Type**

int

Default value

0x0

Base address of IDAU region117.

IDAU_REGION117.ENABLE**Type**

bool

Default value

0x0

Controls if region 117 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION117.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region117 as exempt.

IDAU_REGION117.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region117.

IDAU_REGION117.NSC**Type**

bool

Default value

0x0

Controls if region 117 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION118.BADDR**Type**

int

Default value

0x0

Base address of IDAU region118.

IDAU_REGION118.ENABLE**Type**

bool

Default value

0x0

Controls if region 118 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION118.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region118 as exempt.

IDAU_REGION118.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region118.

IDAU_REGION118.NSC**Type**

bool

Default value

0x0

Controls if region 118 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION119.BADDR**Type**

int

Default value

0x0

Base address of IDAU region119.

IDAU_REGION119.ENABLE**Type**

bool

Default value

0x0

Controls if region 119 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION119.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region119 as exempt.

IDAU_REGION119.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region119.

IDAU_REGION119.NSC**Type**

bool

Default value

0x0

Controls if region 119 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION12.BADDR**Type**

int

Default value

0x0

Base address of IDAU region12.

IDAU_REGION12.ENABLE**Type**

bool

Default value

0x0

Controls if region 12 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION12.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region12 as exempt.

IDAU_REGION12.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region12.

IDAU_REGION12.NSC**Type**

bool

Default value

0x0

Controls if region 12 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION120.BADDR**Type**

int

Default value

0x0

Base address of IDAU region120.

IDAU_REGION120.ENABLE**Type**

bool

Default value

0x0

Controls if region 120 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION120.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region120 as exempt.

IDAU_REGION120.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region120.

IDAU_REGION120.NSC**Type**

bool

Default value

0x0

Controls if region 120 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION121.BADDR**Type**

int

Default value

0x0

Base address of IDAU region121.

IDAU_REGION121.ENABLE**Type**

bool

Default value

0x0

Controls if region 121 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION121.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region121 as exempt.

IDAU_REGION121.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region121.

IDAU_REGION121.NSC**Type**

bool

Default value

0x0

Controls if region 121 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION122.BADDR**Type**

int

Default value

0x0

Base address of IDAU region122.

IDAU_REGION122.ENABLE**Type**

bool

Default value

0x0

Controls if region 122 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION122.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region122 as exempt.

IDAU_REGION122.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region122.

IDAU_REGION122.NSC**Type**

bool

Default value

0x0

Controls if region 122 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION123.BADDR**Type**

int

Default value

0x0

Base address of IDAU region123.

IDAU_REGION123.ENABLE**Type**

bool

Default value

0x0

Controls if region 123 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION123.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region123 as exempt.

IDAU_REGION123.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region123.

IDAU_REGION123.NSC**Type**

bool

Default value

0x0

Controls if region 123 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION124.BADDR**Type**

int

Default value

0x0

Base address of IDAU region124.

IDAU_REGION124.ENABLE**Type**

bool

Default value

0x0

Controls if region 124 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION124.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region124 as exempt.

IDAU_REGION124.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region124.

IDAU_REGION124.NSC**Type**

bool

Default value

0x0

Controls if region 124 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION125.BADDR**Type**

int

Default value

0x0

Base address of IDAU region125.

IDAU_REGION125.ENABLE**Type**

bool

Default value

0x0

Controls if region 125 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION125.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region125 as exempt.

IDAU_REGION125.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region125.

IDAU_REGION125.NSC**Type**

bool

Default value

0x0

Controls if region 125 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION126.BADDR**Type**

int

Default value

0x0

Base address of IDAU region126.

IDAU_REGION126.ENABLE**Type**

bool

Default value

0x0

Controls if region 126 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION126.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region126 as exempt.

IDAU_REGION126.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region126.

IDAU_REGION126.NSC**Type**

bool

Default value

0x0

Controls if region 126 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION127.BADDR**Type**

int

Default value

0x0

Base address of IDAU region127.

IDAU_REGION127.ENABLE**Type**

bool

Default value

0x0

Controls if region 127 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION127.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region127 as exempt.

IDAU_REGION127.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region127.

IDAU_REGION127.NSC**Type**

bool

Default value

0x0

Controls if region 127 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION128.BADDR**Type**

int

Default value

0x0

Base address of IDAU region128.

IDAU_REGION128.ENABLE**Type**

bool

Default value

0x0

Controls if region 128 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION128.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region128 as exempt.

IDAU_REGION128.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region128.

IDAU_REGION128.NSC**Type**

bool

Default value

0x0

Controls if region 128 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION129.BADDR**Type**

int

Default value

0x0

Base address of IDAU region129.

IDAU_REGION129.ENABLE**Type**

bool

Default value

0x0

Controls if region 129 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION129.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region129 as exempt.

IDAU_REGION129.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region129.

IDAU_REGION129.NSC**Type**

bool

Default value

0x0

Controls if region 129 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION13.BADDR**Type**

int

Default value

0x0

Base address of IDAU region13.

IDAU_REGION13.ENABLE**Type**

bool

Default value

0x0

Controls if region 13 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION13.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region13 as exempt.

IDAU_REGION13.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region13.

IDAU_REGION13.NSC**Type**

bool

Default value

0x0

Controls if region 13 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION130.BADDR**Type**

int

Default value

0x0

Base address of IDAU region130.

IDAU_REGION130.ENABLE**Type**

bool

Default value

0x0

Controls if region 130 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION130.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region130 as exempt.

IDAU_REGION130.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region130.

IDAU_REGION130.NSC**Type**

bool

Default value

0x0

Controls if region 130 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION131.BADDR**Type**

int

Default value

0x0

Base address of IDAU region131.

IDAU_REGION131.ENABLE**Type**

bool

Default value

0x0

Controls if region 131 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION131.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region131 as exempt.

IDAU_REGION131.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region131.

IDAU_REGION131.NSC**Type**

bool

Default value

0x0

Controls if region 131 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION132.BADDR**Type**

int

Default value

0x0

Base address of IDAU region132.

IDAU_REGION132.ENABLE**Type**

bool

Default value

0x0

Controls if region 132 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION132.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region132 as exempt.

IDAU_REGION132.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region132.

IDAU_REGION132.NSC**Type**

bool

Default value

0x0

Controls if region 132 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION133.BADDR**Type**

int

Default value

0x0

Base address of IDAU region133.

IDAU_REGION133.ENABLE**Type**

bool

Default value

0x0

Controls if region 133 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION133.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region133 as exempt.

IDAU_REGION133.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region133.

IDAU_REGION133.NSC**Type**

bool

Default value

0x0

Controls if region 133 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION134.BADDR**Type**

int

Default value

0x0

Base address of IDAU region134.

IDAU_REGION134.ENABLE**Type**

bool

Default value

0x0

Controls if region 134 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION134.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region134 as exempt.

IDAU_REGION134.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region134.

IDAU_REGION134.NSC**Type**

bool

Default value

0x0

Controls if region 134 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION135.BADDR**Type**

int

Default value

0x0

Base address of IDAU region135.

IDAU_REGION135.ENABLE**Type**

bool

Default value

0x0

Controls if region 135 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION135.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region135 as exempt.

IDAU_REGION135.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region135.

IDAU_REGION135.NSC**Type**

bool

Default value

0x0

Controls if region 135 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION136.BADDR**Type**

int

Default value

0x0

Base address of IDAU region136.

IDAU_REGION136.ENABLE**Type**

bool

Default value

0x0

Controls if region 136 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION136.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region136 as exempt.

IDAU_REGION136.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region136.

IDAU_REGION136.NSC**Type**

bool

Default value

0x0

Controls if region 136 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION137.BADDR**Type**

int

Default value

0x0

Base address of IDAU region137.

IDAU_REGION137.ENABLE**Type**

bool

Default value

0x0

Controls if region 137 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION137.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region137 as exempt.

IDAU_REGION137.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region137.

IDAU_REGION137.NSC**Type**

bool

Default value

0x0

Controls if region 137 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION138.BADDR**Type**

int

Default value

0x0

Base address of IDAU region138.

IDAU_REGION138.ENABLE**Type**

bool

Default value

0x0

Controls if region 138 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION138.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region138 as exempt.

IDAU_REGION138.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region138.

IDAU_REGION138.NSC**Type**

bool

Default value

0x0

Controls if region 138 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION139.BADDR**Type**

int

Default value

0x0

Base address of IDAU region139.

IDAU_REGION139.ENABLE**Type**

bool

Default value

0x0

Controls if region 139 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION139.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region139 as exempt.

IDAU_REGION139.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region139.

IDAU_REGION139.NSC**Type**

bool

Default value

0x0

Controls if region 139 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION14.BADDR**Type**

int

Default value

0x0

Base address of IDAU region14.

IDAU_REGION14.ENABLE**Type**

bool

Default value

0x0

Controls if region 14 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION14.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region14 as exempt.

IDAU_REGION14.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region14.

IDAU_REGION14.NSC**Type**

bool

Default value

0x0

Controls if region 14 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION140.BADDR**Type**

int

Default value

0x0

Base address of IDAU region140.

IDAU_REGION140.ENABLE**Type**

bool

Default value

0x0

Controls if region 140 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION140.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region140 as exempt.

IDAU_REGION140.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region140.

IDAU_REGION140.NSC**Type**

bool

Default value

0x0

Controls if region 140 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION141.BADDR**Type**

int

Default value

0x0

Base address of IDAU region141.

IDAU_REGION141.ENABLE**Type**

bool

Default value

0x0

Controls if region 141 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION141.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region141 as exempt.

IDAU_REGION141.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region141.

IDAU_REGION141.NSC**Type**

bool

Default value

0x0

Controls if region 141 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION142.BADDR**Type**

int

Default value

0x0

Base address of IDAU region142.

IDAU_REGION142.ENABLE**Type**

bool

Default value

0x0

Controls if region 142 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION142.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region142 as exempt.

IDAU_REGION142.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region142.

IDAU_REGION142.NSC**Type**

bool

Default value

0x0

Controls if region 142 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION143.BADDR**Type**

int

Default value

0x0

Base address of IDAU region143.

IDAU_REGION143.ENABLE**Type**

bool

Default value

0x0

Controls if region 143 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION143.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region143 as exempt.

IDAU_REGION143.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region143.

IDAU_REGION143.NSC**Type**

bool

Default value

0x0

Controls if region 143 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION144.BADDR**Type**

int

Default value

0x0

Base address of IDAU region144.

IDAU_REGION144.ENABLE**Type**

bool

Default value

0x0

Controls if region 144 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION144.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region144 as exempt.

IDAU_REGION144.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region144.

IDAU_REGION144.NSC**Type**

bool

Default value

0x0

Controls if region 144 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION145.BADDR**Type**

int

Default value

0x0

Base address of IDAU region145.

IDAU_REGION145.ENABLE**Type**

bool

Default value

0x0

Controls if region 145 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION145.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region145 as exempt.

IDAU_REGION145.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region145.

IDAU_REGION145.NSC**Type**

bool

Default value

0x0

Controls if region 145 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION146.BADDR**Type**

int

Default value

0x0

Base address of IDAU region146.

IDAU_REGION146.ENABLE**Type**

bool

Default value

0x0

Controls if region 146 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION146.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region146 as exempt.

IDAU_REGION146.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region146.

IDAU_REGION146.NSC**Type**

bool

Default value

0x0

Controls if region 146 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION147.BADDR**Type**

int

Default value

0x0

Base address of IDAU region147.

IDAU_REGION147.ENABLE**Type**

bool

Default value

0x0

Controls if region 147 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION147.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region147 as exempt.

IDAU_REGION147.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region147.

IDAU_REGION147.NSC**Type**

bool

Default value

0x0

Controls if region 147 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION148.BADDR**Type**

int

Default value

0x0

Base address of IDAU region148.

IDAU_REGION148.ENABLE**Type**

bool

Default value

0x0

Controls if region 148 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION148.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region148 as exempt.

IDAU_REGION148.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region148.

IDAU_REGION148.NSC**Type**

bool

Default value

0x0

Controls if region 148 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION149.BADDR**Type**

int

Default value

0x0

Base address of IDAU region149.

IDAU_REGION149.ENABLE**Type**

bool

Default value

0x0

Controls if region 149 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION149.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region149 as exempt.

IDAU_REGION149.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region149.

IDAU_REGION149.NSC**Type**

bool

Default value

0x0

Controls if region 149 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION15.BADDR**Type**

int

Default value

0x0

Base address of IDAU region15.

IDAU_REGION15.ENABLE**Type**

bool

Default value

0x0

Controls if region 15 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION15.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region15 as exempt.

IDAU_REGION15.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region15.

IDAU_REGION15.NSC**Type**

bool

Default value

0x0

Controls if region 15 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION150.BADDR**Type**

int

Default value

0x0

Base address of IDAU region150.

IDAU_REGION150.ENABLE**Type**

bool

Default value

0x0

Controls if region 150 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION150.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region150 as exempt.

IDAU_REGION150.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region150.

IDAU_REGION150.NSC**Type**

bool

Default value

0x0

Controls if region 150 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION151.BADDR**Type**

int

Default value

0x0

Base address of IDAU region151.

IDAU_REGION151.ENABLE**Type**

bool

Default value

0x0

Controls if region 151 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION151.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region151 as exempt.

IDAU_REGION151.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region151.

IDAU_REGION151.NSC**Type**

bool

Default value

0x0

Controls if region 151 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION152.BADDR**Type**

int

Default value

0x0

Base address of IDAU region152.

IDAU_REGION152.ENABLE**Type**

bool

Default value

0x0

Controls if region 152 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION152.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region152 as exempt.

IDAU_REGION152.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region152.

IDAU_REGION152.NSC**Type**

bool

Default value

0x0

Controls if region 152 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION153.BADDR**Type**

int

Default value

0x0

Base address of IDAU region153.

IDAU_REGION153.ENABLE**Type**

bool

Default value

0x0

Controls if region 153 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION153.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region153 as exempt.

IDAU_REGION153.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region153.

IDAU_REGION153.NSC**Type**

bool

Default value

0x0

Controls if region 153 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION154.BADDR**Type**

int

Default value

0x0

Base address of IDAU region154.

IDAU_REGION154.ENABLE**Type**

bool

Default value

0x0

Controls if region 154 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION154.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region154 as exempt.

IDAU_REGION154.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region154.

IDAU_REGION154.NSC**Type**

bool

Default value

0x0

Controls if region 154 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION155.BADDR**Type**

int

Default value

0x0

Base address of IDAU region155.

IDAU_REGION155.ENABLE**Type**

bool

Default value

0x0

Controls if region 155 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION155.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region155 as exempt.

IDAU_REGION155.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region155.

IDAU_REGION155.NSC**Type**

bool

Default value

0x0

Controls if region 155 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION156.BADDR**Type**

int

Default value

0x0

Base address of IDAU region156.

IDAU_REGION156.ENABLE**Type**

bool

Default value

0x0

Controls if region 156 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION156.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region156 as exempt.

IDAU_REGION156.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region156.

IDAU_REGION156.NSC**Type**

bool

Default value

0x0

Controls if region 156 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION157.BADDR**Type**

int

Default value

0x0

Base address of IDAU region157.

IDAU_REGION157.ENABLE**Type**

bool

Default value

0x0

Controls if region 157 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION157.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region157 as exempt.

IDAU_REGION157.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region157.

IDAU_REGION157.NSC**Type**

bool

Default value

0x0

Controls if region 157 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION158.BADDR**Type**

int

Default value

0x0

Base address of IDAU region158.

IDAU_REGION158.ENABLE**Type**

bool

Default value

0x0

Controls if region 158 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION158.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region158 as exempt.

IDAU_REGION158.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region158.

IDAU_REGION158.NSC**Type**

bool

Default value

0x0

Controls if region 158 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION159.BADDR**Type**

int

Default value

0x0

Base address of IDAU region159.

IDAU_REGION159.ENABLE**Type**

bool

Default value

0x0

Controls if region 159 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION159.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region159 as exempt.

IDAU_REGION159.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region159.

IDAU_REGION159.NSC**Type**

bool

Default value

0x0

Controls if region 159 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION16.BADDR**Type**

int

Default value

0x0

Base address of IDAU region16.

IDAU_REGION16.ENABLE**Type**

bool

Default value

0x0

Controls if region 16 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION16.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region16 as exempt.

IDAU_REGION16.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region16.

IDAU_REGION16.NSC**Type**

bool

Default value

0x0

Controls if region 16 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION160.BADDR**Type**

int

Default value

0x0

Base address of IDAU region160.

IDAU_REGION160.ENABLE**Type**

bool

Default value

0x0

Controls if region 160 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION160.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region160 as exempt.

IDAU_REGION160.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region160.

IDAU_REGION160.NSC**Type**

bool

Default value

0x0

Controls if region 160 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION161.BADDR**Type**

int

Default value

0x0

Base address of IDAU region161.

IDAU_REGION161.ENABLE**Type**

bool

Default value

0x0

Controls if region 161 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION161.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region161 as exempt.

IDAU_REGION161.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region161.

IDAU_REGION161.NSC**Type**

bool

Default value

0x0

Controls if region 161 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION162.BADDR**Type**

int

Default value

0x0

Base address of IDAU region162.

IDAU_REGION162.ENABLE**Type**

bool

Default value

0x0

Controls if region 162 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION162.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region162 as exempt.

IDAU_REGION162.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region162.

IDAU_REGION162.NSC**Type**

bool

Default value

0x0

Controls if region 162 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION163.BADDR**Type**

int

Default value

0x0

Base address of IDAU region163.

IDAU_REGION163.ENABLE**Type**

bool

Default value

0x0

Controls if region 163 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION163.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region163 as exempt.

IDAU_REGION163.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region163.

IDAU_REGION163.NSC**Type**

bool

Default value

0x0

Controls if region 163 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION164.BADDR**Type**

int

Default value

0x0

Base address of IDAU region164.

IDAU_REGION164.ENABLE**Type**

bool

Default value

0x0

Controls if region 164 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION164.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region164 as exempt.

IDAU_REGION164.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region164.

IDAU_REGION164.NSC**Type**

bool

Default value

0x0

Controls if region 164 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION165.BADDR**Type**

int

Default value

0x0

Base address of IDAU region165.

IDAU_REGION165.ENABLE**Type**

bool

Default value

0x0

Controls if region 165 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION165.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region165 as exempt.

IDAU_REGION165.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region165.

IDAU_REGION165.NSC**Type**

bool

Default value

0x0

Controls if region 165 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION166.BADDR**Type**

int

Default value

0x0

Base address of IDAU region166.

IDAU_REGION166.ENABLE**Type**

bool

Default value

0x0

Controls if region 166 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION166.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region166 as exempt.

IDAU_REGION166.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region166.

IDAU_REGION166.NSC**Type**

bool

Default value

0x0

Controls if region 166 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION167.BADDR**Type**

int

Default value

0x0

Base address of IDAU region167.

IDAU_REGION167.ENABLE**Type**

bool

Default value

0x0

Controls if region 167 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION167.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region167 as exempt.

IDAU_REGION167.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region167.

IDAU_REGION167.NSC**Type**

bool

Default value

0x0

Controls if region 167 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION168.BADDR**Type**

int

Default value

0x0

Base address of IDAU region168.

IDAU_REGION168.ENABLE**Type**

bool

Default value

0x0

Controls if region 168 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION168.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region168 as exempt.

IDAU_REGION168.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region168.

IDAU_REGION168.NSC**Type**

bool

Default value

0x0

Controls if region 168 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION169.BADDR**Type**

int

Default value

0x0

Base address of IDAU region169.

IDAU_REGION169.ENABLE**Type**

bool

Default value

0x0

Controls if region 169 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION169.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region169 as exempt.

IDAU_REGION169.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region169.

IDAU_REGION169.NSC**Type**

bool

Default value

0x0

Controls if region 169 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION17.BADDR**Type**

int

Default value

0x0

Base address of IDAU region17.

IDAU_REGION17.ENABLE**Type**

bool

Default value

0x0

Controls if region 17 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION17.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region17 as exempt.

IDAU_REGION17.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region17.

IDAU_REGION17.NSC**Type**

bool

Default value

0x0

Controls if region 17 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION170.BADDR**Type**

int

Default value

0x0

Base address of IDAU region170.

IDAU_REGION170.ENABLE**Type**

bool

Default value

0x0

Controls if region 170 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION170.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region170 as exempt.

IDAU_REGION170.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region170.

IDAU_REGION170.NSC**Type**

bool

Default value

0x0

Controls if region 170 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION171.BADDR**Type**

int

Default value

0x0

Base address of IDAU region171.

IDAU_REGION171.ENABLE**Type**

bool

Default value

0x0

Controls if region 171 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION171.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region171 as exempt.

IDAU_REGION171.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region171.

IDAU_REGION171.NSC**Type**

bool

Default value

0x0

Controls if region 171 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION172.BADDR**Type**

int

Default value

0x0

Base address of IDAU region172.

IDAU_REGION172.ENABLE**Type**

bool

Default value

0x0

Controls if region 172 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION172.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region172 as exempt.

IDAU_REGION172.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region172.

IDAU_REGION172.NSC**Type**

bool

Default value

0x0

Controls if region 172 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION173.BADDR**Type**

int

Default value

0x0

Base address of IDAU region173.

IDAU_REGION173.ENABLE**Type**

bool

Default value

0x0

Controls if region 173 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION173.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region173 as exempt.

IDAU_REGION173.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region173.

IDAU_REGION173.NSC**Type**

bool

Default value

0x0

Controls if region 173 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION174.BADDR**Type**

int

Default value

0x0

Base address of IDAU region174.

IDAU_REGION174.ENABLE**Type**

bool

Default value

0x0

Controls if region 174 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION174.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region174 as exempt.

IDAU_REGION174.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region174.

IDAU_REGION174.NSC**Type**

bool

Default value

0x0

Controls if region 174 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION175.BADDR**Type**

int

Default value

0x0

Base address of IDAU region175.

IDAU_REGION175.ENABLE**Type**

bool

Default value

0x0

Controls if region 175 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION175.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region175 as exempt.

IDAU_REGION175.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region175.

IDAU_REGION175.NSC**Type**

bool

Default value

0x0

Controls if region 175 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION176.BADDR**Type**

int

Default value

0x0

Base address of IDAU region176.

IDAU_REGION176.ENABLE**Type**

bool

Default value

0x0

Controls if region 176 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION176.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region176 as exempt.

IDAU_REGION176.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region176.

IDAU_REGION176.NSC**Type**

bool

Default value

0x0

Controls if region 176 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION177.BADDR**Type**

int

Default value

0x0

Base address of IDAU region177.

IDAU_REGION177.ENABLE**Type**

bool

Default value

0x0

Controls if region 177 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION177.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region177 as exempt.

IDAU_REGION177.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region177.

IDAU_REGION177.NSC**Type**

bool

Default value

0x0

Controls if region 177 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION178.BADDR**Type**

int

Default value

0x0

Base address of IDAU region178.

IDAU_REGION178.ENABLE**Type**

bool

Default value

0x0

Controls if region 178 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION178.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region178 as exempt.

IDAU_REGION178.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region178.

IDAU_REGION178.NSC**Type**

bool

Default value

0x0

Controls if region 178 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION179.BADDR**Type**

int

Default value

0x0

Base address of IDAU region179.

IDAU_REGION179.ENABLE**Type**

bool

Default value

0x0

Controls if region 179 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION179.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region179 as exempt.

IDAU_REGION179.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region179.

IDAU_REGION179.NSC**Type**

bool

Default value

0x0

Controls if region 179 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION18.BADDR**Type**

int

Default value

0x0

Base address of IDAU region18.

IDAU_REGION18.ENABLE**Type**

bool

Default value

0x0

Controls if region 18 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION18.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region18 as exempt.

IDAU_REGION18.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region18.

IDAU_REGION18.NSC**Type**

bool

Default value

0x0

Controls if region 18 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION180.BADDR**Type**

int

Default value

0x0

Base address of IDAU region180.

IDAU_REGION180.ENABLE**Type**

bool

Default value

0x0

Controls if region 180 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION180.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region180 as exempt.

IDAU_REGION180.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region180.

IDAU_REGION180.NSC**Type**

bool

Default value

0x0

Controls if region 180 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION181.BADDR**Type**

int

Default value

0x0

Base address of IDAU region181.

IDAU_REGION181.ENABLE**Type**

bool

Default value

0x0

Controls if region 181 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION181.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region181 as exempt.

IDAU_REGION181.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region181.

IDAU_REGION181.NSC**Type**

bool

Default value

0x0

Controls if region 181 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION182.BADDR**Type**

int

Default value

0x0

Base address of IDAU region182.

IDAU_REGION182.ENABLE**Type**

bool

Default value

0x0

Controls if region 182 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION182.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region182 as exempt.

IDAU_REGION182.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region182.

IDAU_REGION182.NSC**Type**

bool

Default value

0x0

Controls if region 182 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION183.BADDR**Type**

int

Default value

0x0

Base address of IDAU region183.

IDAU_REGION183.ENABLE**Type**

bool

Default value

0x0

Controls if region 183 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION183.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region183 as exempt.

IDAU_REGION183.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region183.

IDAU_REGION183.NSC**Type**

bool

Default value

0x0

Controls if region 183 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION184.BADDR**Type**

int

Default value

0x0

Base address of IDAU region184.

IDAU_REGION184.ENABLE**Type**

bool

Default value

0x0

Controls if region 184 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION184.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region184 as exempt.

IDAU_REGION184.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region184.

IDAU_REGION184.NSC**Type**

bool

Default value

0x0

Controls if region 184 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION185.BADDR**Type**

int

Default value

0x0

Base address of IDAU region185.

IDAU_REGION185.ENABLE**Type**

bool

Default value

0x0

Controls if region 185 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION185.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region185 as exempt.

IDAU_REGION185.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region185.

IDAU_REGION185.NSC**Type**

bool

Default value

0x0

Controls if region 185 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION186.BADDR**Type**

int

Default value

0x0

Base address of IDAU region186.

IDAU_REGION186.ENABLE**Type**

bool

Default value

0x0

Controls if region 186 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION186.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region186 as exempt.

IDAU_REGION186.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region186.

IDAU_REGION186.NSC**Type**

bool

Default value

0x0

Controls if region 186 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION187.BADDR**Type**

int

Default value

0x0

Base address of IDAU region187.

IDAU_REGION187.ENABLE**Type**

bool

Default value

0x0

Controls if region 187 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION187.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region187 as exempt.

IDAU_REGION187.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region187.

IDAU_REGION187.NSC**Type**

bool

Default value

0x0

Controls if region 187 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION188.BADDR**Type**

int

Default value

0x0

Base address of IDAU region188.

IDAU_REGION188.ENABLE**Type**

bool

Default value

0x0

Controls if region 188 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION188.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region188 as exempt.

IDAU_REGION188.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region188.

IDAU_REGION188.NSC**Type**

bool

Default value

0x0

Controls if region 188 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION189.BADDR**Type**

int

Default value

0x0

Base address of IDAU region189.

IDAU_REGION189.ENABLE**Type**

bool

Default value

0x0

Controls if region 189 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION189.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region189 as exempt.

IDAU_REGION189.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region189.

IDAU_REGION189.NSC**Type**

bool

Default value

0x0

Controls if region 189 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION19.BADDR**Type**

int

Default value

0x0

Base address of IDAU region19.

IDAU_REGION19.ENABLE**Type**

bool

Default value

0x0

Controls if region 19 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION19.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region19 as exempt.

IDAU_REGION19.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region19.

IDAU_REGION19.NSC**Type**

bool

Default value

0x0

Controls if region 19 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION190.BADDR**Type**

int

Default value

0x0

Base address of IDAU region190.

IDAU_REGION190.ENABLE**Type**

bool

Default value

0x0

Controls if region 190 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION190.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region190 as exempt.

IDAU_REGION190.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region190.

IDAU_REGION190.NSC**Type**

bool

Default value

0x0

Controls if region 190 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION191.BADDR**Type**

int

Default value

0x0

Base address of IDAU region191.

IDAU_REGION191.ENABLE**Type**

bool

Default value

0x0

Controls if region 191 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION191.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region191 as exempt.

IDAU_REGION191.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region191.

IDAU_REGION191.NSC**Type**

bool

Default value

0x0

Controls if region 191 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION192.BADDR**Type**

int

Default value

0x0

Base address of IDAU region192.

IDAU_REGION192.ENABLE**Type**

bool

Default value

0x0

Controls if region 192 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION192.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region192 as exempt.

IDAU_REGION192.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region192.

IDAU_REGION192.NSC**Type**

bool

Default value

0x0

Controls if region 192 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION193.BADDR**Type**

int

Default value

0x0

Base address of IDAU region193.

IDAU_REGION193.ENABLE**Type**

bool

Default value

0x0

Controls if region 193 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION193.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region193 as exempt.

IDAU_REGION193.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region193.

IDAU_REGION193.NSC**Type**

bool

Default value

0x0

Controls if region 193 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION194.BADDR**Type**

int

Default value

0x0

Base address of IDAU region194.

IDAU_REGION194.ENABLE**Type**

bool

Default value

0x0

Controls if region 194 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION194.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region194 as exempt.

IDAU_REGION194.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region194.

IDAU_REGION194.NSC**Type**

bool

Default value

0x0

Controls if region 194 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION195.BADDR**Type**

int

Default value

0x0

Base address of IDAU region195.

IDAU_REGION195.ENABLE**Type**

bool

Default value

0x0

Controls if region 195 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION195.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region195 as exempt.

IDAU_REGION195.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region195.

IDAU_REGION195.NSC**Type**

bool

Default value

0x0

Controls if region 195 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION196.BADDR**Type**

int

Default value

0x0

Base address of IDAU region196.

IDAU_REGION196.ENABLE**Type**

bool

Default value

0x0

Controls if region 196 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION196.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region196 as exempt.

IDAU_REGION196.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region196.

IDAU_REGION196.NSC**Type**

bool

Default value

0x0

Controls if region 196 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION197.BADDR**Type**

int

Default value

0x0

Base address of IDAU region197.

IDAU_REGION197.ENABLE**Type**

bool

Default value

0x0

Controls if region 197 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION197.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region197 as exempt.

IDAU_REGION197.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region197.

IDAU_REGION197.NSC**Type**

bool

Default value

0x0

Controls if region 197 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION198.BADDR**Type**

int

Default value

0x0

Base address of IDAU region198.

IDAU_REGION198.ENABLE**Type**

bool

Default value

0x0

Controls if region 198 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION198.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region198 as exempt.

IDAU_REGION198.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region198.

IDAU_REGION198.NSC**Type**

bool

Default value

0x0

Controls if region 198 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION199.BADDR**Type**

int

Default value

0x0

Base address of IDAU region199.

IDAU_REGION199.ENABLE**Type**

bool

Default value

0x0

Controls if region 199 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION199.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region199 as exempt.

IDAU_REGION199.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region199.

IDAU_REGION199.NSC**Type**

bool

Default value

0x0

Controls if region 199 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION2.BADDR**Type**

int

Default value

0x0

Base address of IDAU region2.

IDAU_REGION2.ENABLE**Type**

bool

Default value

0x0

Controls if region 2 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION2.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region2 as exempt.

IDAU_REGION2.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region2.

IDAU_REGION2.NSC**Type**

bool

Default value

0x0

Controls if region 2 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION20.BADDR**Type**

int

Default value

0x0

Base address of IDAU region20.

IDAU_REGION20.ENABLE**Type**

bool

Default value

0x0

Controls if region 20 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION20.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region20 as exempt.

IDAU_REGION20.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region20.

IDAU_REGION20.NSC**Type**

bool

Default value

0x0

Controls if region 20 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION200.BADDR**Type**

int

Default value

0x0

Base address of IDAU region200.

IDAU_REGION200.ENABLE**Type**

bool

Default value

0x0

Controls if region 200 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION200.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region200 as exempt.

IDAU_REGION200.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region200.

IDAU_REGION200.NSC**Type**

bool

Default value

0x0

Controls if region 200 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION201.BADDR**Type**

int

Default value

0x0

Base address of IDAU region201.

IDAU_REGION201.ENABLE**Type**

bool

Default value

0x0

Controls if region 201 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION201.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region201 as exempt.

IDAU_REGION201.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region201.

IDAU_REGION201.NSC**Type**

bool

Default value

0x0

Controls if region 201 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION202.BADDR**Type**

int

Default value

0x0

Base address of IDAU region202.

IDAU_REGION202.ENABLE**Type**

bool

Default value

0x0

Controls if region 202 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION202.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region202 as exempt.

IDAU_REGION202.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region202.

IDAU_REGION202.NSC**Type**

bool

Default value

0x0

Controls if region 202 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION203.BADDR**Type**

int

Default value

0x0

Base address of IDAU region203.

IDAU_REGION203.ENABLE**Type**

bool

Default value

0x0

Controls if region 203 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION203.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region203 as exempt.

IDAU_REGION203.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region203.

IDAU_REGION203.NSC**Type**

bool

Default value

0x0

Controls if region 203 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION204.BADDR**Type**

int

Default value

0x0

Base address of IDAU region204.

IDAU_REGION204.ENABLE**Type**

bool

Default value

0x0

Controls if region 204 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION204.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region204 as exempt.

IDAU_REGION204.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region204.

IDAU_REGION204.NSC**Type**

bool

Default value

0x0

Controls if region 204 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION205.BADDR**Type**

int

Default value

0x0

Base address of IDAU region205.

IDAU_REGION205.ENABLE**Type**

bool

Default value

0x0

Controls if region 205 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION205.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region205 as exempt.

IDAU_REGION205.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region205.

IDAU_REGION205.NSC**Type**

bool

Default value

0x0

Controls if region 205 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION206.BADDR**Type**

int

Default value

0x0

Base address of IDAU region206.

IDAU_REGION206.ENABLE**Type**

bool

Default value

0x0

Controls if region 206 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION206.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region206 as exempt.

IDAU_REGION206.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region206.

IDAU_REGION206.NSC**Type**

bool

Default value

0x0

Controls if region 206 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION207.BADDR**Type**

int

Default value

0x0

Base address of IDAU region207.

IDAU_REGION207.ENABLE**Type**

bool

Default value

0x0

Controls if region 207 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION207.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region207 as exempt.

IDAU_REGION207.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region207.

IDAU_REGION207.NSC**Type**

bool

Default value

0x0

Controls if region 207 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION208.BADDR**Type**

int

Default value

0x0

Base address of IDAU region208.

IDAU_REGION208.ENABLE**Type**

bool

Default value

0x0

Controls if region 208 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION208.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region208 as exempt.

IDAU_REGION208.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region208.

IDAU_REGION208.NSC**Type**

bool

Default value

0x0

Controls if region 208 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION209.BADDR**Type**

int

Default value

0x0

Base address of IDAU region209.

IDAU_REGION209.ENABLE**Type**

bool

Default value

0x0

Controls if region 209 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION209.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region209 as exempt.

IDAU_REGION209.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region209.

IDAU_REGION209.NSC**Type**

bool

Default value

0x0

Controls if region 209 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION21.BADDR**Type**

int

Default value

0x0

Base address of IDAU region21.

IDAU_REGION21.ENABLE**Type**

bool

Default value

0x0

Controls if region 21 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION21.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region21 as exempt.

IDAU_REGION21.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region21.

IDAU_REGION21.NSC**Type**

bool

Default value

0x0

Controls if region 21 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION210.BADDR**Type**

int

Default value

0x0

Base address of IDAU region210.

IDAU_REGION210.ENABLE**Type**

bool

Default value

0x0

Controls if region 210 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION210.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region210 as exempt.

IDAU_REGION210.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region210.

IDAU_REGION210.NSC**Type**

bool

Default value

0x0

Controls if region 210 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION211.BADDR**Type**

int

Default value

0x0

Base address of IDAU region211.

IDAU_REGION211.ENABLE**Type**

bool

Default value

0x0

Controls if region 211 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION211.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region211 as exempt.

IDAU_REGION211.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region211.

IDAU_REGION211.NSC**Type**

bool

Default value

0x0

Controls if region 211 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION212.BADDR**Type**

int

Default value

0x0

Base address of IDAU region212.

IDAU_REGION212.ENABLE**Type**

bool

Default value

0x0

Controls if region 212 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION212.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region212 as exempt.

IDAU_REGION212.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region212.

IDAU_REGION212.NSC**Type**

bool

Default value

0x0

Controls if region 212 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION213.BADDR**Type**

int

Default value

0x0

Base address of IDAU region213.

IDAU_REGION213.ENABLE**Type**

bool

Default value

0x0

Controls if region 213 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION213.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region213 as exempt.

IDAU_REGION213.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region213.

IDAU_REGION213.NSC**Type**

bool

Default value

0x0

Controls if region 213 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION214.BADDR**Type**

int

Default value

0x0

Base address of IDAU region214.

IDAU_REGION214.ENABLE**Type**

bool

Default value

0x0

Controls if region 214 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION214.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region214 as exempt.

IDAU_REGION214.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region214.

IDAU_REGION214.NSC**Type**

bool

Default value

0x0

Controls if region 214 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION215.BADDR**Type**

int

Default value

0x0

Base address of IDAU region215.

IDAU_REGION215.ENABLE**Type**

bool

Default value

0x0

Controls if region 215 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION215.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region215 as exempt.

IDAU_REGION215.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region215.

IDAU_REGION215.NSC**Type**

bool

Default value

0x0

Controls if region 215 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION216.BADDR**Type**

int

Default value

0x0

Base address of IDAU region216.

IDAU_REGION216.ENABLE**Type**

bool

Default value

0x0

Controls if region 216 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION216.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region216 as exempt.

IDAU_REGION216.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region216.

IDAU_REGION216.NSC**Type**

bool

Default value

0x0

Controls if region 216 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION217.BADDR**Type**

int

Default value

0x0

Base address of IDAU region217.

IDAU_REGION217.ENABLE**Type**

bool

Default value

0x0

Controls if region 217 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION217.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region217 as exempt.

IDAU_REGION217.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region217.

IDAU_REGION217.NSC**Type**

bool

Default value

0x0

Controls if region 217 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION218.BADDR**Type**

int

Default value

0x0

Base address of IDAU region218.

IDAU_REGION218.ENABLE**Type**

bool

Default value

0x0

Controls if region 218 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION218.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region218 as exempt.

IDAU_REGION218.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region218.

IDAU_REGION218.NSC**Type**

bool

Default value

0x0

Controls if region 218 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION219.BADDR**Type**

int

Default value

0x0

Base address of IDAU region219.

IDAU_REGION219.ENABLE**Type**

bool

Default value

0x0

Controls if region 219 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION219.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region219 as exempt.

IDAU_REGION219.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region219.

IDAU_REGION219.NSC**Type**

bool

Default value

0x0

Controls if region 219 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION22.BADDR**Type**

int

Default value

0x0

Base address of IDAU region22.

IDAU_REGION22.ENABLE**Type**

bool

Default value

0x0

Controls if region 22 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION22.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region22 as exempt.

IDAU_REGION22.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region22.

IDAU_REGION22.NSC**Type**

bool

Default value

0x0

Controls if region 22 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION220.BADDR**Type**

int

Default value

0x0

Base address of IDAU region220.

IDAU_REGION220.ENABLE**Type**

bool

Default value

0x0

Controls if region 220 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION220.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region220 as exempt.

IDAU_REGION220.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region220.

IDAU_REGION220.NSC**Type**

bool

Default value

0x0

Controls if region 220 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION221.BADDR**Type**

int

Default value

0x0

Base address of IDAU region221.

IDAU_REGION221.ENABLE**Type**

bool

Default value

0x0

Controls if region 221 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION221.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region221 as exempt.

IDAU_REGION221.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region221.

IDAU_REGION221.NSC**Type**

bool

Default value

0x0

Controls if region 221 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION222.BADDR**Type**

int

Default value

0x0

Base address of IDAU region222.

IDAU_REGION222.ENABLE**Type**

bool

Default value

0x0

Controls if region 222 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION222.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region222 as exempt.

IDAU_REGION222.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region222.

IDAU_REGION222.NSC**Type**

bool

Default value

0x0

Controls if region 222 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION223.BADDR**Type**

int

Default value

0x0

Base address of IDAU region223.

IDAU_REGION223.ENABLE**Type**

bool

Default value

0x0

Controls if region 223 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION223.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region223 as exempt.

IDAU_REGION223.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region223.

IDAU_REGION223.NSC**Type**

bool

Default value

0x0

Controls if region 223 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION224.BADDR**Type**

int

Default value

0x0

Base address of IDAU region224.

IDAU_REGION224.ENABLE**Type**

bool

Default value

0x0

Controls if region 224 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION224.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region224 as exempt.

IDAU_REGION224.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region224.

IDAU_REGION224.NSC**Type**

bool

Default value

0x0

Controls if region 224 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION225.BADDR**Type**

int

Default value

0x0

Base address of IDAU region225.

IDAU_REGION225.ENABLE**Type**

bool

Default value

0x0

Controls if region 225 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION225.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region225 as exempt.

IDAU_REGION225.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region225.

IDAU_REGION225.NSC**Type**

bool

Default value

0x0

Controls if region 225 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION226.BADDR**Type**

int

Default value

0x0

Base address of IDAU region226.

IDAU_REGION226.ENABLE**Type**

bool

Default value

0x0

Controls if region 226 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION226.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region226 as exempt.

IDAU_REGION226.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region226.

IDAU_REGION226.NSC**Type**

bool

Default value

0x0

Controls if region 226 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION227.BADDR**Type**

int

Default value

0x0

Base address of IDAU region227.

IDAU_REGION227.ENABLE**Type**

bool

Default value

0x0

Controls if region 227 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION227.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region227 as exempt.

IDAU_REGION227.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region227.

IDAU_REGION227.NSC**Type**

bool

Default value

0x0

Controls if region 227 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION228.BADDR**Type**

int

Default value

0x0

Base address of IDAU region228.

IDAU_REGION228.ENABLE**Type**

bool

Default value

0x0

Controls if region 228 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION228.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region228 as exempt.

IDAU_REGION228.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region228.

IDAU_REGION228.NSC**Type**

bool

Default value

0x0

Controls if region 228 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION229.BADDR**Type**

int

Default value

0x0

Base address of IDAU region229.

IDAU_REGION229.ENABLE**Type**

bool

Default value

0x0

Controls if region 229 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION229.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region229 as exempt.

IDAU_REGION229.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region229.

IDAU_REGION229.NSC**Type**

bool

Default value

0x0

Controls if region 229 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION23.BADDR**Type**

int

Default value

0x0

Base address of IDAU region23.

IDAU_REGION23.ENABLE**Type**

bool

Default value

0x0

Controls if region 23 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION23.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region23 as exempt.

IDAU_REGION23.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region23.

IDAU_REGION23.NSC**Type**

bool

Default value

0x0

Controls if region 23 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION230.BADDR**Type**

int

Default value

0x0

Base address of IDAU region230.

IDAU_REGION230.ENABLE**Type**

bool

Default value

0x0

Controls if region 230 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION230.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region230 as exempt.

IDAU_REGION230.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region230.

IDAU_REGION230.NSC**Type**

bool

Default value

0x0

Controls if region 230 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION231.BADDR**Type**

int

Default value

0x0

Base address of IDAU region231.

IDAU_REGION231.ENABLE**Type**

bool

Default value

0x0

Controls if region 231 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION231.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region231 as exempt.

IDAU_REGION231.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region231.

IDAU_REGION231.NSC**Type**

bool

Default value

0x0

Controls if region 231 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION232.BADDR**Type**

int

Default value

0x0

Base address of IDAU region232.

IDAU_REGION232.ENABLE**Type**

bool

Default value

0x0

Controls if region 232 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION232.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region232 as exempt.

IDAU_REGION232.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region232.

IDAU_REGION232.NSC**Type**

bool

Default value

0x0

Controls if region 232 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION233.BADDR**Type**

int

Default value

0x0

Base address of IDAU region233.

IDAU_REGION233.ENABLE**Type**

bool

Default value

0x0

Controls if region 233 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION233.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region233 as exempt.

IDAU_REGION233.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region233.

IDAU_REGION233.NSC**Type**

bool

Default value

0x0

Controls if region 233 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION234.BADDR**Type**

int

Default value

0x0

Base address of IDAU region234.

IDAU_REGION234.ENABLE**Type**

bool

Default value

0x0

Controls if region 234 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION234.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region234 as exempt.

IDAU_REGION234.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region234.

IDAU_REGION234.NSC**Type**

bool

Default value

0x0

Controls if region 234 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION235.BADDR**Type**

int

Default value

0x0

Base address of IDAU region235.

IDAU_REGION235.ENABLE**Type**

bool

Default value

0x0

Controls if region 235 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION235.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region235 as exempt.

IDAU_REGION235.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region235.

IDAU_REGION235.NSC**Type**

bool

Default value

0x0

Controls if region 235 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION236.BADDR**Type**

int

Default value

0x0

Base address of IDAU region236.

IDAU_REGION236.ENABLE**Type**

bool

Default value

0x0

Controls if region 236 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION236.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region236 as exempt.

IDAU_REGION236.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region236.

IDAU_REGION236.NSC**Type**

bool

Default value

0x0

Controls if region 236 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION237.BADDR**Type**

int

Default value

0x0

Base address of IDAU region237.

IDAU_REGION237.ENABLE**Type**

bool

Default value

0x0

Controls if region 237 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION237.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region237 as exempt.

IDAU_REGION237.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region237.

IDAU_REGION237.NSC**Type**

bool

Default value

0x0

Controls if region 237 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION238.BADDR**Type**

int

Default value

0x0

Base address of IDAU region238.

IDAU_REGION238.ENABLE**Type**

bool

Default value

0x0

Controls if region 238 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION238.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region238 as exempt.

IDAU_REGION238.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region238.

IDAU_REGION238.NSC**Type**

bool

Default value

0x0

Controls if region 238 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION239.BADDR**Type**

int

Default value

0x0

Base address of IDAU region239.

IDAU_REGION239.ENABLE**Type**

bool

Default value

0x0

Controls if region 239 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION239.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region239 as exempt.

IDAU_REGION239.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region239.

IDAU_REGION239.NSC**Type**

bool

Default value

0x0

Controls if region 239 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION24.BADDR**Type**

int

Default value

0x0

Base address of IDAU region24.

IDAU_REGION24.ENABLE**Type**

bool

Default value

0x0

Controls if region 24 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION24.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region24 as exempt.

IDAU_REGION24.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region24.

IDAU_REGION24.NSC**Type**

bool

Default value

0x0

Controls if region 24 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION240.BADDR**Type**

int

Default value

0x0

Base address of IDAU region240.

IDAU_REGION240.ENABLE**Type**

bool

Default value

0x0

Controls if region 240 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION240.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region240 as exempt.

IDAU_REGION240.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region240.

IDAU_REGION240.NSC**Type**

bool

Default value

0x0

Controls if region 240 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION241.BADDR**Type**

int

Default value

0x0

Base address of IDAU region241.

IDAU_REGION241.ENABLE**Type**

bool

Default value

0x0

Controls if region 241 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION241.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region241 as exempt.

IDAU_REGION241.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region241.

IDAU_REGION241.NSC**Type**

bool

Default value

0x0

Controls if region 241 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION242.BADDR**Type**

int

Default value

0x0

Base address of IDAU region242.

IDAU_REGION242.ENABLE**Type**

bool

Default value

0x0

Controls if region 242 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION242.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region242 as exempt.

IDAU_REGION242.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region242.

IDAU_REGION242.NSC**Type**

bool

Default value

0x0

Controls if region 242 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION243.BADDR**Type**

int

Default value

0x0

Base address of IDAU region243.

IDAU_REGION243.ENABLE**Type**

bool

Default value

0x0

Controls if region 243 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION243.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region243 as exempt.

IDAU_REGION243.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region243.

IDAU_REGION243.NSC**Type**

bool

Default value

0x0

Controls if region 243 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION244.BADDR**Type**

int

Default value

0x0

Base address of IDAU region244.

IDAU_REGION244.ENABLE**Type**

bool

Default value

0x0

Controls if region 244 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION244.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region244 as exempt.

IDAU_REGION244.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region244.

IDAU_REGION244.NSC**Type**

bool

Default value

0x0

Controls if region 244 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION245.BADDR**Type**

int

Default value

0x0

Base address of IDAU region245.

IDAU_REGION245.ENABLE**Type**

bool

Default value

0x0

Controls if region 245 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION245.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region245 as exempt.

IDAU_REGION245.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region245.

IDAU_REGION245.NSC**Type**

bool

Default value

0x0

Controls if region 245 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION246.BADDR**Type**

int

Default value

0x0

Base address of IDAU region246.

IDAU_REGION246.ENABLE**Type**

bool

Default value

0x0

Controls if region 246 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION246.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region246 as exempt.

IDAU_REGION246.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region246.

IDAU_REGION246.NSC**Type**

bool

Default value

0x0

Controls if region 246 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION247.BADDR**Type**

int

Default value

0x0

Base address of IDAU region247.

IDAU_REGION247.ENABLE**Type**

bool

Default value

0x0

Controls if region 247 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION247.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region247 as exempt.

IDAU_REGION247.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region247.

IDAU_REGION247.NSC**Type**

bool

Default value

0x0

Controls if region 247 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION248.BADDR**Type**

int

Default value

0x0

Base address of IDAU region248.

IDAU_REGION248.ENABLE**Type**

bool

Default value

0x0

Controls if region 248 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION248.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region248 as exempt.

IDAU_REGION248.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region248.

IDAU_REGION248.NSC**Type**

bool

Default value

0x0

Controls if region 248 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION249.BADDR**Type**

int

Default value

0x0

Base address of IDAU region249.

IDAU_REGION249.ENABLE**Type**

bool

Default value

0x0

Controls if region 249 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION249.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region249 as exempt.

IDAU_REGION249.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region249.

IDAU_REGION249.NSC**Type**

bool

Default value

0x0

Controls if region 249 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION25.BADDR**Type**

int

Default value

0x0

Base address of IDAU region25.

IDAU_REGION25.ENABLE**Type**

bool

Default value

0x0

Controls if region 25 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION25.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region25 as exempt.

IDAU_REGION25.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region25.

IDAU_REGION25.NSC**Type**

bool

Default value

0x0

Controls if region 25 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION250.BADDR**Type**

int

Default value

0x0

Base address of IDAU region250.

IDAU_REGION250.ENABLE**Type**

bool

Default value

0x0

Controls if region 250 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION250.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region250 as exempt.

IDAU_REGION250.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region250.

IDAU_REGION250.NSC**Type**

bool

Default value

0x0

Controls if region 250 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION251.BADDR**Type**

int

Default value

0x0

Base address of IDAU region251.

IDAU_REGION251.ENABLE**Type**

bool

Default value

0x0

Controls if region 251 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION251.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region251 as exempt.

IDAU_REGION251.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region251.

IDAU_REGION251.NSC**Type**

bool

Default value

0x0

Controls if region 251 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION252.BADDR**Type**

int

Default value

0x0

Base address of IDAU region252.

IDAU_REGION252.ENABLE**Type**

bool

Default value

0x0

Controls if region 252 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION252.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region252 as exempt.

IDAU_REGION252.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region252.

IDAU_REGION252.NSC**Type**

bool

Default value

0x0

Controls if region 252 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION253.BADDR**Type**

int

Default value

0x0

Base address of IDAU region253.

IDAU_REGION253.ENABLE**Type**

bool

Default value

0x0

Controls if region 253 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION253.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region253 as exempt.

IDAU_REGION253.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region253.

IDAU_REGION253.NSC**Type**

bool

Default value

0x0

Controls if region 253 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION254.BADDR**Type**

int

Default value

0x0

Base address of IDAU region254.

IDAU_REGION254.ENABLE**Type**

bool

Default value

0x0

Controls if region 254 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION254.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region254 as exempt.

IDAU_REGION254.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region254.

IDAU_REGION254.NSC**Type**

bool

Default value

0x0

Controls if region 254 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION255.BADDR**Type**

int

Default value

0x0

Base address of IDAU region255.

IDAU_REGION255.ENABLE**Type**

bool

Default value

0x0

Controls if region 255 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION255.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region255 as exempt.

IDAU_REGION255.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region255.

IDAU_REGION255.NSC**Type**

bool

Default value

0x0

Controls if region 255 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION26.BADDR**Type**

int

Default value

0x0

Base address of IDAU region26.

IDAU_REGION26.ENABLE**Type**

bool

Default value

0x0

Controls if region 26 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION26.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region26 as exempt.

IDAU_REGION26.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region26.

IDAU_REGION26.NSC**Type**

bool

Default value

0x0

Controls if region 26 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION27.BADDR**Type**

int

Default value

0x0

Base address of IDAU region27.

IDAU_REGION27.ENABLE**Type**

bool

Default value

0x0

Controls if region 27 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION27.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region27 as exempt.

IDAU_REGION27.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region27.

IDAU_REGION27.NSC**Type**

bool

Default value

0x0

Controls if region 27 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION28.BADDR**Type**

int

Default value

0x0

Base address of IDAU region28.

IDAU_REGION28.ENABLE**Type**

bool

Default value

0x0

Controls if region 28 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION28.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region28 as exempt.

IDAU_REGION28.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region28.

IDAU_REGION28.NSC**Type**

bool

Default value

0x0

Controls if region 28 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION29.BADDR**Type**

int

Default value

0x0

Base address of IDAU region29.

IDAU_REGION29.ENABLE**Type**

bool

Default value

0x0

Controls if region 29 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION29.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region29 as exempt.

IDAU_REGION29.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region29.

IDAU_REGION29.NSC**Type**

bool

Default value

0x0

Controls if region 29 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION3.BADDR**Type**

int

Default value

0x0

Base address of IDAU region3.

IDAU_REGION3.ENABLE**Type**

bool

Default value

0x0

Controls if region 3 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION3.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region3 as exempt.

IDAU_REGION3.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region3.

IDAU_REGION3.NSC**Type**

bool

Default value

0x0

Controls if region 3 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION30.BADDR**Type**

int

Default value

0x0

Base address of IDAU region30.

IDAU_REGION30.ENABLE**Type**

bool

Default value

0x0

Controls if region 30 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION30.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region30 as exempt.

IDAU_REGION30.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region30.

IDAU_REGION30.NSC**Type**

bool

Default value

0x0

Controls if region 30 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION31.BADDR**Type**

int

Default value

0x0

Base address of IDAU region31.

IDAU_REGION31.ENABLE**Type**

bool

Default value

0x0

Controls if region 31 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION31.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region31 as exempt.

IDAU_REGION31.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region31.

IDAU_REGION31.NSC**Type**

bool

Default value

0x0

Controls if region 31 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION32.BADDR**Type**

int

Default value

0x0

Base address of IDAU region32.

IDAU_REGION32.ENABLE**Type**

bool

Default value

0x0

Controls if region 32 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION32.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region32 as exempt.

IDAU_REGION32.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region32.

IDAU_REGION32.NSC**Type**

bool

Default value

0x0

Controls if region 32 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION33.BADDR**Type**

int

Default value

0x0

Base address of IDAU region33.

IDAU_REGION33.ENABLE**Type**

bool

Default value

0x0

Controls if region 33 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION33.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region33 as exempt.

IDAU_REGION33.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region33.

IDAU_REGION33.NSC**Type**

bool

Default value

0x0

Controls if region 33 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION34.BADDR**Type**

int

Default value

0x0

Base address of IDAU region34.

IDAU_REGION34.ENABLE**Type**

bool

Default value

0x0

Controls if region 34 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION34.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region34 as exempt.

IDAU_REGION34.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region34.

IDAU_REGION34.NSC**Type**

bool

Default value

0x0

Controls if region 34 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION35.BADDR**Type**

int

Default value

0x0

Base address of IDAU region35.

IDAU_REGION35.ENABLE**Type**

bool

Default value

0x0

Controls if region 35 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION35.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region35 as exempt.

IDAU_REGION35.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region35.

IDAU_REGION35.NSC**Type**

bool

Default value

0x0

Controls if region 35 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION36.BADDR**Type**

int

Default value

0x0

Base address of IDAU region36.

IDAU_REGION36.ENABLE**Type**

bool

Default value

0x0

Controls if region 36 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION36.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region36 as exempt.

IDAU_REGION36.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region36.

IDAU_REGION36.NSC**Type**

bool

Default value

0x0

Controls if region 36 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION37.BADDR**Type**

int

Default value

0x0

Base address of IDAU region37.

IDAU_REGION37.ENABLE**Type**

bool

Default value

0x0

Controls if region 37 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION37.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region37 as exempt.

IDAU_REGION37.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region37.

IDAU_REGION37.NSC**Type**

bool

Default value

0x0

Controls if region 37 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION38.BADDR**Type**

int

Default value

0x0

Base address of IDAU region38.

IDAU_REGION38.ENABLE**Type**

bool

Default value

0x0

Controls if region 38 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION38.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region38 as exempt.

IDAU_REGION38.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region38.

IDAU_REGION38.NSC**Type**

bool

Default value

0x0

Controls if region 38 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION39.BADDR**Type**

int

Default value

0x0

Base address of IDAU region39.

IDAU_REGION39.ENABLE**Type**

bool

Default value

0x0

Controls if region 39 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION39.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region39 as exempt.

IDAU_REGION39.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region39.

IDAU_REGION39.NSC**Type**

bool

Default value

0x0

Controls if region 39 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION4.BADDR**Type**

int

Default value

0x0

Base address of IDAU region4.

IDAU_REGION4.ENABLE**Type**

bool

Default value

0x0

Controls if region 4 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION4.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region4 as exempt.

IDAU_REGION4.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region4.

IDAU_REGION4.NSC**Type**

bool

Default value

0x0

Controls if region 4 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION40.BADDR**Type**

int

Default value

0x0

Base address of IDAU region40.

IDAU_REGION40.ENABLE**Type**

bool

Default value

0x0

Controls if region 40 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION40.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region40 as exempt.

IDAU_REGION40.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region40.

IDAU_REGION40.NSC**Type**

bool

Default value

0x0

Controls if region 40 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION41.BADDR**Type**

int

Default value

0x0

Base address of IDAU region41.

IDAU_REGION41.ENABLE**Type**

bool

Default value

0x0

Controls if region 41 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION41.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region41 as exempt.

IDAU_REGION41.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region41.

IDAU_REGION41.NSC**Type**

bool

Default value

0x0

Controls if region 41 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION42.BADDR**Type**

int

Default value

0x0

Base address of IDAU region42.

IDAU_REGION42.ENABLE**Type**

bool

Default value

0x0

Controls if region 42 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION42.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region42 as exempt.

IDAU_REGION42.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region42.

IDAU_REGION42.NSC**Type**

bool

Default value

0x0

Controls if region 42 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION43.BADDR**Type**

int

Default value

0x0

Base address of IDAU region43.

IDAU_REGION43.ENABLE**Type**

bool

Default value

0x0

Controls if region 43 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION43.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region43 as exempt.

IDAU_REGION43.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region43.

IDAU_REGION43.NSC**Type**

bool

Default value

0x0

Controls if region 43 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION44.BADDR**Type**

int

Default value

0x0

Base address of IDAU region44.

IDAU_REGION44.ENABLE**Type**

bool

Default value

0x0

Controls if region 44 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION44.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region44 as exempt.

IDAU_REGION44.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region44.

IDAU_REGION44.NSC**Type**

bool

Default value

0x0

Controls if region 44 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION45.BADDR**Type**

int

Default value

0x0

Base address of IDAU region45.

IDAU_REGION45.ENABLE**Type**

bool

Default value

0x0

Controls if region 45 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION45.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region45 as exempt.

IDAU_REGION45.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region45.

IDAU_REGION45.NSC**Type**

bool

Default value

0x0

Controls if region 45 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION46.BADDR**Type**

int

Default value

0x0

Base address of IDAU region46.

IDAU_REGION46.ENABLE**Type**

bool

Default value

0x0

Controls if region 46 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION46.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region46 as exempt.

IDAU_REGION46.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region46.

IDAU_REGION46.NSC**Type**

bool

Default value

0x0

Controls if region 46 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION47.BADDR**Type**

int

Default value

0x0

Base address of IDAU region47.

IDAU_REGION47.ENABLE**Type**

bool

Default value

0x0

Controls if region 47 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION47.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region47 as exempt.

IDAU_REGION47.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region47.

IDAU_REGION47.NSC**Type**

bool

Default value

0x0

Controls if region 47 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION48.BADDR**Type**

int

Default value

0x0

Base address of IDAU region48.

IDAU_REGION48.ENABLE**Type**

bool

Default value

0x0

Controls if region 48 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION48.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region48 as exempt.

IDAU_REGION48.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region48.

IDAU_REGION48.NSC**Type**

bool

Default value

0x0

Controls if region 48 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION49.BADDR**Type**

int

Default value

0x0

Base address of IDAU region49.

IDAU_REGION49.ENABLE**Type**

bool

Default value

0x0

Controls if region 49 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION49.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region49 as exempt.

IDAU_REGION49.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region49.

IDAU_REGION49.NSC**Type**

bool

Default value

0x0

Controls if region 49 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION5.BADDR**Type**

int

Default value

0x0

Base address of IDAU region5.

IDAU_REGION5.ENABLE**Type**

bool

Default value

0x0

Controls if region 5 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION5.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region5 as exempt.

IDAU_REGION5.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region5.

IDAU_REGION5.NSC**Type**

bool

Default value

0x0

Controls if region 5 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION50.BADDR**Type**

int

Default value

0x0

Base address of IDAU region50.

IDAU_REGION50.ENABLE**Type**

bool

Default value

0x0

Controls if region 50 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION50.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region50 as exempt.

IDAU_REGION50.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region50.

IDAU_REGION50.NSC**Type**

bool

Default value

0x0

Controls if region 50 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION51.BADDR**Type**

int

Default value

0x0

Base address of IDAU region51.

IDAU_REGION51.ENABLE**Type**

bool

Default value

0x0

Controls if region 51 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION51.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region51 as exempt.

IDAU_REGION51.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region51.

IDAU_REGION51.NSC**Type**

bool

Default value

0x0

Controls if region 51 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION52.BADDR**Type**

int

Default value

0x0

Base address of IDAU region52.

IDAU_REGION52.ENABLE**Type**

bool

Default value

0x0

Controls if region 52 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION52.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region52 as exempt.

IDAU_REGION52.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region52.

IDAU_REGION52.NSC**Type**

bool

Default value

0x0

Controls if region 52 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION53.BADDR**Type**

int

Default value

0x0

Base address of IDAU region53.

IDAU_REGION53.ENABLE**Type**

bool

Default value

0x0

Controls if region 53 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION53.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region53 as exempt.

IDAU_REGION53.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region53.

IDAU_REGION53.NSC**Type**

bool

Default value

0x0

Controls if region 53 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION54.BADDR**Type**

int

Default value

0x0

Base address of IDAU region54.

IDAU_REGION54.ENABLE**Type**

bool

Default value

0x0

Controls if region 54 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION54.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region54 as exempt.

IDAU_REGION54.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region54.

IDAU_REGION54.NSC**Type**

bool

Default value

0x0

Controls if region 54 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION55.BADDR**Type**

int

Default value

0x0

Base address of IDAU region55.

IDAU_REGION55.ENABLE**Type**

bool

Default value

0x0

Controls if region 55 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION55.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region55 as exempt.

IDAU_REGION55.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region55.

IDAU_REGION55.NSC**Type**

bool

Default value

0x0

Controls if region 55 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION56.BADDR**Type**

int

Default value

0x0

Base address of IDAU region56.

IDAU_REGION56.ENABLE**Type**

bool

Default value

0x0

Controls if region 56 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION56.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region56 as exempt.

IDAU_REGION56.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region56.

IDAU_REGION56.NSC**Type**

bool

Default value

0x0

Controls if region 56 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION57.BADDR**Type**

int

Default value

0x0

Base address of IDAU region57.

IDAU_REGION57.ENABLE**Type**

bool

Default value

0x0

Controls if region 57 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION57.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region57 as exempt.

IDAU_REGION57.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region57.

IDAU_REGION57.NSC**Type**

bool

Default value

0x0

Controls if region 57 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION58.BADDR**Type**

int

Default value

0x0

Base address of IDAU region58.

IDAU_REGION58.ENABLE**Type**

bool

Default value

0x0

Controls if region 58 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION58.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region58 as exempt.

IDAU_REGION58.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region58.

IDAU_REGION58.NSC**Type**

bool

Default value

0x0

Controls if region 58 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION59.BADDR**Type**

int

Default value

0x0

Base address of IDAU region59.

IDAU_REGION59.ENABLE**Type**

bool

Default value

0x0

Controls if region 59 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION59.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region59 as exempt.

IDAU_REGION59.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region59.

IDAU_REGION59.NSC**Type**

bool

Default value

0x0

Controls if region 59 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION6.BADDR**Type**

int

Default value

0x0

Base address of IDAU region6.

IDAU_REGION6.ENABLE**Type**

bool

Default value

0x0

Controls if region 6 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION6.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region6 as exempt.

IDAU_REGION6.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region6.

IDAU_REGION6.NSC**Type**

bool

Default value

0x0

Controls if region 6 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION60.BADDR**Type**

int

Default value

0x0

Base address of IDAU region60.

IDAU_REGION60.ENABLE**Type**

bool

Default value

0x0

Controls if region 60 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION60.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region60 as exempt.

IDAU_REGION60.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region60.

IDAU_REGION60.NSC**Type**

bool

Default value

0x0

Controls if region 60 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION61.BADDR**Type**

int

Default value

0x0

Base address of IDAU region61.

IDAU_REGION61.ENABLE**Type**

bool

Default value

0x0

Controls if region 61 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION61.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region61 as exempt.

IDAU_REGION61.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region61.

IDAU_REGION61.NSC**Type**

bool

Default value

0x0

Controls if region 61 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION62.BADDR**Type**

int

Default value

0x0

Base address of IDAU region62.

IDAU_REGION62.ENABLE**Type**

bool

Default value

0x0

Controls if region 62 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION62.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region62 as exempt.

IDAU_REGION62.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region62.

IDAU_REGION62.NSC**Type**

bool

Default value

0x0

Controls if region 62 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION63.BADDR**Type**

int

Default value

0x0

Base address of IDAU region63.

IDAU_REGION63.ENABLE**Type**

bool

Default value

0x0

Controls if region 63 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION63.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region63 as exempt.

IDAU_REGION63.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region63.

IDAU_REGION63.NSC**Type**

bool

Default value

0x0

Controls if region 63 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION64.BADDR**Type**

int

Default value

0x0

Base address of IDAU region64.

IDAU_REGION64.ENABLE**Type**

bool

Default value

0x0

Controls if region 64 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION64.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region64 as exempt.

IDAU_REGION64.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region64.

IDAU_REGION64.NSC**Type**

bool

Default value

0x0

Controls if region 64 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION65.BADDR**Type**

int

Default value

0x0

Base address of IDAU region65.

IDAU_REGION65.ENABLE**Type**

bool

Default value

0x0

Controls if region 65 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION65.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region65 as exempt.

IDAU_REGION65.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region65.

IDAU_REGION65.NSC**Type**

bool

Default value

0x0

Controls if region 65 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION66.BADDR**Type**

int

Default value

0x0

Base address of IDAU region66.

IDAU_REGION66.ENABLE**Type**

bool

Default value

0x0

Controls if region 66 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION66.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region66 as exempt.

IDAU_REGION66.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region66.

IDAU_REGION66.NSC**Type**

bool

Default value

0x0

Controls if region 66 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION67.BADDR**Type**

int

Default value

0x0

Base address of IDAU region67.

IDAU_REGION67.ENABLE**Type**

bool

Default value

0x0

Controls if region 67 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION67.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region67 as exempt.

IDAU_REGION67.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region67.

IDAU_REGION67.NSC**Type**

bool

Default value

0x0

Controls if region 67 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION68.BADDR**Type**

int

Default value

0x0

Base address of IDAU region68.

IDAU_REGION68.ENABLE**Type**

bool

Default value

0x0

Controls if region 68 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION68.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region68 as exempt.

IDAU_REGION68.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region68.

IDAU_REGION68.NSC**Type**

bool

Default value

0x0

Controls if region 68 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION69.BADDR**Type**

int

Default value

0x0

Base address of IDAU region69.

IDAU_REGION69.ENABLE**Type**

bool

Default value

0x0

Controls if region 69 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION69.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region69 as exempt.

IDAU_REGION69.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region69.

IDAU_REGION69.NSC**Type**

bool

Default value

0x0

Controls if region 69 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION7.BADDR**Type**

int

Default value

0x0

Base address of IDAU region7.

IDAU_REGION7.ENABLE**Type**

bool

Default value

0x0

Controls if region 7 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION7.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region7 as exempt.

IDAU_REGION7.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region7.

IDAU_REGION7.NSC**Type**

bool

Default value

0x0

Controls if region 7 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION70.BADDR**Type**

int

Default value

0x0

Base address of IDAU region70.

IDAU_REGION70.ENABLE**Type**

bool

Default value

0x0

Controls if region 70 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION70.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region70 as exempt.

IDAU_REGION70.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region70.

IDAU_REGION70.NSC**Type**

bool

Default value

0x0

Controls if region 70 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION71.BADDR**Type**

int

Default value

0x0

Base address of IDAU region71.

IDAU_REGION71.ENABLE**Type**

bool

Default value

0x0

Controls if region 71 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION71.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region71 as exempt.

IDAU_REGION71.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region71.

IDAU_REGION71.NSC**Type**

bool

Default value

0x0

Controls if region 71 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION72.BADDR**Type**

int

Default value

0x0

Base address of IDAU region72.

IDAU_REGION72.ENABLE**Type**

bool

Default value

0x0

Controls if region 72 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION72.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region72 as exempt.

IDAU_REGION72.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region72.

IDAU_REGION72.NSC**Type**

bool

Default value

0x0

Controls if region 72 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION73.BADDR**Type**

int

Default value

0x0

Base address of IDAU region73.

IDAU_REGION73.ENABLE**Type**

bool

Default value

0x0

Controls if region 73 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION73.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region73 as exempt.

IDAU_REGION73.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region73.

IDAU_REGION73.NSC**Type**

bool

Default value

0x0

Controls if region 73 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION74.BADDR**Type**

int

Default value

0x0

Base address of IDAU region74.

IDAU_REGION74.ENABLE**Type**

bool

Default value

0x0

Controls if region 74 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION74.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region74 as exempt.

IDAU_REGION74.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region74.

IDAU_REGION74.NSC**Type**

bool

Default value

0x0

Controls if region 74 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION75.BADDR**Type**

int

Default value

0x0

Base address of IDAU region75.

IDAU_REGION75.ENABLE**Type**

bool

Default value

0x0

Controls if region 75 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION75.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region75 as exempt.

IDAU_REGION75.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region75.

IDAU_REGION75.NSC**Type**

bool

Default value

0x0

Controls if region 75 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION76.BADDR**Type**

int

Default value

0x0

Base address of IDAU region76.

IDAU_REGION76.ENABLE**Type**

bool

Default value

0x0

Controls if region 76 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION76.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region76 as exempt.

IDAU_REGION76.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region76.

IDAU_REGION76.NSC**Type**

bool

Default value

0x0

Controls if region 76 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION77.BADDR**Type**

int

Default value

0x0

Base address of IDAU region77.

IDAU_REGION77.ENABLE**Type**

bool

Default value

0x0

Controls if region 77 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION77.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region77 as exempt.

IDAU_REGION77.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region77.

IDAU_REGION77.NSC**Type**

bool

Default value

0x0

Controls if region 77 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION78.BADDR**Type**

int

Default value

0x0

Base address of IDAU region78.

IDAU_REGION78.ENABLE**Type**

bool

Default value

0x0

Controls if region 78 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION78.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region78 as exempt.

IDAU_REGION78.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region78.

IDAU_REGION78.NSC**Type**

bool

Default value

0x0

Controls if region 78 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION79.BADDR**Type**

int

Default value

0x0

Base address of IDAU region79.

IDAU_REGION79.ENABLE**Type**

bool

Default value

0x0

Controls if region 79 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION79.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region79 as exempt.

IDAU_REGION79.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region79.

IDAU_REGION79.NSC**Type**

bool

Default value

0x0

Controls if region 79 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION8.BADDR**Type**

int

Default value

0x0

Base address of IDAU region8.

IDAU_REGION8.ENABLE**Type**

bool

Default value

0x0

Controls if region 8 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION8.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region8 as exempt.

IDAU_REGION8.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region8.

IDAU_REGION8.NSC**Type**

bool

Default value

0x0

Controls if region 8 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION80.BADDR**Type**

int

Default value

0x0

Base address of IDAU region80.

IDAU_REGION80.ENABLE**Type**

bool

Default value

0x0

Controls if region 80 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION80.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region80 as exempt.

IDAU_REGION80.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region80.

IDAU_REGION80.NSC**Type**

bool

Default value

0x0

Controls if region 80 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION81.BADDR**Type**

int

Default value

0x0

Base address of IDAU region81.

IDAU_REGION81.ENABLE**Type**

bool

Default value

0x0

Controls if region 81 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION81.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region81 as exempt.

IDAU_REGION81.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region81.

IDAU_REGION81.NSC**Type**

bool

Default value

0x0

Controls if region 81 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION82.BADDR**Type**

int

Default value

0x0

Base address of IDAU region82.

IDAU_REGION82.ENABLE**Type**

bool

Default value

0x0

Controls if region 82 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION82.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region82 as exempt.

IDAU_REGION82.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region82.

IDAU_REGION82.NSC**Type**

bool

Default value

0x0

Controls if region 82 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION83.BADDR**Type**

int

Default value

0x0

Base address of IDAU region83.

IDAU_REGION83.ENABLE**Type**

bool

Default value

0x0

Controls if region 83 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION83.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region83 as exempt.

IDAU_REGION83.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region83.

IDAU_REGION83.NSC**Type**

bool

Default value

0x0

Controls if region 83 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION84.BADDR**Type**

int

Default value

0x0

Base address of IDAU region84.

IDAU_REGION84.ENABLE**Type**

bool

Default value

0x0

Controls if region 84 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION84.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region84 as exempt.

IDAU_REGION84.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region84.

IDAU_REGION84.NSC**Type**

bool

Default value

0x0

Controls if region 84 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION85.BADDR**Type**

int

Default value

0x0

Base address of IDAU region85.

IDAU_REGION85.ENABLE**Type**

bool

Default value

0x0

Controls if region 85 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION85.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region85 as exempt.

IDAU_REGION85.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region85.

IDAU_REGION85.NSC**Type**

bool

Default value

0x0

Controls if region 85 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION86.BADDR**Type**

int

Default value

0x0

Base address of IDAU region86.

IDAU_REGION86.ENABLE**Type**

bool

Default value

0x0

Controls if region 86 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION86.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region86 as exempt.

IDAU_REGION86.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region86.

IDAU_REGION86.NSC**Type**

bool

Default value

0x0

Controls if region 86 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION87.BADDR**Type**

int

Default value

0x0

Base address of IDAU region87.

IDAU_REGION87.ENABLE**Type**

bool

Default value

0x0

Controls if region 87 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION87.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region87 as exempt.

IDAU_REGION87.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region87.

IDAU_REGION87.NSC**Type**

bool

Default value

0x0

Controls if region 87 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION88.BADDR**Type**

int

Default value

0x0

Base address of IDAU region88.

IDAU_REGION88.ENABLE**Type**

bool

Default value

0x0

Controls if region 88 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION88.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region88 as exempt.

IDAU_REGION88.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region88.

IDAU_REGION88.NSC**Type**

bool

Default value

0x0

Controls if region 88 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION89.BADDR**Type**

int

Default value

0x0

Base address of IDAU region89.

IDAU_REGION89.ENABLE**Type**

bool

Default value

0x0

Controls if region 89 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION89.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region89 as exempt.

IDAU_REGION89.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region89.

IDAU_REGION89.NSC**Type**

bool

Default value

0x0

Controls if region 89 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION9.BADDR**Type**

int

Default value

0x0

Base address of IDAU region9.

IDAU_REGION9.ENABLE**Type**

bool

Default value

0x0

Controls if region 9 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION9.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region9 as exempt.

IDAU_REGION9.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region9.

IDAU_REGION9.NSC**Type**

bool

Default value

0x0

Controls if region 9 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION90.BADDR**Type**

int

Default value

0x0

Base address of IDAU region90.

IDAU_REGION90.ENABLE**Type**

bool

Default value

0x0

Controls if region 90 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION90.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region90 as exempt.

IDAU_REGION90.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region90.

IDAU_REGION90.NSC**Type**

bool

Default value

0x0

Controls if region 90 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION91.BADDR**Type**

int

Default value

0x0

Base address of IDAU region91.

IDAU_REGION91.ENABLE**Type**

bool

Default value

0x0

Controls if region 91 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION91.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region91 as exempt.

IDAU_REGION91.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region91.

IDAU_REGION91.NSC**Type**

bool

Default value

0x0

Controls if region 91 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION92.BADDR**Type**

int

Default value

0x0

Base address of IDAU region92.

IDAU_REGION92.ENABLE**Type**

bool

Default value

0x0

Controls if region 92 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION92.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region92 as exempt.

IDAU_REGION92.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region92.

IDAU_REGION92.NSC**Type**

bool

Default value

0x0

Controls if region 92 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION93.BADDR**Type**

int

Default value

0x0

Base address of IDAU region93.

IDAU_REGION93.ENABLE**Type**

bool

Default value

0x0

Controls if region 93 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION93.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region93 as exempt.

IDAU_REGION93.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region93.

IDAU_REGION93.NSC**Type**

bool

Default value

0x0

Controls if region 93 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION94.BADDR**Type**

int

Default value

0x0

Base address of IDAU region94.

IDAU_REGION94.ENABLE**Type**

bool

Default value

0x0

Controls if region 94 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION94.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region94 as exempt.

IDAU_REGION94.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region94.

IDAU_REGION94.NSC**Type**

bool

Default value

0x0

Controls if region 94 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION95.BADDR**Type**

int

Default value

0x0

Base address of IDAU region95.

IDAU_REGION95.ENABLE**Type**

bool

Default value

0x0

Controls if region 95 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION95.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region95 as exempt.

IDAU_REGION95.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region95.

IDAU_REGION95.NSC**Type**

bool

Default value

0x0

Controls if region 95 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION96.BADDR**Type**

int

Default value

0x0

Base address of IDAU region96.

IDAU_REGION96.ENABLE**Type**

bool

Default value

0x0

Controls if region 96 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION96.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region96 as exempt.

IDAU_REGION96.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region96.

IDAU_REGION96.NSC**Type**

bool

Default value

0x0

Controls if region 96 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION97.BADDR**Type**

int

Default value

0x0

Base address of IDAU region97.

IDAU_REGION97.ENABLE**Type**

bool

Default value

0x0

Controls if region 97 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION97.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region97 as exempt.

IDAU_REGION97.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region97.

IDAU_REGION97.NSC**Type**

bool

Default value

0x0

Controls if region 97 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION98.BADDR**Type**

int

Default value

0x0

Base address of IDAU region98.

IDAU_REGION98.ENABLE**Type**

bool

Default value

0x0

Controls if region 98 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION98.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region98 as exempt.

IDAU_REGION98.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region98.

IDAU_REGION98.NSC**Type**

bool

Default value

0x0

Controls if region 98 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

IDAU_REGION99.BADDR**Type**

int

Default value

0x0

Base address of IDAU region99.

IDAU_REGION99.ENABLE**Type**

bool

Default value

0x0

Controls if region 99 is S or NS, only valid when NSC=0. If NSC=1 this parameter is ignored. 1 = region is NS, 0 = region is S (absent if LADDR=0).

IDAU_REGION99.EXEMPT**Type**

bool

Default value

0x0

Mark IDAU region99 as exempt.

IDAU_REGION99.LADDR**Type**

int

Default value

0x0

Limit address of IDAU region99.

IDAU_REGION99.NSC

Type
bool

Default value
0x0

Controls if region 99 is NSC. 1 = IDAU region is NSC, 0 = ENABLE parameter determines if S or NS.

NUM_IDAU_REGION

Type
int

Default value
0x0

Number of IDAU regions.

3.10.46 IntegrityChecker

Integrity Checker. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1074: IP revisions support

Revision	Quality level
0.5	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for IntegrityChecker

This model has the following Iris instances:

Table 3-1075: IntegrityChecker Iris instances

InstanceName	ComponentName
IntegrityChecker	IntegrityChecker
IntegrityChecker.apb	PVBUSSlave

This model has the following MTI trace components:

Table 3-1076: IntegrityChecker MTI instances

InstanceName	ComponentName
IntegrityChecker.apb	PVBUSSlave

IntegrityChecker contains the following CADI targets:

- IntegrityChecker

Ports for IntegrityChecker

Table 3-1077: Ports

Name	Protocol	Type	Description
apb	PVBus	Slave	APB Subordinate Interface - Access to registers
ic_alarm_out	Signal	Master	Alarm status out signal
ic_interrupt_out	Signal	Master	Interrupt out signal
ic_match_trigger_ack_in	Signal	Slave	IC Match done ack signal
ic_match_trigger_req_out	Signal	Master	IC Match done req signal
pvbus_m	PVBus	Master	To read and write to external memory
reset_in	Signal	Slave	Reset in signal
warm_reset_in	Signal	Slave	Warm Reset in signal

Parameters for IntegrityChecker

ICBC_RESET_VALUE

Type

int

Default value

0x11b

ICBC Registers Reset Value.

ICDL_CHUNK_SIZE

Type

int

Default value

0x8

ICDL Chunk Size.

PID0_RESET_VALUE

Type

int

Default value

0x0

PID0 Registers Reset Value.

PID1_RESET_VALUE**Type**

int

Default value

0xb0

PID1 Registers Reset Value.

diagnostics**Type**

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.47 IoTSS3_SystemControl

IoT Subsystem System 3.0 Control registers. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1078: IP revisions support

Revision	Quality level
3.0	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for IoTSS3_SystemControl

This model has the following Iris instances:

Table 3-1079: IoTSS3_SystemControl Iris instances

InstanceName	ComponentName
IoTSS3_SystemControl	IoTSS3_SystemControl
IoTSS3_SystemControl.PVBusMaster	PVBusMaster
IoTSS3_SystemControl.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-1080: IoTSS3_SystemControl MTI instances

InstanceName	ComponentName
IoTSS3_SystemControl.PVBusMaster	PVBusMaster
IoTSS3_SystemControl.PVBusSlave	PVBusSlave

IoTSS3_SystemControl contains the following CADI targets:

- IoTSS3_SystemControl

Ports for IoTSS3_SystemControl

Table 3-1081: Ports

Name	Protocol	Type	Description
busmaster_control	PVTransactionMaster	Master	-
cpu0_lockup_reset_request	Signal	Slave	-
cpu0_warm_reset_request	Signal	Slave	-
cpu0core_ppu_irq	Signal	Slave	-
cpu1_lockup_reset_request	Signal	Slave	-
cpu1_warm_reset_request	Signal	Slave	-
cpu2_lockup_reset_request	Signal	Slave	-
cpu2_warm_reset_request	Signal	Slave	-
cpu3_lockup_reset_request	Signal	Slave	-
cpu3_warm_reset_request	Signal	Slave	-
cpuextnmienable_out[4]	Signal	Master	-
cpuintnmienable_out[4]	Signal	Master	-
cpuwait_out[4]	Signal	Master	-
crypto_ppu_irq	Signal	Slave	-
crypto_warm_reset_request	Signal	Slave	-
dbg_ppu_irq	Signal	Slave	-
dbgen_in	Signal	Slave	-
dbgen_out	Signal	Master	-
host_level_reset_request	Signal	Slave	-
initsvtor[4]	Value	Master	-
mgmt_ppu_irq	Signal	Slave	-
niden_in	Signal	Slave	-
niden_out	Signal	Master	-
nonsecure_watchdog_reset_request	Signal	Slave	-
npu0_ppu_irq	Signal	Slave	-
pdc_m_pvbus_m	PVBus	Master	-
po_reset	Signal	Master	-
pvbus_s	PVBus	Slave	-
secure_watchdog_reset_request	Signal	Slave	-
slow_clock_watchdog_reset_request	Signal	Slave	-
software_reset_request	Signal	Slave	-
spiden_in	Signal	Slave	-
spiden_out	Signal	Master	-
spniden_in	Signal	Slave	-

Name	Protocol	Type	Description
spniden_out	Signal	Master	-
subsystem_hardware_reset_request	Signal	Slave	-
sys_ppu_irq	Signal	Slave	-
warm_reset	Signal	Master	-

Parameters for IoTSS3_SystemControl

INITSVTOR_RST

Type

int

Default value

0x0

Reset int32_t for INITSVTOR. Should match cpu<i>.INITSVTOR.

NUMCPU

Type

int

Default value

0x1

Number of Cortex-M CPU cores in the subsystem.

NUMVMBANK

Type

int

Default value

0x2

Number of Volatile Memory Banks.

SWRESETREQ_BIT

Type

int

Default value

0x9

Bit used for SWRESETREQ.

cpu0wait**Type**

bool

Default value

0x0

Whether to hold cpu0 in reset at boot.

cpu1wait**Type**

bool

Default value

0x1

Whether to hold cpu1 in reset at boot.

cpu2wait**Type**

bool

Default value

0x1

Whether to hold cpu2 in reset at boot.

cpu3wait**Type**

bool

Default value

0x1

Whether to hold cpu3 in reset at boot.

diagnostics**Type**

int

Default value

0x2

Diagnostics.

3.10.48 IoTSS_AccessControlGate

IoT Subsystem Access Control Gate. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1082: IP revisions support

Revision	Quality level
1.0	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for IoTSS_AccessControlGate

This model has the following Iris instances:

Table 3-1083: IoTSS_AccessControlGate Iris instances

InstanceName	ComponentName
IoTSS_AccessControlGate	IoTSS_AccessControlGate
IoTSS_AccessControlGate.PVBusModifier	PVBusMapper

This model has the following MTI trace components:

Table 3-1084: IoTSS_AccessControlGate MTI instances

InstanceName	ComponentName
IoTSS_AccessControlGate.PVBusModifier	PVBusMapper

IoTSS_AccessControlGate contains the following CADI targets:

- IoTSS_AccessControlGate

Ports for IoTSS_AccessControlGate

Table 3-1085: Ports

Name	Protocol	Type	Description
ext_gate	Signal	Slave	-
master_ppuhwstat	Value	Slave	-
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-
slave_ppuhwstat	Value	Slave	-
wake_request	Signal	Master	-

Parameters for IoTSS_AccessControlGate

enabled

Type

bool

Default value

0x1

Enable the ACG. If disabled, will let all transactions through without side effects.

3.10.49 IoTSS_PeripheralProtectionController

IoT Subsystem Peripheral Protection Controller. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1086: IP revisions support

Revision	Quality level
1.0	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for IoTSS_PeripheralProtectionController

This model has the following Iris instances:

Table 3-1087: IoTSS_PeripheralProtectionController Iris instances

InstanceName	ComponentName
IoTSS_PeripheralProtectionController	IoTSS_PeripheralProtectionController
IoTSS_PeripheralProtectionController.PVBusModifier	PVBusMapper

This model has the following MTI trace components:

Table 3-1088: IoTSS_PeripheralProtectionController MTI instances

InstanceName	ComponentName
IoTSS_PeripheralProtectionController.PVBusModifier	PVBusMapper

IoTSS_PeripheralProtectionController contains the following CADI targets:

- IoTSS_PeripheralProtectionController

Ports for IoTSS_PeripheralProtectionController

Table 3-1089: Ports

Name	Protocol	Type	Description
cfg_ap	ValueState	Slave	-

Name	Protocol	Type	Description
cfg_nonsec	ValueState	Slave	-
cfg_sec_resp	ValueState	Slave	-
idau_invalidate_region	Value_64	Slave	-
ppc_irq	StateSignal	Master	-
pvbus_m[16]	PVBus	Master	-
pvbus_s[16]	PVBus	Slave	-

Parameters for IoTSS_PeripheralProtectionController

DISABLE_GATING

Type

bool

Default value

0x0

Disable Memory gating logic.

NONSEC_MASK

Type

int

Default value

0x0

16-bit wide mask for security checking of ports: 0 = check, 1 = mask.

PORTx_ENABLE

Type

int

Default value

0xffff

Enable (1) or disable (0) port x (where x is between 0-15): enable = 1, disable = 0.

diagnostics

Type

int

Default value

0x0

Diagnostics.

3.10.50 KeyManagementUnit

KeyManagementUnit. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1090: IP revisions support

Revision	Quality level
0.5	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for KeyManagementUnit

This model has the following Iris instances:

Table 3-1091: KeyManagementUnit Iris instances

InstanceName	ComponentName
KeyManagementUnit	KeyManagementUnit
KeyManagementUnit.apb	PVBusSlave
KeyManagementUnit.keys_in	PVBusSlave

This model has the following MTI trace components:

Table 3-1092: KeyManagementUnit MTI instances

InstanceName	ComponentName
KeyManagementUnit.apb	PVBusSlave
KeyManagementUnit.keys_in	PVBusSlave

KeyManagementUnit contains the following CADI targets:

- KeyManagementUnit

Ports for KeyManagementUnit

Table 3-1093: Ports

Name	Protocol	Type	Description
apb	PVBus	Slave	register access via apb port
hw_keys_in	PVBus	Slave	HW key register access via private apb port - connect to LCM
irq_out	Signal	Master	IRQ signal out
keys_out	PVBus	Master	output keys via port
reset_in	Signal	Slave	Reset signal in

Parameters for KeyManagementUnit

KMUDKPARV0

Type

int

Default value

0x0

Reset value of the KMUDKPA<0> register. If no hardware key slot is supported (KMUNHWKSLTS is 0), this configuration option must be set to 0x0000_0000.

KMUDKPARV1

Type

int

Default value

0x0

Reset value of the KMUDKPA<1> register. If no hardware key slot is supported (KMUNHWKSLTS is 1), this configuration option must be set to 0x0000_0000.

KMUDKPARV2

Type

int

Default value

0x0

Reset value of the KMUDKPA<2> register. If no hardware key slot is supported (KMUNHWKSLTS is 2), this configuration option must be set to 0x0000_0000.

KMUDKPARV3

Type

int

Default value

0x0

Reset value of the KMUDKPA<3> register. If no hardware key slot is supported (KMUNHWKSLTS is 3), this configuration option must be set to 0x0000_0000.

KMUDKPARV4

Type

int

Default value

0x0

Reset value of the KMUDKPA<4> register. If no hardware key slot is supported (KMUNHWKSLTS is 4), this configuration option must be set to 0x0000_0000.

KMUDKPARV5**Type**

int

Default value

0x0

Reset value of the KMUDKPA<5> register. If no hardware key slot is supported (KMUNHWKSLTS is 5), this configuration option must be set to 0x0000_0000.

KMUDKPARV6**Type**

int

Default value

0x0

Reset value of the KMUDKPA<6> register. If no hardware key slot is supported (KMUNHWKSLTS is 6), this configuration option must be set to 0x0000_0000.

KMUDKPARV7**Type**

int

Default value

0x0

Reset value of the KMUDKPA<7> register. If no hardware key slot is supported (KMUNHWKSLTS is 7), this configuration option must be set to 0x0000_0000.

KMUKSCRV0**Type**

int

Default value

0x0

Reset value of the KMUKSC<0> register. If no hardware key slot is supported (KMUNHWKSLTS is 0), this configuration option must be set to 0x0000_0000.

KMUKSCRV1**Type**

int

Default value

0x0

Reset value of the KMUKSC<1> register. If no hardware key slot is supported (KMUNHWKSLTS is 1), this configuration option must be set to 0x0000_0000.

KMUKSCRV2**Type**

int

Default value

0x0

Reset value of the KMUKSC<2> register. If no hardware key slot is supported (KMUNHWKSLTS is 2), this configuration option must be set to 0x0000_0000.

KMUKSCRV3**Type**

int

Default value

0x0

Reset value of the KMUKSC<3> register. If no hardware key slot is supported (KMUNHWKSLTS is 3), this configuration option must be set to 0x0000_0000.

KMUKSCRV4**Type**

int

Default value

0x0

Reset value of the KMUKSC<4> register. If no hardware key slot is supported (KMUNHWKSLTS is 4), this configuration option must be set to 0x0000_0000.

KMUKSCRV5**Type**

int

Default value

0x0

Reset value of the KMUKSC<5> register. If no hardware key slot is supported (KMUNHWKSLTS is 5), this configuration option must be set to 0x0000_0000.

KMUKSCRV6**Type**

int

Default value

0x0

Reset value of the KMUKSC<6> register. If no hardware key slot is supported (KMUNHWKSLTS is 6), this configuration option must be set to 0x0000_0000.

KMUKSCRV7**Type**

int

Default value

0x0

Reset value of the KMUKSC<7> register. If no hardware key slot is supported (KMUNHWKSLTS is 7), this configuration option must be set to 0x0000_0000.

KMUNHWKSLTS**Type**

int

Default value

0x7

Number of hardware key slots. Supported values: 0..8 (0 = No hardware key slot). The first KMUNHWKSLTS key slots are filled by hardware (typically by LCM) and the rest are software key slots. (Default=7).

KMUNKS**Type**

int

Default value

0x5

Selects the number of key slots that the KMU supports. This value is reflected in KMUBC.NKS. 0x1=2, 0x2=4, 0x3=8, 0x4=16, 0x5=32 key slots (Default=0x5).

KMUTANG**Type**

int

Default value

0x5

Specifies four possible values for the Top Address Nibble Groups of the target crypto devices that the KMU allows software to set in the KMUDKPA<n> registers.

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.51 LifeCycleManager

LifeCycleManager. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1094: IP revisions support

Revision	Quality level
1.02	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for LifeCycleManager

This model has the following Iris instances:

Table 3-1095: LifeCycleManager Iris instances

InstanceName	ComponentName
LifeCycleManager	RSE_LifeCycleManager
LifeCycleManager.apb	PVBusSlave
LifeCycleManager.hw_keys_out	PVBusMaster
LifeCycleManager.nvm_external_out	PVBusMaster

This model has the following MTI trace components:

Table 3-1096: LifeCycleManager MTI instances

InstanceName	ComponentName
LifeCycleManager.apb	PVBusSlave
LifeCycleManager.hw_keys_out	PVBusMaster
LifeCycleManager.nvm_external_out	PVBusMaster

LifeCycleManager contains the following CADI targets:

- RSE_LifeCycleManager

Ports for LifeCycleManager

Table 3-1097: Ports

Name	Protocol	Type	Description
apb	PVBus	Slave	APB4 Subordinate Interface - Access to LCM registers and internal OTP/NVM
hw_keys_out	PVBus	Master	APB manager interface for output of the HW Root of Trust keys
lcs	Value	Master	The 3-bit value of the LCS register
nvm_external_out	PVBus	Master	APB manager interface for external NVM (OTP)
reset_in	Signal	Slave	LCM reset in
sp_reset_out	Signal	Master	LCM SP_RST_REQ signal out

Parameters for LifeCycleManager

DCU_SP_DISABLE_MASK_VAL

Type

string

Default value

"0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The Secure Provisioning disable mask of the 128-bit DCU signals. Clearing a bit in the mask will force the relevant DCU signal to zero when LCM is in Secure Provisioning Mode (SP_EN=1).

DISABLE_DIRECT_KEY_APB_MASKING

Type

int

Default value

0x0

When set to 1, the Direct Key APB masking feature should be disabled.

KRTL_VAL

Type

string

Default value

0x7bfee0b730dcc241938458dafc2bc784cc15bdabeb84311f59cca8a9a4e8bc35

The Krtl value. (256-bit hex).

OTP_ADDR_WIDTH

Type

int

Default value

0xc

The OTP bus width (width in bits = OTP_ADDR_WIDTH + 2).

OTP_MASK_VAL**Type**

string

Default value

0x3aaf46ac792c53b0ffd80fe92129f0e8d80a9048799c5498c19f1a1ce7ddf5b20e2cc8f9456cf4ade2fe

This value must be generated using a true random number generator (1536-bit hex).

OTP_SIZE_IN_BYTES**Type**

int

Default value

0x4000

The size of the OTP region accessible from the LCM APB-S interface. The maximum size is 60KB.

PCI_DCU_PERMANENT_DISABLE_MASK_VAL_LCS_CM**Type**

string

Default value

"0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The permanent disable mask of the 128-bit DCU signals when LCS=CM and TP Mode=PCI. Clearing a bit in the mask will force the relevant DCU signal to zero.

PCI_DCU_PERMANENT_DISABLE_MASK_VAL_LCS_DM**Type**

string

Default value

"0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The permanent disable mask of the 128-bit DCU signals when LCS=DM and TP Mode=PCI. Clearing a bit in the mask will force the relevant DCU signal to zero.

PCI_DCU_PERMANENT_DISABLE_MASK_VAL_LCS_RMA**Type**

string

Default value

"0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The permanent disable mask of the 128-bit DCU signals when LCS=RMA and TP Mode=PCI. Clearing a bit in the mask will force the relevant DCU signal to zero.

PCI_DCU_PERMANENT_DISABLE_MASK_VAL_LCS_SECURE**Type**

string

Default value`"0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"`

The permanent disable mask of the 128-bit DCU signals when LCS=SE and TP Mode=PCI. Clearing a bit in the mask will force the relevant DCU signal to zero.

PCI_DEFAULT_DCU_VAL_LCS_CM**Type**

string

Default value`"0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"`

The default reset value of the 128-bit DCU signals when LCS=CM and TP Mode=PCI.

PCI_DEFAULT_DCU_VAL_LCS_DM**Type**

string

Default value`"0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"`

The default reset value of the 128-bit DCU signals when LCS=DM and TP Mode=PCI.

PCI_DEFAULT_DCU_VAL_LCS_RMA**Type**

string

Default value`"0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"`

The default reset value of the 128-bit DCU signals when LCS=RMA and TP Mode=PCI.

PCI_DEFAULT_DCU_VAL_LCS_SECURE**Type**

string

Default value`"0x0"`

The default reset value of the 128-bit DCU signals when LCS=SE and TP Mode=PCI.

TCI_DCU_PERMANENT_DISABLE_MASK_VAL_LCS_CM**Type**

string

Default value

"OxFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The permanent disable mask of the 128-bit DCU signals when LCS=CM and TP Mode=TCI. Clearing a bit in the mask will force the relevant DCU signal to zero.

TCI_DCU_PERMANENT_DISABLE_MASK_VAL_LCS_DM**Type**

string

Default value

"OxFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The permanent disable mask of the 128-bit DCU signals when LCS=DM and TP Mode=TCI. Clearing a bit in the mask will force the relevant DCU signal to zero.

TCI_DCU_PERMANENT_DISABLE_MASK_VAL_LCS_RMA**Type**

string

Default value

"OxFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The permanent disable mask of the 128-bit DCU signals when LCS=RMA and TP Mode=TCI. Clearing a bit in the mask will force the relevant DCU signal to zero.

TCI_DCU_PERMANENT_DISABLE_MASK_VAL_LCS_SECURE**Type**

string

Default value

"OxFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The permanent disable mask of the 128-bit DCU signals when LCS=SE and TP Mode=TCI. Clearing a bit in the mask will force the relevant DCU signal to zero.

TCI_DEFAULT_DCU_VAL_LCS_CM**Type**

string

Default value

"OxFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The default reset value of the 128-bit DCU signals when LCS=CM and TP Mode=TCI.

TCI_DEFAULT_DCU_VAL_LCS_DM

Type
string

Default value
"OxFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The default reset value of the 128-bit DCU signals when LCS=DM and TP Mode=TCI.

TCI_DEFAULT_DCU_VAL_LCS_RMA

Type
string

Default value
"OxFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The default reset value of the 128-bit DCU signals when LCS=RMA and TP Mode=TCI.

TCI_DEFAULT_DCU_VAL_LCS_SECURE

Type
string

Default value
"OxFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF"

The default reset value of the 128-bit DCU signals when LCS=SE and TP Mode=TCI.

diagnostics

Type
int

Default value
0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.52 MMC

Generic Multimedia Card. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1098: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MMC

This model has the following Iris instances:

Table 3-1099: MMC Iris instances

InstanceName	ComponentName
MMC	MMC
MMC.timer	ClockTimerThread
MMC.timer.timer	ClockTimerThread64
MMC.timer.timer.thread	SchedulerThread
MMC.timer.timer.thread_event	SchedulerThreadEvent

MMC contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- MMC
- SchedulerThread
- SchedulerThreadEvent

About MMC

This component simulates an SD or SDHC card that is compatible with the [MultiMedia Card Association, MMCA](#) specification version 3.31. The parameters permit configuration of a number of attributes reflected in the CID and CSD registers. You can customize the component further by modifying the supplied MMC model source code directly.

When paired with a PL180_MCI component, the MMC device model provides emulation of a flexible, persistent storage mechanism.

The MMC component uses a file on the host PC to simulate the storage device. The size of this backing store file determines the reported size of the MMC device. As small sections of this file are paged in by the model, large filesystems can be modeled while making efficient use of host PC memory. The backing store file can contain a partition table and filesystems such as FAT or EXT2.

The image file is a direct bit copy of the contents of an SD card. If the image file that the `p_mmc_file` parameter refers to does not exist, the component behaves as if the card is absent. If the image file is read-only, then the component behaves as if the card is read-only.

Operating system boots often attempt to write to the boot filesystem. They might not work properly if the boot filesystem is on a read-only card.

The MMC component does not model card insertion or removal. It models the card having already been inserted at system instantiation time.

You can configure the MMC component to behave as an SDHC card by setting the `card_type` parameter to SDHC. SDHC mode is a model-specific extension, and is not supported by PL180 hardware. It supports filesystems that are larger than 2 GB.

The component supports these commands:

- `MMC_GO_IDLE_STATE`
- `MMC_SEND_OP_COND`
- `MMC_ALL_SEND_CID`
- `MMC_SET_RELATIVE_ADDR`
- `MMC_SET_DSR`
- `MMC_SELDESL_CARD`
- `MMC_SEND_CSD`
- `MMC_SEND_CID`
- `MMC_STOP_TRANSMISSION`
- `MMC_SEND_STATUS`
- `MMC_GO_INACTIVE_STATE`
- `MMC_READ_SINGLE_BLOCK`
- `MMC_READ_MULTIPLE_BLOCK`
- `MMC_SET_BLOCK_COUNT`
- `MMC_WRITE_BLOCK`
- `MMC_WRITE_MULTIPLE_BLOCK`
- `MMC_SEND_EXT_CSD`. This command is supported in SDHC mode only

The block length is 512 bytes. SimGen reports attempts to change it as errors.

The component supports these erase commands (Class 5), but they have no effect on the disk backing storage:

- `MMC_ERASE_GROUP_START`
- `MMC_ERASE_GROUP_END`
- `MMC_ERASE`

The component does not support these commands:

- `MMC_BUSTEST_R`
- `MMC_BUSTEST_W`

The component does not support stream read and write commands (Classes 1 and 3):

- `MMC_READ_DAT_UNTIL_STOP`
- `MMC_WRITE_DAT_UNTIL_STOP`

- `MMC_PROGRAM_CID`
- `MMC_PROGRAM_CSD`

The component does not support block oriented write protection commands (Class 6):

- `MMC_SET_WRITE_PROT`
- `MMC_CLR_WRITE_PROT`
- `MMC_SEND_WRITE_PROT`

The component does not support lock card commands (Class 7) or application-specific commands (Class 8):

- `MMC_LOCK_UNLOCK`
- `MMC_APP_CMD`
- `MMC_GEN_CMD`

The component does not support I/O mode commands (Class 9):

- `MMC_FAST_IO`
- `MMC_GO_IRQ_STATE`

The component does not support reserved commands. Using a reserved command sets the `MMC_STATUS_REG_ILLEGAL_COMMAND` bit in the status register of the card. Read this with the `MMC_SEND_STATUS` command.

Use the `p_diagnostics` parameter to select the level of diagnostic output, to help to debug device driver and controller-to-card protocol issues. It supports the following levels:

Level 0

None

Level 1

Warnings about attempting to change read-only settings.

Level 2

Trace of command calls.

Level 3

Information about every step in the MMC_Protocol interaction.

Level 4

Hex dump of every block sent or received.

The registers are not memory mapped. Instead, you access them using relevant MMC commands. The MMC component model makes the registers available through a CADI interface. Modification of these registers through CADI is not recommended, but not prohibited. For example, modifying the card ID (CID) registers can be useful when experimenting with drivers, but direct modification of the `STATUS_REG` register is likely to put the card model into an indeterminate state.

For a full definition of MMC registers, see the MMCA System Summary documentation. Device-specific register information can also be obtained from MMC vendors.

Table 3-1100: MMC registers

Name	CADI register number	Description
OCR_REG	0x000	Operating conditions register
CID_REG0	0x004	Card ID bits 127:96
CID_REG1	0x005	Card ID bits 95:64
CID_REG2	0x006	Card ID bits 63:32
CID_REG3	0x007	Card ID bits 31:0
CSD_REG0	0x008	Card specific data bits 127:96
CSD_REG1	0x009	Card specific data bits 95:64
CSD_REG2	0x00a	Card specific data bits 63:32
CSD_REG3	0x00b	Card specific data bit 31:0
RCA_REG	0x00c	Relative card address register
DSR_REG	0x00d	Driver stage register
BLOCKLEN_REG	0x00e	Block length
STATUS_REG	0x00f	Card status
BLOCK_COUNT_REG	0x010	Block count

Ports for MMC

Table 3-1101: Ports

Name	Protocol	Type	Description
card_present	StateSignal	Master	Used to signal whether an MMC image is loaded. It is set if an image is loaded, and is clear if no image is loaded.
clk_in	ClockSignal	Slave	Input clock signal used to drive our 'bus'.
mmc	MMC_Protocol	Slave	The MMC slave port.

Parameters for MMC

card_type

Type

string

Default value

"SDHC"

Card type ('SD' or 'SDHC').

diagnostics

Type

int

Default value

0x0

Diagnostics level.

force_sector_addressing**Type**

bool

Default value

0x0

Use sector addressing even on small cards.

p_OEMid**Type**

int

Default value

0x0

Card ID OEM ID.

p_fast_access**Type**

bool

Default value

0x1

Don't simulate MMC block access delays.

p_manid**Type**

int

Default value

0x2

Card ID Manufacturer ID.

p_max_block_count**Type**

int

Default value

0x80

Default maximum block count reg. Default 0x80.

p_mmc_file**Type**

string

Default value

"mmc.dat"

MMCard filename.

p_prodName**Type**

string

Default value

"ARMmmc"

Card ID Product Name (6 chars).

p_prodRev**Type**

int

Default value

0x1

Card ID Product Revision.

p_sernum**Type**

int

Default value

0xca4d0001

Card Serial Number.

support_unpadded_images**Type**

bool

Default value

0x0

Support images that are not a multiple of 512k by padding them to the needed size (SDHC cards only).

3.10.53 MMU_400

MMU-400 component. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1102: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MMU_400

This model has the following Iris instances:

Table 3-1103: MMU_400 Iris instances

InstanceName	ComponentName
MMU_400	MMU_400
MMU_400.mmu	MMU_400_BASE
MMU_400.mmu.apb3_control_ns_slv	PVBusSlave
MMU_400.mmu.apb3_control_s_slv	PVBusSlave
MMU_400.mmu.apb4_control_slv	PVBusSlave
MMU_400.mmu.mapper	PVBusMapper
MMU_400.mmu.ptw_dvm_receiver	PVBusMapper
MMU_400.mmu.ptw_master	PVBusMaster
MMU_400.mmu.pvbus_master	PVBusMaster

This model has the following MTI trace components:

Table 3-1104: MMU_400 MTI instances

InstanceName	ComponentName
MMU_400.mmu	MMU_400_BASE
MMU_400.mmu.apb3_control_ns_slv	PVBusSlave
MMU_400.mmu.apb3_control_s_slv	PVBusSlave
MMU_400.mmu.apb4_control_slv	PVBusSlave
MMU_400.mmu.mapper	PVBusMapper
MMU_400.mmu.ptw_dvm_receiver	PVBusMapper
MMU_400.mmu.ptw_master	PVBusMaster
MMU_400.mmu.pvbus_master	PVBusMaster

MMU_400 contains the following CADI targets:

- MMU_400

- MMU_400_BASE

About MMU_400

Set the `use_label_mapping` parameter to `true` if your upstream devices have labels in the top 16 bits of the transaction MasterID.

The model does not have a concept of AXI-ID, but a transaction can have a MasterID set on it.

Label your upstream components 0...*N* so that the parameters of this component can map those integers to StreamID and SSD_Index.

Set `use_label_mapping` to `false` if the StreamID is encoded in the top 16 bits of the MasterID and the bottom 16 bits encode either the SSD_Index or the SSD state directly, depending on `use_ssd_determination_table`. Typically in hardware, a device emits different AXI-IDs, depending on what it is doing. In the model, MasterIDs are usually not diverse and a device might only emit one MasterID.

If `use_ssd_determination_table` is `true`, the bottom 16 bits of the MasterID encode the SSD_Index. They must be $< 2^{\text{ssd_index_width}}$. If it is `false`, they encode the SSD state directly (zero is Secure and nonzero is Non-secure).

This component models all architectural registers that are specified in the Technical Reference Manual (TRM), except that it does not model any of the performance registers, and has the following limitations:

- MMU-400 does not have an SMMU_STLBSTATUS register because the Secure side is a nominal pass-through. MMU-400 only has stage 2 support and you cannot use stage 2 on the Secure side.
- The SMMU_NSACR is an alias of the Non-secure SMMU_ACR. This component models SMMU_ACR as RAZ/WI.
- The *ACR registers have IMP DEF contents. This component models only the PAGESIZE bit of the SACR, as non-RAZ/WI. It models no other IMP DEF registers.

Ports for MMU_400

Table 3-1105: Ports

Name	Protocol	Type	Description
apb3_control_ns	PVBus	Slave	APBv3 control port for Non-secure access to the register file. If this port is used do not use the APBv4 port.
apb3_control_s	PVBus	Slave	APBv3 control port for Secure access to the register file. If this port is used do not use the APBv4 port.
apb4_control	PVBus	Slave	APBv4 control port for access to the register file. If this port is used do not use the APBv3 ports.
cfg_cttw_in	Signal	Slave	Enables coherent page table walks.

Name	Protocol	Type	Description
cfg_flt_irpt_ns	Signal	Master	Non-secure configuration access fault interrupt. Corresponds to SMMU architectural signal SMMU_NSgCflrpt.
cfg_flt_irpt_s	Signal	Master	Secure configuration access fault interrupt. Corresponds to SMMU architectural signal SMMU_gCflrpt.
comb_irpt_ns	Signal	Master	Non-secure combined interrupt.
comb_irpt_s	Signal	Master	Secure combined interrupt.
cxt_irpt_ns	Signal	Master	Non-secure context bank fault.
glbl_flt_irpt_ns	Signal	Master	Global Non-secure fault interrupt. Corresponds to SMMU architectural signal SMMU_NSglrpt.
glbl_flt_irpt_s	Signal	Master	Global Secure fault interrupt. Corresponds to SMMU architectural signal SMMU_glrlpt.
priv_internals	MMU_400_Internals	Slave	For internal use only, please do not use.
pvbus_m	PVBus	Master	Downstream port of the MMU, where translated transactions emerge.
pvbus_ptw_m	PVBus	Master	Downstream port for page table walks if configured using the ptw_has_separate_port parameter.
pvbus_s	PVBus	Slave	Upstream port of the MMU. Addresses on the port are in VA/IPA.
reset_in	Signal	Slave	Signal to reset the MMU.

Parameters for MMU_400

always_secure_ssd_indices

Type

string

Default value

""

Non-programmable SSD Indexes that are always secure (e.g. 0, 6, 35-64).

cfg_cdtw

Type

bool

Default value

0x1

Perform coherent page table walks.

dump_unpredictability_in_user_flags

Type

bool

Default value

0x0

Override the user flags to encode unpredictable information (validation only).

label0_read_ssd**Type**

int

Default value

0x0

Label0: Read SDD or SSD_Index.

label0_read_stream_id**Type**

int

Default value

0x0

Label0: Read Stream ID.

label0_write_ssd**Type**

int

Default value

0x0

Label0: Write SDD or SSD_Index.

label0_write_stream_id**Type**

int

Default value

0x0

Label0: Write Stream ID.

label10_read_ssd**Type**

int

Default value

0x0

Label10: Read SDD or SSD_Index.

label10_read_stream_id**Type**

int

Default value

0x0

Label10: Read Stream ID.

label10_write_ssd**Type**

int

Default value

0x0

Label10: Write SDD or SSD_Index.

label10_write_stream_id**Type**

int

Default value

0x0

Label10: Write Stream ID.

label11_read_ssd**Type**

int

Default value

0x0

Label11: Read SDD or SSD_Index.

label11_read_stream_id**Type**

int

Default value

0x0

Label11: Read Stream ID.

label11_write_ssd**Type**

int

Default value

0x0

Label11: Write SDD or SSD_Index.

label11_write_stream_id**Type**

int

Default value

0x0

Label11: Write Stream ID.

label12_read_ssd**Type**

int

Default value

0x0

Label12: Read SDD or SSD_Index.

label12_read_stream_id**Type**

int

Default value

0x0

Label12: Read Stream ID.

label12_write_ssd**Type**

int

Default value

0x0

Label12: Write SDD or SSD_Index.

label12_write_stream_id**Type**

int

Default value

0x0

Label12: Write Stream ID.

label13_read_ssd**Type**

int

Default value

0x0

Label13: Read SDD or SSD_Index.

label13_read_stream_id**Type**

int

Default value

0x0

Label13: Read Stream ID.

label13_write_ssd**Type**

int

Default value

0x0

Label13: Write SDD or SSD_Index.

label13_write_stream_id**Type**

int

Default value

0x0

Label13: Write Stream ID.

label14_read_ssd**Type**

int

Default value

0x0

Label14: Read SDD or SSD_Index.

label14_read_stream_id**Type**

int

Default value

0x0

Label14: Read Stream ID.

label14_write_ssd**Type**

int

Default value

0x0

Label14: Write SDD or SSD_Index.

label14_write_stream_id**Type**

int

Default value

0x0

Label14: Write Stream ID.

label15_read_ssd**Type**

int

Default value

0x0

Label15: Read SDD or SSD_Index.

label15_read_stream_id**Type**

int

Default value

0x0

Label15: Read Stream ID.

label15_write_ssd**Type**

int

Default value

0x0

Label15: Write SDD or SSD_Index.

label15_write_stream_id**Type**

int

Default value

0x0

Label15: Write Stream ID.

label16_read_ssd**Type**

int

Default value

0x0

Label16: Read SDD or SSD_Index.

label16_read_stream_id**Type**

int

Default value

0x0

Label16: Read Stream ID.

label16_write_ssd**Type**

int

Default value

0x0

Label16: Write SDD or SSD_Index.

label16_write_stream_id**Type**

int

Default value

0x0

Label16: Write Stream ID.

label17_read_ssd**Type**

int

Default value

0x0

Label17: Read SDD or SSD_Index.

label17_read_stream_id**Type**

int

Default value

0x0

Label17: Read Stream ID.

label17_write_ssd**Type**

int

Default value

0x0

Label17: Write SDD or SSD_Index.

label17_write_stream_id**Type**

int

Default value

0x0

Label17: Write Stream ID.

label18_read_ssd**Type**

int

Default value

0x0

Label18: Read SDD or SSD_Index.

label18_read_stream_id**Type**

int

Default value

0x0

Label18: Read Stream ID.

label18_write_ssd**Type**

int

Default value

0x0

Label18: Write SDD or SSD_Index.

label18_write_stream_id**Type**

int

Default value

0x0

Label18: Write Stream ID.

label19_read_ssd**Type**

int

Default value

0x0

Label19: Read SDD or SSD_Index.

label19_read_stream_id**Type**

int

Default value

0x0

Label19: Read Stream ID.

label19_write_ssd**Type**

int

Default value

0x0

Label19: Write SDD or SSD_Index.

label19_write_stream_id**Type**

int

Default value

0x0

Label19: Write Stream ID.

label1_read_ssd**Type**

int

Default value

0x0

Label1: Read SDD or SSD_Index.

label1_read_stream_id**Type**

int

Default value

0x0

Label1: Read Stream ID.

label1_write_ssd**Type**

int

Default value

0x0

Label1: Write SDD or SSD_Index.

label1_write_stream_id**Type**

int

Default value

0x0

Label1: Write Stream ID.

label20_read_ssd**Type**

int

Default value

0x0

Label20: Read SDD or SSD_Index.

label20_read_stream_id**Type**

int

Default value

0x0

Label20: Read Stream ID.

label20_write_ssd**Type**

int

Default value

0x0

Label20: Write SDD or SSD_Index.

label20_write_stream_id**Type**

int

Default value

0x0

Label20: Write Stream ID.

label21_read_ssd**Type**

int

Default value

0x0

Label21: Read SDD or SSD_Index.

label21_read_stream_id**Type**

int

Default value

0x0

Label21: Read Stream ID.

label21_write_ssd**Type**

int

Default value

0x0

Label21: Write SDD or SSD_Index.

label21_write_stream_id**Type**

int

Default value

0x0

Label21: Write Stream ID.

label22_read_ssd**Type**

int

Default value

0x0

Label22: Read SDD or SSD_Index.

label22_read_stream_id**Type**

int

Default value

0x0

Label22: Read Stream ID.

label22_write_ssd**Type**

int

Default value

0x0

Label22: Write SDD or SSD_Index.

label22_write_stream_id**Type**

int

Default value

0x0

Label22: Write Stream ID.

label123_read_ssd**Type**

int

Default value

0x0

Label23: Read SDD or SSD_Index.

label123_read_stream_id**Type**

int

Default value

0x0

Label23: Read Stream ID.

label123_write_ssd**Type**

int

Default value

0x0

Label23: Write SDD or SSD_Index.

label123_write_stream_id**Type**

int

Default value

0x0

Label23: Write Stream ID.

label124_read_ssd**Type**

int

Default value

0x0

Label24: Read SDD or SSD_Index.

label24_read_stream_id**Type**

int

Default value

0x0

Label24: Read Stream ID.

label24_write_ssd**Type**

int

Default value

0x0

Label24: Write SDD or SSD_Index.

label24_write_stream_id**Type**

int

Default value

0x0

Label24: Write Stream ID.

label25_read_ssd**Type**

int

Default value

0x0

Label25: Read SDD or SSD_Index.

label25_read_stream_id**Type**

int

Default value

0x0

Label25: Read Stream ID.

label25_write_ssd**Type**

int

Default value

0x0

Label25: Write SDD or SSD_Index.

label25_write_stream_id**Type**

int

Default value

0x0

Label25: Write Stream ID.

label26_read_ssd**Type**

int

Default value

0x0

Label26: Read SDD or SSD_Index.

label26_read_stream_id**Type**

int

Default value

0x0

Label26: Read Stream ID.

label26_write_ssd**Type**

int

Default value

0x0

Label26: Write SDD or SSD_Index.

label26_write_stream_id**Type**

int

Default value

0x0

Label26: Write Stream ID.

label27_read_ssd**Type**

int

Default value

0x0

Label27: Read SDD or SSD_Index.

label27_read_stream_id**Type**

int

Default value

0x0

Label27: Read Stream ID.

label27_write_ssd**Type**

int

Default value

0x0

Label27: Write SDD or SSD_Index.

label27_write_stream_id**Type**

int

Default value

0x0

Label27: Write Stream ID.

label128_read_ssd**Type**

int

Default value

0x0

Label28: Read SDD or SSD_Index.

label128_read_stream_id**Type**

int

Default value

0x0

Label28: Read Stream ID.

label128_write_ssd**Type**

int

Default value

0x0

Label28: Write SDD or SSD_Index.

label128_write_stream_id**Type**

int

Default value

0x0

Label28: Write Stream ID.

label129_read_ssd**Type**

int

Default value

0x0

Label29: Read SDD or SSD_Index.

label29_read_stream_id**Type**

int

Default value

0x0

Label29: Read Stream ID.

label29_write_ssd**Type**

int

Default value

0x0

Label29: Write SDD or SSD_Index.

label29_write_stream_id**Type**

int

Default value

0x0

Label29: Write Stream ID.

label12_read_ssd**Type**

int

Default value

0x0

Label12: Read SDD or SSD_Index.

label12_read_stream_id**Type**

int

Default value

0x0

Label12: Read Stream ID.

label12_write_ssd**Type**

int

Default value

0x0

Label12: Write SDD or SSD_Index.

label12_write_stream_id**Type**

int

Default value

0x0

Label12: Write Stream ID.

label130_read_ssd**Type**

int

Default value

0x0

Label130: Read SDD or SSD_Index.

label130_read_stream_id**Type**

int

Default value

0x0

Label130: Read Stream ID.

label130_write_ssd**Type**

int

Default value

0x0

Label130: Write SDD or SSD_Index.

label30_write_stream_id**Type**

int

Default value

0x0

Label30: Write Stream ID.

label31_read_ssd**Type**

int

Default value

0x0

Label31: Read SDD or SSD_Index.

label31_read_stream_id**Type**

int

Default value

0x0

Label31: Read Stream ID.

label31_write_ssd**Type**

int

Default value

0x0

Label31: Write SDD or SSD_Index.

label31_write_stream_id**Type**

int

Default value

0x0

Label31: Write Stream ID.

label13_read_ssd**Type**

int

Default value

0x0

Label3: Read SDD or SSD_Index.

label13_read_stream_id**Type**

int

Default value

0x0

Label3: Read Stream ID.

label13_write_ssd**Type**

int

Default value

0x0

Label3: Write SDD or SSD_Index.

label13_write_stream_id**Type**

int

Default value

0x0

Label3: Write Stream ID.

label14_read_ssd**Type**

int

Default value

0x0

Label4: Read SDD or SSD_Index.

label4_read_stream_id**Type**

int

Default value

0x0

Label4: Read Stream ID.

label4_write_ssd**Type**

int

Default value

0x0

Label4: Write SDD or SSD_Index.

label4_write_stream_id**Type**

int

Default value

0x0

Label4: Write Stream ID.

label5_read_ssd**Type**

int

Default value

0x0

Label5: Read SDD or SSD_Index.

label5_read_stream_id**Type**

int

Default value

0x0

Label5: Read Stream ID.

label15_write_ssd**Type**

int

Default value

0x0

Label15: Write SDD or SSD_Index.

label15_write_stream_id**Type**

int

Default value

0x0

Label15: Write Stream ID.

label16_read_ssd**Type**

int

Default value

0x0

Label16: Read SDD or SSD_Index.

label16_read_stream_id**Type**

int

Default value

0x0

Label16: Read Stream ID.

label16_write_ssd**Type**

int

Default value

0x0

Label16: Write SDD or SSD_Index.

label6_write_stream_id**Type**

int

Default value

0x0

Label6: Write Stream ID.

label7_read_ssd**Type**

int

Default value

0x0

Label7: Read SDD or SSD_Index.

label7_read_stream_id**Type**

int

Default value

0x0

Label7: Read Stream ID.

label7_write_ssd**Type**

int

Default value

0x0

Label7: Write SDD or SSD_Index.

label7_write_stream_id**Type**

int

Default value

0x0

Label7: Write Stream ID.

label18_read_ssd**Type**

int

Default value

0x0

Label18: Read SDD or SSD_Index.

label18_read_stream_id**Type**

int

Default value

0x0

Label18: Read Stream ID.

label18_write_ssd**Type**

int

Default value

0x0

Label18: Write SDD or SSD_Index.

label18_write_stream_id**Type**

int

Default value

0x0

Label18: Write Stream ID.

label19_read_ssd**Type**

int

Default value

0x0

Label19: Read SDD or SSD_Index.

label9_read_stream_id**Type**

int

Default value

0x0

Label9: Read Stream ID.

label9_write_ssd**Type**

int

Default value

0x0

Label9: Write SDD or SSD_Index.

label9_write_stream_id**Type**

int

Default value

0x0

Label9: Write Stream ID.

mmu.seed**Type**

int

Default value

0x12345678

Seed for SMMU.

number_of_contexts**Type**

int

Default value

0x8

Number of context banks.

number_of_smrs**Type**

int

Default value

0x20

Number of stream match registers.

percent_tlbstatus_commits**Type**

int

Default value

0xa

Percentage of times that a poll of TLBSTATUS will commit the TLBI commands.

prefetch_only_requests**Type**

int

Default value

0x0

Handle prefetch-only requests by:- 0 -- deny them 1 -- use debug table walks and TLB entries 2 -- treat them as normal transactions (dangerous).

programmable_non_secure_by_default_ssd_indices**Type**

string

Default value

""

Programmable SSD Indexes that are by default non-secure (e.g. 0, 6, 35-84).

programmable_secure_by_default_ssd_indices**Type**

string

Default value

""

Programmable SSD Indexes that are by default secure (e.g. 0, 6, 35-84).

ptw_has_separate_port**Type**

bool

Default value

0x1

Page Table Walks use pvbus_ptw_m.

pvbus_m_is_ace_lite**Type**

bool

Default value

0x1

Is pvbus_m (the downstream port that translated transaction exit) ACE-Lite.

pvbus_ptw_m_is_ace_lite**Type**

bool

Default value

0x1

Is pvbus_ptw_m (the downstream port that is used for walks if ptw_has_separate_port is true) ACE-Lite.

stream_id_width**Type**

int

Default value

0x6

StreamID bit width.

tlb_depth**Type**

int

Default value

0x40

TLB Depth (0 means 10000). The model will perform best with more TLB entries.

use_label_mapping**Type**

bool

Default value

0x1

Use label mapping.

use_ssd_determination_table**Type**

bool

Default value

0x1

Use SSD Determination Table.

3.10.54 MMU_400_BASE

MMU-400 base component. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1106: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.**Iris and MTI instances for MMU_400_BASE**

This model has the following Iris instances:

Table 3-1107: MMU_400_BASE Iris instances

InstanceName	ComponentName
MMU_400_BASE	MMU_400_BASE
MMU_400_BASE.apb3_control_ns_slv	PVBusSlave
MMU_400_BASE.apb3_control_s_slv	PVBusSlave
MMU_400_BASE.apb4_control_slv	PVBusSlave
MMU_400_BASE.mapper	PVBusMapper
MMU_400_BASE.ptw_dvm_receiver	PVBusMapper
MMU_400_BASE.ptw_master	PVBusMaster
MMU_400_BASE.pvbus_master	PVBusMaster

This model has the following MTI trace components:

Table 3-1108: MMU_400_BASE MTI instances

InstanceName	ComponentName
MMU_400_BASE	MMU_400_BASE
MMU_400_BASE.apb3_control_ns_slv	PVBusSlave
MMU_400_BASE.apb3_control_s_slv	PVBusSlave
MMU_400_BASE.apb4_control_slv	PVBusSlave
MMU_400_BASE.mapper	PVBusMapper
MMU_400_BASE.ptw_dvm_receiver	PVBusMapper
MMU_400_BASE.ptw_master	PVBusMaster
MMU_400_BASE.pvbus_master	PVBusMaster

MMU_400_BASE contains the following CADI targets:

- MMU_400_BASE

Ports for MMU_400_BASE

Table 3-1109: Ports

Name	Protocol	Type	Description
apb3_control_ns	PVBus	Slave	If the device has been configured with APB3 control ports then this is used to address the register file with non-secure accesses. If this is the case then the apb4_control port should not be used.
apb3_control_s	PVBus	Slave	If the device has been configured with APB3 control ports then this is used to address the register file with secure accesses. If this is the case then the apb4_control port should not be used.
apb4_control	PVBus	Slave	If the device has been configured with APB4 control ports then this port is used -- it carries the security world with the transaction itself. If this is the case then the apb3_control_s and apb3_control_ns should not be used.
cfg_cttw_in	Signal	Slave	The SoC supports coherent page walks, this is meant to be sampled at reset. However, in practice the model has to prevent the race condition between cfg_cttw being asserted at the same 'cycle' as negedge reset. Thus we actually only sample the signal on the first transaction to the SMMU or the first transition on this signal after reset. Thus in the model, we require that cfg_cttw be held for at least this period of time.
cfgflt_irpt_ns	Signal	Master	Non-secure Configuration Access Fault Interrupt In the SMMU Architecture this is called SMMU_NSgCflrpt.
cfgflt_irpt_s	Signal	Master	Secure Configuration Access Fault Interrupt In the SMMU Architecture this is called SMMU_gCflrpt.
comb_irpt_ns	Signal	Master	"Non-secure combined interrupt" (cfgflt_irpt_ns glblflt_irpt_ns cxt_irpt_ns)?
comb_irpt_s	Signal	Master	"Secure combined interrupt"
cxt_irpt_ns	Signal	Master	Non-secure context bank fault NOTE that there is only one context bank fault, despite there being potentially 8 contexts. As we are HW stage 2 only then we can't have any banks configured as secure (well if we do then we generate a global fault).
glblflt_irpt_ns	Signal	Master	Global non-secure Fault Interrupt In the SMMU Architecture this is called SMMU_NSglrpt.
glblflt_irpt_s	Signal	Master	Global secure Fault Interrupt In the SMMU Architecture this is called SMMU_glrpt.

Name	Protocol	Type	Description
identify	MMU_400_BASE_IDENTIFY	Master	This port is a special model port that is used to take a transaction and map it to an SSD/SSD_Index and StreamID.
priv_internals	MMU_400_Internals	Slave	For internal use only, please do not use.
pvbus_m	PVBus	Master	This downstream port is where the translated accesses from pvbus_s emerge. If page walks are configured to come out of this port, then they will come out with the with the same attributes as described for pvbus_ptw_m.
pvbus_ptw_m	PVBus	Master	This downstream port is where page table walk accesses come from. This is only used if configured to use a separate page table walk port. The MMU-400 will only obey DVM messages if configured to use this port. The page walks come out of this port with the following master_id and user_flags. master_id : 0xFFFFFFFF The user flags : user_flags[7:0] stage 1 context_id (or 0xFF if stage2 only) user_flags[15:8] stage 2 context_id (or 0xFF if stage 1 with stage 2 bypass) user_flags[18:16] stage 1 level user_flags[21:19] stage 2 level user_flags[23:22] stage 1 descriptor encoding (0=v7s, 1=v7l, 2=v8l, 3=none) user_flags[25:24] stage 2 descriptor encoding (0=v7s, 1=v7l, 2=v8l, 3=none) user_flags[31,30] adomain of the transaction NOTE that if the walk is being done for a stage 1 page walk descriptor fetch then the stage 1 level field will indicate that level. If the walk is being done for a stage 2 descriptor fetch, then the stage 2 level field will show that level. If the context-id for a stage is not valid (0xFF) then the 'level' information is 0x7.
pvbus_s	PVBus	Slave	This port is the upstream port of the device, addresses on the port are in the VA/IPA
reset_in	Signal	Slave	The reset pin.

Parameters for MMU_400_BASE

always_secure_ssd_indices

Type

string

Default value

""

Non-programmable SSD Indexes that are always secure (e.g. 0, 6, 35-64).

cfg_cttw

Type

bool

Default value

0x1

Perform coherent page table walks.

dump_unpredictability_in_user_flags

Type

bool

Default value

0x0

Override the user flags to encode unpredictable information (validation only).

number_of_contexts**Type**

int

Default value

0x8

Number of context banks.

number_of_smrs**Type**

int

Default value

0x10

Number of stream match registers.

percent_tlbstatus_commits**Type**

int

Default value

0xa

Percentage of times that a poll of TLBSTATUS will commit the TLBI commands.

prefetch_only_requests**Type**

int

Default value

0x0

Handle prefetch-only requests by:- 0 -- deny them 1 -- use debug table walks and TLB entries 2 -- treat them as normal transactions (dangerous).

programmable_non_secure_by_default_ssd_indices**Type**

string

Default value

""

Programmable SSD Indexes that are by default non-secure (e.g. 0, 6, 35-84).

programmable_secure_by_default_ssd_indices

Type

string

Default value

""

Programmable SSD Indexes that are by default secure (e.g. 0, 6, 35-84).

ptw_has_separate_port

Type

bool

Default value

0x1

Page Table Walks use pvbus_ptw_m.

pvbus_m_is_ace_lite

Type

bool

Default value

0x1

Is pvbus_m (the downstream port that translated transaction exit) ACE-Lite.

pvbus_ptw_m_is_ace_lite

Type

bool

Default value

0x1

Is pvbus_ptw_m (the downstream port that is used for walks if ptw_has_separate_port is true) ACE-Lite.

seed

Type

int

Default value

0x12345678

Seed for SMMU.

stream_id_width

Type
int

Default value
0x6

StreamID bit width.

tlb_depth

Type
int

Default value
0x40

TLB Depth (0 means 10000). The model will perform best with more TLB entries.

use_ssd_determination_table

Type
bool

Default value
0x1

Use SSD Determination Table.

3.10.55 MMU_500

MMU-500 component. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1110: IP revisions support

Revision	Quality level
r2p4	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MMU_500

This model has the following Iris instances:

MMU_500 contains the following CADI targets:

- MMU_500
- MMU_500_BASE

About MMU_500

This is a model of a basic MMU-500. Set the version using the `version` parameter.

You cannot arbitrarily configure how you derive StreamIDs and SSD_Indexes from the transaction attributes.

This component has two label modes which you select using the parameter `use_label_mapping`:

- Set `use_label_mapping` to `true` if your upstream devices have labels in the top 16 bits of the transaction MasterID.

The model does not have a concept of AXI-ID, but a transaction can have a MasterID set on it.

Label your upstream components 0...*n* so that the parameters of this component can map those integers to StreamID and SSD_Index.

- Set `use_label_mapping` to `false` if the StreamID is encoded in the top 16 bits of the MasterID and the bottom 16 bits encode either the SSD_Index or the SSD state directly, depending on `use_ssd_determination_table`:
 - If `use_ssd_determination_table` is `true`, the bottom 16 bits of the MasterID encode the SSD_Index. They must be $< 2^{\text{ssd_index_width}}$.
 - If `use_ssd_determination_table` is `false`, the bottom 16 bits of the MasterID encode the SSD state directly, where zero is Secure and nonzero is Non-secure.

Typically in hardware, a device emits different AXI-IDs, depending on what it is doing. In the model, MasterIDs are usually not diverse and a device might only emit one MasterID.

This component models the registers as follows:

- It models all architectural registers that the Technical Reference Manual (TRM) specifies, except that it does not model any of the performance registers.
- Unlike the MMU-400, MMU-500 does have an SMMU_STLBGSTATUS register because it has stage 1 and stage 2 support.
- The SMMU_NSACR is an alias of the Non-secure SMMU_ACR. This component models SMMU_ACR as RAZ/WI.
- The *ACR registers have IMP DEF contents. This component models only the PAGESIZE bit of the SACR, as non-RAZ/WI. It models no other IMP DEF registers.

Ports for MMU_500

Table 3-1113: Ports

Name	Protocol	Type	Description
cfg_cttw_in	Signal	Slave	Enables coherent page table walks.
comb_irpt_ns	Signal	Master	Non-secure combined interrupt.
comb_irpt_s	Signal	Master	Secure combined interrupt.
cxt_irpt[128]	Signal	Master	Context interrupt.
glblflt_irpt_ns	Signal	Master	Global Non-secure fault interrupt.
glblflt_irpt_s	Signal	Master	Global Secure fault interrupt.
priv_internals	MMU_500_Internals	Slave	For internal use only, please do not use.
pvbus_control_s	PVBus	Slave	Provides memory-mapped read write access to the control registers of the module.
pvbus_m[32]	PVBus	Master	For all memory accesses. One for each Translation Buffer Unit (TBU).
pvbus_ptw_m	PVBus	Master	If ptw_has_separate_port is true, use for page table walks.
pvbus_s[32]	PVBus	Slave	For transactions from PVBus master/decoder. One for each TBU.
reset_in	Signal	Slave	Reset signal.

Parameters for MMU_500

always_secure_ssd_indices

Type

string

Default value

""

Non-programmable SSD Indexes that are always secure (e.g. 0, 6, 35-64).

cfg_cttw

Type

bool

Default value

0x1

Perform coherent page table walks.

dump_unpredictability_in_user_flags**Type**

bool

Default value

0x0

Override the user flags to encode unpredictable information (validation only).

label0_read_ssd**Type**

int

Default value

0x0

Label0: Read SDD or SSD_Index.

label0_read_stream_id**Type**

int

Default value

0x0

Label0: Read Stream ID.

label0_write_ssd**Type**

int

Default value

0x0

Label0: Write SDD or SSD_Index.

label0_write_stream_id**Type**

int

Default value

0x0

Label0: Write Stream ID.

label10_read_ssd**Type**

int

Default value

0x0

Label10: Read SDD or SSD_Index.

label10_read_stream_id**Type**

int

Default value

0x0

Label10: Read Stream ID.

label10_write_ssd**Type**

int

Default value

0x0

Label10: Write SDD or SSD_Index.

label10_write_stream_id**Type**

int

Default value

0x0

Label10: Write Stream ID.

label11_read_ssd**Type**

int

Default value

0x0

Label11: Read SDD or SSD_Index.

label11_read_stream_id**Type**

int

Default value

0x0

Label11: Read Stream ID.

label11_write_ssd**Type**

int

Default value

0x0

Label11: Write SDD or SSD_Index.

label11_write_stream_id**Type**

int

Default value

0x0

Label11: Write Stream ID.

label12_read_ssd**Type**

int

Default value

0x0

Label12: Read SDD or SSD_Index.

label12_read_stream_id**Type**

int

Default value

0x0

Label12: Read Stream ID.

label12_write_ssd**Type**

int

Default value

0x0

Label12: Write SDD or SSD_Index.

label12_write_stream_id**Type**

int

Default value

0x0

Label12: Write Stream ID.

label13_read_ssd**Type**

int

Default value

0x0

Label13: Read SDD or SSD_Index.

label13_read_stream_id**Type**

int

Default value

0x0

Label13: Read Stream ID.

label13_write_ssd**Type**

int

Default value

0x0

Label13: Write SDD or SSD_Index.

label13_write_stream_id**Type**

int

Default value

0x0

Label13: Write Stream ID.

label14_read_ssd**Type**

int

Default value

0x0

Label14: Read SDD or SSD_Index.

label14_read_stream_id**Type**

int

Default value

0x0

Label14: Read Stream ID.

label14_write_ssd**Type**

int

Default value

0x0

Label14: Write SDD or SSD_Index.

label14_write_stream_id**Type**

int

Default value

0x0

Label14: Write Stream ID.

label15_read_ssd**Type**

int

Default value

0x0

Label15: Read SDD or SSD_Index.

label15_read_stream_id**Type**

int

Default value

0x0

Label15: Read Stream ID.

label15_write_ssd**Type**

int

Default value

0x0

Label15: Write SDD or SSD_Index.

label15_write_stream_id**Type**

int

Default value

0x0

Label15: Write Stream ID.

label16_read_ssd**Type**

int

Default value

0x0

Label16: Read SDD or SSD_Index.

label16_read_stream_id**Type**

int

Default value

0x0

Label16: Read Stream ID.

label16_write_ssd**Type**

int

Default value

0x0

Label16: Write SDD or SSD_Index.

label16_write_stream_id**Type**

int

Default value

0x0

Label16: Write Stream ID.

label17_read_ssd**Type**

int

Default value

0x0

Label17: Read SDD or SSD_Index.

label17_read_stream_id**Type**

int

Default value

0x0

Label17: Read Stream ID.

label17_write_ssd**Type**

int

Default value

0x0

Label17: Write SDD or SSD_Index.

label17_write_stream_id**Type**

int

Default value

0x0

Label17: Write Stream ID.

label18_read_ssd**Type**

int

Default value

0x0

Label18: Read SDD or SSD_Index.

label18_read_stream_id**Type**

int

Default value

0x0

Label18: Read Stream ID.

label18_write_ssd**Type**

int

Default value

0x0

Label18: Write SDD or SSD_Index.

label18_write_stream_id**Type**

int

Default value

0x0

Label18: Write Stream ID.

label19_read_ssd**Type**

int

Default value

0x0

Label19: Read SDD or SSD_Index.

label19_read_stream_id**Type**

int

Default value

0x0

Label19: Read Stream ID.

label19_write_ssd**Type**

int

Default value

0x0

Label19: Write SDD or SSD_Index.

label19_write_stream_id**Type**

int

Default value

0x0

Label19: Write Stream ID.

label11_read_ssd**Type**

int

Default value

0x0

Label1: Read SDD or SSD_Index.

label11_read_stream_id**Type**

int

Default value

0x0

Label1: Read Stream ID.

label11_write_ssd**Type**

int

Default value

0x0

Label1: Write SDD or SSD_Index.

label11_write_stream_id**Type**

int

Default value

0x0

Label1: Write Stream ID.

label20_read_ssd**Type**

int

Default value

0x0

Label20: Read SDD or SSD_Index.

label20_read_stream_id**Type**

int

Default value

0x0

Label20: Read Stream ID.

label20_write_ssd**Type**

int

Default value

0x0

Label20: Write SDD or SSD_Index.

label20_write_stream_id**Type**

int

Default value

0x0

Label20: Write Stream ID.

label21_read_ssd**Type**

int

Default value

0x0

Label21: Read SDD or SSD_Index.

label21_read_stream_id**Type**

int

Default value

0x0

Label21: Read Stream ID.

label21_write_ssd**Type**

int

Default value

0x0

Label21: Write SDD or SSD_Index.

label21_write_stream_id**Type**

int

Default value

0x0

Label21: Write Stream ID.

label22_read_ssd**Type**

int

Default value

0x0

Label22: Read SDD or SSD_Index.

label22_read_stream_id**Type**

int

Default value

0x0

Label22: Read Stream ID.

label22_write_ssd**Type**

int

Default value

0x0

Label22: Write SDD or SSD_Index.

label22_write_stream_id**Type**

int

Default value

0x0

Label22: Write Stream ID.

label23_read_ssd**Type**

int

Default value

0x0

Label23: Read SDD or SSD_Index.

label23_read_stream_id**Type**

int

Default value

0x0

Label23: Read Stream ID.

label23_write_ssd**Type**

int

Default value

0x0

Label23: Write SDD or SSD_Index.

label23_write_stream_id**Type**

int

Default value

0x0

Label23: Write Stream ID.

label24_read_ssd**Type**

int

Default value

0x0

Label24: Read SDD or SSD_Index.

label24_read_stream_id**Type**

int

Default value

0x0

Label24: Read Stream ID.

label24_write_ssd**Type**

int

Default value

0x0

Label24: Write SDD or SSD_Index.

label24_write_stream_id**Type**

int

Default value

0x0

Label24: Write Stream ID.

label25_read_ssd**Type**

int

Default value

0x0

Label25: Read SDD or SSD_Index.

label125_read_stream_id**Type**

int

Default value

0x0

Label25: Read Stream ID.

label125_write_ssd**Type**

int

Default value

0x0

Label25: Write SDD or SSD_Index.

label125_write_stream_id**Type**

int

Default value

0x0

Label25: Write Stream ID.

label126_read_ssd**Type**

int

Default value

0x0

Label26: Read SDD or SSD_Index.

label126_read_stream_id**Type**

int

Default value

0x0

Label26: Read Stream ID.

label26_write_ssd**Type**

int

Default value

0x0

Label26: Write SDD or SSD_Index.

label26_write_stream_id**Type**

int

Default value

0x0

Label26: Write Stream ID.

label27_read_ssd**Type**

int

Default value

0x0

Label27: Read SDD or SSD_Index.

label27_read_stream_id**Type**

int

Default value

0x0

Label27: Read Stream ID.

label27_write_ssd**Type**

int

Default value

0x0

Label27: Write SDD or SSD_Index.

label27_write_stream_id**Type**

int

Default value

0x0

Label27: Write Stream ID.

label28_read_ssd**Type**

int

Default value

0x0

Label28: Read SDD or SSD_Index.

label28_read_stream_id**Type**

int

Default value

0x0

Label28: Read Stream ID.

label28_write_ssd**Type**

int

Default value

0x0

Label28: Write SDD or SSD_Index.

label28_write_stream_id**Type**

int

Default value

0x0

Label28: Write Stream ID.

label29_read_ssd**Type**

int

Default value

0x0

Label29: Read SDD or SSD_Index.

label29_read_stream_id**Type**

int

Default value

0x0

Label29: Read Stream ID.

label29_write_ssd**Type**

int

Default value

0x0

Label29: Write SDD or SSD_Index.

label29_write_stream_id**Type**

int

Default value

0x0

Label29: Write Stream ID.

label12_read_ssd**Type**

int

Default value

0x0

Label12: Read SDD or SSD_Index.

label12_read_stream_id**Type**

int

Default value

0x0

Label12: Read Stream ID.

label12_write_ssd**Type**

int

Default value

0x0

Label12: Write SDD or SSD_Index.

label12_write_stream_id**Type**

int

Default value

0x0

Label12: Write Stream ID.

label130_read_ssd**Type**

int

Default value

0x0

Label130: Read SDD or SSD_Index.

label130_read_stream_id**Type**

int

Default value

0x0

Label130: Read Stream ID.

label30_write_ssd**Type**

int

Default value

0x0

Label30: Write SDD or SSD_Index.

label30_write_stream_id**Type**

int

Default value

0x0

Label30: Write Stream ID.

label31_read_ssd**Type**

int

Default value

0x0

Label31: Read SDD or SSD_Index.

label31_read_stream_id**Type**

int

Default value

0x0

Label31: Read Stream ID.

label31_write_ssd**Type**

int

Default value

0x0

Label31: Write SDD or SSD_Index.

label31_write_stream_id**Type**

int

Default value

0x0

Label31: Write Stream ID.

label3_read_ssd**Type**

int

Default value

0x0

Label3: Read SDD or SSD_Index.

label3_read_stream_id**Type**

int

Default value

0x0

Label3: Read Stream ID.

label3_write_ssd**Type**

int

Default value

0x0

Label3: Write SDD or SSD_Index.

label3_write_stream_id**Type**

int

Default value

0x0

Label3: Write Stream ID.

label14_read_ssd**Type**

int

Default value

0x0

Label4: Read SDD or SSD_Index.

label14_read_stream_id**Type**

int

Default value

0x0

Label4: Read Stream ID.

label14_write_ssd**Type**

int

Default value

0x0

Label4: Write SDD or SSD_Index.

label14_write_stream_id**Type**

int

Default value

0x0

Label4: Write Stream ID.

label15_read_ssd**Type**

int

Default value

0x0

Label5: Read SDD or SSD_Index.

label15_read_stream_id**Type**

int

Default value

0x0

Label5: Read Stream ID.

label15_write_ssd**Type**

int

Default value

0x0

Label5: Write SDD or SSD_Index.

label15_write_stream_id**Type**

int

Default value

0x0

Label5: Write Stream ID.

label16_read_ssd**Type**

int

Default value

0x0

Label6: Read SDD or SSD_Index.

label16_read_stream_id**Type**

int

Default value

0x0

Label6: Read Stream ID.

label6_write_ssd**Type**

int

Default value

0x0

Label6: Write SDD or SSD_Index.

label6_write_stream_id**Type**

int

Default value

0x0

Label6: Write Stream ID.

label7_read_ssd**Type**

int

Default value

0x0

Label7: Read SDD or SSD_Index.

label7_read_stream_id**Type**

int

Default value

0x0

Label7: Read Stream ID.

label7_write_ssd**Type**

int

Default value

0x0

Label7: Write SDD or SSD_Index.

label17_write_stream_id**Type**

int

Default value

0x0

Label7: Write Stream ID.

label18_read_ssd**Type**

int

Default value

0x0

Label8: Read SDD or SSD_Index.

label18_read_stream_id**Type**

int

Default value

0x0

Label8: Read Stream ID.

label18_write_ssd**Type**

int

Default value

0x0

Label8: Write SDD or SSD_Index.

label18_write_stream_id**Type**

int

Default value

0x0

Label8: Write Stream ID.

label9_read_ssd**Type**

int

Default value

0x0

Label9: Read SDD or SSD_Index.

label9_read_stream_id**Type**

int

Default value

0x0

Label9: Read Stream ID.

label9_write_ssd**Type**

int

Default value

0x0

Label9: Write SDD or SSD_Index.

label9_write_stream_id**Type**

int

Default value

0x0

Label9: Write Stream ID.

mmu.PRIVATE_PARAMETER_personality**Type**

string

Default value

""

The personality to use (affects ID codes and various imp def features).

mmu.PRIVATE_PARAMETER_seed**Type**

int

Default value

0x12345678

Seed for randomised SMMU implementation defined behaviour.

mmu.PRIVATE_PARAMETER_validation_mode**Type**

int

Default value

0x0

Internal validation mode.

number_of_contexts**Type**

int

Default value

0x8

Number of context banks.

number_of_smrs**Type**

int

Default value

0x20

Number of stream match registers.

percent_tlbstatus_commits**Type**

int

Default value

0xa

Percentage of times that a poll of TLBSTATUS will commit the TLBI commands.

prefetch_only_requests**Type**

int

Default value

0x0

Handle prefetch-only requests by:- 0 -- deny them 1 -- use debug table walks and TLB entries 2 -- treat them as normal transactions (dangerous).

programmable_non_secure_by_default_ssd_indices**Type**

string

Default value

""

Programmable SSD Indexes that are by default non-secure (e.g. 0, 6, 35-84).

programmable_secure_by_default_ssd_indices**Type**

string

Default value

""

Programmable SSD Indexes that are by default secure (e.g. 0, 6, 35-84).

ptw_has_separate_port**Type**

bool

Default value

0x1

Page Table Walks use pvbus_ptw_m.

supports_nested_translations**Type**

bool

Default value

0x1

Supports nested translations (stage 1 + stage 2).

tlb_depth

Type
int

Default value
0x800

TLB Depth (0 means 10000). The model will perform best with more TLB entries.

use_label_mapping

Type
bool

Default value
0x1

Use label mapping.

use_ssd_determination_table

Type
bool

Default value
0x1

Use SSD Determination Table.

version

Type
string

Default value
"EAC"

Version of the RTL that the model represents. Valid values are LACr1 and EAC.

3.10.56 MMU_500_BASE

MMU-500 base component. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1114: IP revisions support

Revision	Quality level
r2p4	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MMU_500_BASE

This model has the following Iris instances:

Table 3-1115: MMU_500_BASE Iris instances

InstanceName	ComponentName
MMU_500_BASE	MMU_500_BASE
MMU_500_BASE.mapper0	PVBusMapper
MMU_500_BASE.mapper1	PVBusMapper
MMU_500_BASE.mapper10	PVBusMapper
MMU_500_BASE.mapper11	PVBusMapper
MMU_500_BASE.mapper12	PVBusMapper
MMU_500_BASE.mapper13	PVBusMapper
MMU_500_BASE.mapper14	PVBusMapper
MMU_500_BASE.mapper15	PVBusMapper
MMU_500_BASE.mapper16	PVBusMapper
MMU_500_BASE.mapper17	PVBusMapper

MMU_500_BASE contains the following CADI targets:

- MMU_500_BASE

Ports for MMU_500_BASE

Table 3-1117: Ports

Name	Protocol	Type	Description
cfg_cttw_in	Signal	Slave	The SoC supports coherent page walks, this is meant to be sampled at reset. However, in practice the model has to prevent the race condition between cfg_cttw being asserted at the same 'cycle' as negedge reset. Thus we actually only sample the signal on the first transaction to the SMMU or the first transition on this signal after reset. Thus in the model, we require that cfg_cttw be held for at least this period of time.
comb_irpt_ns	Signal	Master	"Non-secure combined interrupt"
comb_irpt_s	Signal	Master	"Secure combined interrupt"
cxt_irpt[128]	Signal	Master	Non-secure context bank fault.
glbl_flt_irpt_ns	Signal	Master	Global non-secure Fault Interrupt In the SMMU Architecture this is called SMMU_NSglrpt.
glbl_flt_irpt_s	Signal	Master	Global secure Fault Interrupt In the SMMU Architecture this is called SMMU_glrpt.
identify	MMU_500_BASE_IDENTIFY	Master	This port is a special model port that is used to take a transaction and map it to an SSD/SSD_Index and StreamID.
priv_internals	MMU_500_Internals	Slave	For internal use only, please do not use.
pvbus_control_s	PVBus	Slave	The register port of the device is AXI.
pvbus_m[32]	PVBus	Master	This downstream port is where the translated accesses from pvbus_s emerge. See notes for pvbus_s[] as well. If the Page Table Walk (PTW) does not have a separate port then PTW accesses will emerge at port 0 with the same attributes as described in pvbus_ptw_m.

Name	Protocol	Type	Description
pvbus_ptw_m	PVBus	Master	This downstream port is where page table walk accesses come from. This is only used if configured to use a separate page table walk port. The MMU-500 will only obey DVM messages if configured to use this port. The page walks come out of this port with the following master_id and user_flags. master_id : 0xFFFFFFFF The user flags : user_flags[7:0] stage 1 context_id (or 0xFF if stage2 only) user_flags[15:8] stage 2 context_id (or 0xFF if stage 1 with stage 2 bypass) user_flags[18:16] stage 1 level user_flags[21:19] stage 2 level user_flags[31,30] adomain of the transaction NOTE that if the walk is being done for a stage 1 page walk descriptor fetch then the stage 1 level field will indicate that level. If the walk is being done for a stage 2 descriptor fetch, then the stage 2 level field will show that level. If the context-id for a stage is not valid (0xFF) then the 'level' information is 0x7.
pvbus_s[32]	PVBus	Slave	This port is the upstream port of the device, addresses on the port are in the VA/IPA Each TBU in the design is represented by a pair of pvbus_s[tbu_id] and pvbus_m[tbu_id]. That is transactions that go into pvbus_s[tbu_id] will emerge at pvbus_m[tbu_id]. The port index that a transaction comes in on is the tbu_number_parameter to the MMU_500_BASE_IDENTIFY::identify() function. The identify() function must use all the information it is given by the parameters to map to the architectural concepts of StreamID and SSD_Index/SSD. How it does this is IMPLEMENTATION DEFINED and depends on the topology of the SoC and the masters upstream of the TBUs.
reset_in	Signal	Slave	The reset pin.

Parameters for MMU_500_BASE

PRIVATE_PARAMETER_personality

Type

string

Default value

""

The personality to use (affects ID codes and various imp def features).

PRIVATE_PARAMETER_seed

Type

int

Default value

0x12345678

Seed for randomised SMMU implementation defined behaviour.

PRIVATE_PARAMETER_validation_mode

Type

int

Default value

0x0

Internal validation mode.

always_secure_ssd_indices**Type**

string

Default value

""

Non-programmable SSD Indexes that are always secure (e.g. 0, 6, 35-64).

cfg_cttw**Type**

bool

Default value

0x1

Perform coherent page table walks.

dump_unpredictability_in_user_flags**Type**

bool

Default value

0x0

Override the user flags to encode unpredictable information (validation only).

number_of_contexts**Type**

int

Default value

0x8

Number of context banks.

number_of_smrs**Type**

int

Default value

0x10

Number of stream match registers.

percent_tlbstatus_commits**Type**

int

Default value

0xa

Percentage of times that a poll of TLBSTATUS will commit the TLBI commands.

prefetch_only_requests**Type**

int

Default value

0x0

Handle prefetch-only requests by:- 0 -- deny them 1 -- use debug table walks and TLB entries 2 -- treat them as normal transactions (dangerous).

programmable_non_secure_by_default_ssd_indices**Type**

string

Default value

""

Programmable SSD Indexes that are by default non-secure (e.g. 0, 6, 35-84).

programmable_secure_by_default_ssd_indices**Type**

string

Default value

""

Programmable SSD Indexes that are by default secure (e.g. 0, 6, 35-84).

ptw_has_separate_port**Type**

bool

Default value

0x1

Page Table Walks use pvbus_ptw_m (or uses pvbus_m[0]).

supports_nested_translations

Type
bool

Default value
0x1

Supports nested translations (stage 1 + stage 2).

tlb_depth

Type
int

Default value
0x800

TLB Depth (0 means 10000). The model will perform best with more TLB entries.

use_ssd_determination_table

Type
bool

Default value
0x1

Use SSD Determination Table.

version

Type
string

Default value
"EAC"

Version of the RTL that the model represents. Valid values are LACr1 and EAC.

3.10.57 MMU_600

This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1118: IP revisions support

Revision	Quality level
r0p0	Full support
r0p1	Full support

Revision	Quality level
r0p2	Full support
r1p0	Full support
r2p0	Full support
r2p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MMU_600

MMU_600 contains the following CADI targets:

- MMU_600

Limitations

- PMU does not implement all architecturally-mandated events:
 - The PMU is intended for demonstration purposes only
 - Note: between 11.17 and 11.18 then the point of triggering for events changed for 'TLB miss' and this might lead to an (architecturally valid) change in the values captured in some circumstances.
- No RAS
- No power control
- No sup_oas that controls the OAS of the SMMU. This is expected to be constant for a system
- Cache maintenance operations cannot be inserted into the SMMU's TBU ports
- PVBus has no representation of the cache stash operations and so they are not supported.
- The SYSCO interface is not implemented
- The low power interface is not implemented
- TCU_CFG.XLATE_SLOTS is fixed at 512
- TCU_STATUS.GNT_XLATE_SLOTS always reads at 512

The model deals with groups of transactions with the same attributes and a similar range of addresses. The mapping used is remembered by the bus infrastructure and is then used for subsequent sufficiently similar transactions without needing the intervention of the SMMU model (and so won't be traced, etc.)

Notes

- The hardware is a distributed SMMU and is divided into:
 - A single Translation Control Unit (TCU)
 - Has a port for the programming interface of the SMMU
 - Receives DVM messages
 - Does all the page walking, queue manipulation, etc.
 - One or more Translation Bus Units (TBUs)
 - Translate transactions from upstream (client) device into downstream transactions.
 - Zero or more connections to PCIe Root Complexes (PCIe-RCs)
 - There can be a total of 62 TBUs and PCIe-RCs attached.

- An interconnect connecting the TBUs, PCIe-RCs to the TCU
- A PCIe-RC has one connection to the TCU to make ATS requests but the PCIe-RC uses one or more TBUs to transform the transactions and pass them to the memory system. In the model, those TBUs used will be listed in the parameter `list_of_pcie_mode`. The SMMU does not know which TBUs a particular PCIe-RC is attached to.
- The TBU ORs a value into each StreamID that it receives. In the model, this is configured by the parameters:
 - `list_of_s_sid_high_at_bitpos0`
 - `list_of_ns_sid_high_at_bitpos0`
- The TCU, TBU, and the interconnect are all represented by this single model component.
- In the model, a pair of ports `tbs_pvbus_s[i]`/`tbm_pvbus_m[i]` represent a TBU 'i' or the `tbs_pvbus_s[i]` represents an incoming connection for a PCIe-RC. The corresponding reverse connection from the TCU to the PCIe-RC is by a special bus called `pvbus_id_routed_m` that is used to transport ATC Invalidates to the PCIe-RC.
 - In order to reduce system construction complexity the `tbs_pvbus_s[i]`/`tbm_pvbus_m[i]` also acts as a TBU so that the PCIe-RC need not separate its normal transactions and its ATS requests.
 - However, ATC Invalidates are only sent to a port which appears in `list_of_pcie_rc`. It should be uniquely decoded to a single port based on `list_of_ns_sid_high_at_bitpos0` and those ATC Invalidates must be routed to the correct PCIe subsystem in order to invalidate the cache of ATS Response in the subsystem. Thus all TBUs that a PCIe-RC uses must have a unique reverse mapping from stream id to port.
- A bad configuration will render the model inactive.
- Some configuration can be adjusted by configuration pins. These are only sampled at the negative edge of the reset pin. If you want to use these pins, you must drive them before sending a negative edge on the reset pin. During simulation_reset the component driving them must also drive this transition again.
- The pin `sup_oas` is not supported, instead it is a parameter as it is assumed that it would be tied to a fixed value in any specific platform.
- Debug reads to the registers do not disturb the state.
- Writes to registers with Update flags (including debug writes) are ignored if the Update flag is already one.
- Debug and real accesses to the registers must be 32 or 64 bits.
- MSIs are issued on the `qtw_pvbus_m` port using attributes determined by the parameter `msi_attribute_transform`, whilst Event Queue writes will always be issued with `ExtendedID=0`, `UserFlags=0`, `MasterID=0xFFFFFFFF`. In the hardware, there is no way of distinguishing Event Queue writes from MSI writes, however, this provides a mechanism that if the model system needs to distinguish then it can.
- The hardware only has a single cacheability attribute for input transactions, but PVBUS transports both inner and outer cacheability.
- For non-PCIe-mode TBUs (i.e. their index does not appear in `list_of_pcie_mode` or `list_of_pcie_rc`):

- For non-cache maintenance operations:
 - If the input attribute is any type of device then it is well defined as being outer-shared and Device-nGnRnE or Device-nGnRE. There is no support for Gathering or Reordering.
 - If the outer cacheable input attribute is normal then if it is Write-back then this is converted to Inner Write-back Outer Write-back (iWB-oWB) with the desired shareability. No Transient hint is supported and is always treated as non-transient.
 - This leaves all other normal memory types that are mapped to Inner Normal Non-cacheable, Outer Normal Non-cacheable outer shared (iNC-oNC-osh).
- Thus the upstream devices must present the cacheability in the *outer* cacheability attribute on PVBUS if it is cacheable. If it is a device type then both the inner and outer attributes must be set to the same. If it is iNC-oNC-osh then it must be presented as such.
- For PCIe-mode TBUs (i.e. their index appears in `list_of_pcie_mode` or `list_of_pcie_rc`):
 - Input transactions are from PCIe and the only indication of the memory type is in the NoSnoop bit of the transaction. No shareability is transported.
 - NoSnoop interpreted as iNC-oNC-osh
 - ! NoSnoop interpreted as iWB-oWB-ish (note inner shareable)
 - If a NoSnoop transaction has an attribute transform applied to it and the result of the transform is weaker than iNC-oNC-osh then it will be forced to iNC-oNC-osh. For example, if a NoSnoop transaction uses a page table and is transformed to iWB-oWB-nsh then it will be forced to iNC-oNC-osh. However, if the page tables transformed it to a device type then, as all device types are stronger than iNC-oNC-osh then it will exit the SMMU as the device type.
 - In the model, transactions are classified by their incoming memory attributes as to whether they are NoSnoop or not and then normalized appropriately:
 - iWB-oWB-any-shareability are interpreted as ! NoSnoop
 - Thus normalized to iWB-oWB-ish
 - Anything else is considered NoSnoop
 - Thus normalized to iNC-oNC-osh
 - Translated accesses also suffer the same interpretation to determine NoSnoop and how they are normalized. Thus they could enter the system with attributes different to if they were Untranslated Accesses translated by normal means.
 - It is expected that there is a component downstream of the SMMU that is aware of the system address map and will override the memory type to 'device' for any transaction that accesses a peripheral.
- The hardware has a single cacheability on input and, for transactions that are neither cache-maintenance operations nor PCIe transactions, normalizes the input to an architectural form before performing the SMMUv3 architectural transform:
 - Any device type is left untouched (the input can only represent Device-nGnRE and Device-nGnRnE).
 - If the input is Write-back (WB) then it is normalized to iWB-oWB with the incoming shareability.

- If the input is anything else it is normalized to iNC-oNC-osh.
- The model accepts full architectural attributes of two levels of cacheability and so has to decide how to interpret this in terms of the hardware. For transactions that are not cache maintenance operations, the model will replicate the outer attribute into the inner attribute and then perform the normalisation that the hardware does.
- The hardware normalizes the architectural output attributes and outputs a single level of cacheability and a user flag (OC) specifying if the architectural attributes were cacheable in the outer cacheable domain. The normalisation is:
 - If the transaction is classified as a PCIe one then the NoSnoop transform described above is applied. That is:
 - if the original transaction was NoSnoop then any weaker memory type is strengthened to iNC-oNC-osh, then apply the following transform:

```

if      iWB-oWB-nsh/ish/osh      then output WB-nsh/ish/osh,  OC = 1
else if i (NC/WT/WB) -o (WB/WT)  then output NC-Sys,      OC = 1
else if i (NC/WT/WB) -oNC        then output NC-Sys,      OC = 0
else if Device-(GRE/nGRE/nGnRE)  then output DV-Sys,      OC = 0
else                             output SO-Sys,          OC = 0

```

- The model only normalizes according to PCIe but otherwise leaves the architectural attributes intact on the output bus.

Ports for MMU_600

Table 3-1121: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock signal (in RTL aclk) This is a clock time-base used by the TCU to spread some of its processing over time, if enabled by the wait_* parameters. The clock must always be connected.
cmd_sync_irpt_ns	Signal	Master	Pulsed interrupt output signal for non-secure CMD_SYNC having a completion signal of SIG_IRQ.
cmd_sync_irpt_s	Signal	Master	Pulsed interrupt output signal for secure CMD_SYNC having a completion signal of SIG_IRQ.
event_q_irpt_ns	Signal	Master	Pulsed interrupt output signal for the non-secure event queue becoming non-empty.
event_q_irpt_s	Signal	Master	Pulsed interrupt output signal for the secure event queue becoming non-empty.
evento	Signal	Master	Event signal
global_irpt_ns	Signal	Master	Pulsed interrupt output signal for non-secure SMMU_GERROR(N) signalling an error.
global_irpt_s	Signal	Master	Pulsed interrupt output signal for secure SMMU_S_GERROR(N) signalling an error.

Name	Protocol	Type	Description
identify	SMMUv3AEMIdentifyProtocol	Master	Map the transaction to the tuple (StreamID, SubStreamID, SubStreamIDValid, SSD) The StreamID that is produced by the implementation of this protocol is not the final StreamID. The final StreamID is produced by using the list_of_ns_sid_high_at_bitpos0/list_of_s_sid_high_at_bitpos0 parameter to map the StreamID based on the upstream port index. Also see the parameter howto_identify which can replace the functionality of this port under certain circumstances.
pri_q_irpt_ns	Signal	Master	Pulsed interrupt output signal for the PRI queue becoming non-empty. Exists only for r1 and higher.
prog_pvbus_s	PVBus	Slave	Register subordinate port (in RTL PROG)
pvbus_id_routed_m[62]	PVBus	Master	This is a special "id-routed" port for transmitting ATC invalidates upstream into the PCIe EndPoints, it is not a normal bus. See the parameter output_id_routed_transform. The FastModels ATC Invalidate and PRI Response protocol specifies how to route and deal with this port.
qtw_pvbus_m	PVBus	Master	Manager port used for Table Walks, MSIs and Queue access. Note that although this is a manager port, it can still receive DVM messages.
sec_override	Signal	Slave	Allow certain registers to be accessible to non-secure accesses from reset, as described in the TCU_SCR register. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_btm	Signal	Slave	System supports BTM and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. If BTM (Broadcast Table Maintenance) is not supported then DVM messages will be ignored. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_cohacc	Signal	Slave	System supports COHACC and will be reflected in the IDR registers. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_sev	Signal	Slave	System supports SEV and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
tbm_pvbus_m[62]	PVBus	Master	The TBU manager ports that carry transactions that have been translated from the correspondingly numbered tbs_pvbus_s[] port.
tbs_pvbus_s[62]	PVBus	Slave	The TBU subordinate ports that receive transactions to be translated. They will exit the SMMU through the same numbered pvbus_m[] port.
tbu_pmu_irpt[62]	Signal	Master	TBU Performance Monitoring Unit interrupt, one per TBU.
tbu_pmusnapshot_ack[62]	Signal	Master	PMU snapshot interface for the TBU, ack a snapshot.
tbu_pmusnapshot_req[62]	Signal	Slave	PMU snapshot interface for the TBU, request a snapshot.
tbu_ras_irpt[62]	Signal	Master	The RAS interrupt pin for errors detected in the TBUs.

Name	Protocol	Type	Description
tbu_reset_in[62]	Signal	Slave	Reset signals The TBUs can have independent reset signals. Each signal <code>tbu_reset_in[n]</code> corresponds to the TBU using <code>tbs_pvbus_s[n]/tbs_pvbus_s[n]</code> pair. If the SMMU receives a transaction whilst the TBU is expected to be in reset then it will complain using the <code>ArchMsg.Warning.warning</code> trace source. Those <code>tbu_reset_in</code> that correspond to a PCIe-RC connection can be connected to monitor the PCIe-RC's reset signal. If it receives an ATS request when in reset then it will complain in a similar way. You must connect these pins if you wish the <code>TCU_NODE_STATUS</code> for the nodes to be accurate (including any connected to the PCIe-RC).
tcu_pmu_irpt	Signal	Master	TCU Performance Monitoring Unit interrupt
tcu_pmusnapshot_ack	Signal	Master	PMU snapshot interface for the TCU, ack a snapshot.
tcu_pmusnapshot_req	Signal	Slave	PMU snapshot interface This is a four-phase handshake to have the corresponding PMCG perform a capture of the current counter values. PMU snapshot interface for the TCU, request a snapshot.
tcu_ras_irpt	Signal	Master	The RAS interrupt pin for errors detected in the TCU.
tcu_reset_in	Signal	Slave	The reset signal to the TCU interface.

Parameters for MMU_600

TCUCFG_XLATE_SLOTS

Type

`uint32_t`

Default value

512

Maximum number of outstanding stalled transactions that the SMMU supports.

Note

`TCUCFG_XLATE_SLOTS` must be \geq `TCUCFG_PTW_SLOTS` which is currently fixed to 512.

Accepted Values: 512

all_error_messages_through_trace

Type

`bool`

Default value

false

Some conditions in the SMMU are so strange that the software programming the SMMU has done something wrong. At this point messages are output to either `ArchMsg.Error.*` or

`ArchMsg.Warning.*` or to the error stream of the simulator. Outputting to the error stream of the simulator may cause it to return with a non-zero exit status.

If you set this option to true then instead of using the error stream of the simulator it will always use a trace stream allowing the simulation to exit with a zero exit status.

behaviour_of_sampled_at_reset_signals

Type

unsigned

Default value

0

Some configuration signals into the SMMU are sampled on negedge of reset.

However, it can sometimes be hard to arrange to drive a configuration pin before the negedge of reset.

The configuration pins are sampled:

0

at negedge reset.

1

at negedge reset, but if a later change occurs at the same simulated time, and no transactions have occurred, then they will be resampled and the SMMU reset again.

cmdq_max_number_of_commands_to_buffer

Type

uint32_t

Default value

10

The command queues can buffer fetched commands before issuing them. This parameter is roughly the maximum number of commands to do this for. The programmer visible effects are that just because the CONS pointer shows a command has been consumed does not necessarily mean that it has been issued (and completed). Higher values accentuate this effect.

enable_device_id_checks

Type

bool

Default value

true

If this parameter is true then the DeviceIDs seen by the GIC are:

- **for client devices**

`DeviceID = StreamID + translated_device_id_base`

Copyright © 2017–2024 Arm Limited (or its affiliates). All rights reserved.
Non-Confidential

- **for SMMU-generated MSIs**

`smmu_msi_device_id`

This parameter enables two checks:

- If the DeviceID is used in the `output_attribute_transform` parameter, if it overflows 32 bits then the model warns. If the DeviceID is not used, it is assumed that the external agent that forms the DeviceID warns if it overflows.
- If the SMMU supports MSIs, the model checks that the GIC is able to distinguish an MSI generated by the SMMU from one generated by a client device.

As the exact mechanism to determine the DeviceID is in the system and not necessarily under control of the SMMU then you can disable these warnings using this parameter.

See also the parameters: `output_attribute_transform` and `msi_attribute_transform`.

howto_identify

Type

string

Default value

"use-identify"

If `use-identify` then the SMMU uses the `identify` port to determine the `ssd`, `streamID`, `subStreamID`. Otherwise, this string extracts them from the transaction's attributes.

Examples:

```
SEC_SID=ExtendedID[63], SSV=ExtendedID[62], SubstreamID=ExtendedID[51:32],
StreamID=ExtendedID[31:0]
nSEC_SID=ExtendedID[63], StreamID=ExtendedID[55:24], nSSV=ExtendedID[20],
SubstreamID=ExtendedID[19:0]
StreamID[31:24]=0, StreamID[23:0]=ExtendedID[23:0], SSV=1[0], ...
```

The `streamID` (32 b) is valid if `sidv` is 1 or both `sidv` and `nsidv` are unused.

`sec_sid` is 1b in the model. For RME systems, in hardware, then `sec_sid` is 2b, in the model `sec_sid_bit_1` represents bit[1].

The `substreamID` (20 b) is valid if `ssv` is true.

`sidv == 0` indicates a NoStreamID transaction and the SSD is the PAS of the transaction, `SEC_SID` is not used.

`nSEC_SID`, `nSSV`, `nsidv` are available with negative logic. Different attributes are independent and can use negative or positive logic. Negative and positive logic symbols for the same attribute is an error.

The model uses the term SSD (Security State Determination) to mean which security state the transaction, register, structure, event, etc. belongs to.

In the SMMUv3 Architecture, the side-band signal `SEC_SID` holds the information for the transactions, but uses a different encoding.

Before RME, `SEC_SID` was a one bit signal. With RME, in the hardware, it was expanded to 2b. To retain backwards compatibility in the model, `SEC_SID` remains as 1b in this parameter, but the second bit can be expressed with `SEC_SID_bit_1` (and its negative logic version `NSID_bit_1`)

Security state	SSD	SEC_SID_bit_1	SEC_SID
secure	0	0	1
non-secure	1	0	0
root (reserved)	2	1	1
realm	3	1	0

For those systems that support NoStreamID transactions, and `howto_identify` is not using the port, first the SMMU determines the value of `SIDV` or `NSIDV` to see if the transaction is a NoStreamID transaction (`SIDV == 0` or `NSIDV == 1`). If so then the rest of the `howto_identify` string is ignored as the information extracted relates only to StreamID transactions. Instead more information is extracted using the parameter `howto_identify_NoStreamID_extra_info`.

`list_of_ns_sid_high_at_bitpos0`

Type

string

Default value

""

A comma-separated list of values to bitwise OR into each Non-secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID.

Each TBU that is connected to a PCIe-RC (see `list_of_pcie_rc`) must serve a unique contiguous subset of StreamIDs as determined by their top bits. This is used in order to know which port to route ATC Invalidates and PRI Responses to the PCIe subsystems.

The empty string corresponds to all 0s.

`list_of_pcie_mode`

Type

string

Default value

""

A comma-separated list of ranges of ports that represent TBUs that are attached to PCIe Root Complexes (PCIe-RC). A single PCIe-RC might use several TBUs and stripe accesses across them. The attribute handling for these TBUs is slightly different in that if the PCIe transaction is NoSnoop and the output attributes of the translation would be weaker than `INC-ONC-osh` then the output is forced to `INC-ONC-osh`.

INC-oNC-osh == “inner normal non-cacheable, out normal non-cacheable, outer shared”

list_of_pcie_rc

Type

string

Default value

""

This is a list of ports that are connected to PCIe Root Complex (PCIe-RC) by a protocol called DTI-ATS. This port is used to transport ATS and PRI Requests to the SMMU from the PCIe-RC.

In the real hardware, the PCIe-RC uses this port for ATS/PRI, and the actual transactions go through separate TBUs. In the model, this port can accept actual transactions as well. However, in the model, then the ATC Invalidates and the PRI Responses need to be transferred over the corresponding pvbush_id_routed_m port as DTI-ATS is bidirectional, but PVBush is not.

list_of_s_sid_high_at_bitpos0

Type

string

Default value

""

A comma-separated list of values to bitwise OR into each Secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID.

The empty string corresponds to all 0s.

use_ns can be used to apply the list_of_ns_sid_high_at_bitpos0 values instead.

msi_attribute_transform

Type

string

Default value

“ExtendedID[31:0]=smmu_msi_device_id, MasterID=0xFFFFffffff”

Transform downstream attributes of MSI transactions.

After 11.25 the interrupt_kind field was extended to 5 bits. This is strictly a non-backwards compatible change. However, the original 3 bits was insufficient to express all the interrupt kinds that exist.

number_of_ports**Type**

unsigned

Default value

1

The number of port pairs that the SMMU has.

output_attribute_transform**Type**

string

Default value

"ExtendedID[31:0]=DeviceID"

Transform the downstream attributes of a translated transaction.

- "" or "none" – the input and output attributes are identical.
- How to alter the output attributes, for example:

```
"ExtendedID[15:0]=DeviceID[15:0], UserFlags[31]=nSSV,
UserFlags[19:0]=SubstreamID"
```

The attributes that can appear on the left hand side of the transform are `ExtendedID`, `MasterID` and `UserFlags`.

The source attributes that can be used are:

ExtendedID/MasterID/UserFlags

the incoming attributes.

DeviceID`StreamID + translated_device_id_base``StreamID/SubstreamID/SSV/SEC_SID`**nSEC_SID/nSSV**

the negative logic versions.

St1PBHA/St2PBHA

the Page Based Hardware Attributes from any used leaf descriptors (or zero if not used).

STE_IMPDEF1`STE[127:116]`

The right hand side may also contain numeric literals. Any bits of the attributes that have no transform specified are retained from the input.

The `StreamID` has had `ns_sid_high/s_sid_high` ORred into it for the appropriate TBU.

output_id_routed_transform

Type

string

Default value

"Address[27:12]=StreamID[15:0], PAS=SSD"

The SMMU generates the following ID-routed transaction on the pvbus_id_routed_m bus:

- ATC Invalidate
- PRI Response

This parameter controls how the SMMU should express:

- the StreamID
- the Trusted (T) bit

The value is a comma-separated list of assignments:

```
Address[27:12]=StreamID[15:0], ExtendedID[60]=T, ExtendedID[15:0]=StreamID[31:16]
```

Address bits[11:0] cannot be used.

The LHS can be one of:

- PAS
- MasterID/ExtendedID/UserFlags
- Address

The RHS can be one of:

- a numeric constant
- SSD
- T or negative version nT
- StreamID

For realm (or 'Trusted') transactions, then SSD=0b11, T=1, nT=0. For non-secure (or 'Non-Trusted') transactions, then SSD=0b01, T=0, nT=1

prefetch_only_requests

Type

unsigned

Default value

0

The simulator supports ‘prefetch-only’ DMI requests, which can occur at any time and for any reason and are intended to be invisible to the end execution of the model and to the user.

0

deny all prefetch-only requests

1

- use debug requests for any page table walks
 - form and use debug TLB/cache entries
 - any faults will not record, but deny the prefetch request

2

- treat prefetch-only requests like normal transactions
 - use normal page table walk transactions
 - use and form normal TLB/cache entries
 - faults will alter the programmer-visible state of the SMMU

0 is the safest.

1 treats the access like a debug request and requires that debug page table walks are treated correctly downstream. Any descriptors that need HTTU to allow the transaction to proceed will fail the request.

2 is dangerous, it use real transactions and reports faults that are unphysical. Real transactions can be wait()ed and this disobeys the SystemC spec for get_direct_mem_ptr().

sec_override

Type

bool

Default value

false

The IMP DEF port sec_override controls whether some of the registers are accessible to secure or non-secure transactions. This parameter is the default value assumed for that port if the port is not driven by a signal.

seed

Type

uint32_t

Default value

0x12345678

Used to seed the pseudo-random number generator that the SMMU model uses.

size_of_cd_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding CD structures. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_l1cd_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding L1CD descriptors. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_l1ste_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding L1STE descriptors. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_ste_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding STE structures. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_tlb**Type**

uint32_t

Default value

0

The number of entries in the TLB. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

smmu_msi_device_id

Type

uint32_t

Default value

0

When appropriately enabled, assume that MSIs that are generated by the SMMU are presented to the GIC with this DeviceID.

See parameters `msi_attribute_transform` and `enable_device_id_checks`.

sup_btm

Type

bool

Default value

true

The default value of the register field `SMMU_IDR0.BTM` and `SMMU_ROOT_IDR0.BGPTM` (when supported). This enables Broadcast TLB maintenance.

sup_cohacc

Type

bool

Default value

true

The default value of the register `SMMU_IDR0.COACC`

sup_oas

Type

unsigned

Default value

5

The hardware has an input port `sup_oas[2:0]` that indicates what output address size (OAS) the system has. This is sampled at reset.

The model does not have this port as it is expected to be a constant for the system and not to change. Instead it is just a parameter.

The allowed values are:

0	32 bits
1	36 bits
2	40 bits
3	42 bits
4	44 bits
5	48 bits

sup_sev**Type**

bool

Default value

true

The default value of the register `SMMU_IDR0.SEV`

tlb_when_do_f_tlb_conflict_on_overlap**Type**

unsigned

Default value

0

If a TLB entry is created by a walk and it overlaps an existing entry, there are some architectural situations where the result is known. For all others, then an implementation is allowed to use an **UNPREDICTABLE** combination of the two entries, or it can generate `F_TLB_CONFLICT`:

0	never generate
1	sometimes generate
2	always generate

Conflicts between global and non-global entries are not detected by the model.

translated_device_id_base**Type**

uint32_t

Default value

0

When appropriately enabled, assume that client device accesses are translated to a DeviceID as seen by the GIC of:

```
StreamID + translated_device_id_base
```

See parameter `output_attribute_transform` and `enable_device_id_checks`.

tw_qs_attribute_transform**Type**

string

Default value

""

Transform downstream attributes of table walk and queue transactions.

- "" or "none" – no transform
- How to alter the output attributes. Example:

```
"ExtendedID[35:32]=HWATTR_KIND_0"
```

RHS/LHS Symbols:

- ExtendedID/MasterID/UserFlags

RHS Symbols:

- HWATTR_KIND_0: PBHA information
- kind
 - for a read:
 - 0/1** L1STE/STE
 - 2/3** L1CD/CD
 - 4/5** S1/S2 TTD (including CAS)
 - 6** CMDQ

7

VMS

11/12

LOGPT/L1GPT

13/14

LODPT/L1DPT

- for a write

0

EVENTQ

1:

PRIQ

- numeric literals.

ExtendedID/MasterID/UserFlags start with values {0, 0xFFFFffff, 0} respectively.

Any bits with no transform are unchanged.

See also `output_attribute_transform` and `msi_attribute_transform`.

version

Type

string

Default value

"rOp0"

The version of this product

wait_cmdq_ticks

Type

uint64_t

Default value

0

This is the time to wait before doing something on the command queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffff)) - 1]$.

wait_eventq_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing something on the event queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFFFFF)) - 1]$.

wait_imp_def_work_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing an IMP DEF operation. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFFFFF)) - 1]$.

The IMP DEF work in this case is the number of ticks between raising pmusnapshot_req and pmusnapshot_ack being raised, and the converse operation.

wait_misc_async_actions_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing an async action that could be delayed is performed. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFFFFF)) - 1]$.

wait_msi_ticks**Type**

uint64_t

Default value

0

This is the time to wait before sending an MSI. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFFFFF)) - 1]$.

wait_pri_req_ticks**Type**

uint64_t

Default value

0

This is the time to wait before processing a PRI Request. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \ \& \ 0xFFFFffff)) - 1]$.

wait_pri_resp_ticks**Type**

uint64_t

Default value

1

This is the time to wait before sending a PRI Response back to the PCIe subsystem. When a PRI Response is an auto-response then the ATC might immediately make a new ATS request, that immediately fails, immediately makes a PRI Request, or auto-responds, etc. To break this loop, then we introduce a minimum time on all PRI Responses to give other components in the system a chance to run. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \ \& \ 0xFFFFffff)) - 1]$.

3.10.58 MMU_700

This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1123: IP revisions support

Revision	Quality level
r0p0	Full support
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

MMU_700 contains the following CADI targets:

- MMU_700

Limitations

- PMU does not implement all architecturally mandated events:
 - The PMU is intended for demonstration purposes only
 - Note: between 11.17 and 11.18 then the point of triggering for events changed for 'TLB miss' and this might lead to an (architecturally
- Limited RAS
- No power control

- The IMP DEF MPAM register file is not implemented. This controls how the internal resources of the MMU-700 are partitioned.
- No sup_oas that controls the OAS of the SMMU. This is expected to be constant for a system
- tcu_sid[31:0] is not modelled, instead the parameter `smmu_msi_device_id` is used.
- PVBUS has no representation of the cache stash operations and so they are not supported.
- The SYSCO interface is not implemented
- The low power interface is not implemented
- `TCU_STATUS.GNT_XLATE_SLOTS` always reads at 512
- The HWATTR side-band signal is available by configuring `output_attribute_transform`, `msi_attribute_transform` and `tw_qs_attribute_transform` with `HWATTR_KIND_0`. For some transactions then HWATTR comes from the `SMMU_s_AGBPA[3:0]`. In the hardware, this register has an 'Update' bit[31] that should be written as 1 and will be turned to zero when all transactions using the old value have completed. The model does not implement this behaviour and the Update bit is **RAZ/WI**.

The model deals with groups of transactions with the same attributes and a similar range of addresses. The mapping used is remembered by the bus infrastructure and is then used for subsequent sufficiently similar transactions without needing the intervention of the SMMU model (and so won't be traced, etc.)

Notes {section}

- The hardware is a distributed SMMU and is divided into:
 - A single Translation Control Unit (TCU)
 - Has a port for the programming interface of the SMMU
 - Receives DVM messages
 - Does all the page walking, queue manipulation, etc.
 - One or more Translation Bus Units (TBUs)
 - Translate transactions from upstream (client) device into downstream transactions.
 - Zero or more connections to PCIe Root Complexes (PCIe-RCs)
 - There can be a total of 62 TBUs and PCIe-RCs attached.
 - An interconnect connecting the TBUs, PCIe-RCs to the TCU.
- A PCIe-RC has one connection to the TCU to make ATS requests but the PCIe-RC uses one or more TBUs to transform the transactions and pass them to the memory system. In the model, those TBUs used will be listed in the parameter `list_of_pcie_mode`. The SMMU does not know which TBUs a particular PCIe-RC is attached to.
- The TBU ORs a value into each StreamID that it receives. In the model, this is configured by the parameters:
 - `list_of_s_sid_high_at_bitpos0`
 - `list_of_ns_sid_high_at_bitpos0`

- The TCU, TBU, and the interconnect are all represented by this single model component.
- In the model, a pair of ports `tbs_pvbuss_s[i]/tbm_pvbuss_m[i]` represent a TBU 'i' or the `tbs_pvbuss_s[i]` represents an incoming connection for a PCIe-RC. The corresponding reverse connection from the TCU to the PCIe-RC is by a special bus called `pvbus_id_routed_m` that is used to transport ATC Invalidates to the PCIe-RC.
 - In order to reduce system construction complexity the `tbs_pvbuss_s[i]/tbm_pvbuss_m[i]` also acts as a TBU so that the PCIe-RC need not separate its normal transactions and its ATS requests.
 - However, ATC Invalidates are only sent to a port which appears in `list_of_pcie_rc`. It should be uniquely decoded to a single port based on `list_of_ns_sid_high_at_bitpos0` and those ATC Invalidates must be routed to the correct PCIe subsystem in order to invalidate the cache of ATS Response in the subsystem. Thus all TBUs that a PCIe-RC uses must have a unique reverse mapping from stream id to port.
- A bad configuration will renders the model inactive.
- Some configuration can be adjusted by configuration pins. These are only sampled at the negative edge of the reset pin. If you want to use these pins then you must drive them before sending a negative edge on the reset pin. During simulation_reset then the component driving them must also drive this transition again.
- The pin `sup_oas` is not supported, instead it is a parameter as it is assumed that it would be tied to a fixed value in any specific platform.
- Debug reads to the registers do not disturb the state.
- Writes to registers with Update flags (including debug writes) are ignored if the Update flag is already one.
- Debug and real accesses to the registers must be 32 or 64 bits.
- MSIs are issued on the `qtw_pvbuss_m` port using attributes determined by the parameter `msi_attribute_transform`, whilst Event Queue writes will always be issued with `ExtendedID=0`, `UserFlags=0`, `MasterID=0xFFFFFFFF`. In the hardware, there is no way of distinguishing Event Queue writes from MSI writes, however, this provides a mechanism that if the model system needs to distinguish then it can.
- The hardware only has a single cacheability attribute for input transactions, but PVBUS transports both inner and outer cacheability.
- For non-PCIe-mode TBUs (i.e. their index does not appear in `list_of_pcie_mode` or `list_of_pcie_rc`):
 - For non-cache maintenance operations:
 - If the input attribute is any type of device then it is well defined as being outer-shared and Device-nGnRnE or Device-nGnRE. There is no support for Gathering or Reordering.
 - If the outer cacheable input attribute is normal then if it is Write-back then this is converted to Inner Write-back Outer Write-back (iWB-oWB) with the desired shareability. No Transient hint is supported and is always treated as non-transient.
 - This leaves all other normal memory types that are mapped to Inner Normal Non-cacheable, Outer Normal Non-cacheable outer shared (iNC-oNC-osh).

- Thus the upstream devices must present the cacheability in the *outer* cacheability attribute on PVBUS if it is cacheable. If it is a device type then both the inner and outer attributes must be set to the same. If it is iNC-oNC-osh then it must be presented as such.
- For PCIe-mode TBUs (i.e. their index appears in `list_of_pcie_mode` or `list_of_pcie_rc`):
 - Input transactions are from PCIe and the only indication of the memory type is in the NoSnoop bit of the transaction. No shareability is transported.
 - NoSnoop interpreted as iNC-oNC-osh
 - ! NoSnoop interpreted as iWB-oWB-ish (note inner shareable)
 - If a NoSnoop transaction has an attribute transform applied to it and the result of the transform is weaker than iNC-oNC-osh then it will be forced to iNC-oNC-osh. For example, if a NoSnoop transaction uses a page table and is transformed to iWB-oWB-nsh then it will be forced to iNC-oNC-osh. However, if the page tables transformed it to a device type then, as all device types are stronger than iNC-oNC-osh then it will exit the SMMU as the device type.
 - In the model, transactions are classified by their incoming memory attributes as to whether they are NoSnoop or not and then normalized appropriately:
 - iWB-oWB-any-shareability are interpreted as ! NoSnoop
 - thus normalized to iWB-oWB-ish
 - anything else is considered NoSnoop
 - thus normalized to iNC-oNC-osh
 - Translated accesses also suffer the same interpretation to determine NoSnoop and how they are normalized. Thus they could enter the system with attributes different to if they were Untranslated Accesses translated by normal means.
 - It is expected that there is a component downstream of the SMMU that is aware of the system address map and will override the memory type to 'device' for any transaction that accesses a peripheral.
- The hardware has a single cacheability on input and, for transactions that are neither cache-maintenance operations nor PCIe transactions, normalizes the input to an architectural form before performing the SMMUv3 architectural transform:
 - Any device type is left untouched (the input can only represent Device-nGnRE and Device-nGnRnE).
 - If the input is Write-back (WB) then it is normalized to iWB-oWB with the incoming shareability.
 - If the input is anything else it is normalized to iNC-oNC-osh.
- The model accepts full architectural attributes of two levels of cacheability and so has to decide how to interpret this in terms of the hardware. For transactions that are not cache maintenance operations, the model will replicate the outer attribute into the inner attribute and then perform the normalisation that the hardware does.
- The hardware normalizes the architectural output attributes and outputs a single level of cacheability and a user flag (OC) specifying if the architectural attributes were cacheable in the outer cacheable domain. The normalisation is:

- If the transaction is classified as a PCIe one then the NoSnoop transform described above is applied. That is:
 - if the original transaction was NoSnoop then any weaker memory type is strengthened to iNC-oNC-osh, then apply the following transform:

```

if      iWB-oWB-nsh/ish/osh      then output WB-nsh/ish/osh, OC = 1
else if i (NC/WT/WB) -o (WB/WT) then output NC-Sys,      OC = 1
else if i (NC/WT/WB) -oNC        then output NC-Sys,      OC = 0
else if Device-(GRE/nGRE/nGnRE) then output DV-Sys,      OC = 0
else                             output SO-Sys,          OC = 0

```

- The model only normalizes according to PCIe but otherwise leaves the architectural attributes intact on the output bus.

Ports for MMU_700

Table 3-1126: Ports

Name	Protocol	Type	Description
axi_stream_msi_addr_to_match_s	Value_64	Slave	Any SMMU-originated MSI which exactly matches the address in this port will be sent through the AXI stream port axi_stream_msi_m which is usually connected to the GIC through axi_stream_msi_s. As MSIs are 32 bit aligned then if bits[1:0] != 0 or the address is above OAS then this is effectively disabled. NOTE that the model does not support tcu_sid[31:0] which is the MSI DeviceID to send on axi_stream_msi_m. Instead the parameter smmu_msi_device_id is used. See also the parameters: axi_stream_msi_TID and axi_stream_msi_TDEST. The default value of this port is set by the parameter axi_stream_msi_addr_to_match. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
axi_stream_msi_m	PVBus	Master	Manager port used for sending SMMU originated MSIs directly to the GIC
clk_in	ClockSignal	Slave	Clock signal (in RTL aclk) This is a clock time-base used by the TCU to spread some of its processing over time, if enabled by the wait_* parameters. The clock must always be connected.
cmd_sync_irpt_ns	Signal	Master	Pulsed interrupt output signal for non-secure CMD_SYNC having a completion signal of SIG_IRQ.
cmd_sync_irpt_s	Signal	Master	Pulsed interrupt output signal for secure CMD_SYNC having a completion signal of SIG_IRQ.
event_q_irpt_ns	Signal	Master	Pulsed interrupt output signal for the non-secure event queue becoming non-empty.
event_q_irpt_s	Signal	Master	Pulsed interrupt output signal for the secure event queue becoming non-empty.
evento	Signal	Master	Event signal
global_irpt_ns	Signal	Master	Pulsed interrupt output signal for non-secure SMMU_GERROR(N) signalling an error.
global_irpt_s	Signal	Master	Pulsed interrupt output signal for secure SMMU_S_GERROR(N) signalling an error.

Name	Protocol	Type	Description
identify	SMMUv3AEMIdentifyProtocol	Master	Map the transaction to the tuple (StreamID, SubStreamID, SubStreamIDValid, SSD) The StreamID that is produced by the implementation of this protocol is not the final StreamID. The final StreamID is produced by using the list_of_ns_sid_high_at_bitpos0/list_of_s_sid_high_at_bitpos0 parameter to map the StreamID based on the upstream port index. Also see the parameter howto_identify which can replace the functionality of this port under certain circumstances.
pri_q_irpt_ns	Signal	Master	Pulsed interrupt output signal for the PRI queue becoming non-empty.
prog_pvbus_s	PVBus	Slave	Register subordinate port (in RTL PROG)
pvbus_id_routed_m[62]	PVBus	Master	This is a special "id-routed" port for transmitting ATC invalidates upstream into the PCIe EndPoints, it is not a normal bus. See the parameter output_id_routed_transform. The FastModels ATC Invalidate and PRI Response protocol specifies how to route and deal with this port.
qtw_pvbus_m	PVBus	Master	Manager port used for Table Walks, MSIs and Queue access. Note that although this is a manager port, it can still receive DVM messages.
sec_override	Signal	Slave	Allow certain registers to be accessible to non-secure accesses from reset, as described in the TCU_SCR register. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_btm	Signal	Slave	System supports BTM and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. If BTM (Broadcast Table Maintenance) is not supported then DVM messages will be ignored. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_cohacc	Signal	Slave	System supports COHACC and will be reflected in the IDR registers. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_httu	Signal	Slave	System supports HTTU and will be reflected in the value of SMMU_IDR0.HTTU: - 0b00 (HTTU not supported) if sup_httu is 0 - 0b10 (update of AF and Dirty flags supported) if sup_httu is 1 The default value for this pin is 1. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_sev	Signal	Slave	System supports SEV and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
tbm_pvbus_m[62]	PVBus	Master	The TBU manager ports that carry transactions that have been translated from the correspondingly numbered tbs_pvbus_s[] port.
tbs_pvbus_s[62]	PVBus	Slave	The TBU subordinate ports that receive transactions to be translated. They will exit the SMMU through the same numbered pvbus_m[] port.

Name	Protocol	Type	Description
tbu_cri_irpt[62]	Signal	Master	Critical error interrupt for RAS events from the TBU. This is used for specific uncorrected errors where a System Coprocessor (SCP) might have to reset the system because the stability of the system can no longer be guaranteed. NOTE in the hardware then this is called ras_cri.
tbu_eri_irpt[62]	Signal	Master	Error Recovery Interrupt for RAS events from the TBU. This is used for uncorrected errors. NOTE in the hardware then this is called ras_eri.
tbu_fhi_irpt[62]	Signal	Master	Fault Handling Interrupt for RAS events from the TBU. Usually this is for corrected errors. NOTE in the hardware then this is called ras_fhi.
tbu_pmu_irpt[62]	Signal	Master	TBU Performance Monitoring Unit interrupt, one per TBU.
tbu_pmusnapshot_ack[62]	Signal	Master	PMU snapshot interface for the TBU, ack a snapshot.
tbu_pmusnapshot_req[62]	Signal	Slave	PMU snapshot interface for the TBU, request a snapshot.
tbu_reset_in[62]	Signal	Slave	Reset signals The TBUs can have independent reset signals. Each signal tbu_reset_in[n] corresponds to the TBU using tbs_pvbus_s[n]/tbs_pvbus_s[n] pair. If the SMMU receives a transaction whilst the TBU is expected to be in reset then it will complain using the ArchMsg.Warning.warning trace source. Those tbu_reset_in that correspond to a PCIe-RC connection can be connected to monitor the PCIe-RC's reset signal. If it receives an ATS request when in reset then it will complain in a similar way. You must connect these pins if you wish the TCU_NODE_STATUS for the nodes to be accurate (including any connected to the PCIe-RC).
tcu_cri_irpt	Signal	Master	Critical error interrupt for RAS events from the TCU. This is used for specific uncorrected errors where a System Coprocessor (SCP) might have to reset the system because the stability of the system can no longer be guaranteed. NOTE in the hardware then this is called ras_cri.
tcu_eri_irpt	Signal	Master	Error Recovery Interrupt for RAS events from the TCU. This is used for uncorrected errors. NOTE in the hardware then this is called ras_eri.
tcu_fhi_irpt	Signal	Master	Fault Handling Interrupt for RAS events from the TCU. Usually this is for corrected errors. NOTE in the hardware then this is called ras_fhi.
tcu_pmu_irpt	Signal	Master	TCU Performance Monitoring Unit interrupt
tcu_pmusnapshot_ack	Signal	Master	PMU snapshot interface for the TCU, ack a snapshot.
tcu_pmusnapshot_req	Signal	Slave	PMU snapshot interface This is a four-phase handshake to have the corresponding PMCG perform a capture of the current counter values. PMU snapshot interface for the TCU, request a snapshot.
tcu_reset_in	Signal	Slave	The reset signal to the TCU interface.

Parameters for MMU_700

TCUCFG_PARTID_WIDTH

Type

unsigned

Default value

9

The width of the MPAM PARTID on the bus.

See also parameter `mpam_attribute_transform`. Accepted Values: 1 6 9

TCUCFG_XLATE_SLOTS

Type

uint32_t

Default value

512

Maximum number of outstanding stalled transactions that the SMMU supports.

TCUCFG_XLATE_SLOTS must be \geq TCUCFG_PTW_SLOTS which is currently fixed to 512.

Accepted Values: 512 1024 2048 4096

all_error_messages_through_trace

Type

bool

Default value

false

Some conditions in the SMMU are so strange that the software programming the SMMU has done something wrong. At this point messages are output to either `ArchMsg.Error.*` or `ArchMsg.Warning.*` or to the error stream of the simulator. Outputting to the error stream of the simulator may cause it to return with a non-zero exit status.

If you set this option to true then instead of using the error stream of the simulator it will always use a trace stream allowing the simulation to exit with a zero exit status.

axi_stream_msi_TDEST

Type

uint32_t

Default value

0

ID of the AXI stream subordinate port on the GIC that receives SMMU originated MSIs sent directly. The name of the GIC port is `axi_stream_msi_s`.

If `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_addr_to_match`
- `axi_stream_msi_TID`

axi_stream_msi_TID**Type**`uint32_t`**Default value**

0

ID of the AXI stream manager port that sends SMMU TCU originated MSIs directly to the GIC. The name of the SMMU port is `axi_stream_msi_m`.

If `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_addr_to_match`
- `axi_stream_msi_TDEST`

axi_stream_msi_addr_to_match**Type**`uint64_t`**Default value**`0xFFFFffffff`

If the last two bits are 0, any SMMU-originated MSI which exactly matches the address will be sent through the AXI stream port `axi_stream_msi_m` which is usually connected to the GIC.

This parameter drives the value of the `axi_stream_msi_addr_to_match_s` port at simulation reset. For every reset after that, the value of the port will be sampled and used if changed.

The entire address must match, including bits [1:0]. As MSIs are 32 bit aligned then if `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_TID`
- `axi_stream_msi_TDEST`

behaviour_of_sampled_at_reset_signals

Type

unsigned

Default value

0

Some configuration signals into the SMMU are sampled on negedge of reset.

However, it can sometimes be hard to arrange to drive a configuration pin before the negedge of reset.

The configuration pins are sampled:

0

at negedge reset.

1

at negedge reset, but if a later change occurs at the same simulated time, and no transactions have occurred, then they will be resampled and the SMMU reset again.

cmdq_max_number_of_commands_to_buffer

Type

uint32_t

Default value

10

The command queues can buffer fetched commands before issuing them. This parameter is roughly the maximum number of commands to do this for. The programmer visible effects are that just because the CONS pointer shows a command has been consumed does not necessarily mean that it has been issued (and completed). Higher values accentuate this effect.

enable_device_id_checks

Type

bool

Default value

true

If this parameter is true then the DeviceIDs seen by the GIC are:

- **for client devices**

`DeviceID = StreamID + translated_device_id_base`

- **for SMMU-generated MSIs**

`smmu_msi_device_id`

This parameter enables two checks:

- If the DeviceID is used in the `output_attribute_transform` parameter, if it overflows 32 bits then the model warns. If the DeviceID is not used, it is assumed that the external agent that forms the DeviceID warns if it overflows.
- If the SMMU supports MSIs, the model checks that the GIC is able to distinguish an MSI generated by the SMMU from one generated by a client device.

As the exact mechanism to determine the DeviceID is in the system and not necessarily under control of the SMMU then you can disable these warnings using this parameter.

See also the parameters: `output_attribute_transform` and `msi_attribute_transform`.

howto_identify

Type

string

Default value

"use-identify"

If `use-identify` then the SMMU uses the `identify` port to determine the `ssid`, `streamID`, `subStreamID`. Otherwise, this string extracts them from the transaction's attributes.

Examples:

```
SEC_SID=ExtendedID[63], SSV=ExtendedID[62], SubstreamID=ExtendedID[51:32],
StreamID=ExtendedID[31:0]
nSEC_SID=ExtendedID[63], StreamID=ExtendedID[55:24], nSSV=ExtendedID[20],
SubstreamID=ExtendedID[19:0]
StreamID[31:24]=0, StreamID[23:0]=ExtendedID[23:0], SSV=1[0], ...
```

The `streamID` (32 b) is valid if `sidv` is 1 or both `sidv` and `nsidv` are unused.

`SEC_SID` is 1b in the model. For RME systems, in hardware, then `SEC_SID` is 2b, in the model `SEC_SID_bit_1` represents bit[1].

The `substreamID` (20 b) is valid if `ssv` is true.

`sidv == 0` indicates a NoStreamID transaction and the SSD is the PAS of the transaction, `SEC_SID` is not used.

`nSEC_SID`, `nSSV`, `nSIDV` are available with negative logic. Different attributes are independent and can use negative or positive logic. Negative and positive logic symbols for the same attribute is an error.

The model uses the term SSD (Security State Determination) to mean which security state the transaction, register, structure, event, etc. belongs to.

In the SMMUv3 Architecture, the side-band signal `SEC_SID` holds the information for the transactions, but uses a different encoding.

Before RME, `SEC_SID` was a one bit signal. With RME, in the hardware, it was expanded to 2b. To retain backwards compatibility in the model, `SEC_SID` remains as 1b in this parameter, but the second bit can be expressed with `SEC_SID_bit_1` (and its negative logic version `nSEC_SID_bit_1`)

Security state	SSD	SEC_SID_bit_1	SEC_SID
secure	0	0	1
non-secure	1	0	0
root (reserved)	2	1	1
realm	3	1	0

For those systems that support NoStreamID transactions, and `howto_identify` is not using the port, first the SMMU determines the value of `sidv` or `nSIDV` to see if the transaction is a NoStreamID transaction (`sidv == 0` or `nSIDV == 1`). If so then the rest of the `howto_identify` string is ignored as the information extracted relates only to StreamID transactions. Instead more information is extracted using the parameter `howto_identify_NoStreamID_extra_info`.

ish_is_osh_DANGER

Type

bool

Default value

true

When set, any transaction that would use the architectural inner shareable domain is converted to use the outer shareable domain.

This parameter should match the equivalent `ish_is_osh` from the PE. If an incompatible value of the `ish_is_osh` parameter is configured for the PE and the SMMU, data coherency may be compromised.

All implementations should have this parameter as true but it is allowed in the model to give it a false value for modelling and debug purposes only.

list_of_ns_sid_high_at_bitpos0

Type

string

Default value

""

A comma-separated list of values to bitwise OR into each Non-secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID.

Each TBU that is connected to a PCIe-RC (see `list_of_pcie_rc`) must serve a unique contiguous subset of StreamIDs as determined by their top bits. This is used in order to know which port to route ATC Invalidates and PRI Responses to the PCIe subsystems.

The empty string corresponds to all 0s.

list_of_pcie_mode

Type

string

Default value

""

A comma-separated list of ranges of ports that represent TBUs that are attached to PCIe Root Complexes (PCIe-RC). A single PCIe-RC might use several TBUs and stripe accesses across them. The attribute handling for these TBUs is slightly different in that if the PCIe transaction is NoSnoop and the output attributes of the translation would be weaker than `iNC-oNC-osh` then the output is forced to `iNC-oNC-osh`.

`iNC-oNC-osh` == "inner normal non-cacheable, out normal non-cacheable, outer shared"

list_of_pcie_rc

Type

string

Default value

""

This is a list of ports that are connected to PCIe Root Complex (PCIe-RC) by a protocol called DTI-ATS. This port is used to transport ATS and PRI Requests to the SMMU from the PCIe-RC.

In the real hardware, the PCIe-RC uses this port for ATS/PRI, and the actual transactions go through separate TBUs. In the model, this port can accept actual transactions as well. However, in the model, then the ATC Invalidates and the PRI Responses need to be transferred over the corresponding `pvbus_id_routed_m` port as DTI-ATS is bidirectional, but PVBUS is not.

list_of_s_sid_high_at_bitpos0

Type

string

Default value

""

A comma-separated list of values to bitwise OR into each Secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID.

The empty string corresponds to all 0s.

`use-ns` can be used to apply the `list_of_ns_sid_high_at_bitpos0` values instead.

mpam_attribute_transform

Type

string

Default value

"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS"

If MPAM is supported, this is applied to *all* downstream transactions to transport the MPAM information.

- "" or "none" – no transform
- How to alter the output attributes. Example:

```
"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,  
ExtendedID[38]=MPAM_NS"
```

RHS/LHS Symbols:

- `ExtendedID/MasterID/UserFlags`.

RHS Symbols:

- `MPAM_PARTID`
- `MPAM_PMG`
- `MPAM_NS`
- numeric literals

Any bits with no transform are unchanged.

Note

- attribute transforms applied before this:
 - for client transactions 'output_attribute_transform'.
 - for table walks `tw_qs_attribute_transform`.
 - for MSIs `msi_attribute_transform`.
- for translated transactions from client devices then `MPAM_NS = ! SEC_SID`.

msi_attribute_transform

Type

string

Default value

"ExtendedID[31:0]=smmu_msi_device_id, MasterID=0xFFFFFFFF"

Transform downstream attributes of MSI transactions.

Note

After 11.25 the `interrupt_kind` field was extended to 5 bits. This is strictly a non-backwards compatible change. However, the original 3 bits was insufficient to express all the interrupt kinds that exist.

normalize_input_normal_non_iWB_oWB_to_iNC_oNC_osh_DANGER

Type

bool

Default value

true

When set, use Inner Non Cacheable, Outer Non Cacheable, Outer Shareable for any upstream transaction that would use any of the following attributes:

- Normal Non-cacheable Bufferable
- Normal Non-cacheable Non-bufferable
- Write-through

Note

This parameter should match the equivalent configuration from the PE. If an incompatible value of this parameter is configured for the PE and the SMMU, data coherency may be compromised.

All implementations should have this parameter as true but it is allowed in the model to give it a false value for modelling and debug purposes only.

number_of_ports**Type**

unsigned

Default value

1

The number of port pairs that the SMMU has.

output_attribute_transform**Type**

string

Default value

"ExtendedID[31:0]=DeviceID"

Transform the downstream attributes of a translated transaction.

- "" or "none": no transform
- How to alter output attributes. Example:

```
"ExtendedID[15:0]=DeviceID[15:0], UserFlags[31]=nSSV,
UserFlags[19:0]=SubstreamID,
MasterID[10]=MasterID[11], MasterID[11]=MasterID[10]"
```

RHS/LHS Symbols:

- ExtendedID/MasterID/UserFlags: incoming/outgoing attributes.

RHS Symbols:

- **DeviceID**
StreamID + translated_device_id_base
- StreamID/SubstreamID/SSV/SEC_SID
- **nSEC_SID/nSSV**
negative logic versions.
- **st1PBHA/st2PBHA**
Page Based Hardware Attributes from leaf descriptors (zero if unused).
- **STE_IMPDEF1**
STE[127:116]
- numeric literals.

The streamID has had ns_sid_high/s_sid_high ORred into it for the appropriate TBU.

Note

'mpam_attribute_transform' is applied after this.

- "" or "none": no transform
- How to alter output attributes. Example:

```
"ExtendedID[15:0]=DeviceID[15:0], UserFlags[31]=nSSV, UserFlags[19:0]=SubstreamID,
MasterID[10]=MasterID[11], MasterID[11]=MasterID[10]"
```

RHS/LHS Symbols:

- **ExtendedID/MasterID/UserFlags**
incoming/outgoing attributes.

RHS Symbols:

- **DeviceID**
StreamID + translated_device_id_base
- StreamID/SubstreamID/SSV/SEC_SID
- **nSSV/nSEC_SID/**
negative logic versions.
- **St1PBHA/St2PBHA**
Page Based Hardware Attributes from leaf descriptors (zero if not used).
- **STE_IMPDEF1**
STE[127:116]
- **HWATTR_KIND_0**
PBHA information
- numeric literals.
- SIDV = 1, nSIDV = 0 (fixed values to indicate StreamID)

Any bits with no transform are unchanged.

Note

- mpam_attribute_transform and mec_attribute_transform are applied in order after this.
- See also output_attribute_transform_for_NoStreamID for NoStreamID transactions.

output_id_routed_transform

Type

string

Default value

“Address[27:12]=StreamID[15:0], PAS=SSD”

The SMMU generates the following ID-routed transaction on the pvb_{bus_id_routed_m} bus:

- ATC Invalidate
- PRI Response

This parameter controls how the SMMU should express:

- the StreamID
- the Trusted (T) bit

The value is a comma-separated list of assignments:

```
Address[27:12]=StreamID[15:0], ExtendedID[60]=T, ExtendedID[15:0]=StreamID[31:16]
```

Address bits[11:0] cannot be used.

The LHS can be one of:

- PAS
- MasterID/ExtendedID/UserFlags
- Address

The RHS can be one of:

- a numeric constant
- SSD
- T or negative version nT
- StreamID

For realm (or ‘Trusted’) transactions, then SSD=0b11, T=1, nT=0. For non-secure (or ‘Non-Trusted’) transactions, then SSD=0b01, T=0, nT=1

prefetch_only_requests**Type**

unsigned

Default value

0

The simulator supports ‘prefetch-only’ DMI requests, which can occur at any time and for any reason and are intended to be invisible to the end execution of the model and to the user.

0

deny all prefetch-only requests

1

- use debug requests for any page table walks
 - form and use debug TLB/cache entries
 - any faults will not record, but deny the prefetch request

2

- treat prefetch-only requests like normal transactions
 - use normal page table walk transactions
 - use and form normal TLB/cache entries
 - faults will alter the programmer-visible state of the SMMU

0 is the safest.

1 treats the access like a debug request and requires that debug page table walks are treated correctly downstream. Any descriptors that need HTTU to allow the transaction to proceed will fail the request.

2 is dangerous, it use real transactions and reports faults that are unphysical. Real transactions can be wait()ed and this disobeys the SystemC spec for `get_direct_mem_ptr()`.

sec_override**Type**

bool

Default value

false

The IMP DEF port `sec_override` controls whether some of the registers are accessible to secure or non-secure transactions. This parameter is the default value assumed for that port if the port is not driven by a signal.

seed**Type**

uint32_t

Default value

0x12345678

Used to seed the pseudo-random number generator that the SMMU model uses.

size_of_cd_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding CD structures. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_l1cd_cache

Type

uint32_t

Default value

0

The number of entries in the cache holding L1CD descriptors. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_l1ste_cache

Type

uint32_t

Default value

0

The number of entries in the cache holding L1STE descriptors. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_ste_cache

Type

uint32_t

Default value

0

The number of entries in the cache holding STE structures. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_tlb

Type

uint32_t

Default value

0

The number of entries in the TLB. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

smmu_msi_device_id

Type

uint32_t

Default value

0

When appropriately enabled, assume that MSIs that are generated by the SMMU are presented to the GIC with this DeviceID.

See parameters `msi_attribute_transform` and `enable_device_id_checks`.

sup_btm**Type**

bool

Default value

true

The default value of the register field `SMMU_IDR0.BTM` and `SMMU_ROOT_IDR0.BGPTM` (when supported). This enables Broadcast TLB maintenance.

sup_cohacc**Type**

bool

Default value

true

The default value of the register `SMMU_IDR0.COHAACC`

sup_httu**Type**

bool

Default value

true

The initial value of the `sup_httu` port. See the port description for `sup_httu`.

sup_oas**Type**

unsigned

Default value

6

The hardware has an input port `sup_oas[2:0]` that indicates what output address size (OAS) the system has. This is sampled at reset.

The model does not have this port as it is expected to be a constant for the system and not to change. Instead it is just a parameter.

The allowed values are:

0 :32 bits

1

36 bits

2

40 bits

3

42 bits

4

44 bits

5

48 bits

6

52 bits

sup_sev

Type

bool

Default value

true

The default value of the register `SMMU_IDR0.SEV`

tlb_when_do_f_tlb_conflict_on_overlap

Type

unsigned

Default value

0

If a TLB entry is created by a walk and it overlaps an existing entry, there are some architectural situations where the result is known. For all others, then an implementation is allowed to use an **UNPREDICTABLE** combination of the two entries, or it can generate `F_TLB_CONFLICT`:

0

never generate

1

sometimes generate

2

always generate

Conflicts between global and non-global entries are not detected by the model.

translated_device_id_base**Type**

uint32_t

Default value

0

When appropriately enabled, assume that client device accesses are translated to a DeviceID as seen by the GIC of:

```
StreamID + translated_device_id_base
```

See parameter `output_attribute_transform` and `enable_device_id_checks`.

tw_qs_attribute_transform**Type**

string

Default value

""

Transform downstream attributes of table walk and queue transactions.

- "" or "none" – no transform
- How to alter the output attributes. Example:

```
"ExtendedID[35:32]=HWATTR_KIND_0"
```

RHS/LHS Symbols:

- ExtendedID/MasterID/UserFlags

RHS Symbols:

- HWATTR_KIND_0: PBHA information
- kind
 - for a read:
 - 0/1**
L1STE/STE
 - 2/3**
L1CD/CD
 - 4/5**
S1/S2 TTD (including CAS)
 - 6**
CMDQ

7

VMS

11/12

LOGPT/L1GPT

13/14

LODPT/L1DPT

- for a write

0

EVENTQ

1:

PRIQ

- numeric literals.

ExtendedID/MasterID/UserFlags start with values {0, 0xFFFFffff, 0} respectively.

Any bits with no transform are unchanged.

See also `output_attribute_transform` and `msi_attribute_transform`.

version

Type

string

Default value

"rOp0"

The version of this product.

Valid values are:

- rOp0
- r1p0

wait_cmdq_ticks

Type

uint64_t

Default value

0

This is the time to wait before doing something on the command queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff) - 1)]$.

wait_eventq_ticks

Type

uint64_t

Default value

0

This is the time to wait before doing something on the event queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff) - 1)]$.

wait_misc_async_actions_ticks

Type

uint64_t

Default value

0

This is the time to wait before doing an async action that could be delayed is performed. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff) - 1)]$.

wait_msi_ticks

Type

uint64_t

Default value

0

This is the time to wait before sending an MSI. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff) - 1)]$.

wait_pri_req_ticks

Type

uint64_t

Default value

0

This is the time to wait before processing a PRI Request. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff) - 1)]$.

wait_pri_resp_ticks**Type**

uint64_t

Default value

1

This is the time to wait before sending a PRI Response back to the PCIe subsystem. When a PRI Response is an auto-response then the ATC might immediately make a new ATS request, that immediately fails, immediately makes a PRI Request, or auto-responds, etc. To break this loop, then we introduce a minimum time on all PRI Responses to give other components in the system a chance to run. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffff)) - 1]$.

3.10.59 MMU_S3

This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1128: IP revisions support

Revision	Quality level
r0p0	Full support
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17**Table 3-1129: Model quality changes**

MMU_S3 contains the following CADI targets:

- MMU_S3

Limitations

- The model supports architectural features and registers matching rOp0-00eac0 and r1p0-00eac0.
- PMU does not implement all architecturally-mandated events
- The PMU is intended for demonstration purposes only
- No power control
- The IMP DEF MPAM register file is not implemented. This controls how the internal resources of the MMU-S3 are partitioned.
- tcu_sid[31:0] is not modelled, instead the parameter `smmu_msi_device_id` is used.
- PVBus has no representation of the cache stash operations and so are not supported.

- The SYSCO interface is not implemented
- The low power interface is not implemented
- The HWATTR side-band signal is available by configuring `output_attribute_transform`, `msi_attribute_transform` and `tw_qs_attribute_transform` with `HWATTR_KIND_0`. For some transactions then HWATTR comes from the `SMMU_s_AGBPA[3:0]`. In the hardware, this register has an 'Update' bit[31] that should be written as 1 and will be turned to zero when all transactions using the old value have completed. The model does not implement this behavior and the Update bit is **RAZ/WI**.
- Any configuration parameter listed in the TRM but not shown in this file is not supported.
- `TCU_CTRL_AUX0-55` registers are modeled but unlike the TRM reset values for these registers are 0. There is no functionality associated with these registers.
- There is no functionality associated with `TCU_ROOT_CTRL` register field `DIS_DVM`.
Note: If `DIS_DVM` is set to 1, error message is thrown which can be disabled by setting `all_error_messages_through_trace` to true.

The model deals with groups of transactions with the same attributes and a similar range of addresses. The mapping used is remembered by the bus infrastructure and is then used for subsequent sufficiently similar transactions without needing the intervention of the SMMU model (and so won't be traced, etc.)

Notes

- The hardware is a distributed SMMU and is divided into:
 - A single Translation Control Unit (TCU)
 - Has a port for the programming interface of the SMMU
 - Receives DVM messages
 - Does all the page walking, queue manipulation, etc.
 - One or more Translation Bus Units (TBUs)
 - Translate transactions from upstream (client) device into downstream transactions.
 - Zero or more connections to PCIe Root Complexes (PCIe-RCs)
 - There can be a total of 62 TBUs and PCIe-RCs attached.
 - An interconnect connecting the TBUs, PCIe-RCs to the TCU.
- A PCIe-RC has one connection to the TCU to make ATS requests but the PCIe-RC uses one or more TBUs to transform the transactions and pass them to the memory system. In the model, those TBUs used will be listed in the parameter `list_of_pcie_mode`. The SMMU does not know which TBUs a particular PCIe-RC is attached to.
- The TBU ORs a value into each StreamID that it receives. In the model, this is configured by the parameters:
 - `list_of_s_sid_high_at_bitpos0`
 - `list_of_ns_sid_high_at_bitpos0`
- The TCU, TBU, and the interconnect are all represented by this single model component.

- In the model, a pair of ports `tbs_pvbus_s[i]`/`tbm_pvbus_m[i]` represent a TBU 'i' or the `tbs_pvbus_s[i]` represents an incoming connection for a PCIe-RC. The corresponding reverse connection from the TCU to the PCIe-RC is by a special bus called `pvbus_id_routed_m` that is used to transport ATC Invalidates to the PCIe-RC.
 - In order to reduce system construction complexity the `tbs_pvbus_s[i]`/`tbm_pvbus_m[i]` also acts as a TBU so that the PCIe-RC need not separate its normal transactions and its ATS requests.
 - However, ATC Invalidates are only sent to a port which appears in `list_of_pcie_rc`. It should be uniquely decoded to a single port based on `list_of_ns_sid_high_at_bitpos0` and those ATC Invalidates must be routed to the correct PCIe subsystem in order to invalidate the cache of ATS Response in the subsystem. Thus all TBUs that a PCIe-RC uses must have a unique reverse mapping from stream id to port.
- A bad configuration renders the model inactive.
- Some configuration can be adjusted by configuration pins. These are only sampled at the negative edge of the reset pin. If you want to use these pins, you must drive them before sending a negative edge on the reset pin. During `simulation_reset`, the component driving them must also drive this transition again.
- The pin `sup_oas` is not supported, instead it is a parameter as it is assumed that it would be tied to a fixed value in any specific platform.
- Debug reads to the registers do not disturb the state.
- Writes to registers with Update flags (including debug writes) are ignored if the Update flag is already one.
- Debug and real accesses to the registers must be 32 or 64 bits.
- MSIs are issued on the `qtw_pvbus_m` port using attributes determined by the parameter `msi_attribute_transform`, whilst Event Queue writes will always be issued with `ExtendedID=0`, `UserFlags=0`, `MasterID=0xFFFFffff`. In the hardware, there is no way of distinguishing Event Queue writes from MSI writes, however, this provides a mechanism that if the model system needs to distinguish then it can. MPAM and MEC attributes are provided by the parameters:
 - `mpam_attribute_transform`
 - `mec_attribute_transform` (not all versions support MEC)
- The hardware only has a single cacheability attribute for input transactions, but PVBUS transports both inner and outer cacheability.
- For non-PCIe-mode TBUs (i.e. their index does not appear in `list_of_pcie_mode` or `list_of_pcie_rc`):
 - For non-cache maintenance operations:
 - If the input attribute is any type of device then it is well defined as being outer-shared and Device-nGnRnE or Device-nGnRE. There is no support for Gathering or Reordering.
 - If the outer cacheable input attribute is normal then if it is Write-back then this is converted to Inner Write-back Outer Write-back (iWB-oWB) with the desired shareability. No Transient hint is supported and is always treated as non-transient.
 - This leaves all other normal memory types that are mapped to Inner Normal Non-cacheable, Outer Normal Non-cacheable outer shared (iNC-oNC-osh).

- Thus the upstream devices must present the cacheability in the *outer* cacheability attribute on PVBUS if it is cacheable. If it is a device type then both the inner and outer attributes must be set to the same. If it is iNC-oNC-osh then it must be presented as such.
- For PCIe-mode TBUs (i.e. their index appears in `list_of_pcie_mode` or `list_of_pcie_rc`):
 - Input transactions are from PCIe and the only indication of the memory type is in the NoSnoop bit of the transaction. No shareability is transported.
 - NoSnoop interpreted as iNC-oNC-osh
 - ! NoSnoop interpreted as iWB-oWB-ish (note inner shareable)
 - If a NoSnoop transaction has an attribute transform applied to it and the result of the transform is weaker than iNC-oNC-osh then it will be forced to iNC-oNC-osh. For example, if a NoSnoop transaction uses a page table and is transformed to iWB-oWB-nsh then it will be forced to iNC-oNC-osh. However, if the page tables transformed it to a device type then, as all device types are stronger than iNC-oNC-osh then it will exit the SMMU as the device type.
 - In the model, transactions are classified by their incoming memory attributes as to whether they are NoSnoop or not and then normalized appropriately:
 - iWB-oWB-any-shareability are interpreted as ! NoSnoop
 - Thus normalized to iWB-oWB-ish
 - Anything else is considered NoSnoop
 - Thus normalized to iNC-oNC-osh
 - Translated accesses also suffer the same interpretation to determine NoSnoop and how they are normalized. Thus they could enter the system with attributes different to if they were Untranslated Accesses translated by normal means.
 - It is expected that there is a component downstream of the SMMU that is aware of the system address map and will override the memory type to 'device' for any transaction that accesses a peripheral.
- The hardware has a single cacheability on input and, for transactions that are neither cache-maintenance operations nor PCIe transactions, normalizes the input to an architectural form before performing the SMMUv3 architectural transform:
 - Any device type is left untouched (the input can only represent Device-nGnRE and Device-nGnRnE).
 - If the input is Write-back (WB) then it is normalized to iWB-oWB with the incoming shareability.
 - If the input is anything else it is normalized to iNC-oNC-osh.
- The model accepts full architectural attributes of two levels of cacheability and so has to decide how to interpret this in terms of the hardware. For transactions that are not cache maintenance operations, the model will replicate the outer attribute into the inner attribute and then perform the normalisation that the hardware does.
- The hardware normalizes the architectural output attributes and outputs a single level of cacheability and a user flag (OC) specifying if the architectural attributes were cacheable in the outer cacheable domain. The normalisation is:

- If the transaction is classified as a PCIe one then the NoSnoop transform described above is applied. That is:
 - If the original transaction was NoSnoop then any weaker memory type is strengthened to iNC-oNC-osh, then apply the following transform.

```

if      iWB-oWB-nsh/ish/osh      then output WB-nsh/ish/osh, OC = 1
else if i (NC/WT/WB) -o (WB/WT) then output NC-Sys,      OC = 1
else if i (NC/WT/WB) -oNC        then output NC-Sys,      OC = 0
else if Device- (GRE/nGRE/nGnRE) then output DV-Sys,      OC = 0
else                               output SO-Sys,      OC = 0

```

- The model only normalizes according to PCIe but otherwise leaves the architectural attributes intact on the output bus.
- The model does not support the eventoack signal. In integration mode, the value of the field “eventoack” (bit 0) in ITIN_PIU will match the value of the evento signal.
- Note that some older versions of MMU-S3 documentation/RTL referred to the ns_gbpa_abort_init and s_gbpa_abort_init tie-offs as sup_ns_gbpa_abort_rst and sup_s_gbpa_abort_rst.
- There is no functionality associated with TCU_NODE_STATUS register field ATSv, which indicates whether the node implements DTI-ATSv4.

Ports for MMU_S3

Table 3-1132: Ports

Name	Protocol	Type	Description
axi_stream_msi_addr_to_match_s	Value_64	Slave	Any SMMU-originated MSI which exactly matches the address in this port will be sent through the AXI stream port axi_stream_msi_m which is usually connected to the GIC through axi_stream_msi_s. As MSIs are 32 bit aligned then if bits[1:0] != 0 or the address is above OAS then this is effectively disabled. NOTE that the model does not support tcu_sid[31:0] which is the MSI DeviceID to send on axi_stream_msi_m. Instead the parameter smmu_msi_device_id is used. See also the parameters: axi_stream_msi_TID and axi_stream_msi_TDEST. The default value of this port is set by the parameter axi_stream_msi_addr_to_match. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
axi_stream_msi_m	PVBus	Master	Manager port used for sending SMMU originated MSIs directly to the GIC
clk_in	ClockSignal	Slave	Clock signal (in RTL aclk) This is a clock time-base used by the TCU to spread some of its processing over time, if enabled by the wait_* parameters. The clock must always be connected.
cmd_sync_irpt_ns	Signal	Master	Pulsed interrupt output signal for non-secure CMD_SYNC having a completion signal of SIG_IRQ.
cmd_sync_irpt_r	Signal	Master	Pulsed interrupt output signal for realm CMD_SYNC having a completion signal of SIG_IRQ. This pin exists in r0 but is tied off to 0. It is implemented in r1.
cmd_sync_irpt_s	Signal	Master	Pulsed interrupt output signal for secure CMD_SYNC having a completion signal of SIG_IRQ.

Name	Protocol	Type	Description
event_q_irpt_ns	Signal	Master	Pulsed interrupt output signal for the non-secure event queue becoming non-empty.
event_q_irpt_r	Signal	Master	Pulsed interrupt output signal for the realm event queue becoming non-empty. This pin exists in r0 but is tied off to 0. It is implemented in r1.
event_q_irpt_s	Signal	Master	Pulsed interrupt output signal for the secure event queue becoming non-empty.
evento	Signal	Master	Event signal This aligns with the eventoreq signal on the RTL. The eventock signal is not supported.
global_irpt_ns	Signal	Master	Pulsed interrupt output signal for non-secure SMMU_GERROR(N) signalling an error.
global_irpt_r	Signal	Master	Pulsed interrupt output signal for realm SMMU_R_GERROR(N) signalling an error. This pin exists in r0 but is tied off to 0. It is implemented in r1.
global_irpt_s	Signal	Master	Pulsed interrupt output signal for secure SMMU_S_GERROR(N) signalling an error.
gpf_far	Signal	Master	An error becomes active in SMMU_ROOT_GPF_FAR.
gpt_cfg_far	Signal	Master	An error becomes active in SMMU_ROOT_GPT_CFG_FAR.
identify	SMMUv3AEMIdentifyProtocol	Master	Map the transaction to the tuple (StreamID, SubStreamID, SubStreamIDValid, SSD) The StreamID that is produced by the implementation of this protocol is not the final StreamID. The final StreamID is produced by using the list_of_ns_sid_high_at_bitpos0/list_of_s_sid_high_at_bitpos0 parameter to map the StreamID based on the upstream port index. Also see the parameter howto_identify which can replace the functionality of this port under certain circumstances.
logptsz_s	Value	Slave	RME: This is a four bit signal that encodes the region size that a single LOGPT entry covers. The default value of this port is derived from the parameter rme_logpt_entry_covers_log2size_in_bytes which is in a different format to the port. If a valid value is driven then it will be put in the field SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ. The port uses the same encoding as the field. If an invalid value is driven to this port and legacy_tz_en is low then the value is reported in the SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ and then all transactions will fault with a GPT Configuration fault (gpt_cfg_far). This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
legacy_tz_en	Signal	Slave	Tie this high to get non-RME behaviour. On the real hardware, then each of the TCUs and the TBUs have a legacy_tz_en and they must all be driven to the same value. In the model, we only have a single version of this pin. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
ns_gbpa_abort_init	Signal	Slave	This port is an Non-secure global bypass. The ns_gbpa_abort_init signal sets the reset value of SMMU_GBPA.ABORT: 0 - On reset, do not abort all incoming transactions. 1 - On reset, abort all incoming transactions. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.

Name	Protocol	Type	Description
pri_q_irpt_ns	Signal	Master	Pulsed interrupt output signal for the non-secure PRI queue becoming non-empty.
pri_q_irpt_r	Signal	Master	Pulsed interrupt output signal for the realm PRI queue becoming non-empty. This pin exists in r0 but is tied off to 0. It is implemented in r1.
prog_pvbus_s	PVBus	Slave	Register subordinate port (in RTL PROG)
pvbus_id_routed_m[62]	PVBus	Master	This is a special "id-routed" port for transmitting ATC invalidates upstream into the PCIe EndPoints, it is not a normal bus. See parameter output_id_routed_transform. The FastModels ATC Invalidate and PRI Response protocol specifies how to route and deal with this port.
qtw_pvbus_m	PVBus	Master	Manager port used for Table Walks, MSIs and Queue access. Note that although this is a manager port, it can still receive DVM messages.
s_gbpa_abort_init	Signal	Slave	This port is an secure global bypass. The s_gbpa_abort_init signal sets the reset value of SMMU_S_GBPA.ABORT: 0 - On reset, do not abort all incoming transactions. 1 - On reset, abort all incoming transactions. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sec_override	Signal	Slave	Allow certain registers to be accessible to non-secure accesses from reset, as described in the TCU_SCR register. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_btm	Signal	Slave	System supports BTM and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. If BTM (Broadcast Table Maintenance) is not supported then DVM messages will be ignored. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_cohacc	Signal	Slave	System supports COHACC and will be reflected in the IDR registers. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_httu	Signal	Slave	System supports HTTU and will be reflected in the value of SMMU_IDR0.HTTU: - 0b00 (HTTU not supported) if sup_httu is 0 - 0b10 (update of AF and Dirty flags supported) if sup_httu is 1 The default value for this pin is 1. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
sup_sev	Signal	Slave	System supports SEV and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. This port is sampled at negedge of tcu_reset_in and must be set before the negedge of the reset signal.
tbm_pvbus_m[62]	PVBus	Master	The TBU manager ports that carry transactions that have been translated from the correspondingly numbered tbs_pvbus_s[] port.
tbs_pvbus_s[62]	PVBus	Slave	The TBU subordinate ports that receive transactions to be translated. They will exit the SMMU through the same numbered pvbus_m[] port.

Name	Protocol	Type	Description
tbu_crit_err[62]	Signal	Master	Critical error. This cannot occur in the model except by using an Integration Register to generate it.
tbu_pmu_irpt[62]	Signal	Master	TBU Performance Monitoring Unit interrupt, one per TBU.
tbu_pmusnapshot_ack[62]	Signal	Master	PMU snapshot interface for the TBU, ack a snapshot.
tbu_pmusnapshot_req[62]	Signal	Slave	PMU snapshot interface for the TBU, request a snapshot.
tbu_ras_cri[62]	Signal	Master	Critical error interrupt for RAS events from the TBU. This is used for specific uncorrected errors where a System Coprocessor (SCP) might have to reset the system because the stability of the system can no longer be guaranteed. NOTE that in the MMU-700 model this is called tbu_cri_irpt.
tbu_ras_eri[62]	Signal	Master	Error Recovery Interrupt for RAS events from the TBU. This is used for uncorrected errors. NOTE that in the MMU-700 model this is called tbu_eri_irpt. NOTE that in the MMU-700 model this is called tbu_eri_irpt.
tbu_ras_fhi[62]	Signal	Master	Fault Handling Interrupt for RAS events from the TBU. Usually this is for corrected errors. NOTE that in the MMU-700 model this is called tbu_fhi_irpt.
tbu_ras_lt_cri[62]	Signal	Master	Level triggered critical error interrupt for RAS events from the TBU.
tbu_ras_lt_eri[62]	Signal	Master	Level triggered error recovery interrupt for RAS events from the TBU.
tbu_ras_lt_fhi[62]	Signal	Master	Level triggered fault handling interrupt for RAS events from the TBU.
tbu_ras_lt_irpt_v[62]	Signal	Master	Level triggered valid output for connection to System RAS agents. Asserted when the RAS record contains at least one valid error.
tbu_reset_in[62]	Signal	Slave	Reset signals The TBUs can have independent reset signals. Each signal tbu_reset_in[n] corresponds to the TBU using tbs_pvbus_s[n]/tbs_pvbus_s[n] pair. If the SMMU receives a transaction whilst the TBU is expected to be in reset then it will complain using the ArchMsg.Warning.warning trace source. Those tbu_reset_in that correspond to a PCIe-RC connection can be connected to monitor the PCIe-RC's reset signal. If it receives an ATS request when in reset then it will complain in a similar way. You must connect these pins if you wish the TCU_NODE_STATUS for the nodes to be accurate (including any connected to the PCIe-RC).
tcu_pmu_irpt	Signal	Master	TCU Performance Monitoring Unit interrupt
tcu_pmusnapshot_ack	Signal	Master	PMU snapshot interface for the TCU, ack a snapshot.
tcu_pmusnapshot_req	Signal	Slave	PMU snapshot interface This is a four-phase handshake to have the corresponding PMCG perform a capture of the current counter values. PMU snapshot interface for the TCU, request a snapshot.
tcu_ras_cri	Signal	Master	Critical error interrupt for RAS events from the TCU. This is used for specific uncorrected errors where a System Coprocessor (SCP) might have to reset the system because the stability of the system can no longer be guaranteed. NOTE that in the MMU-700 model this is called tcu_cri_irpt.

Name	Protocol	Type	Description
tcu_ras_eri	Signal	Master	Error Recovery Interrupt for RAS events from the TCU. This is used for uncorrected errors. NOTE that in the MMU-700 model this is called tcu_eri_irpt.
tcu_ras_fhi	Signal	Master	Fault Handling Interrupt for RAS events from the TCU. Usually this is for corrected errors. NOTE that in the MMU-700 model this is called tcu_fhi_irpt.
tcu_ras_lt_cri	Signal	Master	Level triggered critical error interrupt for RAS events from the TCU.
tcu_ras_lt_eri	Signal	Master	Level triggered error recovery interrupt for RAS events from the TCU.
tcu_ras_lt_fhi	Signal	Master	Level triggered fault handling interrupt for RAS events from the TCU.
tcu_ras_lt_irpt_v	Signal	Master	Level triggered valid output for connection to System RAS agents. Asserted when the RAS record contains at least one valid error.
tcu_reset_in	Signal	Slave	The reset signal to the TCU interface.

Parameters for MMU_S3

TCUCFG_DPT_SUPPORT

Type

bool

Default value

true

MMU-S3 r1 Parameter Only: Enable Device Permission Table (DPT), a mechanism to enforce the association between granules of physical address space and the memory footprint of virtual machines.

```
0
: Realm DPT is disabled

1
: Realm DPT is enabled (default)
```

TCUCFG_DVM_VAS

Type

uint32_t

Default value

53

Virtual address size used by the system. Once set, this value is discoverable using `TCU_SYSDISC35.TCUCFG_DVM_VAS`.

In hardware, it is important to get this parameter correct as it determines the DVM message format. If this doesn't match the PEs, DVM messages are misinterpreted and any TLBI operations performed are incorrectly applied.

The model uses a representation of DVM that does not depend on the VA size and so misconfiguring this has no effect other than on the system discovery register value. Accepted Values: 49 53

TCUCFG_MECID_WIDTH

Type

uint32_t

Default value

16

Memory Encryption Context (MEC) is a feature introduced in MMU-S3. The MECID is a 1-16 bit identifier that, if implemented, supports Memory Encryption Contexts for the Realm programming interface. The given value indicates the number of bits in the MECID. A value of 0 will disable MEC. Accepted Values: 0 4 8 12 16

TCUCFG_PARTID_WIDTH

Type

unsigned

Default value

9

The width of the MPAM PARTID on the bus.

The value 10 is just for MMU_S3 r1.

See also parameter mpam_attribute_transform. Accepted Values: 1 6 9 10

TCUCFG_XLATE_SLOTS

Type

uint32_t

Default value

512

Maximum number of outstanding stalled transactions that the SMMU supports.

TCUCFG_XLATE_SLOTS must be \geq TCUCFG_PTW_SLOTS which is currently fixed to 512.

Accepted Values: 512 1024 2048 4096

all_error_messages_through_trace

Type

bool

Default value

false

Some conditions in the SMMU are so strange that the software programming the SMMU has done something wrong. At this point messages are output to either `ArchMsg.Error.*` or `ArchMsg.Warning.*` or to the error stream of the simulator. Outputting to the error stream of the simulator may cause it to return with a non-zero exit status.

If you set this option to true then instead of using the error stream of the simulator it will always use a trace stream allowing the simulation to exit with a zero exit status.

axi_stream_msi_TDEST

Type

uint32_t

Default value

0

ID of the AXI stream subordinate port on the GIC that receives SMMU originated MSIs sent directly. The name of the GIC port is `axi_stream_msi_s`.

If `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_addr_to_match`
- `axi_stream_msi_TID`

axi_stream_msi_TID

Type

uint32_t

Default value

0

ID of the AXI stream manager port that sends SMMU TCU originated MSIs directly to the GIC. The name of the SMMU port is `axi_stream_msi_m`.

Note

If `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_addr_to_match`
- `axi_stream_msi_TDEST`

`axi_stream_msi_addr_to_match`

Type

`uint64_t`

Default value

`0xFFFFFFFFFFFFFFFF`

If the last two bits are 0, any SMMU-originated MSI which exactly matches the address will be sent through the AXI stream port `axi_stream_msi_m` which is usually connected to the GIC.

This parameter drives the value of the `axi_stream_msi_addr_to_match_s` port at simulation reset. For every reset after that, the value of the port will be sampled and used if changed.

Note

The entire address must match, including bits [1:0]. As MSIs are 32 bit aligned then if `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_TID`
- `axi_stream_msi_TDEST`

`behaviour_of_sampled_at_reset_signals`

Type

unsigned

Default value

0

Some configuration signals into the SMMU are sampled on negedge of reset.

However, it can sometimes be hard to arrange to drive a configuration pin before the negedge of reset.

The configuration pins are sampled:

0

at negedge reset.

1

at negedge reset, but if a later change occurs at the same simulated time, and no transactions have occurred, then they will be resampled and the SMMU reset again.

cmdq_max_number_of_commands_to_buffer**Type**

uint32_t

Default value

10

The command queues can buffer fetched commands before issuing them. This parameter is roughly the maximum number of commands to do this for. The programmer visible effects are that just because the CONS pointer shows a command has been consumed does not necessarily mean that it has been issued (and completed). Higher values accentuate this effect.

enable_device_id_checks**Type**

bool

Default value

true

If this parameter is true then the DeviceIDs seen by the GIC are:

- **for client devices**

$$\text{DeviceID} = \text{StreamID} + \text{translated_device_id_base}$$

- **for SMMU-generated MSIs**

$$\text{smmu_msi_device_id}$$

This parameter enables two checks:

- If the DeviceID is used in the `output_attribute_transform` parameter, if it overflows 32 bits then the model warns. If the DeviceID is not used, it is assumed that the external agent that forms the DeviceID warns if it overflows.
- If the SMMU supports MSIs, the model checks that the GIC is able to distinguish an MSI generated by the SMMU from one generated by a client device.

As the exact mechanism to determine the DeviceID is in the system and not necessarily under control of the SMMU then you can disable these warnings using this parameter.

See also the parameters: `output_attribute_transform` and `msi_attribute_transform`.

hide_warning_EOPD_differs_from_what_would_be_cached

Type

bool

Default value

false

When this parameter is set to true, warnings that the effective EOPD value differs from what would be cached in the TLB are disabled. False (warnings are showed) by default.

hide_warning_NoStreamID_transaction_for_unsupported_PAS_or_MPAM_SP

Type

bool

Default value

false

When RME is not supported then a NoStreamID transaction with `PAS[1] == 1` or `MPAM_SP[1] == 1` is treated as though `PAS[1] == 0` and `MPAM_SP[1] == 0`. This is usually a system construction error and is not expected to occur.

The SMMU warns when this occurs, but the warning can be hidden by setting this parameter.

howto_identify

Type

string

Default value

"use-identify"

If `use-identify` then the SMMU uses the `identify` port to determine the `ssd`, `streamID`, `substreamID`. Otherwise, this string extracts them from the transaction's attributes.

Examples:

```
SEC_SID=ExtendedID[63], SSV=ExtendedID[62], SubstreamID=ExtendedID[51:32],
StreamID=ExtendedID[31:0]
nSEC_SID=ExtendedID[63], StreamID=ExtendedID[55:24], nSSV=ExtendedID[20],
SubstreamID=ExtendedID[19:0]
StreamID[31:24]=0, StreamID[23:0]=ExtendedID[23:0], SSV=1[0], ...
```

The `streamID` (32 b) is valid if `sidv` is 1 or both `sidv` and `nsidv` are unused.

`SEC_SID` is 1b in the model. For RME systems, in hardware, then `SEC_SID` is 2b, in the model `SEC_SID_bit_1` represents bit[1].

The `substreamID` (20 b) is valid if `ssv` is true.

`SIDV == 0` indicates a NoStreamID transaction and the SSD is the PAS of the transaction, `SEC_SID` is not used.

`nSEC_SID`, `nSSV`, `nSIDV` are available with negative logic. Different attributes are independent and can use negative or positive logic. Negative and positive logic symbols for the same attribute is an error.

The model uses the term SSD (Security State Determination) to mean which security state the transaction, register, structure, event, etc. belongs to.

In the SMMUv3 Architecture, the side-band signal `SEC_SID` holds the information for the transactions, but uses a different encoding.

Before RME, `SEC_SID` was a one bit signal. With RME, in the hardware, it was expanded to 2b. To retain backwards compatibility in the model, `SEC_SID` remains as 1b in this parameter, but the second bit can be expressed with `SEC_SID_bit_1` (and its negative logic version `nSEC_SID_bit_1`)

Security state	SSD	SEC_SID_bit_1	SEC_SID
secure	0	0	1
non-secure	1	0	0
root (reserved)	2	1	1
realm	3	1	0

For those systems that support NoStreamID transactions, and `howto_identify` is not using the port, first the SMMU determines the value of `SIDV` or `nSIDV` to see if the transaction is a NoStreamID transaction (`SIDV == 0` or `nSIDV == 1`). If so then the rest of the `howto_identify` string is ignored as the information extracted relates only to StreamID transactions. Instead more information is extracted using the parameter `howto_identify_NoStreamID_extra_info`.

howto_identify_NoStreamID_extra_info

Type

string

Default value

""

The behavior of this parameter depends on `howto_identify`

- if it equals 'use-identify' then this must be "", otherwise there is an error.
- if it identifies a NoStreamID transaction (`SIDV=0`) then this parameter includes one or more of
 - `MPAM_SP`
 - `MPAM_PARTID`
 - `MPAM_PMG`
 - `MECID`
 - `HWATTR_KIND_0`
- in any other case, this parameter is ignored.

Fields set in this parameter must not overlap the `sidv/nsidv` fields in `howto_identify`

Example:

```
MPAM_PMG[7:0]=ExtendedID[62:55], MPAM_PARTID[15:0]=ExtendedID[54:39],
MPAM_SP[1:0]=ExtendedID[38:37], MECID[15:0]=UserFlags[31:16]
HWATTR_KIND_0[3:0]=ExtendedID[42:39]
```

ish_is_osh_DANGER

Type

bool

Default value

true

When set, any transaction that would use the architectural inner shareable domain is converted to use the outer shareable domain.

This parameter should match the equivalent `ish_is_osh` from the PE. If an incompatible value of the `ish_is_osh` parameter is configured for the PE and the SMMU, data coherency may be compromised.

All implementations should have this parameter as true but it is allowed in the model to give it a false value for modelling and debug purposes only.

legacy_tz_en

Type

bool

Default value

false

The default value of the `legacy_tz_en` pin:

```
0
: RME is enabled

1
: RME is disabled
```

list_of_ns_sid_high_at_bitpos0

Type

string

Default value

""

A comma-separated list of values to bitwise OR into each Non-secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID.

Each TBU that is connected to a PCIe-RC (see `list_of_pcie_rc`) must serve a unique contiguous subset of StreamIDs as determined by their top bits. This is used in order to know which port to route ATC Invalidates and PRI Responses to the PCIe subsystems. The effective value for any PCIe-RC ports must be the same for non-secure and realm. See `list_of_r_sid_high_at_bitpos0`.

The empty string corresponds to all 0s.

list_of_pcie_mode**Type**

string

Default value

""

A comma-separated list of ranges of ports that represent TBUs that are attached to PCIe Root Complexes (PCIe-RC). A single PCIe-RC might use several TBUs and stripe accesses across them. The attribute handling for these TBUs is slightly different in that if the PCIe transaction is NoSnoop and the output attributes of the translation would be weaker than `INC-ONC-OSH` then the output is forced to `INC-ONC-OSH`.

`INC-ONC-OSH` == "inner normal non-cacheable, out normal non-cacheable, outer shared"

list_of_pcie_rc**Type**

string

Default value

""

This is a list of ports that are connected to PCIe Root Complex (PCIe-RC) by a protocol called DTI-ATS. This port is used to transport ATS and PRI Requests to the SMMU from the PCIe-RC.

In the real hardware, the PCIe-RC uses this port for ATS/PRI, and the actual transactions go through separate TBUs. In the model, this port can accept actual transactions as well. However, in the model, then the ATC Invalidates and the PRI Responses need to be transferred over the corresponding `pvbush_id_routed_m` port as DTI-ATS is bidirectional, but PVBush is not.

list_of_r_sid_high_at_bitpos0**Type**

string

Default value

""

A comma-separated list of values to bitwise OR into each Realm StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID. This only has an effect for r1 and later.

Each TBU that is connected to a PCIe-RC (see `list_of_pcie_rc`) must serve a unique contiguous subset of StreamIDs as determined by their top bits. This is used in order to know which port to route ATC Invalidates and PRI Responses to the PCIe subsystems. The effective value for any PCIe-RC ports must be the same for non-secure and realm. See `list_of_ns_sid_high_at_bitpos0`.

The empty string corresponds to all 0s.

“use-ns” can be used to apply the `list_of_ns_sid_high_at_bitpos0` values instead.

list_of_s_sid_high_at_bitpos0**Type**

string

Default value

""

A comma-separated list of values to bitwise OR into each Secure StreamID for each TBU/Node. Bit 0 of the value corresponds to bit 0 of the StreamID.

The empty string corresponds to all 0s.

use-ns can be used to apply the `list_of_ns_sid_high_at_bitpos0` values instead.

mec_attribute_transform**Type**

string

Default value

""

If MEC is supported, this is applied to *all* downstream transactions to transport the MEC information.

- "" or “none” – no transform
- How to alter the output attributes. Example:

```
"UserFlags[31:16]=MECID[15:0]"
```

RHS/LHS Symbols: * ExtendedID/MasterID/UserFlags.

RHS Symbols: * MECID * numeric literals.

Any bits with no transform are unchanged.

Attribute transforms applied before this: * for client transactions
output_attribute_transform/output_attribute_transform_for_NoStreamID. * for
table walks tw_qs_attribute_transform. * for MSIs msi_attribute_transform. * if
MPAM is enabled mpam_attribute_transform.

mpam_attribute_transform

Type

string

Default value

"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS"

If MPAM is supported, this is applied to *all* downstream transactions to transport the MPAM information.

- "" or "none" – no transform
- How to alter the output attributes. Example:

```
"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,  
ExtendedID[38]=MPAM_SP[0]"
```

RHS/LHS Symbols:

- ExtendedID/MasterID/UserFlags.

RHS Symbols:

- MPAM_PARTID
- MPAM_PMG
- MPAM_NS
- MPAM_SP
- numeric literals

Any bits with no transform are unchanged.

- attribute transforms applied before this:
 - for client transactions output_attribute_transform /
output_attribute_transform_for_NoStreamID.
 - for table walks tw_qs_attribute_transform.
 - for MSIs msi_attribute_transform.
- mec_attribute_transform is applied after this.

- for translated transactions from client devices then `MPAM_NS = ! SEC_SID`.

msi_attribute_transform

Type

string

Default value

"ExtendedID[31:0]=smmu_msi_device_id, MasterID=0xFFFFFFFF"

Transform downstream attributes of MSI transactions.

After 11.25 the interrupt_kind field was extended to 5 bits. This is strictly a non-backwards compatible change. However, the original 3 bits was insufficient to express all the interrupt kinds that exist.

normalize_input_normal_non_iWB_oWB_to_iNC_oNC_osh_DANGER

Type

bool

Default value

true

When set, use Inner Non Cacheable, Outer Non Cacheable, Outer Shareable for any upstream transaction that would use any of the following attributes:

- Normal Non-cacheable Bufferable
- Normal Non-cacheable Non-bufferable
- Write-through

This parameter should match the equivalent configuration from the PE. If an incompatible value of this parameter is configured for the PE and the SMMU, data coherency may be compromised.

All implementations should have this parameter as true but it is allowed in the model to give it a false value for modelling and debug purposes only.

ns_gbpa_abort_init

Type

bool

Default value

false

The default value of the tie off signal `ns_gbpa_abort_init`

number_of_ports**Type**

unsigned

Default value

1

The number of port pairs that the SMMU has.

output_attribute_transform**Type**

string

Default value

"ExtendedID[31:0]=DeviceID"

Transform the downstream attributes of a translated transaction.

- "" or "none": no transform
- How to alter output attributes. Example:

```
"ExtendedID[15:0]=DeviceID[15:0], UserFlags[31]=nSSV,
UserFlags[19:0]=SubstreamID,
MasterID[10]=MasterID[11], MasterID[11]=MasterID[10]"
```

RHS/LHS Symbols:

- ExtendedID/MasterID/UserFlags: incoming/outgoing attributes.

RHS Symbols:

- **DeviceID**
StreamID + translated_device_id_base
- StreamID/SubstreamID/SSV/SEC_SID
- **nSEC_SID/nSSV**
negative logic versions.
- **st1PBHA/st2PBHA**
Page Based Hardware Attributes from leaf descriptors (zero if unused).
- **STE_IMPDEF1**
STE[127:116]
- numeric literals.

The streamID has had ns_sid_high/s_sid_high ORred into it for the appropriate TBU.

Note

'mpam_attribute_transform' is applied after this.

- "" or "none": no transform
- How to alter output attributes. Example:

```
"ExtendedID[15:0]=DeviceID[15:0], UserFlags[31]=nSSV, UserFlags[19:0]=SubstreamID,
MasterID[10]=MasterID[11], MasterID[11]=MasterID[10]"
```

RHS/LHS Symbols:

- **ExtendedID/MasterID/UserFlags**
incoming/outgoing attributes.

RHS Symbols:

- **DeviceID**
StreamID + translated_device_id_base
- StreamID/SubstreamID/SSV/SEC_SID
- **nSSV/nSEC_SID/**
negative logic versions.
- **St1PBHA/St2PBHA**
Page Based Hardware Attributes from leaf descriptors (zero if not used).
- **STE_IMPDEF1**
STE[127:116]
- **HWATTR_KIND_0**
PBHA information
- numeric literals.
- SIDV = 1, nSIDV = 0 (fixed values to indicate StreamID)

Any bits with no transform are unchanged.

Note

- mpam_attribute_transform and mec_attribute_transform are applied in order after this.
- See also output_attribute_transform_for_NoStreamID for NoStreamID transactions.

output_attribute_transform_for_NoStreamID

Type

string

Default value

"ExtendedID[31:0]=0, ExtendedID[32]=1"

Transform downstream attributes of NoStreamID transactions.

- "" or "none": no transform
- How to alter output attributes. Example:

```
"ExtendedID[15:0]=0, UserFlags[31]=1, UserFlags[19:0]=0, MasterID[10]=MasterID[11],
MasterID[11]=MasterID[10] MasterID[9:6]=HWATTR_KIND_0"
```

RHS/LHS Symbols: * ExtendedID/MasterID/UserFlags: incoming/outgoing attributes.

RHS Symbols: * SIDV = 0, nSIDV = 1 (fixed values to indicate NoStreamID) * PAS *
HWATTR_KIND_0 * numeric literals.

Any bits with no transform are unchanged.

Note

- mpam_attribute_transform and mec_attribute_transform are applied in order after this.
- see also output_attribute_transform for StreamID transactions.

output_id_routed_transform**Type**

string

Default value

"Address[27:12]=StreamID[15:0], PAS=SSD"

The SMMU generates the following ID-routed transaction on the pvbus_id_routed_m bus:

- ATC Invalidate
- PRI Response

This parameter controls how the SMMU should express:

- the StreamID
- the Trusted (T) bit

The value is a comma-separated list of assignments:

```
Address[27:12]=StreamID[15:0], ExtendedID[60]=T, ExtendedID[15:0]=StreamID[31:16]
```

Address bits[11:0] cannot be used.

The LHS can be one of:

- PAS
- MasterID/ExtendedID/UserFlags
- Address

The RHS can be one of:

- a numeric constant
- SSD
- T or negative version nT
- StreamID

For realm (or 'Trusted') transactions, then SSD=0b11, T=1, nT=0. For non-secure (or 'Non-Trusted') transactions, then SSD=0b01, T=0, nT=1

prefetch_only_requests

Type

unsigned

Default value

0

The simulator supports 'prefetch-only' DMI requests, which can occur at any time and for any reason and are intended to be invisible to the end execution of the model and to the user.

0

deny all prefetch-only requests

1

- use debug requests for any page table walks
 - form and use debug TLB/cache entries
 - any faults will not record, but deny the prefetch request

2

- treat prefetch-only requests like normal transactions
 - use normal page table walk transactions
 - use and form normal TLB/cache entries
 - faults will alter the programmer-visible state of the SMMU

0 is the safest.

1 treats the access like a debug request and requires that debug page table walks are treated correctly downstream. Any descriptors that need HTTU to allow the transaction to proceed will fail the request.

2 is dangerous, it use real transactions and reports faults that are unphysical. Real transactions can be wait()ed and this disobeys the SystemC spec for get_direct_mem_ptr().

rme_l0gpt_entry_covers_log2size_in_bytes**Type**

uint32_t

Default value

30

Each LOGPT entry covers:

```
2**rme_l0gpt_entry_covers_log2size_in_bytes
```

bytes of address space.

The valid values for this parameter are: * 30, 34, 36, 39

This parameter is reported in an encoded format as the read-only field:

```
SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ
```

This parameter can be overridden by the port `l0gptsz_s` when sampled on negedge of reset.

s_gbpa_abort_init**Type**

bool

Default value

false

The default value of the tie off signal `s_gbpa_abort_init`

sec_override**Type**

bool

Default value

false

The IMP DEF port `sec_override` controls whether some of the registers are accessible to secure or non-secure/realms transactions. This parameter is the default value assumed for that port if the port is not driven by a signal.

seed**Type**

uint32_t

Default value

0x12345678

Used to seed the pseudo-random number generator that the SMMU model uses.

size_of_cd_cache

Type

uint32_t

Default value

0

The number of entries in the cache holding CD structures. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_dpttlb

Type

uint32_t

Default value

0

The number of entries in the DPT TLB. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_l1cd_cache

Type

uint32_t

Default value

0

The number of entries in the cache holding L1CD descriptors. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_l1ste_cache

Type

uint32_t

Default value

0

The number of entries in the cache holding L1STE descriptors. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_ste_cache

Type

uint32_t

Default value

0

The number of entries in the cache holding STE structures. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_tlb

Type

uint32_t

Default value

0

The number of entries in the TLB. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

smmu_msi_device_id

Type

uint32_t

Default value

0

When appropriately enabled, assume that MSIs that are generated by the SMMU are presented to the GIC with this DeviceID.

See parameters `msi_attribute_transform` and `enable_device_id_checks`.

sup_btm

Type

bool

Default value

true

The default value of the register field `SMMU_IDR0.BTM` and `SMMU_ROOT_IDR0.BGPTM` (when supported). This enables Broadcast TLB maintenance.

sup_cohacc

Type

bool

Default value

true

The default value of the register `SMMU_IDR0.COACC`

sup_httu

Type

bool

Default value

true

The initial value of the `sup_httu` port. See the port description for `sup_httu`.

sup_oas**Type**

unsigned

Default value

6

The hardware has an input port `sup_oas[2:0]` that indicates what output address size (OAS) the system has. This is sampled at reset.

The model does not have this port as it is expected to be a constant for the system and not to change. Instead it is just a parameter.

The allowed values are:

0 :32 bits

1

36 bits

2

40 bits

3

42 bits

4

44 bits

5

48 bits

6

52 bits

sup_sev**Type**

bool

Default value

true

The default value of the register `SMMU_IDR0.SEV`

tlb_when_do_f_tlb_conflict_on_overlap**Type**

unsigned

Default value

0

If a TLB entry is created by a walk and it overlaps an existing entry, there are some architectural situations where the result is known. For all others, then an implementation is allowed to use an **UNPREDICTABLE** combination of the two entries, or it can generate F_TLB_CONFLICT:

0

never generate

1

sometimes generate

2

always generate

Conflicts between global and non-global entries are not detected by the model.

translated_device_id_base**Type**

uint32_t

Default value

0

When appropriately enabled, assume that client device accesses are translated to a DeviceID as seen by the GIC of:

```
StreamID + translated_device_id_base
```

See parameter `output_attribute_transform` and `enable_device_id_checks`.

tw_qs_attribute_transform**Type**

string

Default value

""

Transform downstream attributes of table walk and queue transactions.

- "" or "none" – no transform

- How to alter the output attributes. Example:

```
"ExtendedID[35:32]=HWATTR_KIND_0"
```

RHS/LHS Symbols:

- ExtendedID/MasterID/UserFlags

RHS Symbols:

- HWATTR_KIND_0: PBHA information
- kind
 - for a read:
 - 0/1**
L1STE/STE
 - 2/3**
L1CD/CD
 - 4/5**
S1/S2 TTD (including CAS)
 - 6**
CMDQ
 - 7**
VMS
 - 11/12**
LOGPT/L1GPT
 - 13/14**
LODPT/L1DPT
 - for a write
 - 0**
EVENTQ
 - 1:**
PRIQ
- numeric literals.

ExtendedID/MasterID/UserFlags start with values {0, 0xFFFFffff, 0} respectively.

Any bits with no transform are unchanged.

See also `output_attribute_transform` and `msi_attribute_transform`.

version**Type**

string

Default value

"rOp0"

The version of this product.

Valid values are:

- rOp0
- r1p0

wait_cmdq_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing something on the command queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff) - 1)]$.

wait_eventq_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing something on the event queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff) - 1)]$.

wait_misc_async_actions_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing an async action that could be delayed is performed. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff) - 1)]$.

wait_msi_ticks

Type
uint64_t

Default value
0

This is the time to wait before sending an MSI. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \ \& \ 0xFFFFFFFF)) - 1]$.

wait_pri_req_ticks

Type
uint64_t

Default value
0

This is the time to wait before processing a PRI Request. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \ \& \ 0xFFFFFFFF)) - 1]$.

wait_pri_resp_ticks

Type
uint64_t

Default value
1

This is the time to wait before sending a PRI Response back to the PCIe subsystem. When a PRI Response is an auto-response then the ATC might immediately make a new ATS request, that immediately fails, immediately makes a PRI Request, or auto-responds, etc. To break this loop, then we introduce a minimum time on all PRI Responses to give other components in the system a chance to run. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \ \& \ 0xFFFFFFFF)) - 1]$.

3.10.60 MemoryMappedCounterModule

Memory Mapped Counter Module for Generic Timers. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1134: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MemoryMappedCounterModule

This model has the following Iris instances:

Table 3-1135: MemoryMappedCounterModule Iris instances

InstanceName	ComponentName
MemoryMappedCounterModule	MemoryMappedCounterModule
MemoryMappedCounterModule.pvbus_control_s[0]	PVBusSlave
MemoryMappedCounterModule.pvbus_read_s[0]	PVBusSlave

This model has the following MTI trace components:

Table 3-1136: MemoryMappedCounterModule MTI instances

InstanceName	ComponentName
MemoryMappedCounterModule	MemoryMappedCounterModule
MemoryMappedCounterModule.pvbus_control_s[0]	PVBusSlave
MemoryMappedCounterModule.pvbus_read_s[0]	PVBusSlave

MemoryMappedCounterModule contains the following CADI targets:

- MemoryMappedCounterModule

About MemoryMappedCounterModule

This component must be used by multicluster models. It also must be used to run a single core system with a timer that runs at a rate that is different to the input clock to the core.

Note

The component has two bus slave ports because the architecture specification permits you to map each set of registers at different, non-contiguous base addresses.

Ports for MemoryMappedCounterModule

Table 3-1137: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	This clock input determines the frequency of the Physical Count provided to the clusters connected to the cntvalueb port.
cntvalueb	CounterInterface	Master	This master port implements a private protocol between the cluster and the MemoryMappedCounterModule. This must be connected to the cntvalueb port on each cluster in the system and to the MemoryMappedCounterModule component.
counter_reset	Signal	Slave	Resets when set.
pvbus_control_s	PVBus	Slave	This slave port provides memory-mapped read write access to the control registers of the module.
pvbus_read_s	PVBus	Slave	This slave port provides memory-mapped read access to the status frame registers.

Parameters for MemoryMappedCounterModule

base_frequency

Type

int

Default value

0x5f5e100

Reset value for CNTFID0, base frequency in Hz.

cntcldr0123_C

Type

int

Default value

0x0

Values to be returned for control-frame CIDR registers.

cntcldr0123_R

Type

int

Default value

0x0

Values to be returned for read-frame CIDR registers.

cntpidr0123_C

Type

int

Default value

0x0

Values to be returned for control-frame PIDR registers 0-3.

cntpidr0123_R

Type

int

Default value

0x0

Values to be returned for read-frame PIDR registers 0-3.

cntpidr4567_C**Type**

int

Default value

0x0

Values to be returned for control-frame PIDR registers 4-7.

cntpidr4567_R**Type**

int

Default value

0x0

Values to be returned for read-frame PIDR registers 4-7.

diagnostics**Type**

int

Default value

0x0

Diagnostics.

has_additional_registers**Type**

bool

Default value

0x0

Implements additional REFCLK CNT control registers.

has_counter_scaling**Type**

bool

Default value

0x0

Implements ARMv8.4 generic counter scaling (FEAT_CNTSC).

non_arch_fixed_frequency**Type**

int

Default value

0x0

If set, ignore CNTFID0 and instead use this frequency in Hz.

non_arch_start_at_default**Type**

bool

Default value

0x0

Firmware is expected to enable the timer at boot time. However, turning this parameter on is a model-specific way of enabling the counter module out of reset.

readonly_is_WI**Type**

bool

Default value

0x0

Ignore (rather than failing) on writes to read-frame.

use_real_time**Type**

bool

Default value

0x0

****Deprecated, this parameter will be removed in future versions**** Update the Generic Timer counter at a real-time base frequency instead of simulator time.

3.10.61 MessageHandlingUnit

Message Handling Unit. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1138: IP revisions support

Revision	Quality level
v2.0	Full support
v2.1	Full support
v3	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MessageHandlingUnit

This model has the following Iris instances:

Table 3-1139: MessageHandlingUnit Iris instances

InstanceName	ComponentName
MessageHandlingUnit	MessageHandlingUnit
MessageHandlingUnit.a_to_b_v2	MessageHandlingUnitV2
MessageHandlingUnit.a_to_b_v3	MessageHandlingUnitV3
MessageHandlingUnit.version_mapper_a_to_b_rec	PVBusMapper
MessageHandlingUnit.version_mapper_a_to_b_snd	PVBusMapper

This model has the following MTI trace components:

Table 3-1140: MessageHandlingUnit MTI instances

InstanceName	ComponentName
MessageHandlingUnit.a_to_b_v2	MessageHandlingUnitV2
MessageHandlingUnit.a_to_b_v3	MessageHandlingUnitV3
MessageHandlingUnit.version_mapper_a_to_b_rec	PVBusMapper
MessageHandlingUnit.version_mapper_a_to_b_snd	PVBusMapper

MessageHandlingUnit contains the following CADI targets:

- MessageHandlingUnit
- MessageHandlingUnitV2
- MessageHandlingUnitV3

Ports for MessageHandlingUnit

Table 3-1141: Ports

Name	Protocol	Type	Description
pvbus_s_rec	PVBus	Slave	-
pvbus_s_snd	PVBus	Slave	-
rec_combined_channel_irq_out[200]	Signal	Master	-
rec_combined_irq_out	Signal	Master	-
rec_reset_in	Signal	Slave	-

Name	Protocol	Type	Description
snd_combined_channel_irq_out[200]	Signal	Master	-
snd_combined_irq_out	Signal	Master	-
snd_reset_in	Signal	Slave	-

Parameters for MessageHandlingUnit

NUM_DB_CH

Type

int

Default value

0x1

Number of doorbell channels.

NUM_FAST_CH

Type

int

Default value

0x1

Number of fast channels.

a_to_b_v3.NUM_FIFO_CH

Type

int

Default value

0x1

Number of FIFO Channels, default=1.

a_to_b_v3.auto_op_full

Type

bool

Default value

0x0

AutoOp mode - AutoOp(min) == false, AutoOp(full) == true - default: AutoOp(min).

a_to_b_v3.fast_ch_group_int_enable

Type

bool

Default value

0x0

Fast Channel group interrupts enable, default=false.

a_to_b_v3.fifo_depth**Type**

int

Default value

0x4

Depth of the FIFO = fifo_depth + 1.

a_to_b_v3.m16ba_spt**Type**

bool

Default value

0x0

Mailbox 16 bit access support to FIFO registers.

a_to_b_v3.m32ba_spt**Type**

bool

Default value

0x1

Mailbox 32 bit access support to FIFO registers.

a_to_b_v3.m64ba_spt**Type**

bool

Default value

0x0

Mailbox 64 bit access support to FIFO registers.

a_to_b_v3.m8ba_spt**Type**

bool

Default value

0x0

Mailbox 8 bit access support to FIFO registers.

a_to_b_v3.monolithic**Type**

bool

Default value

0x1

Monolithic or Distributed MHU - default: monolithic(true).

a_to_b_v3.p16ba_spt**Type**

bool

Default value

0x0

Postbox 16 bit access support to FIFO registers.

a_to_b_v3.p32ba_spt**Type**

bool

Default value

0x1

Postbox 32 bit access support to FIFO registers.

a_to_b_v3.p64ba_spt**Type**

bool

Default value

0x0

Postbox 64 bit access support to FIFO registers.

a_to_b_v3.p8ba_spt**Type**

bool

Default value

0x0

Postbox 8 bit access support to FIFO registers.

diagnostics**Type**

int

Default value

0x2

Diagnostics 0==FATAL_ERROR -> 4==DEBUG.

fast_ch_group_int_enable**Type**

bool

Default value

0x0

Fast Channel group interrupts enable, default=false.

fast_ch_n_per_group**Type**

int

Default value

0x1

Fast Channel num channels per group, default=1.

fast_ch_num_groups**Type**

int

Default value

0x1

Fast Channel num of groups, default=1.

fast_ch_word_size**Type**

int

Default value

0x20

Fast Channel word size 32bit or 64bit, default=32.

major_version

Type
int

Default value
0x2

MHU major version (default=2).

mhu_arch_beta01

Type
bool

Default value
0x0

true = Aligns to MHUv3.beta01; false = Aligns to MHUv3.2.

minor_version

Type
int

Default value
0x1

MHU minor version (default=1).

product_id

Type
int

Default value
0x0

MHU part number.

3.10.62 MessageHandlingUnitV2

Message Handling Unit Version 2. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1142: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MessageHandlingUnitV2

This model has the following Iris instances:

Table 3-1143: MessageHandlingUnitV2 Iris instances

InstanceName	ComponentName
MessageHandlingUnitV2	MessageHandlingUnitV2

This model has the following MTI trace components:

Table 3-1144: MessageHandlingUnitV2 MTI instances

InstanceName	ComponentName
MessageHandlingUnitV2	MessageHandlingUnitV2

MessageHandlingUnitV2 contains the following CADI targets:

- MessageHandlingUnitV2

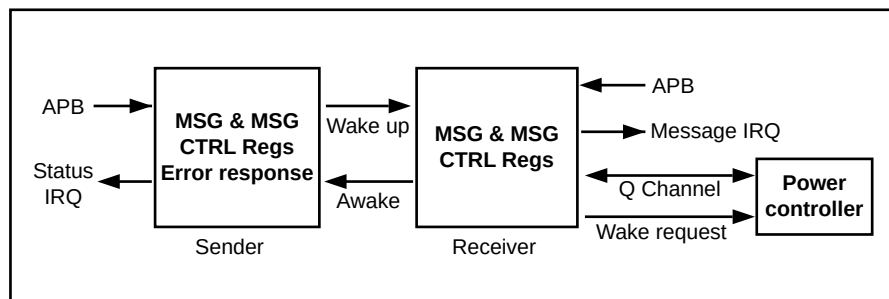

About MessageHandlingUnitV2

MessageHandlingUnitV2 is a unidirectional message channel with two APB interfaces, one for the sender and one for the receiver. There is one message handling unit for each sender and receiver pair.

The receiver can be powered off. A Q-Channel is provided for power control on the receiver side.

The message payload can be written directly to status registers. Multiple channels can be combined into a single message.

Figure 3-3: MessageHandlingUnitV2 structure

Ports for MessageHandlingUnitV2

Table 3-1145: Ports

Name	Protocol	Type	Description
int_access_nr2r	Signal	Master	-

Name	Protocol	Type	Description
int_access_r2nr	Signal	Master	-
mhu_combined_irq	Signal	Master	-
mhu_irq[124]	Signal	Master	-
mhu_snd_irq[124]	Signal	Master	-
pvbus_s_rec	PVBus	Slave	-
pvbus_s_snd	PVBus	Slave	-
qchannel_mhu_pwr	PChannel	Slave	-
reset_rec	Signal	Slave	-
reset_snd	Signal	Slave	-
snd_combined_irq	Signal	Master	-
wakerequest	Signal	Master	-

Parameters for MessageHandlingUnitV2

NUM_CH

Type

int

Default value

0x1

Number of device channels.

minor_revision

Type

int

Default value

0x0

MHUv2 minor revision, 0 for v2.0, 1 for v2.1.

product_id

Type

int

Default value

0x0

MHUv2 Product ID, MHU Part Number.

3.10.63 MessageHandlingUnitV3

Message Handling Unit Version 3. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1146: IP revisions support

Revision	Quality level
v3	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for MessageHandlingUnitV3

This model has the following Iris instances:

Table 3-1147: MessageHandlingUnitV3 Iris instances

InstanceName	ComponentName
MessageHandlingUnitV3	MessageHandlingUnitV3

This model has the following MTI trace components:

Table 3-1148: MessageHandlingUnitV3 MTI instances

InstanceName	ComponentName
MessageHandlingUnitV3	MessageHandlingUnitV3

MessageHandlingUnitV3 contains the following CADI targets:

- MessageHandlingUnitV3

Ports for MessageHandlingUnitV3

Table 3-1149: Ports

Name	Protocol	Type	Description
pdbus_s_rec	PVBus	Slave	Register access for Receiver/Mailbox
pdbus_s_snd	PVBus	Slave	Register access for Sender/Postbox
rec_combined_irq_out	Signal	Master	All interrupts combined for Receiver/MBX
rec_fast_channel_group_irq_out[32]	Signal	Master	Receiver fast channel group interrupts
rec_fast_channel_irq_out[1024]	Signal	Master	Receiver fast channel interrupts
rec_reset_in	Signal	Slave	Reset signal for Receiver/Mailbox
snd_combined_irq_out	Signal	Master	All Interrupts combined for Sender/PBX
snd_reset_in	Signal	Slave	Reset signal for Sender/Postbox

Parameters for MessageHandlingUnitV3

NUM_DB_CH

Type

int

Default value

0x1

Number of DoorBell Channels, default=1.

NUM_FAST_CH

Type

int

Default value

0x1

Number of Fast Channels, default=1.

NUM_FIFO_CH

Type

int

Default value

0x1

Number of FIFO Channels, default=1.

auto_op_full

Type

bool

Default value

0x0

AutoOp mode - AutoOp(min) == false, AutoOp(full) == true - default: AutoOp(min).

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG), default=2.

fast_ch_group_int_enable**Type**

bool

Default value

0x0

Fast Channel group interrupts enable, default=false.

fast_ch_n_per_group**Type**

int

Default value

0x1

Fast Channel num channels per group, default=1.

fast_ch_num_groups**Type**

int

Default value

0x1

Fast Channel num of groups, default=1.

fast_ch_word_size**Type**

int

Default value

0x20

Fast Channel word size 32bit or 64bit, default=32.

fifo_depth**Type**

int

Default value

0x4

Depth of the FIFO = fifo_depth + 1.

m16ba_spt**Type**

bool

Default value

0x0

Mailbox 16 bit access support to FIFO registers.

m32ba_spt**Type**

bool

Default value

0x1

Mailbox 32 bit access support to FIFO registers.

m64ba_spt**Type**

bool

Default value

0x0

Mailbox 64 bit access support to FIFO registers.

m8ba_spt**Type**

bool

Default value

0x0

Mailbox 8 bit access support to FIFO registers.

mhu_arch_beta01**Type**

bool

Default value

0x0

true = Aligns to MHUv3.beta01; false = Aligns to MHUv3.2.

monolithic**Type**

bool

Default value

0x1

Monolithic or Distributed MHU - default: monolithic(true).

p16ba_spt**Type**

bool

Default value

0x0

Postbox 16 bit access support to FIFO registers.

p32ba_spt**Type**

bool

Default value

0x1

Postbox 32 bit access support to FIFO registers.

p64ba_spt**Type**

bool

Default value

0x0

Postbox 64 bit access support to FIFO registers.

p8ba_spt**Type**

bool

Default value

0x0

Postbox 8 bit access support to FIFO registers.

3.10.64 NI700

NI700 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1150: IP revisions support

Revision	Quality level
r0p0	Preliminary support
r1p0	Preliminary support
r2p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for NI700

This model has the following Iris instances:

Table 3-1151: NI700 Iris instances

InstanceName	ComponentName
NI700	NI700
NI700.decoder	PVBusMapper

This model has the following MTI trace components:

Table 3-1152: NI700 MTI instances

InstanceName	ComponentName
NI700	NI700
NI700.decoder	PVBusMapper

NI700 contains the following CADI targets:

- NI700

Configuring and using the model

- Major IP revisions (rX) are modeled and are controlled by the `revision` parameter.
- Minor IP revisions (pY) are not modeled. There are no functional differences in the model between pY revisions, with the exception of the `periph_id2` register.
- To configure the model, you must have installed Arm Socrates. The `mesh_config_file` parameter defines the mesh placement of NI700 components. Set it to the name of the yaml configuration file emitted by Socrates. You must use version r1p5-03rel0 or later of Socrates to generate the file. For more information about Socrates, see [Arm Socrates](#) on Arm Developer. To download it, contact Arm Technical Support.
- Interconnect models are based on the TRM description and do not typically model RTL defects.
- The mapping between the port number for ASNI, AMNI, HSNI, HMNI, and PMNI ports and the xxNI name used in the yml file is its index when all xxNIs of that same type are sorted

in ascending alphabetical order. For example, if the yml file has three ASNIIs `asni_s100_scp`, `asni_s101_dap`, and `asni_s204_periph0`:

- `asni_s100_scp` is mapped to `pvbus_s_asni[0]`
- `asni_s101_dap` is mapped to `pvbus_s_asni[1]`
- `asni_s204_periph0` is mapped to `pvbus_s_asni[2]`

Similarly:

- AMNIs are mapped to `pvbus_m_amni`
- HSNIs are mapped to `pvbus_s_hsn`
- HMNIs are mapped to `pvbus_m_hmni`
- PMNIs are mapped to `pvbus_m_pmni`

Additionally, NI700's parser prints the name-to-index mappings when the component parameter `print_parser_log=true`.

The following functionality is expected to work:

- The discovery feature to determine the system address of all nodes.
- Hashed and non-hashed memory regions. They are parsed from the `mesh_config_file`.
- MPAM support. Software must configure MPAM override in ASNI nodes by enabling and configuring the `ASNI_AR_MPAM_OVERRIDE` (0x0E0) and `ASNI_AW_MPAM_OVERRIDE` (0x0E4) registers. The `GT_MPAM_SUPPORT` signal is ignored. Software must configure MPAM support in ASNI nodes by enabling and configuring the Request MPAM Override (0x0E0) register.
- IDM support. The IDM features Access control and Reset control are modeled. Starting in r1p0, non-secure versions of the `ACCESS_STATUS` and `RESET_STATUS` registers are present. The DeviceID and the information whether an xxNI has IDM enabled are parsed from the `mesh_config_file`. When an xxNI is isolated with IDM Access Control or under reset with IDM Reset, all transactions to and from that xxNI are aborted. With respect to IDM reset support, IDM reset signals are modeled and they should be connected to the managed devices that are connected to the respective xxNI port. The register `IDM_RESET_CONTROL` is supported. The target xxNI always enters or exits IDM reset immediately and drives the reset signals accordingly. In register `IDM_RESET_STATUS`, the bitfields `active_write` and `active_read` read always zero. In registers `IDM_RESET_READID` and `IDM_RESET_WRITEID`, the bitfields `vmaster_id` and `master_id` read always zero.
- There are no software functional differences for r2p1 and r2p0 can be used in its place.

Model limitations

- Out of scope:
 - PMU counters are not supported. Counter registers are implemented as **RAZ**.
 - QoS is not supported and all related registers are **RAZ/WI**.
 - Error injection and error generation are not supported. All error registers are **RAZ/WI**.
 - Power, clock, and interrupt signals are not supported.

- An access to a reserved or nonexistent register does not abort. It returns `pv::Tx_Data::TX_OK` and is **RAZ/WI**.
- The maximum number of manager Network Interfaces is 127. The maximum tested is 127 AMNIs, 127 PMNIs, and 9 HMNIs.
- The maximum number of subordinate Network Interfaces is 128. The maximum tested is 128 ASNIs and 9 HSNIs.
- The maximum voltage, power, and clock domains of 32 each have not been tested.
- There is no support for 1 stripe target in a group, additional granularities, or the additional stripe group remap functionality described in r2p0 TRM section 2.4.5.
- Remapping features not supported:
 - Tested 5 out of the maximum of 8 remap states.
 - The priority for multiple address remapping states.
 - One target remapped to a different target.
 - A single target remapped to a stripe group.
 - One stripe group remapped to a different stripe group.
 - A stripe group remapped to a single target.
- Stripe features not supported:
 - ASNI striping to an HMNI target has not been tested.
 - Limited testing of stripe groups with different numbers of targets and granularities.
 - Single target stripe.
- The hashed memory regions support is limited by Fast Models DMI. Due to the 4KB memory pages in DMI, granularities smaller than 4KB are not accounted for by the model. Thus, subsequent accesses within a 4KB address range are delivered to the same destination node.
- PMNI supports multiple interfaces but in the model only a single interface is listed in the `PMNI_INTERFACEID` registers of a PMNI.
- AMNI nodes in the model are interface-indifferent and registers do not reflect the protocol version.
- r2 CMO Response control is not supported.
- There is no revision string for r2p1. r2p0 is functionally equivalent.
- Hashing of stripe groups is limited to a granularity of 4096B.
- xSNI access to CFGNI is not limited by router connectivity defined in the `mesh_config_file`. It considers only whether the xSNI has the CFGNI target defined in its memory map.
- A reset after model startup does not reset the registers or address remap selections.
- `*_IDM_RESET_STRAP` and its effect on the endpoint soft reset and `IDM_RESET_CONTROL` register is not supported.
- IDM for power domains is not supported.
- No register visibility support for a debugger.
- No software control for the CMO terminate response in register `AMNI_CONFIG_CTL`.

Ports for NI700

Table 3-1153: Ports

Name	Protocol	Type	Description
idm_reset_signal_amni[127]	Signal	Master	IDM reset signals to AMNIs.
idm_reset_signal_asni[128]	Signal	Master	IDM reset signals to ASNIs.
idm_reset_signal_hmni[127]	Signal	Master	IDM reset signals to HMNIs.
idm_reset_signal_hsni[128]	Signal	Master	IDM reset signals to HSNIs.
idm_reset_signal_pmni[127]	Signal	Master	IDM reset signals to PMNIs.
pvbust_m_amni[127]	PVBus	Master	AMNI downstream ports.
pvbust_m_hmni[127]	PVBus	Master	HMNI downstream ports.
pvbust_m_pmni[127]	PVBus	Master	PMNI downstream ports.
pvbust_s_asni[128]	PVBus	Slave	ASNI upstream ports.
pvbust_s_hsni[128]	PVBus	Slave	HSNI upstream ports.
reset_in	Signal	Slave	Reset signal.

Parameters for NI700

mesh_config_file

Type

string

Default value

""

Name of a file containing mesh placement of NI700 components.

mpam_attributes

Type

string

Default value

""

User-defined transform to be applied to bus attributes like `MasterID`, `ExtendedID` or `UserFlags`, for MPAM Attributes encoded into bus attributes.

For example:

```
ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_NS
```

An empty string disables MPAM support.

periphbase**Type**

int

Default value

0xffffffffffffffff

Value for PERIPHBASE.

print_config**Type**

bool

Default value

0x0

Enables printing the config register addresses.

print_parser_log**Type**

bool

Default value

0x0

Enables printing the yaml config parser log messages.

revision**Type**

string

Default value

"r2p0"

Component revision. Currently supports r0p0, r1p0, r2p0.

show_banner**Type**

uint64_t

Default value

2

Show component banner:

0

supress entire banner

- 1
suppress config file
- 2+
show full banner

3.10.65 PL011_Uart

ARM PrimeCell UART(PL011). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1154: IP revisions support

Revision	Quality level
r1p4	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL011_Uart

This model has the following Iris instances:

Table 3-1155: PL011_Uart Iris instances

InstanceName	ComponentName
PL011_Uart	PL011_Uart
PL011_Uart.busslave	PVBusSlave
PL011_Uart.clk_divider	ClockDivider
PL011_Uart.timer	ClockTimerThread
PL011_Uart.timer.timer	ClockTimerThread64
PL011_Uart.timer.timer.thread	SchedulerThread
PL011_Uart.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1156: PL011_Uart MTI instances

InstanceName	ComponentName
PL011_Uart	PL011_Uart
PL011_Uart.busslave	PVBusSlave
PL011_Uart.clk_divider	ClockDivider

PL011_Uart contains the following CADI targets:

- ClockDivider
- ClockTimerThread
- ClockTimerThread64

- PL011_Uart
- SchedulerThread
- SchedulerThreadEvent

Using `in_file` and `in_file_escape_sequence` parameters

The UART reads input from `in_file`. If `in_file` contains a line beginning:

```
## WaitForPrompt <something-up-to-end-of-line>
```

then the UART stops reading from `in_file` until the prompt has appeared.

For example, if `in_file` contains the following lines, the UART outputs `ls` only after the root prompt appears:

```
## WaitForPrompt root #
ls
```

Use the parameter `in_file_escape_sequence` to set a different escape sequence to `##`.

Using the `untimed_fifos` parameter

When the `untimed_fifos` parameter is false, characters of serial data are clocked to or from the `SerialData` port at a rate controlled by the `clk_in_ref` clock rate and the `baud-rate-divider` configuration of the UART clock. Enabling `untimed_fifos` permits serial data to be sent or received as fast as it can be generated or consumed. The modem control signals are still generated correctly, so the UART is not able to transmit data faster than the receiving end can handle. For example, `TelnetTerminal` uses the CTS signal to avoid overflowing its TCP/IP buffer. See [TelnetTerminal](#).

Differences between the model and the RTL

This component does not implement the DMA functionality of the PL011 PrimeCell.

Ports for PL011_Uart

Table 3-1157: Ports

Name	Protocol	Type	Description
<code>clk_in_ref</code>	<code>ClockSignal</code>	Slave	Clock input, typically 14.745MHz, which sets the master transmit/receive rate.
<code>intr</code>	<code>Signal</code>	Master	Interrupt signal.
<code>pvbuss</code>	<code>PVBus</code>	Slave	Slave port for register access.
<code>serial_out</code>	<code>SerialData</code>	Master	Serial input/output and control signals. Used to communicate with a serial device, such as a terminal.

Parameters for PL011_Uart

baud_rate

Type

int

Default value

0x9600

Baud rate.

clk_divider.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clk_divider.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clock_rate

Type

int

Default value

0xe10000

Clock rate for PL011.

enable_dc4

Type

bool

Default value

0x1

Enable DC4 commands (try echo -e "help\024" in a Linux shell in a serial console).

flow_ctrl_mask_en**Type**

bool

Default value

0x0

Enable hardware flow control workaround which forcefully disables CTSen and RTSen bits in UARTCR register.

halt**Type**

bool

Default value

0x0

Halt instead of shutdown for shutdown_on_eot and shutdown_tag.

in_file**Type**

string

Default value

""

Input file for data to be read by the UART.

in_file_escape_sequence**Type**

string

Default value

"##"

Input file escape sequence.

out_file**Type**

string

Default value

""

Output file to hold data written by the UART (use '-' to send all output to stdout).

revision**Type**

string

Default value

"r1p4"

Revision to simulate.

shutdown_on_eot**Type**

bool

Default value

0x0

Shutdown simulation when a EOT (ASCII 4) char is transmitted (useful for regression tests when semihosting is not available).

shutdown_tag**Type**

string

Default value

""

Shutdown simulation when a string is transmitted.

toggle_mti**Type**

string

Default value

""

Start/stop token for any ToggleMTI source. Argument uses the JSON format: [{"start": "START-TOKEN", "stop": "STOP-TOKEN"}] where 'START-TOKEN/END-TOKEN' are the corresponding start/stop tokens for toggling the trace plugins. Note that '\n' will be ignored if at start or end of the token. For additional information, use 'help' as the value of this parameter.

uart_enable**Type**

bool

Default value

0x0

Enable uart when the system starts up. (clock_rate and baud_rate are only valid when this option is enabled.).

unbuffered_output

Type

bool

Default value

0x0

Unbuffered output.

untimed_fifos

Type

bool

Default value

0x1

Ignore the clock rate and transmit/receive serial data immediately.

3.10.66 PL011_Uart_cpp

ARM PrimeCell UART(PL011). This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1158: IP revisions support

Revision	Quality level
r1p4	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL011_Uart_cpp

This model has the following Iris instances:

Table 3-1159: PL011_Uart_cpp Iris instances

InstanceName	ComponentName
PL011_Uart_cpp	PL011_Uart
PL011_Uart_cpp.ClockDivider	ClockDivider
PL011_Uart_cpp.ClockTimerThread	ClockTimerThread
PL011_Uart_cpp.ClockTimerThread.ClockTimerThread64	ClockTimerThread64
PL011_Uart_cpp.ClockTimerThread.ClockTimerThread64.SchedulerThread	SchedulerThread
PL011_Uart_cpp.ClockTimerThread.ClockTimerThread64.SchedulerThreadEvent	SchedulerThreadEvent
PL011_Uart_cpp.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-1160: PL011_Uart_cpp MTI instances

InstanceName	ComponentName
PL011_Uart_cpp	PL011_Uart
PL011_Uart_cpp.ClockDivider	ClockDivider
PL011_Uart_cpp.PVBusSlave	PVBusSlave

PL011_Uart_cpp contains the following CADl targets:

- PL011_Uart

Ports for PL011_Uart_cpp

Table 3-1161: Ports

Name	Protocol	Type	Description
clk_in_ref	ClockSignal	Slave	-
intr	Signal	Master	-
pvbus	PVBus	Slave	-
serial_out	SerialData	Master	-

Parameters for PL011_Uart_cpp

baud_rate

Type

int

Default value

0x9600

Baud rate.

clock_rate

Type

int

Default value

0xe10000

Clock rate for PL011.

diagnostics

Type

int

Default value

0x0

Diagnostics.

enable_dc4**Type**

bool

Default value

0x1

Enable DC4 commands (try echo -e "help\024" in a Linux shell in a serial console).

flow_ctrl_mask_en**Type**

bool

Default value

0x0

Enable hardware flow control workaround which forcefully disables CTSen and RTSen bits in UARTCR register.

halt**Type**

bool

Default value

0x0

Halt instead of shutdown for shutdown_on_eot and shutdown_tag.

in_file**Type**

string

Default value

""

Input file for data to be read by the UART.

in_file_escape_sequence**Type**

string

Default value

"##"

Input file escape sequence.

out_file**Type**

string

Default value

""

Output file to hold data written by the UART (use '-' to send all output to stdout).

revision**Type**

string

Default value

"r1p4"

Revision to simulate.

shutdown_on_eot**Type**

bool

Default value

0x0

Shutdown simulation when a EOT (ASCII 4) char is transmitted (useful for regression tests when semihosting is not available).

shutdown_tag**Type**

string

Default value

""

Shutdown simulation when a string is transmitted.

toggle_mti**Type**

string

Default value

""

Start/stop token for any ToggleMTI source. Argument uses the JSON format: [{ "start": "START-TOKEN", "stop": "STOP-TOKEN" }] where 'START-TOKEN/END-TOKEN' are the corresponding start/stop tokens for toggling the trace plugins. Note that '\n' will be ignored if at start or end of the token. For additional information, use 'help' as the value of this parameter.

uart_enable

Type
bool

Default value
0x0

Enable uart when the system starts up. (clock_rate and baud_rate are only valid when this option is enabled.).

unbuffered_output

Type
bool

Default value
0x0

Unbuffered output.

untimed_fifos

Type
bool

Default value
0x1

Ignore the clock rate and transmit/receive serial data immediately.

3.10.67 PL022_SSP

ARM PrimeCell Synchronous Serial Port(PL022). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1162: IP revisions support

Revision	Quality level
r1p4	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL022_SSP

This model has the following Iris instances:

Table 3-1163: PL022_SSP Iris instances

InstanceName	ComponentName
PL022_SSP	PL022_SSP

InstanceName	ComponentName
PL022_SSP.busslave	PVBusSlave
PL022_SSP.prescaler	ClockDivider

This model has the following MTI trace components:

Table 3-1164: PL022_SSP MTI instances

InstanceName	ComponentName
PL022_SSP.busslave	PVBusSlave
PL022_SSP.prescaler	ClockDivider

PL022_SSP contains the following CADI targets:

- ClockDivider
- PL022_SSP

Differences between the model and the RTL

This component is a preliminary release. It is not a fully-supported peripheral.

Ports for PL022_SSP

Table 3-1165: Ports

Name	Protocol	Type	Description
clk	ClockSignal	Slave	Main PrimeCell SSP clock input.
clkin	ClockSignal	Slave	PrimeCell SSP clock input.
clkout	ClockSignal	Master	Clock output.
intr	Signal	Master	Interrupt signaling.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.
rorintr	Signal	Master	Receive overrun interrupt.
rtintr	Signal	Master	Receive timeout interrupt. We don't implement time out interrupt.
rx_dma_port	PL080_DMAC_DmaPortProtocol	Master	PrimeCell SSP receive DMA port.
rx_d	Value	Slave	PrimeCell SSP receive data.
rxintr	Signal	Master	Receive FIFO service request port.
tx_dma_port	PL080_DMAC_DmaPortProtocol	Master	PrimeCell SSP transmit DMA port.
tx_d	Value	Master	PrimeCell SSP transmit data.
txintr	Signal	Master	Transmit FIFO service request.

Parameters for PL022_SSP

`prescaler.div`

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

`prescaler.mul`

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

3.10.68 PL030_RTC

ARM PrimeCell Real Time Clock(PL030). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1166: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL030_RTC

This model has the following Iris instances:

Table 3-1167: PL030_RTC Iris instances

InstanceName	ComponentName
PL030_RTC	PL030_RTC
PL030_RTC.busslave	PVBusSlave
PL030_RTC.timer	ClockTimerThread
PL030_RTC.timer.timer	ClockTimerThread64
PL030_RTC.timer.timer.thread	SchedulerThread
PL030_RTC.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1168: PL030_RTC MTI instances

InstanceName	ComponentName
PL030_RTC.busslave	PVBusSlave

PL030_RTC contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL030_RTC
- SchedulerThread
- SchedulerThreadEvent

Ports for PL030_RTC

Table 3-1169: Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	Clock input, typically 1MHz, driving master count rate.
intr	Signal	Master	Interrupt signaling.
pvbuss	PVBus	Slave	Slave port for connection to PV bus master/decoder.

3.10.69 PL031_RTC

ARM PrimeCell Real Time Clock(PL031). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1170: IP revisions support

Revision	Quality level
r1p3	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL031_RTC

This model has the following Iris instances:

Table 3-1171: PL031_RTC Iris instances

InstanceName	ComponentName
PL031_RTC	PL031_RTC
PL031_RTC.busslave	PVBusSlave
PL031_RTC.timer	ClockTimerThread
PL031_RTC.timer.timer	ClockTimerThread64
PL031_RTC.timer.timer.thread	SchedulerThread
PL031_RTC.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1172: PL031_RTC MTI instances

InstanceName	ComponentName
PL031_RTC.busslave	PVBusSlave

PL031_RTC contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL031_RTC
- SchedulerThread
- SchedulerThreadEvent

About PL031_RTC

This component can provide a basic alarm function or long time base counter.

It has no impact on the performance of a PV system when idle or counting down. The component only executes code when the counter expires or during bus accesses.

Ports for PL031_RTC

Table 3-1173: Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	Clock input, typically 1MHz, driving master count rate.
intr	Signal	Master	Interrupt signaling.
pvbuss	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Parameters for PL031_RTC

RTCDR_reset_value

Type

int

Default value

0x0

Reset value for RTCDR.

RTCDR_use_current_time

Type

bool

Default value

0x1

Use current Unix/POSIX time for reset value for RTCDR. If true RTCDR_reset_value is ignored.

3.10.70 PL041_AACI

ARM PrimeCell Advanced Audio CODEC Interface(PL041). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1174: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL041_AACI

This model has the following Iris instances:

Table 3-1175: PL041_AACI Iris instances

InstanceName	ComponentName
PL041_AACI	PL041_AACI
PL041_AACI.busslave	PVBusSlave
PL041_AACI.timer	ClockTimerThread
PL041_AACI.timer.timer	ClockTimerThread64
PL041_AACI.timer.timer.thread	SchedulerThread
PL041_AACI.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1176: PL041_AACI MTI instances

InstanceName	ComponentName
PL041_AACI.busslave	PVBusSlave

PL041_AACI contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL041_AACI
- SchedulerThread
- SchedulerThreadEvent

About PL041_AACI

The PL041_AACI component is designed to connect to an audio output component such as [AudioOut_File](#) or [AudioOut_SDL](#).

The ability to play audio through this component depends on the AudioOut component in use and on the performance requirements of the software running on the simulated system. The rate of FIFO draining is controlled by the audio output to which the component is connected. This might not correspond to the rate that would be expected from the reference clock.

This component also contains a minimal register model of the LM4529 secondary codec as implemented on development boards supplied by Arm.

This component is not a complete implementation of the AACI because the following functionality is not implemented:

- Audio input
- DMA access to FIFOs, rather than Programmed I/O
- Programming of the secondary codec through FIFOs rather than slot registers

Ports for PL041_AACI

Table 3-1177: Ports

Name	Protocol	Type	Description
audio	AudioControl	Master	Used to communicate with an audio out device.
clk_in_ref	ClockSignal	Slave	Reference clock input, typically 25MH.
dma_rx	PL080_DMAC_DmaPortProtocol	Master	DMA receive port.
dma_tx	PL080_DMAC_DmaPortProtocol	Master	DMA transmit port.
irq	Signal	Master	Single IRQ output port.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Parameters for PL041_AACI

enabled

Type

bool

Default value

0x1

Host interface connection enabled.

3.10.71 PL050_KMI

ARM PrimeCell PS2 Keyboard/Mouse Interface(PL050). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1178: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL050_KMI

This model has the following Iris instances:

Table 3-1179: PL050_KMI Iris instances

InstanceName	ComponentName
PL050_KMI	PL050_KMI
PL050_KMI.busslave	PVBusSlave
PL050_KMI.clk_divider	ClockDivider

This model has the following MTI trace components:

Table 3-1180: PL050_KMI MTI instances

InstanceName	ComponentName
PL050_KMI.busslave	PVBusSlave
PL050_KMI.clk_divider	ClockDivider

PL050_KMI contains the following CADI targets:

- ClockDivider
- PL050_KMI

About PL050_KMI

This model communicates with models of PS/2-like devices, for example a PS2Keyboard or PS2Mouse.

Ports for PL050_KMI

Table 3-1181: Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	Clock input, typically 1MHz, which sets the master transmit/receive rate.
intr	Signal	Master	Master port signaling completion of transmit or receive.
ps2device	PS2Data	Slave	Used to communicate with a PS/2-like device.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Parameters for PL050_KMI

`clk_divider.div`

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clk_divider.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

3.10.72 PL061_GPIO

ARM PrimeCell General Purpose Input/Output(PL061). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1182: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL061_GPIO

This model has the following Iris instances:

Table 3-1183: PL061_GPIO Iris instances

InstanceName	ComponentName
PL061_GPIO	PL061_GPIO
PL061_GPIO.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-1184: PL061_GPIO MTI instances

InstanceName	ComponentName
PL061_GPIO.busslave	PVBusSlave

PL061_GPIO contains the following CADI targets:

- PL061_GPIO

About PL061_GPIO

This component provides eight programmable inputs or outputs. Ports of different widths can be created by multiple instantiation. In addition, an interrupt interface is provided to configure any number of pins as interrupt sources.

Ports for PL061_GPIO

Table 3-1185: Ports

Name	Protocol	Type	Description
GPIO_In	Value	Slave	Input lines. 32-bit data in, only [7:0] is used.
GPIO_Intr	Signal	Master	Interrupt signal indicating to an interrupt controller that an interrupt occurred in one or more of the GPIO_In lines.
GPIO_MIS	Value	Master	Indicates the masked interrupt status. 32-bit data out , only [7:0] is used. NOT necessary, as the GPIOMIS can be read from address 0x418.
GPIO_Out	Value	Master	Output lines. 32-bit data out, only [7:0] is used.
pvbus	PVBus	Slave	Slave port for register access.

Parameters for PL061_GPIO

init_inputs

Type

int

Default value

0x0

Default input values [7:0].

3.10.73 PL080_DMAC

ARM PrimeCell DMA Controller(PL080/081). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1186: IP revisions support

Revision	Quality level
r1p3	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL080_DMAC

This model has the following Iris instances:

Table 3-1187: PL080_DMAC Iris instances

InstanceName	ComponentName
PL080_DMAC	PL080_DMAC
PL080_DMAC.busmaster0	PVBusMaster
PL080_DMAC.busmaster1	PVBusMaster
PL080_DMAC.busslave	PVBusSlave
PL080_DMAC.timer	ClockTimerThread
PL080_DMAC.timer.timer	ClockTimerThread64
PL080_DMAC.timer.timer.thread	SchedulerThread
PL080_DMAC.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1188: PL080_DMAC MTI instances

InstanceName	ComponentName
PL080_DMAC.busmaster0	PVBusMaster
PL080_DMAC.busmaster1	PVBusMaster
PL080_DMAC.busslave	PVBusSlave

PL080_DMAC contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL080_DMAC
- SchedulerThread
- SchedulerThreadEvent

About PL080_DMAC

This component provides 8 configurable DMA channels and 16 DMA ports for handshaking with peripherals. You can configure each channel to operate in one of eight flow control modes either under DMA control or the control of the source or destination peripheral. Transfers can occur on either master channel and can optionally be endian-converted on both source and destination transfers.

This component might have a significant impact on system performance in certain flow control modes. Channels configured for small bursts, or using single bursts, and with peripheral DMA handshaking could add significant overhead. The peripheral has not been fully optimized to make use of the advanced features of the PVBus model.

Ports for PL080_DMAC

Table 3-1189: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock signal to control DMA transfer rate.

Name	Protocol	Type	Description
dma_port[16]	PL080_DMAC_DmaPortProtocol	Slave	request/response ports for communicating with devices.
interr	Signal	Master	DMA error interrupt signal.
intr	Signal	Master	Combined DMA error and terminal count signal.
inttc	Signal	Master	DMA terminal count signal.
pvbus0_m	PVBus	Master	Master bus interface 0 for DMA transfers.
pvbus1_m	PVBus	Master	Master bus interface 1 for DMA transfers.
pvbus_s	PVBus	Slave	Slave port for register accesses.
reset_in	Signal	Slave	System reset.

Parameters for PL080_DMAC

activate_delay

Type

int

Default value

0x0

request delay.

fifo_size

Type

int

Default value

0x10

Channel FIFO size in bytes.

generate_clear

Type

bool

Default value

0x0

Generate clear response.

max_transfer

Type

int

Default value

0x100

Largest atomic transfer.

3.10.74 PL110_CLCD

ARM PrimeCell Color LCD Controller(PL110). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1190: IP revisions support

Revision	Quality level
r1p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL110_CLCD

This model has the following Iris instances:

Table 3-1191: PL110_CLCD Iris instances

InstanceName	ComponentName
PL110_CLCD	PL110_CLCD
PL110_CLCD.pl11x_clcd	PL11x_CLCD
PL110_CLCD.pl11x_clcd.busmaster	PVBusMaster
PL110_CLCD.pl11x_clcd.busslave	PVBusSlave
PL110_CLCD.pl11x_clcd.timer	ClockTimerThread
PL110_CLCD.pl11x_clcd.timer.timer	ClockTimerThread64
PL110_CLCD.pl11x_clcd.timer.timer.thread	SchedulerThread
PL110_CLCD.pl11x_clcd.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1192: PL110_CLCD MTI instances

InstanceName	ComponentName
PL110_CLCD.pl11x_clcd	PL11x_CLCD
PL110_CLCD.pl11x_clcd.busmaster	PVBusMaster
PL110_CLCD.pl11x_clcd.busslave	PVBusSlave

PL110_CLCD contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL110_CLCD
- PL11x_CLCD
- SchedulerThread

- SchedulerThreadEvent

About PL110_CLCD

This implementation provides a register model of the LCD controller.

You can connect the model through a framebuffer port to a visualization component, for example, so that LCD output can be viewed.

The implementation is optimized for situations where the majority of the framebuffer does not change. For instance, displaying full-screen video results in significantly reduced performance. Rendering pixel data into an appropriate form for the framebuffer port (rasterization) can also take a significant amount of simulation time. If the pixel data are coming from a PVBUSSlave region that has been configured as memory-like, rasterization only occurs in regions where memory contents are modified.

Ports for PL110_CLCD

Table 3-1193: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
control	Value	Slave	Auxiliary control register 1.
display	LCD	Master	Connection to visualization component.
intr	Signal	Master	Interrupt signaling for flyback events.
pvbust	PVBUS	Slave	Slave port for register access.
pvbust_m	PVBUS	Master	DMA port for video data.

Parameters for PL110_CLCD

disable_snooping_dma

Type

bool

Default value

0x0

Disable DMA snooping.

pixel_double_limit

Type

int

Default value

0x12c

Minimum LCD pixel width before display will be zoomed.

3.10.75 PL111_CLCD

ARM PrimeCell Color LCD Controller(PL111). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1194: IP revisions support

Revision	Quality level
r0p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL111_CLCD

This model has the following Iris instances:

Table 3-1195: PL111_CLCD Iris instances

InstanceName	ComponentName
PL111_CLCD	PL111_CLCD
PL111_CLCD.pl11x_clcd	PL11x_CLCD
PL111_CLCD.pl11x_clcd.busmaster	PVBusMaster
PL111_CLCD.pl11x_clcd.busslave	PVBusSlave
PL111_CLCD.pl11x_clcd.timer	ClockTimerThread
PL111_CLCD.pl11x_clcd.timer.timer	ClockTimerThread64
PL111_CLCD.pl11x_clcd.timer.timer.thread	SchedulerThread
PL111_CLCD.pl11x_clcd.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1196: PL111_CLCD MTI instances

InstanceName	ComponentName
PL111_CLCD.pl11x_clcd	PL11x_CLCD
PL111_CLCD.pl11x_clcd.busmaster	PVBusMaster
PL111_CLCD.pl11x_clcd.busslave	PVBusSlave

PL111_CLCD contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL111_CLCD
- PL11x_CLCD
- SchedulerThread
- SchedulerThreadEvent

About PL111_CLCD

This component implements the hardware cursor support of the PL111_CLCD, which is the main difference with PL110_CLCD.

Ports for PL111_CLCD

Table 3-1197: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
control	Value	Slave	Auxiliary control register 1.
display	LCD	Master	Connection to visualization component.
intr	Signal	Master	Interrupt signaling for flyback events.
pvbuss	PVBus	Slave	Slave port for register access.
pvbuss_m	PVBus	Master	DMA port for video data.

Parameters for PL111_CLCD

disable_snooping_dma

Type

bool

Default value

0x0

Disable DMA snooping.

pixel_double_limit

Type

int

Default value

0x12c

Minimum LCD pixel width before display will be zoomed.

3.10.76 PL180_MCI

ARM PrimeCell Multimedia Card Interface (PL180). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1198: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL180_MCI

This model has the following Iris instances:

Table 3-1199: PL180_MCI Iris instances

InstanceName	ComponentName
PL180_MCI	PL180_MCI
PL180_MCI.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-1200: PL180_MCI MTI instances

InstanceName	ComponentName
PL180_MCI.busslave	PVBusSlave

PL180_MCI contains the following CADI targets:

- PL180_MCI

About PL180_MCI

When paired with an MMC card model, the PL180_MCI component provides emulation of a flexible, persistent storage mechanism. See [MMC](#). The PL180_MCI component fully models the registers of the corresponding PrimeCell, but supports a subset of the functionality of the PL180:

- The controller supports block mode transfers, but does not currently support streaming data transfer.
- The controller can be attached to a single MMC device. The MMC bus mode and SDIO modes of the PL180 PrimeCell are not supported.
- Command and Data timeouts are not simulated.
- Payload CRC errors are not simulated.
- The DMA interface present in the PL180 PrimeCell is not modeled.
- Minimal timing is implemented within the model.

Note

At compile time, you can enable command tracing within the PL180_MCI component by modifying the `PL180_TRACE` macro in the `MMC.lisa` file. This sends command and event trace to standard output. You can use this output to help diagnose device driver and controller-to-card protocol issues.

Ports for PL180_MCI

Table 3-1201: Ports

Name	Protocol	Type	Description
MCIINTR[2]	Signal	Master	Interrupts.
mmc_m	MMC_Protocol	Master	The MultiMediaCard (MMC) master port.
pvbus	PVBus	Slave	Slave port for register access.

Parameters for PL180_MCI

`p1180_fifo_depth`

Type
int

Default value
0x10

PL180 FIFO Depth.

3.10.77 PL192_VIC

ARM PrimeCell Vectored Interrupt Controller(PL192). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1202: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL192_VIC

This model has the following Iris instances:

Table 3-1203: PL192_VIC Iris instances

InstanceName	ComponentName
PL192_VIC	PL192_VIC
PL192_VIC.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-1204: PL192_VIC MTI instances

InstanceName	ComponentName
PL192_VIC.busslave	PVBusSlave

PL192_VIC contains the following CADI targets:

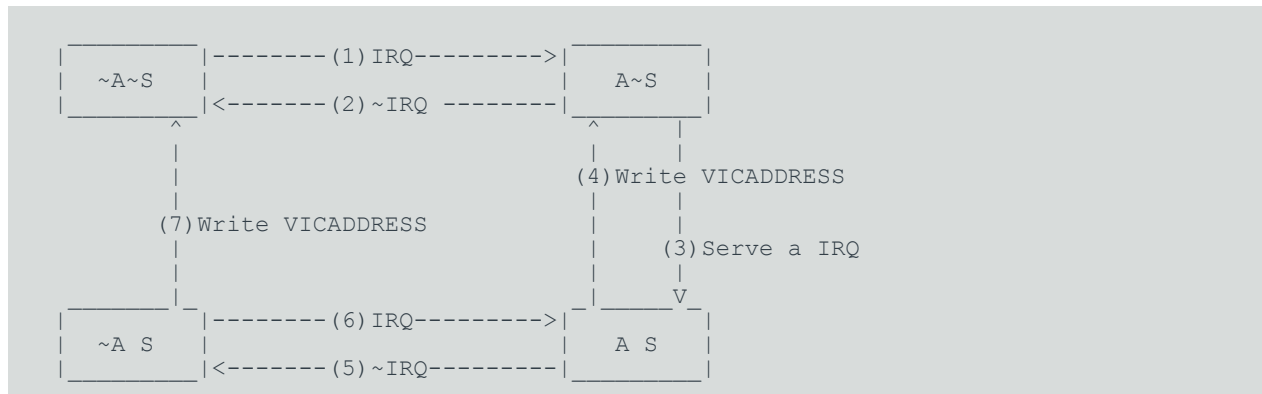

- PL192_VIC

About PL192_VIC

This component aggregates interrupts and generates interrupt signals for the Arm processor. When coupled with an Arm processor that provides a VIC port, routing to the appropriate interrupt handler can optionally be performed in hardware, reducing interrupt latency. The PL192_VIC can

also be daisy-chained with other PL192 VICs to permit more than 32 interrupts. The VIC supports hardware and software prioritization of interrupts.

This is the state transition diagram of a VIC 192 interrupt source:

A

The IRQ is active. It is in the `irqServeList` which is a sorted list of active IRQs that need to be served.

$\sim A$

Inactive IRQ. The corresponding input port is tied to low.

S

The IRQ is being served.

$\sim S$

The IRQ is waiting to be served

Detailed Descriptions

1

An IRQ is asserted, and state changes from $\sim A \sim S$ to $A \sim S$. The IRQ is inserted into a sorted list called `irqServeList` to wait for service. In this case, the corresponding input pin is tied to high.

2

The IRQ is deasserted. This can happen when the device does not want to keep IRQ active. For example, after continuously sending data, a UART can deassert IRQ to indicate stopping data transmission. In this case, even if the IRQ is in the stack and ready to be served it should be removed from the stack immediately.

3

When an IRQ that is at the top of the waiting stack is being served, the state changes from $A \sim S$ to AS .

4

Writing to the `VICADDRESS` register indicates that the current served interrupt has been finished. However, the state of the IRQ could be still active. The device, such as a UART, that raised the IRQ could still want to generate a new IRQ to finish a task.

5

The IRQ is being served. Before finishing, the device deasserts the IRQ. The current IRQ will be removed from the top of the stack immediately, but it is still being served.

6

The IRQ is being served, and it is not in the stack. At this point, the device reasserts the IRQ and the state of IRQ changes from \sim AS to AS. In another words, the IRQ is reinserted into the stack.

7

An ISR writes to VICADDRESS to indicate the current IRQ has been served. Meanwhile the IRQ is deasserted by the device, the state of the VIC changes from \sim A S to \sim A \sim S.

The handshake when VIC is using VIC port to communicate. As this is an untimed model, it is not possible to model the timed nature of vector address passing accurately. There are two options offered:

1. Send the address just after the IRQ. This is closer to the hardware but requires that daisy chained VICs repeatedly send their address as new, higher priority IRQs arrive, so may be slower:

2. Send the address during the ack. In this case, the ack ripples up through the VICs until it finds the IRQ and then the address ripples back down through the VICs, before the ack returns:

In both cases the ack clear is ignored by the VIC.

Ports for PL192_VIC

Table 3-1205: Ports

Name	Protocol	Type	Description
nVICFIQ	Signal	Master	Send out FIQ signal to the next level VIC or CPI.
nVICFIQIN	Signal	Slave	Used to receive FIQ signal when daisy chained.
nVICIRQ	Signal	Master	Send out IRQ signal to the next level VIC or procesessor.
nVICIRQIN	Signal	Slave	Used to receive IRQ signal when daisy chained.
pvbuss	PVBus	Slave	Slave port for register access.

Name	Protocol	Type	Description
VICIntSource[32]	Signal	Slave	Interrupt source input sources.
VICIRQACK	Signal	Slave	Receive acknowledge signal from next level VIC or processor.
VICIRQACKOUT	Signal	Master	Used to send out acknowledge signals when daisy chained.
VICVECTADDRIN	ValueState	Slave	Used to receive vector address when daisy chained.
VICVECTADDRROUT	ValueState	Master	Used to send vector address to next level VIC or processor.

3.10.78 PL310_L2CC

ARM PrimeCell Level 2 Cache Controller (PL310). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1206: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL310_L2CC

This model has the following Iris instances:

Table 3-1207: PL310_L2CC Iris instances

InstanceName	ComponentName
PL310_L2CC	PL310_L2CC

This model has the following MTI trace components:

Table 3-1208: PL310_L2CC MTI instances

InstanceName	ComponentName
PL310_L2CC	PL310_L2CC

PL310_L2CC contains the following CADI targets:

- [PL310_L2CC](#)

About PL310_L2CC

The presence of additional on-chip secondary cache can improve performance when significant memory traffic is generated by the processor. A secondary cache assumes the existence of a Level 1, or primary, cache that is closely coupled or internal to the processor.

This component has two modes of operation, which are controlled by the `cache-state_modelled` parameter:

Register view

Cache control registers are present but the cache behavior is not modeled.

Functional model

Cache behavior is modeled.

Arm supports the use of the PL310 when connected to the Arm® Cortex®-A5 or Cortex-A9 processor.

This component implements the programmer-visible functionality of the PL310, and excludes some non-programmer visible features. The following features are implemented in the model:

- Physically addressed and physically tagged.
- Lockdown format C supported, for data and instructions. Lockdown format C is also known as way locking.
- Lockdown by line supported.
- Lockdown by master ID supported.
- Direct mapped to 16-way associativity, depending on the configuration and the use of lockdown registers. The associativity is configurable as 8 or 16.
- L2 cache available size can be 16 KB to 8 MB, depending on configuration and the use of the lockdown registers.
- Fixed line length of 32 bytes (8 words or 256 bits).
- Supports all of the AXI cache modes:
 - Write-through and write-back.
 - Read allocate, write allocate, read and write allocate.
- Force write-allocate option to always have cacheable writes allocated to L2 cache, for processors not supporting this mode.
- Normal memory non-cacheable shared reads are treated as cacheable non-allocatable. Normal memory non-cacheable shared writes are treated as cacheable write-through no write-allocate. There is an option, Shared Override, to override this behavior.
- TrustZone support, with the following features:
 - Non-Secure (NS) tag bit added in tag RAM and used for lookup in the same way as an address bit.
 - NS bit in Tag RAM used to determine security level of evictions to L3.
 - Restrictions for NS accesses for control, configuration, and maintenance registers to restrict access to secure data.
- Pseudo-Random victim selection policy. You can make this deterministic by using lockdown registers.
- Software option to enable exclusive cache configuration.
- Configuration registers accessible using address decoding in the component.
- Interrupt triggering in case of an error response when accessing L3.
- Maintenance operations.

- Prefetching capability.

The performance of this component depends on the configuration of the associated L1 caches and the mode it is in:

Register mode

No significant effect.

Functional mode with functional-mode L1

The addition of a functional L2 cache has minimal further impact on performance when running applications that are cache-bound.

Functional mode with a register-mode L1

There is a significant impact on system performance.

Setting timing delays in this model does not impact the simulation speed. Generally, timing delays are only modeled for CPUs.

Differences between the model and the RTL

This model does not implement the following features, most of which are not relevant from a PV modeling point of view:

- There is no interface to the data and tag RAM as they are embedded in the model.
- Critical word first linefill is not supported, as it is not relevant for PV modeling.
- Buffers are not modeled.
- Outstanding accesses on slave and master ports cannot occur by design in a PV model as all transactions are atomic.
- Option to select one or two master ports and option to select one or two slave ports is not supported. Only one master port and one slave port are supported.
- Clock management and power modes are not supported, as they are not relevant for PV modeling.
- Wait, latency, clock enable, parity, and error support for data and tag RAMs are not included, as they are not relevant for PV modeling, and the data and tag RAMs embedded in the model cannot generate error responses.
- MBIST support is not included.
- Debug mode and debug registers are not supported.
- Test mode and scan chains are not supported.
- L2 cache event monitoring is not supported.
- Address filtering in the master ports is not supported.
- Performance counters are not supported.
- These Cortex-A9-related optimizations are not supported:
 - Prefetch hints

- Full line of zero
- Early write response
- Hazard detection is not required because of the atomic nature of the accesses in PV modeling and the fact that buffers are not modeled, therefore hazards cannot occur.
- Registers that belong to unimplemented features are accessible but do not have any functionality.

This model implements the following features differently to the hardware:

- Error handling. DECERR from the master port is mapped to SLVERR. Internal errors in cache RAM, for example parity errors, cannot happen in the model.
- Background cache operations do not occur in the background. They occur atomically.
- The LOCKDOWN_BY_LINE and LOCKDOWN_BY_MASTER parameter values are reflected in the CacheType register, but the feature is not switched off when the parameter is 0.
- This feature is additional:
 - Data RAM and Tag RAM are embedded in the model.

Ports for PL310_L2CC

Table 3-1209: Ports

Name	Protocol	Type	Description
DECERRINTR	Signal	Master	Decode error received on master port from L3.
ECNTRINTR	Signal	Master	Event Counter Overflow / Increment.
ERRRDINTR	Signal	Master	Error on L2 data RAM read.
ERRRTINTR	Signal	Master	Error on L2 tag RAM read.
ERRWDINTR	Signal	Master	Error on L2 data RAM write.
ERRWTINTR	Signal	Master	Error on L2 tag RAM write.
L2CCINTR	Signal	Master	Combined interrupt output.
PARRDINTR	Signal	Master	Parity error on L2 data RAM read.
PARRTINTR	Signal	Master	Parity error on L2 tag RAM read.
pvbus_m	PVBus	Master	Master port for connection to PV bus master/decoder.
pvbus_s	PVBus	Slave	Slave port for connection to PV bus master/decoder.
SLVERRINTR	Signal	Master	Slave error on master port from L3.

Parameters for PL310_L2CC

ASSOCIATIVITY

Type

int

Default value

0x0

Associativity for Auxiliary Control Register.

CACHEID**Type**

int

Default value

0x0

Cache controller cache ID.

CFGBIGEND**Type**

int

Default value

0x0

Big-endian mode for accessing configuration registers out of reset.

LOCKDOWN_BY_LINE**Type**

int

Default value

0x0

Lockdown by line - value is reflected in CacheType register Bit 25, but the feature is not switched off when the parameter is 0.

LOCKDOWN_BY_MASTER**Type**

int

Default value

0x0

Lockdown by master - value is reflected in CacheType register Bit 26, but the feature is not switched off when the parameter is 0.

REGFILEBASE**Type**

int

Default value

0x1f002000

Base address for accessing configuration registers.

WAYSIZE**Type**

int

Default value

0x1

Size of ways for Auxiliary Control Register.

cache-state_modelled**Type**

bool

Default value

0x0

Specifies whether real cache state is modelled (vs. register model).

delay_cache_hit**Type**

int

Default value

0x0

Cost to handle a cache hit.

delay_cache_miss**Type**

int

Default value

0x0

Cost to handle a cache miss.

delay_cache_perbeat**Type**

int

Default value

0x0

Cost to handle one beat of cache data movement.

3.10.79 PL330_DMAC

ARM PrimeCell DMA Controller(PL330). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1210: IP revisions support

Revision	Quality level
rOp0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL330_DMAC

This model has the following Iris instances:

Table 3-1211: PL330_DMAC Iris instances

InstanceName	ComponentName
PL330_DMAC	PL330_DMAC
PL330_DMAC.busmaster	PVBusMaster
PL330_DMAC.busslave	PVBusSlave
PL330_DMAC.busslave_ns	PVBusSlave
PL330_DMAC.timer	ClockTimerThread
PL330_DMAC.timer.timer	ClockTimerThread64
PL330_DMAC.timer.timer.thread	SchedulerThread
PL330_DMAC.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1212: PL330_DMAC MTI instances

InstanceName	ComponentName
PL330_DMAC	PL330_DMAC
PL330_DMAC.busmaster	PVBusMaster
PL330_DMAC.busslave	PVBusSlave
PL330_DMAC.busslave_ns	PVBusSlave

PL330_DMAC contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL330_DMAC
- SchedulerThread
- SchedulerThreadEvent

About PL330_DMAC

The model uses a single LISA+ component but with a C++ model for each of the channels included in the LISA+ file. Enabled channels are kept on an enabled channels stack in priority order. When a channel state changes, re-arbitration takes place to make the highest (topmost) channel active.

Each transaction carries the identity of the requesting thread. This controller has up to eight channel threads and a manager thread. Each has an ID. In the hardware:

ID

AxID[3:0]

Identifying channels

0x0 - (numberOfChannels - 1)

Managers

numberOfChannels

For example, 0x0-0x7 and 0x8, respectively. The manager originates only instruction fetches, and the manager ID is also used for instruction fetches issued by the channels.

In the model, the identity of the requesting thread is encoded into each transaction using the low-order 16 bits of the Master ID field:

- Channel data: 0-7.
- Channel instruction fetch: 0xffff.
- Manager instruction fetch: 0xffff.

If a downstream component needs to know the IDs of bus masters that use either the low-order 16 bits or the label, use the label. The LabellerForDMA330 component shifts the low-order 16 bits into the label, while providing a degree of control over the label encoding. The example below maintains separate IDs for each data channel while using the correct hardware ID to identify instruction fetch for a DMA-330 with 8 channels:

```
pl330_dma : PL330_DMAC( "p_max_channels" = 8 );
dma_labeller : LabellerForDMA330(
    "dma330_discriminate_data_channels" = true,
    "dma330_s_instruction_label" = 8,
    "dma330_ns_instruction_label" = 8 );
pl330_dma.pvbus_m => dma_labeller.pvbus_s;
dma_labeller.pvbus_m => output_bus.pvbus_s;
```

Ports for PL330_DMAC

Table 3-1213: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock input.
irq_abort_master_port	Signal	Master	Undefined instruction or instruction error.
irq_master_port[32]	Signal	Master	Sets when DMASEV.
pvbus_m	PVBus	Master	Master port for all memory accesses.
pvbus_s	PVBus	Slave	Slave port for all register accesses (secure).

Name	Protocol	Type	Description
pvbuss_s_ns	PVBus	Slave	Slave port for all register accesses (non-secure).
reset_in	Signal	Slave	System reset.

Parameters for PL330_DMAC

activate_delay

Type

int

Default value

0x0

request delay.

fifo_size

Type

int

Default value

0x10

Channel FIFO size in bytes.

generate_clear

Type

bool

Default value

0x0

Generate clear response.

max_transfer

Type

int

Default value

0x100

Largest atomic transfer.

p_axi_bus_width_param

Type

int

Default value

0x20

AXI bus width.

p_buffer_depth**Type**

int

Default value

0x10

buffer depth.

p_cache_line_words**Type**

int

Default value

0x1

number of words in a cache line.

p_cache_lines**Type**

int

Default value

0x1

number of cache lines.

p_controller_boots**Type**

bool

Default value

0x1

DMA boots from reset.

p_controller_nsecure**Type**

bool

Default value

0x0

Controller non-secure at reset (boot_manager_ns).

p_irq_nsecure**Type**

int

Default value

0x0

Interrupts non-secure at reset.

p_lsq_read_size**Type**

int

Default value

0x4

LSQ read buffer depth.

p_lsq_write_size**Type**

int

Default value

0x4

LSQ write buffer depth.

p_max_channels**Type**

int

Default value

0x8

virtual channels.

p_max_irqs**Type**

int

Default value

0x20

number of interrupts.

p_max_periph**Type**

int

Default value

0x20

number of peripheral interfaces.

p_perip_request_acceptance_0**Type**

int

Default value

0x2

Peripheral 0 request acceptance.

p_perip_request_acceptance_1**Type**

int

Default value

0x2

Peripheral 1 request acceptance.

p_perip_request_acceptance_10**Type**

int

Default value

0x2

Peripheral 10 request acceptance.

p_perip_request_acceptance_11**Type**

int

Default value

0x2

Peripheral 11 request acceptance.

p_perip_request_acceptance_12**Type**

int

Default value

0x2

Peripheral 12 request acceptance.

p_perip_request_acceptance_13**Type**

int

Default value

0x2

Peripheral 13 request acceptance.

p_perip_request_acceptance_14**Type**

int

Default value

0x2

Peripheral 14 request acceptance.

p_perip_request_acceptance_15**Type**

int

Default value

0x2

Peripheral 15 request acceptance.

p_perip_request_acceptance_16**Type**

int

Default value

0x2

Peripheral 16 request acceptance.

p_perip_request_acceptance_17**Type**

int

Default value

0x2

Peripheral 17 request acceptance.

p_perip_request_acceptance_18**Type**

int

Default value

0x2

Peripheral 18 request acceptance.

p_perip_request_acceptance_19**Type**

int

Default value

0x2

Peripheral 19 request acceptance.

p_perip_request_acceptance_2**Type**

int

Default value

0x2

Peripheral 2 request acceptance.

p_perip_request_acceptance_20**Type**

int

Default value

0x2

Peripheral 20 request acceptance.

p_perip_request_acceptance_21**Type**

int

Default value

0x2

Peripheral 21 request acceptance.

p_perip_request_acceptance_22**Type**

int

Default value

0x2

Peripheral 22 request acceptance.

p_perip_request_acceptance_23**Type**

int

Default value

0x2

Peripheral 23 request acceptance.

p_perip_request_acceptance_24**Type**

int

Default value

0x2

Peripheral 24 request acceptance.

p_perip_request_acceptance_25**Type**

int

Default value

0x2

Peripheral 25 request acceptance.

p_perip_request_acceptance_26**Type**

int

Default value

0x2

Peripheral 26 request acceptance.

p_perip_request_acceptance_27**Type**

int

Default value

0x2

Peripheral 27 request acceptance.

p_perip_request_acceptance_28**Type**

int

Default value

0x2

Peripheral 28 request acceptance.

p_perip_request_acceptance_29**Type**

int

Default value

0x2

Peripheral 29 request acceptance.

p_perip_request_acceptance_3**Type**

int

Default value

0x2

Peripheral 3 request acceptance.

p_perip_request_acceptance_30**Type**

int

Default value

0x2

Peripheral 30 request acceptance.

p_perip_request_acceptance_31**Type**

int

Default value

0x2

Peripheral 31 request acceptance.

p_perip_request_acceptance_4**Type**

int

Default value

0x2

Peripheral 4 request acceptance.

p_perip_request_acceptance_5**Type**

int

Default value

0x2

Peripheral 5 request acceptance.

p_perip_request_acceptance_6**Type**

int

Default value

0x2

Peripheral 6 request acceptance.

p_perip_request_acceptance_7**Type**

int

Default value

0x2

Peripheral 7 request acceptance.

p_perip_request_acceptance_8**Type**

int

Default value

0x2

Peripheral 8 request acceptance.

p_perip_request_acceptance_9**Type**

int

Default value

0x2

Peripheral 9 request acceptance.

p_periph_nsecure**Type**

bool

Default value

0x0

Peripherals non-secure at reset.

p_read_issuing_capability**Type**

int

Default value

0x1

AXI read issuing capability.

p_reset_pc

Type
int

Default value
0x60000000

DMA PC at reset.

p_write_issuing_capability

Type
int

Default value
0x1

AXI write issuing capability.

revision

Type
string

Default value
"r0p0"

revision ID.

3.10.80 PL340_DMC

ARM PrimeCell Dynamic Memory Controller(PL340). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1214: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

PL340_DMC.exclusive_monitor2	PVBusExclusiveMonitor
PL340_DMC.exclusive_monitor2.bus_mapper	PVBusMapper
PL340_DMC.exclusive_monitor3	PVBusExclusiveMonitor
PL340_DMC.exclusive_monitor3.bus_mapper	PVBusMapper

PL340_DMC contains the following CADI targets:

- PL340_DMC
- PVBusExclusiveMonitor

About PL340_DMC

This component provides an interface for up to four DRAM chips. The implementation also provides an APB interface to configure the controller behavior. You can access the registers through the APB interface.

Ports for PL340_DMC

Table 3-1217: Ports

Name	Protocol	Type	Description
apb_interface	PVBus	Slave	Receive the apb config read/writes here.
axi_if_in[4]	PVBus	Slave	Receive the axi reads/writes here; up to four chips can be connected.
axi_if_out[4]	PVBus	Master	The output ports where the actual mem chips are connected.

Parameters for PL340_DMC

IF_CHIP0

Type

int

Default value

0xffffffffffffffff

Set this parameter to 0 if memory is connected.

IF_CHIP1

Type

int

Default value

0xffffffffffffffff

Set this parameter to 0 if memory is connected.

IF_CHIP2

Type

int

Default value

0xffffffffffffffff

Set this parameter to 0 if memory is connected.

IF_CHIP3

Type

int

Default value

0xffffffffffffffff

Set this parameter to 0 if memory is connected.

MEMORY_WIDTH

Type

int

Default value

0x20

Set this parameter to 0 if memory is connected.

exclusive_monitor0.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor0.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor0.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor0.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor0.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor0.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor0.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor0.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor0.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor1.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor1.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor1.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor1.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor1.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor1.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor1.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor1.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor1.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor2.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor2.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor2.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor2.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor2.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor2.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor2.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor2.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor2.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor3.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor3.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor3.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor3.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor3.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor3.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor3.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor3.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor3.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

3.10.81 PL350_SMC

ARM PrimeCell Static Memory Controller(PL350). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1218: IP revisions support

Revision	Quality level
r1p2	Full support
r2p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL350_SMC

This model has the following Iris instances:

Table 3-1219: PL350_SMC Iris instances

InstanceName	ComponentName
PL350_SMC	PL350_SMC
PL350_SMC.addr_remapper	TZSwitch
PL350_SMC.addr_remapper.pvbus_mapper	PVBusMapper
PL350_SMC.apb_slave	PVBusSlave
PL350_SMC.exclusive_monitor0_0	PVBusExclusiveMonitor
PL350_SMC.exclusive_monitor0_0.bus_mapper	PVBusMapper
PL350_SMC.exclusive_monitor0_1	PVBusExclusiveMonitor
PL350_SMC.exclusive_monitor0_1.bus_mapper	PVBusMapper
PL350_SMC.exclusive_monitor0_2	PVBusExclusiveMonitor
PL350_SMC.exclusive_monitor0_2.bus_mapper	PVBusMapper
PL350_SMC.exclusive_monitor0_3	PVBusExclusiveMonitor

PL350_SMC.master_if1_2	PVBusMaster
PL350_SMC.master_if1_3	PVBusMaster
PL350_SMC.nand_remap_slave	PVBusSlave

PL350_SMC contains the following CADI targets:

- PL350_SMC
- PVBusExclusiveMonitor
- TZSwitch

About PL350_SMC

This component provides two memory interfaces. Each interface can be connected to a maximum of four memory devices, giving a total of eight inputs from the PVBusDecoder and eight outputs to either SRAM or NAND devices. Only one kind of memory can be connected to a particular interface, either SRAM or NAND.

It provides a PVBus slave to control the device behavior. A remap port is also provided to assist in remapping particular memory regions.

This component is optimized to have negligible impact on transaction performance, except when memory remap settings are changed, when there might be a significant effect.

Ports for PL350_SMC

Table 3-1221: Ports

Name	Protocol	Type	Description
apb_interface	PVBus	Slave	This is where we expect to receive all the APB data which is used to read/write the device regs.
axi_chip_if0_in[4]	PVBus	Slave	This is where we expect to receive all the AXI data which is used to read/wrie NAND/RAM mem.
axi_chip_if0_out[4]	PVBus	Master	Master interface 0 to connect to SRAM/NAND.
axi_chip_if1_in[4]	PVBus	Slave	This is where we expect to receive all the AXI data which is used to read/wrie NAND/RAM mem.
axi_chip_if1_out[4]	PVBus	Master	Master interface 1 to connect to SRAM/NAND.
axi_remap	PVBus	Slave	This is the remap port that the designer needs to connect to zero.
irq_in_if0	Signal	Slave	Interrupt signals from devices connected on interface 0.
irq_in_if1	Signal	Slave	Interrupt signals from device connected on interface 1.
irq_out	Signal	Master	Interrupt port.
nand_remap_port	PVBus	Slave	Remaps the connected NAND port to 0x0.

Parameters for PL350_SMC

IF0_CHIP0

Type

bool

Default value

0x0

Interface 0 chip 0 connected.

IF0_CHIP0_BASE

Type

int

Default value

0x0

Interface 0 chip 0 Base address.

IF0_CHIP0_SIZE

Type

int

Default value

0x0

Interface 0 chip 0 Size.

IF0_CHIP1

Type

bool

Default value

0x0

Interface 0 chip 1 connected.

IF0_CHIP1_BASE

Type

int

Default value

0x0

Interface 0 chip 1 Base address.

IF0_CHIP1_SIZE**Type**

int

Default value

0x0

Interface 0 chip 1 Size.

IF0_CHIP2**Type**

bool

Default value

0x0

Interface 0 chip 2 connected.

IF0_CHIP2_BASE**Type**

int

Default value

0x0

Interface 0 chip 2 Base address.

IF0_CHIP2_SIZE**Type**

int

Default value

0x0

Interface 0 chip 2 Size.

IF0_CHIP3**Type**

bool

Default value

0x0

Interface 0 chip 3 connected.

IF0_CHIP3_BASE**Type**

int

Default value

0x0

Interface 0 chip 3 Base address.

IF0_CHIP3_SIZE**Type**

int

Default value

0x0

Interface 0 chip 3 Size.

IF0_MEM_TYPE_PARAMETER**Type**

int

Default value

0x0

Interface 0 Mem type.

IF1_CHIP0**Type**

bool

Default value

0x0

Interface 1 chip 0 connected.

IF1_CHIP0_BASE**Type**

int

Default value

0x0

Interface 1 chip 0 Base address.

IF1_CHIP0_SIZE**Type**

int

Default value

0x0

Interface 1 chip 0 Size.

IF1_CHIP1**Type**

bool

Default value

0x0

Interface 1 chip 1 connected.

IF1_CHIP1_BASE**Type**

int

Default value

0x0

Interface 1 chip 1 Base address.

IF1_CHIP1_SIZE**Type**

int

Default value

0x0

Interface 1 chip 1 Size.

IF1_CHIP2**Type**

bool

Default value

0x0

Interface 1 chip 2 connected.

IF1_CHIP2_BASE**Type**

int

Default value

0x0

Interface 1 chip 2 Base address.

IF1_CHIP2_SIZE**Type**

int

Default value

0x0

Interface 1 chip 2 Size.

IF1_CHIP3**Type**

bool

Default value

0x0

Interface 1 chip 3 connected.

IF1_CHIP3_BASE**Type**

int

Default value

0x0

Interface 1 chip 3 Base address.

IF1_CHIP3_SIZE**Type**

int

Default value

0x0

Interface 1 chip 3 Size.

IF1_MEM_TYPE_PARAMETER**Type**

int

Default value

0x0

Interface 1 Mem type.

PERIPH_ID_0**Type**

int

Default value

0x52

Periph_ID_0 value.

REMAP**Type**

int

Default value

0xffffffffffffffff

Remap the device.

addr_remapper.normal**Type**

int

Default value

0x2

Normal Port.

addr_remapper.secure**Type**

int

Default value

0x1

Secure Port.

exclusive_monitor0_0.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor0_0.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor0_0.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor0_0.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor0_0.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor0_0.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor0_0.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor0_0.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor0_0.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor0_1.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor0_1.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor0_1.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor0_1.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor0_1.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor0_1.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor0_1.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor0_1.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor0_1.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor0_2.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor0_2.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor0_2.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor0_2.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor0_2.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor0_2.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor0_2.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor0_2.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor0_2.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor0_3.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor0_3.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor0_3.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor0_3.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor0_3.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor0_3.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor0_3.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor0_3.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor0_3.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor1_0.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor1_0.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor1_0.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor1_0.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor1_0.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor1_0.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor1_0.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor1_0.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor1_0.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor1_1.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor1_1.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor1_1.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor1_1.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor1_1.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor1_1.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor1_1.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor1_1.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor1_1.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor1_2.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor1_2.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor1_2.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor1_2.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor1_2.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor1_2.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor1_2.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor1_2.number_of_monitors**Type**

int

Default value

0x8

Number of monitors.

exclusive_monitor1_2.shareability_domain**Type**

int

Default value

0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

exclusive_monitor1_3.apply_access_width_criteria_to_non_excl_stores**Type**

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

exclusive_monitor1_3.clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

exclusive_monitor1_3.enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor1_3.exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

exclusive_monitor1_3.match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

exclusive_monitor1_3.monitor_access_level**Type**

int

Default value

0x0

0: Monitor all accesses, 1: Monitor all accesses except WriteBack, 2: Only monitor accesses with memory type NonCacheable or Device.

exclusive_monitor1_3.monitor_non_excl_stores**Type**

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

exclusive_monitor1_3.number_of_monitors

Type
int

Default value
0x8

Number of monitors.

exclusive_monitor1_3.shareability_domain

Type
int

Default value
0x3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored (0-non-shared, 1-inner, 2-outer, 3-system).

revision

Type
string

Default value
"r1p2"

Revision.

3.10.82 PL350_SMC_NAND_FLASH

A NAND Flash implementation which works with PL350. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1222: IP revisions support

Revision	Quality level
r1p2	Full support
r2p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL350_SMC_NAND_FLASH

This model has the following Iris instances:

Table 3-1223: PL350_SMC_NAND_FLASH Iris instances

InstanceName	ComponentName
PL350_SMC_NAND_FLASH	PL350_SMC_NAND_FLASH
PL350_SMC_NAND_FLASH.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-1224: PL350_SMC_NAND_FLASH MTI instances

InstanceName	ComponentName
PL350_SMC_NAND_FLASH.busslave	PVBusSlave

PL350_SMC_NAND_FLASH contains the following CADI targets:

- PL350_SMC_NAND_FLASH

About PL350_SMC_NAND_FLASH

Program the component as you would the hardware.

Ports for PL350_SMC_NAND_FLASH

Table 3-1225: Ports

Name	Protocol	Type	Description
irq	Signal	Master	Interrupt signaling.
pvbuss	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Parameters for PL350_SMC_NAND_FLASH

DEVICE_1

Type

int

Default value

0xec

Device manufacturer code.

DEVICE_2

Type

int

Default value

0xda

Device code.

DEVICE_3**Type**

int

Default value

0x80

Device 3rd cycle code.

DEVICE_4**Type**

int

Default value

0x15

Device 4th cycle code.

DEVICE_NAME**Type**

string

Default value

"Samsung K9F1G08U0M"

Device Name.

NAND_BLOCK_COUNT**Type**

int

Default value

0x800

number of blocks in the flash device.

NAND_FLASH_SIZE**Type**

int

Default value

0x10800000

flash size in byte.

NAND_PAGE_COUNT_PER_BLOCK

Type
int

Default value
0x40

number of pages in each block.

NAND_PAGE_SIZE

Type
int

Default value
0x840

page size.

NAND_SPARE_SIZE_PER_PAGE

Type
int

Default value
0x40

Spare size per page.

NAND_VALID_SIZE_PER_PAGE

Type
int

Default value
0x800

valid page size.

3.10.83 PL370_HDLCD

ARM PrimeCell HD Color LCD Controller (Nominal Designation PL370). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1226: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL370_HDLCD

This model has the following Iris instances:

Table 3-1227: PL370_HDLCD Iris instances

InstanceName	ComponentName
PL370_HDLCD	PL370_HDLCD
PL370_HDLCD.busmaster	PVBusMaster
PL370_HDLCD.busslave	PVBusSlave
PL370_HDLCD.timer	ClockTimerThread
PL370_HDLCD.timer.timer	ClockTimerThread64
PL370_HDLCD.timer.timer.thread	SchedulerThread
PL370_HDLCD.timer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1228: PL370_HDLCD MTI instances

InstanceName	ComponentName
PL370_HDLCD.busmaster	PVBusMaster
PL370_HDLCD.busslave	PVBusSlave

PL370_HDLCD contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PL370_HDLCD
- SchedulerThread
- SchedulerThreadEvent

Too fast a pixel clock can slow the rest of the simulation.

Ports for PL370_HDLCD

Table 3-1229: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
display	LCD	Master	Connection to visualization component.
intr	Signal	Master	Interrupt signaling line for flyback events.
pvbus	PVBus	Slave	Slave port for connection to PV bus master/decoder.

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	DMA port for collecting video data from memory/framebuffer.

Parameters for PL370_HDLCD

diagnostics

Type

int

Default value

0x0

Diagnostics level.

disable_snooping_dma

Type

bool

Default value

0x0

Disable DMA snooping.

force_frame_rate

Type

int

Default value

0x32

Force frame rate to the value of the parameter in frames per simulated second, regardless of the input clock. When 0, use the input clock as a pixel clock.

3.10.84 PL390_GIC

Generic Interrupt Controller (PL390). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1230: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PL390_GIC

This model has the following Iris instances:

Table 3-1231: PL390_GIC Iris instances

InstanceName	ComponentName
PL390_GIC	PL390_GIC
PL390_GIC.busslave_cpu	PVBusSlave
PL390_GIC.busslave_distributor	PVBusSlave

This model has the following MTI trace components:

Table 3-1232: PL390_GIC MTI instances

InstanceName	ComponentName
PL390_GIC.busslave_cpu	PVBusSlave
PL390_GIC.busslave_distributor	PVBusSlave

PL390_GIC contains the following CADI targets:

- PL390_GIC

About PL390_GIC

The GIC provides support for three interrupt types:

- Software Generated Interrupts (SGI)
- Private Peripheral Interrupts (PPI)
- Shared Peripheral Interrupts (SPI)

You can set:

- Security state for an interrupt
- Priority state for an interrupt
- Enabling or disabling state for an interrupt
- Processors that receive an interrupt

A processor interface consists of a pair of interfaces called `pdbus_cpu` and `pdbus_distributor`. The `enable_cx` and `match_cx` signals identify the originator of a transaction on `pdbus_cpu`. Similarly, the `enable_dx` and `match_dx` signals identify the originator of a transaction on `pdbus_distributor`. X corresponds to the number of a processor interface.

Note

To reduce compile time, the registers are not available by default. To activate them, uncomment either of the following statements in `PL390_GIC.lisa`:

```
// #define FEW_CADI_REGISTER
// #define ALL_CADI_REGISTER
```

Ports for PL390_GIC

Table 3-1233: Ports

Name	Protocol	Type	Description
cfgsdisable	Signal	Slave	Set preventing write accesses to security-critical configuration registers.
enable_c[8]	ValueState	Slave	Compared with masked PVBUS master id to select processor interface: (master_id & enable_c<n>) == match_c<n>.
enable_d[8]	ValueState	Slave	Compared with masked PVBUS master id to select distributor interface: (master_id & enable_d<n>) == match_d<n>.
legacy_nfiq[8]	Signal	Slave	Legacy FIQ interrupt for processor Interface <n>.
legacy_nirq[8]	Signal	Slave	Input interrupt signals.
match_c[8]	ValueState	Slave	Mask on the PVBUS master id to select processor interface: (master_id & enable_c<n>) == match_c<n>.
match_d[8]	ValueState	Slave	Mask on the PVBUS master id to select distributor interface: (master_id & enable_d<n>) == match_d<n>.
nfiq[8]	Signal	Master	Send out FIQ signal to processor <n>.
nirq[8]	Signal	Master	Send out IRQ signal to processor <n>.
ppi_c0[16]	Signal	Slave	Private peripheral interrupt for processor 0 (num_cpus> = 1).
ppi_c1[16]	Signal	Slave	Private peripheral interrupt for processor 1 (num_cpus> = 2).
ppi_c2[16]	Signal	Slave	Private peripheral interrupt for processor 2 (num_cpus> = 3).
ppi_c3[16]	Signal	Slave	Private peripheral interrupt for processor 3 (num_cpus> = 4).
ppi_c4[16]	Signal	Slave	Private peripheral interrupt for processor 4 (num_cpus> = 5).
ppi_c5[16]	Signal	Slave	Private peripheral interrupt for processor 5 (num_cpus> = 6).
ppi_c6[16]	Signal	Slave	Private peripheral interrupt for processor 6 (num_cpus> = 7).
ppi_c7[16]	Signal	Slave	Private peripheral interrupt for processor 7 (num_cpus> = 8).
pvbuss_cpu	PVBUS	Slave	Slave port for connection to processor interface.
pvbuss_distributor	PVBUS	Slave	Slave port for connection to distributor interface.
reset_in	Signal	Slave	Reset signal.
spi[988]	Signal	Slave	Shared peripheral interrupt inputs.

Parameters for PL390_GIC

ARCHITECTURE_VERSION

Type

int

Default value

0x1

set architecture version in periph_id register.

AXI_IF

Type

bool

Default value

0x1

set interface type in peripheral identification register 8.

C_ID_WIDTH**Type**

int

Default value

0x20

width of the cpu interface master id.

D_ID_WIDTH**Type**

int

Default value

0x20

width of the distributor interface master id.

ENABLE_LEGACY_FIQ**Type**

bool

Default value

0x1

provide legacy fiq interrupt inputs.

ENABLE_LEGACY_IRQ**Type**

bool

Default value

0x1

provide legacy irq interrupt inputs.

ENABLE_PPI_EDGE**Type**

bool

Default value

0x0

ppi edge sensitive.

ENABLE_TRUSTZONE**Type**

bool

Default value

0x1

support trustzone.

INIT_ENABLE_C0**Type**

int

Default value

0xffffffff

initial value of register ENABLE_C0.

INIT_ENABLE_C1**Type**

int

Default value

0xffffffff

initial value of register ENABLE_C1.

INIT_ENABLE_C2**Type**

int

Default value

0xffffffff

initial value of register ENABLE_C2.

INIT_ENABLE_C3**Type**

int

Default value

0xffffffff

initial value of register ENABLE_C3.

INIT_ENABLE_C4**Type**

int

Default value

0xffffffff

initial value of register ENABLE_C4.

INIT_ENABLE_C5**Type**

int

Default value

0xffffffff

initial value of register ENABLE_C5.

INIT_ENABLE_C6**Type**

int

Default value

0xffffffff

initial value of register ENABLE_C6.

INIT_ENABLE_C7**Type**

int

Default value

0xffffffff

initial value of register ENABLE_C7.

INIT_ENABLE_D0**Type**

int

Default value

0xffffffff

initial value of register ENABLE_D0.

INIT_ENABLE_D1**Type**

int

Default value

0xffffffff

initial value of register ENABLE_D1.

INIT_ENABLE_D2**Type**

int

Default value

0xffffffff

initial value of register ENABLE_D2.

INIT_ENABLE_D3**Type**

int

Default value

0xffffffff

initial value of register ENABLE_D3.

INIT_ENABLE_D4**Type**

int

Default value

0xffffffff

initial value of register ENABLE_D4.

INIT_ENABLE_D5**Type**

int

Default value

0xffffffff

initial value of register ENABLE_D5.

INIT_ENABLE_D6**Type**

int

Default value

0xffffffff

initial value of register ENABLE_D6.

INIT_ENABLE_D7**Type**

int

Default value

0xffffffff

initial value of register ENABLE_D7.

INIT_MATCH_C0**Type**

int

Default value

0x0

initial value of register MATCH_C0.

INIT_MATCH_C1**Type**

int

Default value

0x1

initial value of register MATCH_C1.

INIT_MATCH_C2**Type**

int

Default value

0x2

initial value of register MATCH_C2.

INIT_MATCH_C3**Type**

int

Default value

0x3

initial value of register MATCH_C3.

INIT_MATCH_C4**Type**

int

Default value

0x4

initial value of register MATCH_C4.

INIT_MATCH_C5**Type**

int

Default value

0x5

initial value of register MATCH_C5.

INIT_MATCH_C6**Type**

int

Default value

0x6

initial value of register MATCH_C6.

INIT_MATCH_C7**Type**

int

Default value

0x7

initial value of register MATCH_C7.

INIT_MATCH_D0**Type**

int

Default value

0x0

initial value of register MATCH_D0.

INIT_MATCH_D1**Type**

int

Default value

0x1

initial value of register MATCH_D1.

INIT_MATCH_D2**Type**

int

Default value

0x2

initial value of register MATCH_D2.

INIT_MATCH_D3**Type**

int

Default value

0x3

initial value of register MATCH_D3.

INIT_MATCH_D4**Type**

int

Default value

0x4

initial value of register MATCH_D4.

INIT_MATCH_D5**Type**

int

Default value

0x5

initial value of register MATCH_D5.

INIT_MATCH_D6**Type**

int

Default value

0x6

initial value of register MATCH_D6.

INIT_MATCH_D7**Type**

int

Default value

0x7

initial value of register MATCH_D7.

NUM_CPU**Type**

int

Default value

0x8

number of cpu interfaces.

NUM_LSPI**Type**

int

Default value

0x1f

number of lockable shared peripheral interrupts.

NUM_PPI

Type
int

Default value
0x10

number of peripheral interrupts.

NUM_PRIORITY_LEVELS

Type
int

Default value
0x100

number of priority levels.

NUM_SGI

Type
int

Default value
0x10

number of software generated interrupts.

NUM_SPI

Type
int

Default value
0x3dc

number of shared peripheral interrupts.

3.10.85 PPUMTWakerequest

Power Policy Unit (PPU) v8.2 Multi-threaded Core Wakerequest Logic. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1234: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Ports for PPUMTWakerequest

Table 3-1235: Ports

Name	Protocol	Type	Description
cpu_pchannel_m	PChannel	Master	-
ppu_pchannel_s	PChannel	Slave	-
thread_wake_request[2]	Signal	Slave	-
wakerequest	Signal	Master	-

Parameters for PPUMTWakerequest

mt_mode

Type

bool

Default value

0x0

Multi-threaded mode.

thread0_op_mode_bit

Type

int

Default value

0x10

Thread0 Operation Mode bit of DEVPACTIVE.

thread1_op_mode_bit

Type

int

Default value

0x11

Thread1 Operation Mode bit of DEVPACTIVE.

3.10.86 PPUv0

Power Policy Unit (PPU) v0.8 architectural model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1236: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for PPUv0

This model has the following Iris instances:

Table 3-1237: PPUv0 Iris instances

InstanceName	ComponentName
PPUv0	PPUv0
PPUv0.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-1238: PPUv0 MTI instances

InstanceName	ComponentName
PPUv0	PPUv0
PPUv0.busslave	PVBusSlave

PPUv0 contains the following CADI targets:

- [PPUv0](#)

Ports for PPUv0

Table 3-1239: Ports

Name	Protocol	Type	Description
irq	Signal	Master	-
powerdown	Signal	Master	-
ppuhwstat	Value	Master	-
pvbus_s	PVBus	Slave	-
smpen	Signal	Slave	-
standbywfi	Signal	Slave	-
wakerequest	Signal	Slave	-

Parameters for PPUv0

`default_power_state_on`

Type

bool

Default value

0x0

Default power state ON.

device_channels

Type

int

Default value

0x0

Number of device channels (0: P-Channel, 1-8: Q-Channels).

dynamic_off

Type

bool

Default value

0x0

Dynamic Off.

dynamic_on

Type

bool

Default value

0x0

Dynamic On.

dynamic_warm_reset

Type

bool

Default value

0x0

Dynamic Warm Reset.

full_ret

Type

int

Default value

0x0

Full Retention (0: not supported, 1: static, 2: dynamic).

func_ret**Type**

int

Default value

0x0

Functional Retention (0: not supported, 1: static, 2: dynamic).

logic_ret**Type**

int

Default value

0x0

Logic Retention (0: not supported, 1: static, 2: dynamic).

mem_off**Type**

int

Default value

0x0

Memory Off (0: not supported, 1: static, 2: dynamic).

mem_ret**Type**

int

Default value

0x0

Memory Retention (0: not supported, 1: static, 2: dynamic).

revision**Type**

string

Default value

"rOp0"

Revision.

use_active_signal

Type
bool

Default value
0x0

Use device-active signal.

3.10.87 PPUv1

Power Policy Unit (PPU) v1.1 architectural model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1240: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- bypass_handshake

Iris and MTI instances for PPUv1

This model has the following Iris instances:

Table 3-1241: PPUv1 Iris instances

InstanceName	ComponentName
PPUv1	PPUv1
PPUv1.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-1242: PPUv1 MTI instances

InstanceName	ComponentName
PPUv1	PPUv1
PPUv1.busslave	PVBusSlave

PPUv1 contains the following CADI targets:

- PPUv1

About PPUv1

Software can determine which features the PPU supports by reading the PPU Identification Register 0, `PPU_IDR0` and the PPU Identification Register 1, `PPU_IDR1`.

The following power policies are offered by the PPU model, in order of increasing priority:

- Off.
- Emulated Off.
- Memory Retention.
- Emulated Memory Retention.
- Logic Retention.
- Full Retention.
- Memory Off.
- Functional Retention.
- On.
- Warm Reset.
- Debug Recovery Reset.

For the power mode transition rules, see [Arm Power Policy Unit Architecture Specification](#).

There are 16 operating mode values. The meaning of these values is specific to the device that is connected to the PPU. The operating mode can only be configured to change during a power transition of ON to ON.

The PPU model supports static and dynamic transitions on the P-Channel interface. It does not yet support Q-Channel.

`DEVPACTIVE` and `DEVPSTATE` have the following bit encodings:

DEVPACTIVE bits [10:0]

Each bit indicates a required power mode.

DEVPSTATE bits [3:0]

The integer formed by this bitfield indicates a power mode.

DEVPACTIVE bits [23:16]

Operating mode. The interpretation of these bits depends on the `DEVPACTIVE` use model (Ladder or Independent).

DEVPSTATE bits [7:4]

The integer formed by this bitfield indicates an operating mode.

Communication over the Low Power Interface (`PREQUEST` and `PACTIVE`) uses blocking calls and does not model any delays. See [2.5.1 PChannel protocol](#) on page 90 for further details.

For the AMBA Low Power Interface Specification Arm Q-Channel and P-Channel Interfaces, see [AMBA Low Power Interface Specification](#).

For static transitions, software sets the policy as the required power mode. The PPU then sends a `PREQUEST` with the required power state to the attached device. The device can `ACCEPT` or `DENY` it. For dynamic transitions, software sets the policy as a minimum power mode. Based on whether the device has sent a signal using `DEVPACTIVE`, the PPU sends a `PREQUEST` with the required power state to the attached device. The device can `ACCEPT` or `DENY` it.

The PPU model is automatically reset by the simulation engine when the model starts up. Reset can also occur through the `reset_in` port. The PPU model is reset only when the signal value is `signal::Set`. Use `signal::Set` instead of zero, its integer value, to prevent unexpected behavior.

The `ppuhwstat` port notifies the power state change inside the PPU and the definition of each bit is the same as `DEVPACTIVE[10:0]`.

The `smpen` and `standbywfi` ports are defined in PPUv0 and are not supported in PPUv1.

Differences between the model and the RTL

- Q-Channel is not supported
- The PPU model has been validated with devices supporting only ON and OFF power modes. Arm has not tested the case where a connected device supports other power modes offered by the PPU.

Ports for PPUv1

Table 3-1243: Ports

Name	Protocol	Type	Description
<code>dev_clk_en_out</code>	Signal	Master	Domain clock enable
<code>dev_emu_clk_en_out</code>	Signal	Master	Domain emulated mode clock enable
<code>dev_emu_isolaten_out</code>	Signal	Master	Domain emulated isolation control.
<code>dev_isolaten_out</code>	Signal	Master	Domain isolation control.
<code>dev_poresetn_out</code>	Signal	Master	Domain power on reset
<code>dev_ret_resetrn_out</code>	Signal	Master	Domain retention reset.
<code>dev_warm_resetrn_out</code>	Signal	Master	Domain warm reset
<code>devpactive</code>	PChannel	Master	P-Channel port
<code>irq</code>	Signal	Master	PPU IRQ signal
<code>powerdown</code>	Signal	Master	Notify whether or not the PPU is in OFF state.
<code>ppuhwstat</code>	Value	Master	Notify the power state change inside the PPU. The definition of each bit is the same as <code>DEVPACTIVE[10:0]</code> .
<code>pvbus_s</code>	PVBus	Slave	PPU APB bus slave port
<code>reset_in</code>	Signal	Slave	PPU reset signal input
<code>wakerequest</code>	Signal	Slave	Input port for the wakerequest signal. It is ORed with <code>PACTIVE[8]</code> (ON) inside the PPU as input to PPU <code>DEVPACTIVE[8]</code> (ON). The "is_core_ppu" parameter controls whether there is additional logic to hold this signal until the PPU is in OFF/OFF_EMU state.

Parameters for PPUv1

RevD_support

Type

bool

Default value

0x1

Whether to support Rev D locked IRQ.

bypass_handshake

Type

bool

Default value

0x0

Bypass pcsn handshake.

dbg_recov

Type

int

Default value

0x0

Debug Recovery Reset (0: not supported, 1: static mode only, 2: both dynamic & static mode).

default_op_dyn_en

Type

bool

Default value

0x0

Whether to enable operating mode dynamic transition by default.

default_op_policy

Type

int

Default value

0x0

Default operating policy.

default_power_state_on**Type**

bool

Default value

0x0

Default power state ON.

default_pwr_dyn_en**Type**

bool

Default value

0x0

Whether to enable dynamic power mode transition by default.

device_channels**Type**

int

Default value

0x0

Number of device channels (0: P-Channel, 1-8: Q-Channels).

dynamic_off**Type**

bool

Default value

0x0

Dynamic Off.

dynamic_on**Type**

bool

Default value

0x0

Dynamic On.

dynamic_warm_reset**Type**

bool

Default value

0x0

Dynamic Warm Reset.

full_ret**Type**

int

Default value

0x0

Full Retention (0: not supported, 1: static mode only, 2: both dynamic & static mode).

func_ret**Type**

int

Default value

0x0

Functional Retention (0: not supported, 1: static mode only, 2: both dynamic & static mode).

is_core_ppu**Type**

bool

Default value

0x0

PPU is core_ppu type which means wake_request would wait till PPU is OFF/OFF_EMU.

lock_support**Type**

bool

Default value

0x1

Whether to support OFF lock feature.

logic_ret**Type**

int

Default value

0x0

Logic Retention (0: not supported, 1: static, 2: dynamic).

mem_off**Type**

int

Default value

0x0

Memory Off (0: not supported, 1: static mode only, 2: both dynamic & static mode).

mem_ret**Type**

int

Default value

0x0

Memory Retention (0: not supported, 1: static mode only, 2: both dynamic & static mode).

mem_ret_emu**Type**

int

Default value

0x0

Emulated Memory Retention (0: not supported, 1: static mode only, 2: both dynamic & static mode).

num_opmode_cfg**Type**

int

Default value

0x0

Number of operating modes.

off_emu**Type**

int

Default value

0x0

Emulated Off (0: not supported, 1: static mode only, 2: both dynamic & static mode).

off_mem_ret_trans_cfg**Type**

bool

Default value

0x0

OFF to MEM_RET direct transition configuration (0: not allowed, 1: allowed).

op_active_cfg**Type**

int

Default value

0x0

Operating mode active configuration (0: Ladder use model, 1: Independent user model).

revision**Type**

string

Default value

"r1p1"

Revision.

use_active_signal**Type**

bool

Default value

0x0

Use device-active signal.

3.10.88 PPUv1_Cluster_Wakerequest_Logic

PPUv1 wake request stall logic. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1244: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Ports for PPUv1_Cluster_Wakerequest_Logic

Table 3-1245: Ports

Name	Protocol	Type	Description
cluster_wake_request	Signal	Master	-
core_wake_request_in[8]	Signal	Slave	-
core_wake_request_out[8]	Signal	Master	-
ppuhwstat	Value	Slave	-
reset_in	Signal	Slave	-

Parameters for PPUv1_Cluster_Wakerequest_Logic

`core_ppu_wakerequest_stall_condition_after_reset`

Type

bool

Default value

0x0

Set Stall Condition of Core WakeRequest (from GIC) for Core PPU after reset.

`disable_core_ppu_wakerequest_input_stall`

Type

bool

Default value

0x0

Disable wakerequest input stall of Core PPU. This feature is enabled by default to mimic the P-Channel request stall when Cluster PPU is in OFF.

`enable_cluster_wakeup_if_cluster_on_funcret`

Type

bool

Default value

0x1

enable cluster wakeup logic. If it's disabled, core_wake_request_in[x] will be directly connected to core_wake_request_out[x] and cluster_wake_request port is disabled.

3.10.89 RSE_CPU_Private_Region

RSE CPU processor private region. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1246: IP revisions support

Revision	Quality level
1.46	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for RSE_CPU_Private_Region

This model has the following Iris instances:

Table 3-1247: RSE_CPU_Private_Region Iris instances

InstanceName	ComponentName
RSE_CPU_Private_Region	RSE_CPU_Private_Region
RSE_CPU_Private_Region.apb_nonsecure	PVBusSlave
RSE_CPU_Private_Region.apb_secure	PVBusSlave

This model has the following MTI trace components:

Table 3-1248: RSE_CPU_Private_Region MTI instances

InstanceName	ComponentName
RSE_CPU_Private_Region.apb_nonsecure	PVBusSlave
RSE_CPU_Private_Region.apb_secure	PVBusSlave

RSE_CPU_Private_Region contains the following CADI targets:

- RSE_CPU_Private_Region

Ports for RSE_CPU_Private_Region**Table 3-1249: Ports**

Name	Protocol	Type	Description
apb_nonsecure	PVBus	Slave	-
apb_secure	PVBus	Slave	secure & non-secure Subordinate APB Interface
reset_in	Signal	Slave	Reset in signal

Parameters for RSE_CPU_Private_Region

CPUID_RESET_VALUE

Type
int

Default value
0x0

CPUID Registers Reset Value.

diagnostics

Type
int

Default value
0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.90 SMMUv3AEM

This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1250: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- mpam_sp_options

Iris and MTI instances for SMMUv3AEM

This model has the following Iris instances:

SMMUv3AEM contains the following CADI targets:

- SMMUv3AEM

About SMMUv3AEM

The SMMUv3 Architecture Envelope Model component is an architectural model that implements the SMMUv3.0, SMMUv3.1, and SMMUv3.2 architectures for I/O virtualization of devices, except for the limitations listed below.

The SMMUv3 specifies that input addresses are conceptually 64 bits. The SMMUv3AEM model assumes that the input address is 64 bits. If the SoC has less than 64 bits as an input address bus then if the SoC wants to use the high address space (and use TT1) then it must sign extend the address from the upstream peripherals to get to 64 bits.

The SMMUv3AEM model deals with groups of transactions with the same attributes and a similar range of addresses. The mapping used is remembered by the bus infrastructure and is used for subsequent sufficiently similar transactions without requiring intervention from the SMMU model, and so will not be traced, for instance. The range of addresses that the mapping is valid for is determined by the SMMU model, depending on architectural and model-implementation details. However, as it is unaware of any sign-extension then the mapping that the SoC does, the SoC is responsible for subsequently narrowing the range of addresses for which this mapping is valid. Typically, this is done automatically when using `PVBusMapper`.

The model has the following limitations:

- It does not support:
 - RAS.
 - Power control.
 - AMBA® stash operations and destructive read operations are not supported on `PVBus` and also are not supported by the device.
 - PCIe-NoSnoop transactions.
- The PMU has limited functionality. Only a subset of the architecturally mandatory events are supported, as indicated by the `SMMU_PMC_G_CBEID0` fields. The PMU is intended for demonstration purposes only and for driver development.

Notes

- A bad configuration renders the model inactive.
- Some configurations can be adjusted by configuration pins. These are only sampled at the negative edge of the reset pin. If you want to use these pins then you must drive them before sending a negative edge on the reset pin. During `simulation_reset` the component driving them must also drive this transition again.
- Debug reads to the registers do not disturb the state.
- Writes to registers with Update flags, including debug writes, are ignored if the Update flag is already set to one.
- Debug and real accesses to the registers must be 32 bits or 64 bits.
- MSIs are issued using attributes determined by the parameter `msi_attribute_transform`, whilst Event queue writes are always issued with `ExtendedID=0`, `UserFlags=0`, `MasterID=0xFFFFFFFF`. Thus, if your system needs to distinguish MSI writes from Event queue writes, it can do so using this mechanism.
- If your system does table walks and queue accesses through TBU0 (`separate_tw_msi_qs_port == false`), then care must be taken to distinguish table walk and queue traffic (with `MasterID=0xFFFFFFFF`) from normal translated traffic.
- If `SMMU_IDR1.TABLES_PRESET` or `SMMU_IDR1.QUEUES_PRESET` is set then see parameter `PRESET_REL_base_address` and the parameters it mentions. Embedded implementations of the SMMU are allowed to have the queues/stream table in a 'close' RAM, either on-chip or in the SMMU itself. For the model, it is up to the integrator to supply this memory and for the SMMU model to be able to access. Thus if the actual hardware has the memory built into the

SMMU then it will be necessary for the integrator to wrap this model with a bus decoder and a memory model to more closely model the embedded implementation.

Security State Determination (SSD)

The model uses the term SSD to mean the security state that the transaction, register, structure, or event belongs to. In the SMMUv3 architecture, the sideband signal SEC_SID holds this information for the transactions, but uses a different encoding.

Before RME, SEC_SID was a one-bit signal. With RME, in the hardware, it was expanded to two bits. To retain backwards compatibility in the model, SEC_SID remains as one-bit in the parameter `howto_identify`, but the second bit can be expressed with `SEC_SID_bit_1`, and its negative logic version `nSEC_SID_bit_1`.

Table 3-1253: Security State Determination (SSD) encoding

Security state	SSD	SEC_SID_bit_1	SEC_SID
Secure	0	0	1
Non-secure	1	0	0
Root (reserved)	2	1	1
Realm	3	1	0

Ports for SMMUv3AEM

Table 3-1254: Ports

Name	Protocol	Type	Description
<code>axi_stream_msi_addr_to_match_s</code>	Value_64	Slave	Any SMMU-originated MSI which exactly matches the address in this port will be sent through the AXI stream port <code>axi_stream_msi_m</code> which is usually connected to the GIC through <code>axi_stream_msi_s</code> . As MSIs are 32 bit aligned then if bits[1:0] != 0 or the address is above OAS then this is effectively disabled. The parameter <code>smmu_msi_device_id</code> is the DeviceID to send on the interface. See also the parameters: <code>axi_stream_msi_TID</code> and <code>axi_stream_msi_TDEST</code> . The default value of this port is set by the parameter <code>axi_stream_msi_addr_to_match</code> . This port is sampled at negedge of <code>reset_in</code> and must be set before the negedge of the reset signal.
<code>axi_stream_msi_m</code>	PVBus	Master	Manager port used for sending SMMU originated MSIs directly to the GIC when <code>axi_stream_msi_enabled == true</code>
<code>clk_in</code>	ClockSignal	Slave	Clock signal
<code>conf_reset_of_SMMU_GBPA_ABORT</code>	Signal	Slave	System reset value of SMMU_GBPA.ABORT. This port is sampled at negedge of <code>reset_in</code> and must be set before the negedge of the reset signal.
<code>conf_reset_of_SMMU_S_GBPA_ABORT</code>	Signal	Slave	System reset value of SMMU_S_GBPA.ABORT. This port is sampled at negedge of <code>reset_in</code> and must be set before the negedge of the reset signal.
<code>conf_system_supports_bgptm</code>	Signal	Slave	System supports broadcast TLBI PAALL and TLBI RPA for supporting RME. This port is sampled at negedge of <code>reset_in</code> and must be set before the negedge of the reset signal.

Name	Protocol	Type	Description
conf_system_supports_btm	Signal	Slave	System supports BTM and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. If BTM (Broadcast Table Maintenance) is not supported then DVM messages will be ignored. This port is sampled at negedge of reset_in and must be set before the negedge of the reset signal.
conf_system_supports_cohacc	Signal	Slave	System supports COHACC and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. If COHACC is set then page walks and SMMU-generated accesses will have the required shareability set, otherwise they will be marked as non-shareable. This port is sampled at negedge of reset_in and must be set before the negedge of the reset signal.
conf_system_supports_httu	Signal	Slave	System supports HTTU and will be reflected in the IDR registers. See parameter support_for_httu_when_starts_disallowed for the use of this signal. This port is sampled at negedge of reset_in and must be set before the negedge of the reset signal.
conf_system_supports_sev	Signal	Slave	System supports SEV and will be reflected in the IDR registers. This signal can override the value set by the parameters configuring the IDR registers. This port is sampled at negedge of reset_in and must be set before the negedge of the reset signal.
identify	SMMUv3AEMIdentifyProtocol	Master	Map the transaction to the tuple (StreamID, SubstreamID, SubstreamIDValid, SSD)
irq_out_command_queue_sync_ns	Signal	Master	Pulsed interrupt output signal for non-secure CMD_SYNC having a completion signal of SIG_IRQ.
irq_out_command_queue_sync_rl	Signal	Master	Pulsed interrupt output signal for realm CMD_SYNC having a completion signal of SIG_IRQ.
irq_out_command_queue_sync_s	Signal	Master	Pulsed interrupt output signal for secure CMD_SYNC having a completion signal of SIG_IRQ.
irq_out_event_queue_ns	Signal	Master	Pulsed interrupt output signal for the non-secure event queue becoming non-empty.
irq_out_event_queue_rl	Signal	Master	Pulsed interrupt output signal for the realm event queue becoming non-empty.
irq_out_event_queue_s	Signal	Master	Pulsed interrupt output signal for the secure event queue becoming non-empty.
irq_out_gerror_ns	Signal	Master	Pulsed interrupt output signal for non-secure SMMU_GERROR(N) signaling an error.
irq_out_gerror_rl	Signal	Master	Pulsed interrupt output signal for realm SMMU_GERROR(N) signaling an error.
irq_out_gerror_s	Signal	Master	Pulsed interrupt output signal for secure SMMU_GERROR(N) signaling an error.
irq_out_gpf_far	Signal	Master	For RME-enabled SMMUs. A new error reported in SMMU_ROOT_GPF_FAR will pulse this interrupt.
irq_out_gpt_cfg_far	Signal	Master	For RME-enabled SMMUs. A new error reported in SMMU_ROOT_GPT_CFG_FAR will pulse this interrupt.

Name	Protocol	Type	Description
irq_out_ns	Signal	Master	Pulsed interrupt output signal combined from all non-secure (non-RAS) interrupts. This delivers a pulse if any of the interrupt pins of the specified world also deliver a pulse. SW will have to poll all the different reasons to see why it was delivered.
irq_out_pmcg_ns_as_value	Value	Master	Non-secure PMCG interrupt value port. Value port representing a set of Performance Monitor Counter Group interrupts. There is an unknown number of PMCGs and so an unknown number of PMCG interrupts. There may not necessarily even be an interrupt per group. We export the interrupt to be generated as a unsigned. The 'pmcg_index' is exported on the top 16 bits and the 'pmcg_counter' (that overflowed) on the bottom 16 bits. Any configured MSI for this group will be the next transaction out of the pvbush_m_tw_msi_qs port. The architecture supports an MSI from a PMCG could come out of a different port (say the TBU manager port that a PMCG might be associated with). However the AEM only supports it coming out of the TCU port (pvbush_m_tw_msi_qs).
irq_out_pmcg_s_as_value	Value	Master	Secure PMCG interrupt value port. Value port representing a set of Performance Monitor Counter Group interrupts. There is an unknown number of PMCGs and so an unknown number of PMCG interrupts. There may not necessarily even be an interrupt per group. We export the interrupt to be generated as a unsigned. The 'pmcg_index' is exported on the top 16 bits and the 'pmcg_counter' (that overflowed) on the bottom 16 bits. Any configured MSI for this group will be the next transaction out of the pvbush_m_tw_msi_qs port. The architecture supports an MSI from a PMCG could come out of a different port (say the TBU manager port that a PMCG might be associated with). However the AEM only supports it coming out of the TCU port (pvbush_m_tw_msi_qs).
irq_out_pri_queue	Signal	Master	Pulsed interrupt output signal for the non-secure PRI queue.
irq_out_pri_queue_rl	Signal	Master	Pulsed interrupt output signal for the realm PRI queue.
irq_out_ras_cri_as_value	Value	Master	RAS Critical error interrupt value port. The number of RAS error record groups is dependent on the configuration. As each error record group could have its own interrupts then we write to this value port the error record group number (which is dependent on the configuration) to simulate an interrupt pulse. We only support modelling edge-triggered interrupts. The value passed is formatted as follows: bits[23:16] the ras error group index (if multiple error groups) (0 atm) bits[15:8] node id bits[7:0] the ras record index in the node.
irq_out_ras_eri_as_value	Value	Master	RAS Error Handling Interrupt value port. The number of RAS error record groups is dependent on the configuration. As each error record group could have its own interrupts then we write to this value port the error record group number (which is dependent on the configuration) to simulate an interrupt pulse. We only support modelling edge-triggered interrupts. The value passed is formatted as follows: bits[23:16] the ras error group index (if multiple error groups) (0 atm) bits[15:8] node id bits[7:0] the ras record index in the node.

Name	Protocol	Type	Description
irq_out_ras_fhi_as_value	Value	Master	RAS Fault Handling Interrupt value port. The number of RAS error record groups is dependent on the configuration. As each error record group could have its own interrupts then we write to this value port the error record group number (which is dependent on the configuration) to simulate an interrupt pulse. We only support modelling edge-triggered interrupts. The value passed is formatted as follows: bits[23:16] the ras error group index (if multiple error groups) (0 atm) bits[15:8] node id bits[7:0] the ras record index in the node.
irq_out_rl	Signal	Master	Pulsed interrupt output signal combined from all realm (non-RAS) interrupts. This delivers a pulse if any of the interrupt pins of the specified world also deliver a pulse. SW will have to poll all the different reasons to see why it was delivered.
irq_out_s	Signal	Master	Pulsed interrupt output signal combined from all secure (non-RAS) interrupts. This delivers a pulse if any of the interrupt pins of the specified world also deliver a pulse. SW will have to poll all the different reasons to see why it was delivered.
logptsz_s	Value	Slave	RME: This is a four bit signal that encodes the region size that a single LOGPT entry covers. The default value of this port is derived from the parameter <code>rme_logpt_entry_covers_log2size_in_bytes</code> which is in a different format to the port. If a valid value is driven then it will be put in the field <code>SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ</code> . The port uses the same encoding as the field. If an invalid value is driven to this pin and <code>legacy_tz_en</code> is low then the model will obey the setting of the parameter <code>out_of_range_logptsz_s</code> . This port is sampled at negedge of <code>reset_in</code> and must be set before the negedge of the reset signal.
legacy_tz_en	Signal	Slave	For an RME-enabled SMMU then tie this high to get non-RME behaviour See also the parameter <code>SMMU_ROOT_IDR0</code> . This port is sampled at negedge of <code>reset_in</code> and must be set before the negedge of the reset signal.
pvbus_control_s	PVBus	Slave	Register subordinate port
pvbus_id_routed_m	PVBus	Master	This is a special "id-routed" port for transmitting ATC invalidates and PRI Responses upstream into the PCIe EndPoints, it is not a normal bus. The FastSim ATC invalidate protocol specifies how to route and deal with this this port. See the parameter <code>output_id_routed_transform</code> It is assumed that the StreamID can uniquely route the transaction if there are multiple PCIe Root Complexes.
pvbus_m[64]	PVBus	Master	The TBU manager ports that carry transactions that have been translated from the correspondingly numbered <code>pvbus_s[]</code> port.
pvbus_m_tw_msi_qs	PVBus	Master	Manager port used for Table Walks, MSIs and Queue access when <code>separate_tw_msi_qs_port=true</code>
pvbus_s[64]	PVBus	Slave	The TBU subordinate ports that receive transactions to be translated. They will exit the SMMU through the same numbered <code>pvbus_m[]</code> port.
reset_in	Signal	Slave	Reset signal
sev_out	Signal	Master	Event signal

Parameters for SMMUv3AEM

PRESET_REL_base_address

Type

uint64_t

Default value

0

If using preset addresses (SMMU_IDR1.QUEUES_PRESET/TABLES_PRESET) then the queue and table base registers become fixed. If SMMU_IDR1.REL then the addresses are relative to the base of the register file and this parameter tells the model what address to add to the queue/table addresses to calculate the actual address.

This is for 'embedded implementations' where the memory for these structures is held within the SMMU itself or in a 'close' RAM. The model does not contain any RAM and the integrator must supply a RAM at the appropriate address.

If the preset tables/queues overlap, the RAM has to implement separate secure and non-secure address spaces.

See also: * TABLES_PRESET_smmu_{s,r}strtab_base *
TABLES_PRESET_smmu_{s,r}strtab_base_cfg * QUEUES_PRESET_smmu_{s,r}cmdq_base *
QUEUES_PRESET_smmu_{s,r}eventq_base * QUEUES_PRESET_smmu_{r}priq_base (no secure PRIQ)

QUEUES_PRESET_smmu_cmdq_base

Type

uint64_t

Default value

0

If SMMU_IDR1.QUEUES_PRESET == 1 then this is the value that appears in SMMU_CMDQ_BASE and SMMU_CMDQ_BASE becomes read-only.

See also parameter PRESET_REL_base_address.

QUEUES_PRESET_smmu_eventq_base

Type

uint64_t

Default value

0

If SMMU_IDR1.QUEUES_PRESET == 1 then this is the value that appears in SMMU_EVENTQ_BASE and SMMU_EVENTQ_BASE becomes read-only.

See also parameter PRESET_REL_base_address.

QUEUES_PRESET_smmu_priq_base

Type

uint64_t

Default value

0

If SMMU_IDR1.QUEUES_PRESET == 1 and SMMU_IDR0.PRI == 1 then this is the value that appears in SMMU_PRIQ_BASE and SMMU_PRIQ_BASE becomes read-only.

See also parameter PRESET_REL_base_address.

QUEUES_PRESET_smmu_r_cmdq_base

Type

uint64_t

Default value

0

If SMMU_IDR1.QUEUES_PRESET == 1 then this is the value that appears in SMMU_R_CMDQ_BASE and SMMU_R_CMDQ_BASE becomes read-only.

See also parameter PRESET_REL_base_address.

QUEUES_PRESET_smmu_r_eventq_base

Type

uint64_t

Default value

0

If SMMU_IDR1.QUEUES_PRESET == 1 and SMMU_ROOT_IDR0.REALM_IMPL == 1 then this is the value that appears in SMMU_R_EVENTQ_BASE and SMMU_R_EVENTQ_BASE becomes read-only.

See also parameter PRESET_REL_base_address.

QUEUES_PRESET_smmu_r_priq_base

Type

uint64_t

Default value

0

If `SMMU_IDR1.QUEUES_PRESET == 1` and `SMMU_IDR0.PRI == 1` and `SMMU_ROOT_IDR0.REALM_IMPL == 1` then this is the value that appears in `SMMU_PRIQ_BASE` and `SMMU_PRIQ_BASE` becomes read-only.

See also parameter `PRESET_REL_base_address`.

QUEUES_PRESET_smmu_s_cmdq_base

Type

`uint64_t`

Default value

0

If `SMMU_IDR1.QUEUES_PRESET == 1` and `SMMU_S_IDR1.SECURE_IMPL == 1` then this is the value that appears in `SMMU_S_CMDQ_BASE` and `SMMU_S_CMDQ_BASE` becomes read-only.

See also parameter `PRESET_REL_base_address`.

QUEUES_PRESET_smmu_s_eventq_base

Type

`uint64_t`

Default value

0

If `SMMU_IDR1.QUEUES_PRESET == 1` and `SMMU_S_IDR1.SECURE_IMPL == 1` then this is the value that appears in `SMMU_S_EVENTQ_BASE` and `SMMU_S_EVENTQ_BASE` becomes read-only.

See also parameter `PRESET_REL_base_address`.

SMMU_AIDR

Type

`uint32_t`

Default value

0

`SMMU_AIDR` contains the Major and Minor architectural revisions numbers

SMMU_IDR0

Type

`uint32_t`

Default value

•

`SMMU_IDR0`. The following fields are further combined with the port `conf_system_supports_{sev,httu,btm,cohacc}`: - * sev * ht tu * btm * cohacc

NOTE that SMMU_IDR0.RME_IMPL is the value that the SMMU should have if the SMMU is currently RME-aware. It will be forced to zero if the SMMU has been forced to be unaware of RME by legacy_tz_en.

SMMU_IDR1

Type

uint32_t

Default value

•

SMMU_IDR1.

SMMU_IDR2

Type

uint32_t

Default value

0

SMMU_IDR2 holds the BA_VATOS field.

SMMU_IDR3

Type

uint32_t

Default value

0

SMMU_IDR3 is reserved.

SMMU_IDR4

Type

uint32_t

Default value

0

SMMU_IDR4 is Imp def.

SMMU_IDR5

Type

uint32_t

Default value

0

SMMU_IDR5 contains, amongst others the output address encoded size (OAS).

SMMU_IDR6

Type

uint32_t

Default value

0

SMMU_IDR6 is **RES0** if Enhanced Command Queues do not exist (SMMU_IDR1.ECMDQ == 0).

Otherwise, SMMU_IDR6 contains information about the configuration of the ECMDQs.

SMMU_IIDR

Type

uint32_t

Default value

0

SMMU_IIDR contains fields for the implementer, product revision, etc.

SMMU_MPAMIDR

Type

uint32_t

Default value

0

SMMUv3.2: If SMMU_IDR3.MPAM == 1 then SMMU_MPAMIDR holds further ID information for Memory Partitioning And Monitoring (MPAM) extension.

This is optional in SMMUv3.2 and is backported to SMMUv3.1.

SMMU_ROOT_IDR0

Type

uint32_t

Default value

0

If SMMU_ROOT_IDR0 is 0 then the SMMU is RME-unaware.

Otherwise...

legacy_tz_en is a pin that when high disables RME and the SMMU_ROOT_IDR0 register reads as zero.

The effective value of legacy_tz_en is derived from * the last signalled value sampled at negedge of reset * or if never signalled, the inverse of ROOT_IMPL (bit[0]) of this parameter.

Thus, `ROOT_IMPL` should be zero if we want `legacy_tz_en` to start as high regardless of the actual configuration we want in the `SMMU_ROOT_IDR0` register when the SMMU is RME-aware.

In other words, if the SMMU is to be RME-aware, then all parameters should be configured as though the SMMU is currently RME-aware with the exception that `SMMU_ROOT_IDR0.ROOT_IMPL` is the inverse of the default value of `legacy_tz_en`.

`SMMU_ROOT_IDR0.BGPTM` is the default value of the pin `conf_system_supports_bgptm`.

SMMU_ROOT_IIDR

Type

`uint32_t`

Default value

0

The value of the `SMMU_ROOT_IIDR` register. If is zero then will be the same as `SMMU_IIDR`.

SMMU_R_AIDR

Type

`uint32_t`

Default value

0

The value of `SMMU_R_AIDR`.

SMMU_R_IDR0

Type

`uint32_t`

Default value

0

The value of `SMMU_R_IDR0`.

SMMU_R_IDR3

Type

`uint32_t`

Default value

0

The value of `SMMU_R_IDR3`.

SMMU_R_IDR6

Type

uint32_t

Default value

0

The value of SMMU_R_IDR6 that configures the ECMDQs.

SMMU_R_MECIDR

Type

uint32_t

Default value

0

The value of SMMU_R_MECIDR.

SMMU_R_MPAMIDR

Type

uint64_t

Default value

0xFFFFffffffFFFFFF

NOTE this parameter is 64 bits but the ID register is 32 bits.

This parameter is the value of SMMU_R_MPAMIDR, or if ~0ull then it will have the following default values:

- PARTID_MAX/PMG_MAX from the SMMU_MPAMIDR
- HAS_MPAM_NS from the SMMU_S_MPAMIDR if it exists, otherwise 0.

SMMU_S_IDR0

Type

uint32_t

Default value

0

Secure IDR0 register.

SMMU_S_IDR1

Type

uint32_t

Default value

-

SMMU_S_IDR1 Indicates if there is a secure side by bit 31.

SMMU_S_IDR2

Type

uint32_t

Default value

0

SMMU_S_IDR2 Reserved

SMMU_S_IDR3

Type

uint32_t

Default value

0

SMMU_S_IDR3 Reserved

SMMU_S_IDR4

Type

uint32_t

Default value

0

SMMU_S_IDR4 IMP DEF

SMMU_S_IDR6

Type

uint32_t

Default value

0

SMMU_S_IDR6 is **RES0** if Secure Enhanced Command Queues do not exist (SMMU_S_IDR0.ECMDQ == 0).

Otherwise, SMMU_S_IDR6 contains information about the configuration of the ECMDQs.

SMMU_S_MPAMIDR

Type

uint32_t

Default value

0

SMMUv3.2: If SMMU_IDR3.MPAM == 1 then SMMU_S_MPAMIDR holds further ID information for Memory Partitioning And Monitoring (MPAM) extension.

This is optional in SMMUv3.2 and is backported to SMMUv3.1.

TABLES_PRESET_smmu_r_strtab_base

Type

uint64_t

Default value

0

If SMMU_IDR1.TABLES_PRESET == 1 and SMMU_ROOT_IDR0.REALM_IMPL == 1 then this is the value that appears in SMMU_R_STRTAB_BASE and SMMU_R_STRTAB_BASE becomes read-only.

See also parameter PRESET_REL_base_address.

TABLES_PRESET_smmu_r_strtab_base_cfg

Type

uint32_t

Default value

0

If SMMU_IDR1.TABLES_PRESET == 1 and SMMU_ROOT_IDR0.REALM_IMPL == 1 then this is the value that appears in SMMU_R_STRTAB_BASE_CFG and SMMU_R_STRTAB_BASE_CFG becomes read-only.

See also parameter PRESET_REL_base_address.

TABLES_PRESET_smmu_s_strtab_base

Type

uint64_t

Default value

0

If SMMU_IDR1.TABLES_PRESET == 1 and SMMU_S_IDR1.SECURE_IMPL == 1 then this is the value that appears in SMMU_S_STRTAB_BASE and SMMU_S_STRTAB_BASE becomes read-only.

See also parameter PRESET_REL_base_address.

TABLES_PRESET_smmu_s_strtab_base_cfg

Type

uint32_t

Default value

0

If `SMMU_IDR1.TABLES_PRESET == 1` and `SMMU_S_IDR1.SECURE_IMPL == 1` then this is the value that appears in `SMMU_S_STRTAB_BASE_CFG` and `SMMU_S_STRTAB_BASE_CFG` becomes read-only.

See also parameter `PRESET_REL_base_address`.

TABLES_PRESET_smmu_strtab_base

Type

`uint64_t`

Default value

0

If `SMMU_IDR1.TABLES_PRESET == 1` then this is the value that appears in `SMMU_STRTAB_BASE` and `SMMU_STRTAB_BASE` becomes read-only.

See also parameter `PRESET_REL_base_address`.

TABLES_PRESET_smmu_strtab_base_cfg

Type

`uint32_t`

Default value

0

If `SMMU_IDR1.TABLES_PRESET == 1` then this is the value that appears in `SMMU_STRTAB_BASE_CFG` and `SMMU_STRTAB_BASE_CFG` becomes read-only.

See also parameter `PRESET_REL_base_address`.

all_error_messages_through_trace

Type

`bool`

Default value

false

Some conditions in the SMMU are so strange that the software programming the SMMU has done something wrong. At this point messages are output to either `ArchMsg.Error.*` or `ArchMsg.Warning.*` or to the error stream of the simulator. Outputting to the error stream of the simulator may cause it to return with a non-zero exit status.

If you set this option to true then instead of using the error stream of the simulator it will always use a trace stream allowing the simulation to exit with a zero exit status.

allow_non_secure_access_to_SMMU_S_INIT

Type

`bool`

Default value

false

If the system has no software operating as a secure agent then set this parameter. This allows non-secure accesses to the SMMU_S_INIT register and allows the non-secure software to reset the TLB, clearing out any 'secure' TLB entries.

If the SMMU does not implement the security extensions (SMMU_S_IDR1.SECURE_IMPL == 0) then this parameter is ignored.

apply_ste_instcfg_privcfg_on_all_ats_translated_accesses**Type**

bool

Default value

false

If SMMU_IDR1.ATTR_PERMS_OVR == 0 then this parameter is ignored.

Otherwise, if this parameter is:

- false: STE.INSTCFG/PRIVCFG will only be applied to ATS-TranslatedTransactions if STE.EATS==split-stage.
- true: STE.INSTCFG/PRIVCFG will be applied to all ATS-TranslatedTransactions regardless of the value of STE.EATS.

ats_split_stage_dbm_update_do_with_ATSRequest**Type**

unsigned

Default value

0

When doing split-stage ATS, then the DBM update for the final stage 2 descriptor can be done either whilst processing the ATS request or delayed until it actually sees the PCIe Translated Transaction using the stage 2 descriptor.

0 – do when see actual transaction 1 – do when processing the ATS request 2 – do it randomly with 50% chance.

axi_stream_msi_TDEST**Type**

uint32_t

Default value

0

ID of the AXI stream subordinate port on the GIC that receives SMMU originated MSIs sent directly. The name of the GIC port is `axi_stream_msi_s`.

If `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_addr_to_match`
- `axi_stream_msi_TID`

`axi_stream_msi_TID`

Type

`uint32_t`

Default value

0

ID of the AXI stream manager port that sends SMMU TCU originated MSIs directly to the GIC. The name of the SMMU port is `axi_stream_msi_m`.

If `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_addr_to_match`
- `axi_stream_msi_TDEST`

`axi_stream_msi_addr_to_match`

Type

`uint64_t`

Default value

`0xFFFFFFFFFFFFFFFF`

If the last two bits are 0, any SMMU-originated MSI which exactly matches the address will be sent through the AXI stream port `axi_stream_msi_m` which is usually connected to the GIC.

This parameter drives the value of the `axi_stream_msi_addr_to_match_s` port at simulation reset. For every reset after that, the value of the port will be sampled and used if changed.

The entire address must match, including bits [1:0]. As MSIs are 32 bit aligned then if `axi_stream_msi_addr_to_match[1:0] != 0`, or the address is above OAS then this is effectively disabled.

See also:

- `axi_stream_msi_TID`
- `axi_stream_msi_TDEST`

behaviour_of_sampled_at_reset_signals

Type

unsigned

Default value

0

Some configuration signals into the SMMU are sampled on negedge of reset.

However, it can sometimes be hard to arrange to drive a configuration pin before the negedge of reset.

The configuration pins are sampled:

0

at negedge reset.

1

at negedge reset, but if a later change occurs at the same simulated time, and no transactions have occurred, then they will be resampled and the SMMU reset again.

cmdq_max_number_of_commands_to_buffer

Type

uint32_t

Default value

10

The command queues can buffer fetched commands before issuing them. This parameter is roughly the maximum number of commands to do this for. The programmer visible effects are that just because the CONS pointer shows a command has been consumed does not necessarily mean that it has been issued (and completed). Higher values accentuate this effect.

dpt_configure_ATS_formed_entries

Type

string

Default value

"all_enabled_stages, vmsa_and_gpc"

A comma-separated list of options.

If the string is "" / "none", then no ATS-formed DPT TLB entries are used.

Otherwise...

One of:

- "all_enabled_stages" / "" – use all enabled VMSA stages (default)
- "last_enabled_stage" – use only the last enabled VMSA stage.

The DPT entry size, one of:

- "vmsa_and_gpc" / "" – store as the smaller of the VMSA and GPC region (default)
- "vmsa_only" – store as the VMSA region

ATS-formed entries and DPT-formed entries can be distinguishable, one of:

- "on_fault_always_walk" / "" – ATS-formed and DPT-formed entries are not distinguished (default)
- "on_fault_walk_if_ATS_formed" – ATS-formed entries are not definitive and will cause a walk. DPT-formed entries are definitive and will not cause a walk.

An ATS-formed entry can still be inserted if the only reason it fails is because of the final GPC check, one of:

- "only_if_passes_final_PA_GPC_check"
- "even_if_fails_final_PA_GPC_check"

Example:

"all_enabled_stages, vmsa_and_gpc"

If we find a DPT TLB entry that is ATS-formed or the implementation does not distinguished ATS-formed or DPT-formed entries then:

- for downgradeable transactions, then if the entry does not allow the transaction but would allow the downgraded transaction:
 - "do_not_prefer_downgrade_over_DPT_walk" – walk the DPT to see if the non-downgraded transaction would be allowed.
 - "prefer_downgrade_over_DPT_walk" (default) – just do the downgrade and avoid a DPT walk.
- for a NOPpable transaction, then if the entry does not allow the transaction:
 - "do_not_prefer_found_entry_NOP_over_DPT_walk" – walk the DPT to see if the original transaction is allowed.

- “prefer_found_entry_NOP_over_DPT_walk” (default) – just **NOP** the transaction and avoid a DPT walk.

NOTE that if no entry is found then a NOPpable transaction will still perform a walk.

dpt_configure_invalidation

Type

string

Default value

""

Configure when entries are invalidated when performing a DPT check.

A comma-separated list of options.

Choose one of: * lookup_fault_invalidates_any_existing_entries / "" (default) *
lookup_fault_leaves_any_existing_entries

Choose one of: * noaccess_fault_invalidates_any_existing_entries / "" (default) *
noaccess_fault_leaves_any_existing_entries

enable_device_id_checks

Type

bool

Default value

true

If this parameter is true then the DeviceIDs seen by the GIC are:

- **for client devices**

`DeviceID = StreamID + translated_device_id_base`

- **for SMMU-generated MSIs**

`smmu_msi_device_id`

This parameter enables two checks:

- If the DeviceID is used in the `output_attribute_transform` parameter, if it overflows 32 bits then the model warns. If the DeviceID is not used, it is assumed that the external agent that forms the DeviceID warns if it overflows.
- If the SMMU supports MSIs, the model checks that the GIC is able to distinguish an MSI generated by the SMMU from one generated by a client device.

As the exact mechanism to determine the DeviceID is in the system and not necessarily under control of the SMMU then you can disable these warnings using this parameter.

See also the parameters: `output_attribute_transform` and `msi_attribute_transform`.

hide_warning_EOPD_differs_from_what_would_be_cached**Type**

bool

Default value

false

When this parameter is set to true, warnings that the effective EOPD value differs from what would be cached in the TLB are disabled. False (warnings are showed) by default.

hide_warning_NoStreamID_transaction_for_unsupported_PAS_or_MPAM_SP**Type**

bool

Default value

false

When RME is not supported then a NoStreamID transaction with `PAS[1] == 1` or `MPAM_SP[1] == 1` is treated as though `PAS[1] == 0` and `MPAM_SP[1] == 0`. This is usually a system construction error and is not expected to occur.

The SMMU warns when this occurs, but the warning can be hidden by setting this parameter.

howto_identify**Type**

string

Default value

"use-identify"

If `use-identify` then the SMMU uses the `identify` port to determine the `ssd`, `streamID`, `substreamID`. Otherwise, this string extracts them from the transaction's attributes.

Examples:

```
SEC_SID=ExtendedID[63], SSV=ExtendedID[62], SubstreamID=ExtendedID[51:32],
StreamID=ExtendedID[31:0]
nSEC_SID=ExtendedID[63], StreamID=ExtendedID[55:24], nSSV=ExtendedID[20],
SubstreamID=ExtendedID[19:0]
StreamID[31:24]=0, StreamID[23:0]=ExtendedID[23:0], SSV=1[0], ...
```

The `streamID` (32 b) is valid if `sidv` is 1 or both `sidv` and `nsidv` are unused.

`SEC_SID` is 1b in the model. For RME systems, in hardware, then `SEC_SID` is 2b, in the model `SEC_SID_bit_1` represents bit[1].

The `substreamID` (20 b) is valid if `ssv` is true.

`SIDV == 0` indicates a NoStreamID transaction and the SSD is the PAS of the transaction, `SEC_SID` is not used.

`nSEC_SID`, `nSSV`, `nSIDV` are available with negative logic. Different attributes are independent and can use negative or positive logic. Negative and positive logic symbols for the same attribute is an error.

The model uses the term SSD (Security State Determination) to mean which security state the transaction, register, structure, event, etc. belongs to.

In the SMMUv3 Architecture, the side-band signal `SEC_SID` holds the information for the transactions, but uses a different encoding.

Before RME, `SEC_SID` was a one bit signal. With RME, in the hardware, it was expanded to 2b. To retain backwards compatibility in the model, `SEC_SID` remains as 1b in this parameter, but the second bit can be expressed with `SEC_SID_bit_1` (and its negative logic version `nSEC_SID_bit_1`)

Security state	SSD	SEC_SID_bit_1	SEC_SID
secure	0	0	1
non-secure	1	0	0
root (reserved)	2	1	1
realm	3	1	0

For those systems that support NoStreamID transactions, and `howto_identify` is not using the port, first the SMMU determines the value of `SIDV` or `nSIDV` to see if the transaction is a NoStreamID transaction (`SIDV == 0` or `nSIDV == 1`). If so then the rest of the `howto_identify` string is ignored as the information extracted relates only to StreamID transactions. Instead more information is extracted using the parameter `howto_identify_NoStreamID_extra_info`.

howto_identify_NoStreamID_extra_info

Type

string

Default value

""

The behavior of this parameter depends on `howto_identify`

- if it equals 'use-identify' then this must be "", otherwise there is an error.
- if it identifies a NoStreamID transaction (`SIDV=0`) then this parameter includes one or more of
 - `MPAM_SP`
 - `MPAM_PARTID`
 - `MPAM_PMG`
 - `MECID`
 - `HWATTR_KIND_0`
- in any other case, this parameter is ignored.

Fields set in this parameter must not overlap the `sidv/nsidv` fields in `howto_identify`

Example:

```
MPAM_PMG[7:0]=ExtendedID[62:55], MPAM_PARTID[15:0]=ExtendedID[54:39],
MPAM_SP[1:0]=ExtendedID[38:37], MECID[15:0]=UserFlags[31:16]
HWATTR_KIND_0[3:0]=ExtendedID[42:39]
```

httu_early_st2_permission_fault_if_af_update_at_stage1

Type

unsigned

Default value

0

If a stage 1 descriptor needs an HTTU update, but the descriptor is unwriteable at stage 2 and also a stage 1 permission fault occurs, then the architecture permits either the stage 1 or stage 2 permission fault to be recorded.

0 – stage 1 permission check check stage 1 descriptor writeable at stage 2 if AF- or DBM-update required

1 – check stage 1 descriptor writeable at stage 2 if AF-update required stage 1 permission check
check stage 1 descriptor writeable at stage 2 if DBM-update required

2 – do behaviour 1 or 2 randomly with a 50% chance.

httu_memory_types_supported

Type

string

Default value

“rawaWB, raWB, waWB, naWB”

This is a comma-separated list of memory types that are **IMPLEMENTATION DEFINED** as supporting HTTU. However, the system must have Far Atomic support for the specified memory address and memory type.

Device types: * nGnRnE, nGnRE, nGRE, GRE

Normal memory types are composed of an ‘inner’ and an ‘outer’ cacheability. The model only supports types where the inner and outer are identical.

- Normal non-cacheable types
 - nc_nb, nc
- Cacheable types are of the form (na?|(ra)?(wa)?)(WT|WB)(tr)?
 - na/ra/wa – no/read/write allocate
 - WT/WB – write through/write back

- tr – transient
- exceptions:
 - ‘na’ and ‘tr’ are incompatible
 - without ‘na’ then you must specify at least one of ra/wa. Example: “WT” is illegal, “raWT” is legal.

rawaWB is always supported and it is optional.

Examples: * “rawaWB, raWB, waWB, naWB” – only the WB type is supported * “nc” – rawaWB and the normal non-cacheable type are supported

imp_def_L1CD_L2Ptr_out_of_range

Type

unsigned

Default value

0

If an L1CD.L2Ptr is out of range of IAS/OAS as appropriate then what happens is controlled by this parameter: 0 – if is an IPA, then Stage 2 Translation Fault, if is a PA then truncate to OAS 1 – generate C_BAD_SUBSTREAMID if an IPA and > IAS, or if a PA and > OAS. 2 – generate C_BAD_SUBSTREAMID if an IPA and > IAS, or F_CD_FETCH if a PA and > OAS. 3 – truncate the IPA or PA to IAS/OAS as appropriate

NOTE that if the model is configured as SMMUv3.1 then this parameter is IGNORED, and behaves as though this parameter was set to 1. The SMMUv3.1 architecture actually allows more behaviours but the model will only implement this one.

NOTE that the SMMUv3.0 allows more behaviours than can be expressed by this parameter.

imp_def_PID0

Type

unsigned

Default value

0x83

If imp_def_has_PID_CID is true then this is the PID0 value.

imp_def_PID1

Type

unsigned

Default value

0xb4

If imp_def_has_PID_CID is true then this is the PID1 value.

imp_def_PID2**Type**

unsigned

Default value

0xb

If imp_def_has_PID_CID is true then this is the PID2 value.

imp_def_PID3**Type**

unsigned

Default value

0x0

If imp_def_has_PID_CID is true then this is the PID3 value.

imp_def_PID4**Type**

unsigned

Default value

0x4

If imp_def_has_PID_CID is true then this is the PID4 value.

imp_def_S1ContextPtr_out_of_range**Type**

unsigned

Default value

0

If an STE is fetched that uses a stage 1 then if: - Stage 1 only and S1ContextPtr > OAS, or - Stage 1+2 and S1ContextPtr > IAS then what happens is IMP DEF and this parameter controls the behaviour:- 0 – stage 1 only – C_BAD_STE – stage 1+2 – C_BAD_STE 1 – stage 1 only – C_BAD_STE – stage 1+2 – truncate to IAS 2 – stage 1 only – truncate to OAS – stage 1+2 – C_BAD_STE 3 – stage 1 only – truncate to OAS – stage 1+2 – truncate to IAS 4 – stage 1 only – truncate to OAS – stage 1+2 – Stage 2 translation fault 5 – stage 1 only – C_BAD_STE – stage 1+2 – Stage 2 translation fault The architecture also allows for F_CD_FETCH, but the model does not support this.

NOTE that in SMMUv3.1 then the only allowed values of this parameter are 0 or 5.

imp_def_alloccfg**Type**

unsigned

Default value

0

ALLOCCFG overrides the read/write/transient hints on cacheable types. However these are hints and an implementation may choose to treat them differently. 0 – apply the alloc hints as architecturally specified 1 – ignore all ALLOCCFG fields (treated as zero) 2 – apply ALLOCCFG only when MTCFG == 1

imp_def_apply_dre_dcp_to_full_ats**Type**

bool

Default value

false

STE.DRE and STE.DCP control the downgrade of certain transactions to **NOP**.

If this parameter is true, then for ATS-TranslatedTransactions using STE.EATS == all_stages or use_dpt then the STE.DRE/STE.DCP controls are applied.

For ATS-TranslatedTransactions using STE.EATS == eats_use_dpt then the controls are always applied.

For SMMUv3.4 and later, or if SMMU_IDR3.DPT == 1 then this parameter is ignored and treated as 'true'.

imp_def_ats_attribute_stashing**Type**

unsigned

Default value

0

The SMMU architecture allows an ATS request to return the attributes with which to make the Translated Access. PCIe does not define any transaction attributes in the ARM sense and so the mechanism for doing this is IMP DEF. Usually this would be done by packing them into the high order address bits of the return response.

In the model, then the representation of the ATS reply returns the attributes directly and it is up to the ATC whether it wants to use them or not.

The parameter configures what to place in those architectural attributes in the ATS Reply.

0 – the architectural attributes 1 – Inner Write Back, Outer Write Back, Inner Shared, read and write allocate, User-Data 2 – Inner Write Back, Outer Write Back, Outer Shared, read and write allocate, User-Data

The SMMU cannot force an ATC to use these attributes, it is simply the attributes that are returned in the non-PCIe part of the ATS reply.

imp_def_ats_response_stu

Type

unsigned

Default value

0

A successful ATS Response with RW != 0 can return any-sized region from the STU to the actual region size. The chosen size is:

- 0 – use the full size of the region
- 1 – use the STU
- 2 – use half the size of the region

imp_def_cohacc_effect

Type

unsigned

Default value

0

SMMU_IDR0.COHAACC is a system property. However, the exact nature of the transactions that the SMMU emits is an IMP DEF property when COHAACC == 0: 0 – COHAACC == 0 forces the output attributes of SMMU-generated accesses to non-shared. 1 – The only effect of COHAACC is what is reported in SMMU_IDR0.COHAACC and has no effect on the output attributes of SMMU-generated accesses.

imp_def_contiguous_bit_handling

Type

unsigned

Default value

0

If the Contiguous bit is set in a translation table descriptor then modify how it is cached:

- 0 – use the full size of the contiguous region
- 1 – ignore the contig bit for determining the region size
- 2 – use half the size of the contiguous region

See `imp_def_gpt_contiguous_bit_handling` for GPT Contig bit handling.

imp_def_effective_ATTR_TYPES_OVR_is_false_per_port**Type**

string

Default value

""

SMMU_IDR1.ATTR_TYPES_OVR == 1 means that the STE and SMMU_(S_)GBPA MTCFG/SHCFG/ALLOCCFG have an effect.

However, an implementation is allowed to ignore this being one for specific ports and *not* apply the overrides MTCFG/SHCFG/ALLOCCFG despite SMMU_IDR1.ATTR_TYPES_OVR == 1.

This parameter is a comma-separated lists of port ranges (indexed from 0) for those ports where SMMU_IDR1.ATTR_TYPES_OVR behaves as 0. For example:

0, 10-20, 40

imp_def_gpt_contiguous_bit_handling**Type**

unsigned

Default value

0

If we find a GPT Contiguous descriptor then modify how it is cached:

- 0 – use the full size of the contiguous region
- 1 – ignore the contig bit for determining the region size and use PGS
- 2 – use half the size of the contiguous region

See imp_def_contiguous_bit_handling for VMSA Contig bit handling.

imp_def_has_PID_CID**Type**

bool

Default value

true

If this is true then the SMMU model will have the standard PID/CID ID registers. Only the PID0..PID4 registers can be customized and the parameters imp_def_PID0..imp_def_PID4 are used.

imp_def_ns_bit_for_s_gatos_on_s1_bypass_non_sel2**Type**

uint32_t

Default value

0

This parameter only has an effect if SEL2 == 0.

When SEL2 == 0, Secure virtualisation is not supported and only stage 1 is supported for Secure Streams.

In this case, the Secure ATOS interface does not provide a mechanism to specify the input NS bit to the stage 1 translation. The input bit is IMP DEF and only has an effect if the transaction has no SubstreamID and bypasses by S1DSS.

This parameter specifies the IMP DEF input bit: 0 – secure 1 – non-secure 2 – random

See also `imp_def_ns_bit_for_s_vatos_on_s1_bypass` which configures something similar for the Secure VATOS (not GATOS) interface.

`imp_def_ns_bit_for_s_vatos_on_s1_bypass`**Type**

uint32_t

Default value

0

When a Secure VATOS operations for a translation that bypasses stage 1 by S1DSS then the output NS bit is the same as the input NS bit of the translation.

The architecture does not provide an input NS bit in the SMMU_S_VATOS_ADDR register and it is treated as an IMP DEF value.

This parameter specifies that value: 0 – secure 1 – non-secure 2 – random

See also `imp_def_ns_bit_for_s_gatos_on_s1_bypass_non_sel2` which configures something similar for the Secure GATOS (not VATOS) interface.

`imp_def_ras_access_control_policy`**Type**

string

Default value

"use-imp_def_ras_allow_non_secure_accesses_if_supports_secure"

The access control of the RAS nodes:

- "" / "use-imp_def_ras_allow_non_secure_accesses_if_supports_secure"
 - The parameter `imp_def_ras_allow_non_secure_accesses_if_supports_secure` is used to determine access
- "non-secure"

- Allow access to all PASEs.
- “secure”
 - Only allow access to secure and root. If secure is not implemented then will allow access to non-secure.
- “root-only”
 - The register file is only accessible to root-pas transactions. If root is not implemented then it will act as though this parameter was: “use-imp_def_ras_allow_non_secure_accesses_if_supports_secure”

imp_def_ras_allow_non_secure_accesses_if_supports_secure

Type

bool

Default value

false

If two security worlds are supported, i.e.: SMMU_S_IDR1.SECURE_IMPL == 1 then if this parameter is true, then non-secure accesses are allowed to access any RAS registers (see parameter ‘ras’). Otherwise, non-secure accesses are **RAZ/WI**.

If only a single security state (non-secure) is supported, then this parameter is ignored and non-secure accesses are always allowed.

See also imp_def_ras_access_control_policy that can override this parameter.

imp_def_reset_unknown_fields_to_zero

Type

bool

Default value

false

Many fields and registers in the SMMUv3 architecture reset to an **UNKNOWN** value. However, many implementations will choose to reset to 0. By setting this parameter to true then those fields will be initialised to zero.

imp_def_rme_gpf_syndrome_for_PMCG_MSIs

Type

string

Default value

“other_gpf”

An MSI access from a PMCG that experiences a GPF is permitted to be reported as either of:

- REASON = GERROR and FAULTCODE = OTHER_GPF

- REASON = TRANSACTION

The values of this string are one of: * other_gpf * transaction

See also the parameter `imp_def_rme_gpf_syndrome_for_RAS_MSIs`

`imp_def_rme_gpf_syndrome_for_RAS_MSIs`

Type

string

Default value

"other_gpf"

An MSI access from a RAS record interrupt that experiences a GPF is permitted to be reported as either of:

- REASON = GERROR and FAULTCODE = OTHER_GPF
- REASON = TRANSACTION

The values of this string are one of: * other_gpf * transaction

See also the parameter `imp_def_rme_gpf_syndrome_for_PMCG_MSIs`

`imp_def_rme_mpam_info_from_NoStreamID_on_gpt_walks_ignored`

Type

bool

Default value

false

The MPAM related fields set in 'howto_identify_NoStreamID_extra_info' are ignored when this parameter is set. This parameter only makes sense when 'howto_identify' equals 'use-identify' so in any other case it must be false.

When this parameter is set: * MPAM_SP = PAS * MPAM_PARTID = 0 * MPAM_PMG = 0

`imp_def_split_ATS_attributes_is_stage1`

Type

bool

Default value

false

If using split stage ATS, then it is IMP DEF whether the stage 1 attributes are returned to the ATS request or stage 2.

This only has a meaning if the SMMU can stash attributes in the ATS response.

imp_def_truncate_out_of_range_streamids_on_invalidate_commands**Type**

bool

Default value

false

If this parameter is true then the StreamID fields of the following commands will be truncated to (S_)SIDSIZE:

- CMD_ATC_INV
- CMD_CFGI_STE
- CMD_CFGI_STE_RANGE
- CMD_CFGI_CD
- CMD_CFGI_CD_ALL

Otherwise, these commands will **NOP**.

imp_def_v3_atos_fault**Type**

unsigned

Default value

0

For an IPA to PA ATOS translation that encounters a Stage 1 Address Size Fault then the PAR.REASON field reports: * in SMMUv3.1, 'Stage 1' (0) * in SMMUv3.0, 'Stage 1' (0) or 'Input' (3) depending on the implementation.

This parameter is ignored for SMMUv3.1.

For SMMUv3.0 then the values are: 0 – report as 'Input' (3) 1 – report as 'Stage 1' (0)

ish_is_osh**Type**

bool

Default value

false

When set, any transaction that would use the architectural inner shareable domain is converted to use the outer shareable domain.

NOTE that this parameter should match the equivalent ish_is_osh from the PE. If an incompatible value of the ish_is_osh parameter is configured for the PE and the SMMU, data coherency may be compromised.

mec_attribute_transform

Type

string

Default value

""

If MEC is supported, this is applied to *all* downstream transactions to transport the MEC information.

- "" or "none" – no transform
- How to alter the output attributes. Example:

```
"UserFlags[31:16]=MECID[15:0]"
```

RHS/LHS Symbols: * ExtendedID/MasterID/UserFlags.

RHS Symbols: * MECID * numeric literals.

Any bits with no transform are unchanged.

Attribute transforms applied before this: * for client transactions
output_attribute_transform/output_attribute_transform_for_NoStreamID. * for
table walks tw_qs_attribute_transform. * for MSIs msi_attribute_transform. * if
MPAM is enabled mpam_attribute_transform.

mpam_attribute_transform

Type

string

Default value

```
"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,  
ExtendedID[38]=MPAM_NS"
```

If MPAM is supported, this is applied to *all* downstream transactions to transport the MPAM information.

- "" or "none" – no transform
- How to alter the output attributes. Example:

```
"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,  
ExtendedID[38]=MPAM_SP[0]"
```

RHS/LHS Symbols:

- ExtendedID/MasterID/UserFlags.

RHS Symbols:

- MPAM_PARTID
- MPAM_PMG
- MPAM_NS
- MPAM_SP
- numeric literals

Any bits with no transform are unchanged.

Note

- attribute transforms applied before this:
 - for client transactions `output_attribute_transform / output_attribute_transform_for_NoStreamID`.
 - for table walks `tw_qs_attribute_transform`.
 - for MSIs `msi_attribute_transform`.
- `mec_attribute_transform` is applied after this.
- for translated transactions from client devices then `MPAM_NS = ! SEC_SID`.

mpam_sp_options

Type

unsigned

Default value

2

The width of the MPAM_SP output side-band information.

The SMMU architecture says that the SMMU is a four-space MPAM component when RME-DA is implemented. However, it can potentially be converted to a two-space MPAM at the edge of the SMMU.

This parameter controls the width of the MPAM_SP output side-band information:

- 1 – 1b, conventionally the side-band is then called `MPAM_NS`. Any 2b MPAM_SP value generated will have bit[1] forced to zero.
- 2 – 2b, the side-band is 2b

The same effect can be achieved by using the parameter `mpam_attribute_transform` to only export a single bit of the MPAM_SP. However, this option allows a model system to be built with a single static version of `mpam_attribute_transform` and then dynamically switch its behaviour more simply.

msi_attribute_transform

Type

string

Default value

"ExtendedID[31:0]=smmu_msi_device_id, MasterID=0xFFFFFFFF"

Transform downstream attributes of MSI transactions.

After 11.25 the interrupt_kind field was extended to 5 bits. This is strictly a non-backwards compatible change. However, the original 3 bits was insufficient to express all the interrupt kinds that exist.

msi_ra_wa_tr

Type

uint32_t

Default value

7

A bitmap of the Read Allocation, Write Allocate and Transient hints for MSIs to cacheable memory: bit[0] Transient bit[1] Write Allocate bit[2] Read Allocate If not Write Allocate then it will be forced to Read Allocate as a limitation of AMBA.

non_arch_incoming_stronger_than_iWB_oWB_forces_output_iNC_oNC_or_stronger

Type

string

Default value

""

If not empty, then this enables a specific non-architectural behaviour on the comma-separated list of port indexes, or ranges. For example:

0, 10-20, 40

In the normal translation process, then the input attributes are usually replaced by the attributes from the page tables or SMMU_(S_)GBPA.

The behaviour is:

if incoming attributes are iWB-oWB use the architectural attributes else use the stronger of iNC-oNC-osh and the architectural attributes.

This is useful if the ports represent transactions from the PCIe subsystem and the PCIe devices output: * iWB-oWB if not No_Snoop -> output is architectural attributes * iNC-oNC-osh if No_Snoop -> output is iNC-oNC-osh or stronger

normalize_input_normal_non_iWB_oWB_to_iNC_oNC_osh

Type

bool

Default value

false

When set, use Inner Non Cacheable, Outer Non Cacheable, Outer Shareable for any upstream transaction that would use any of the following attributes: * Normal Non-cacheable Bufferable * Normal Non-cacheable Non-bufferable * Write-through

NOTE that this parameter should match the equivalent configuration from the PE. If an incompatible value of this parameter is configured for the PE and the SMMU, data coherency may be compromised.

number_of_ports

Type

unsigned

Default value

1

The number of port pairs that the SMMU has.

nw_dcp_extra_drop_conditions

Type

string

Default value

""

NW-DCP is a hint and can be dropped for any reason.

This is a comma-separated list of:

- “INST” – NW-DCP is architecturally ‘data’ but by enabling this option then STE.INSTCFG is applied and it can fault due to SIF and, for rl-ssd, preventing instruction access to ns-PAS.
- “SIF-cached” – NW-DCP needs any of rwx permissions to go downstream. If SIF has been cached into the TLB entry then it will have removed execute permission and so for an execute-only page the NW-DCP would be denied.

If you set this option then, for NW-DCP, the SMMU will behave as if SIF was cached.

The parameter `ordering_of_PAN_and_xn_by_ns_pas` can force TLB-caching of SIF and takes precedence over this option.

- “combined-st2” – when considering the stage 2 permissions then they are first combined with any stage 1 permissions before applying the permission check.
- “combined-st1-st2” – always fetches all stages and combine before applying the permissions check.

ordering_of_PAN_and_xn_by_ns_pas

Type

unsigned

Default value

0

Execution from ns-pas can be forbidden:

- for secure, this is controlled by SMMU_S_CRO.SIF.
- for realm, this is mandatory. In the model, we call this RIF and is always cached in the TLB.

When PAN is interpreted as EPAN then whether SIF/RIF is applied before or after PAN can get different results for the direct permission model.

In the model, the following options are available:

0 – PAN applied first, SIF not cached in the TLB, RIF cached in the TLB. 1 – PAN applied first, SIF/RIF cached in the TLB. 2 – SIF/RIF cached in the TLB, then PAN applied

NOTE that if you cache SIF in the TLB then all SIF faults are no longer traced separately as SIF faults but as permission faults – which architecturally they are reported as. As RIF is always cached in the TLB, then they are not distinguished in the trace separately to permission faults.

out_of_range_CMD_ATC_INV_Size

Type

unsigned

Default value

0

If CMD_ATC_INV.Size > 52 then the model is allowed to:- 0 – raise CERROR_ILL 1 – treat as NOP

The architecture also allows for an **UNKNOWN** invalidate size to be used as well but the model does not support this.

out_of_range_l0gptsz_s

Type

int32_t

Default value

-1

If the port `logptsz_s` is driven to an invalid value and that value is used then the following behaviors are possible:

- -2 – report the incoming value in `SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ` and all transactions will report a GPT Config Error if GPC checking is enabled.
- -1 – produce an error and make the model unusable (default)
- invalid LOGPTSZ encoding – report this value in `SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ` and all transactions will report a GPT Config Error if GPC checking is enabled.

All other values are reserved and act as -1.

output_attribute_transform

Type

string

Default value

"ExtendedID[31:0]=DeviceID"

Transform downstream attributes of StreamID transactions.

- "" or "none": no transform
- How to alter output attributes. Example:

```
"ExtendedID[15:0]=DeviceID[15:0], UserFlags[31]=nSSV, UserFlags[19:0]=SubstreamID,
MasterID[10]=MasterID[11], MasterID[11]=MasterID[10]"
```

RHS/LHS Symbols:

- **ExtendedID/MasterID/UserFlags**
incoming/outgoing attributes.

RHS Symbols:

- **DeviceID**
StreamID + translated_device_id_base
- StreamID/SubstreamID/SSV/SEC_SID
- **nSSV/nSEC_SID/**
negative logic versions.
- **St1PBHA/St2PBHA**
Page Based Hardware Attributes from leaf descriptors (zero if not used).
- **STE_IMPDEF1**
STE[127:116]
- **HWATTR_KIND_0**
PBHA information
- numeric literals.
- SIDV = 1, nSIDV = 0 (fixed values to indicate StreamID)

Any bits with no transform are unchanged.

- `mpam_attribute_transform` and `mec_attribute_transform` are applied in order after this.
- See also `output_attribute_transform_for_NoStreamID` for NoStreamID transactions.

output_attribute_transform_for_NoStreamID

Type

string

Default value

"ExtendedID[31:0]=0, ExtendedID[32]=1"

Transform downstream attributes of NoStreamID transactions.

- "" or "none": no transform
- How to alter output attributes. Example:

```
"ExtendedID[15:0]=0, UserFlags[31]=1, UserFlags[19:0]=0, MasterID[10]=MasterID[11],
MasterID[11]=MasterID[10] MasterID[9:6]=HWATTR_KIND_0"
```

RHS/LHS Symbols: * ExtendedID/MasterID/UserFlags: incoming/outgoing attributes.

RHS Symbols: * SIDV = 0, nSIDV = 1 (fixed values to indicate NoStreamID) * PAS * HWATTR_KIND_0 * numeric literals.

Any bits with no transform are unchanged.

- `mpam_attribute_transform` and `mec_attribute_transform` are applied in order after this.
- see also `output_attribute_transform` for StreamID transactions.

output_id_routed_transform

Type

string

Default value

"Address[43:12]=StreamID, PAS=SSD"

The SMMU generates the following ID-routed transaction on the `pvbus_id_routed_m` bus:

- ATC Invalidate
- PRI Response

This parameter controls how the SMMU should express:

- the StreamID
- the Trusted (T) bit

The value is a comma-separated list of assignments:

```
Address[27:12]=StreamID[15:0], ExtendedID[60]=T, ExtendedID[15:0]=StreamID[31:16]
```

Address bits[11:0] cannot be used.

The LHS can be one of:

- PAS
- MasterID/ExtendedID/UserFlags
- Address

The RHS can be one of:

- a numeric constant
- SSD
- T or negative version nT
- StreamID

For realm (or 'Trusted') transactions, then SSD=0b11, T=1, nT=0. For non-secure (or 'Non-Trusted') transactions, then SSD=0b01, T=0, nT=1

percent_commit

Type

uint32_t

Default value

20

Percentage of times that a read of a register with Update will commit the update. 0 means commit immediately.

percent_commit_Update_clear

Type

uint32_t

Default value

20

Percentage of times that a read of a register with a pending Update clear will lower the Update flag.

pmu**Type**

string

Default value

""

What to instantiate as a PMU.

NOTE that all events and counters are intended for demonstration purposes only and should not be treated as in any way reflecting accurate values for a real implementation. The model's internal representation of actions differ significantly from real hardware and the particular value obtained from the counters should not be used for benchmarking.

Values of this parameter are: * "" – no PMU * "distributed-0" * "distributed-1"

distributed-0: * a PMCG per TBU (number_of_ports, up to 63 ports) * a single PMCG for a TCU * Connect a debugger to see the configuration.

distributed-1: * same as distributed-0, except for supporting MSIs and MPAM on the MSIs if MPAM is supported by rest of the SMMU.

ports_that_ignore_PnU_InD_on_transactions_with_no_SubstreamID**Type**

string

Default value

""

Some bus systems (notably PCIe) do not support marking a transaction as Privileged/User or Instruction/Data unless the transaction has a SubstreamID.

This accepts a comma separated list of numbers and ranges, for example:

0, 10-12, 15

If the number P is named in this list then the upstream pvbus_s[P] will have all transactions with no Substream considered to be User and Data.

prefetch_only_requests**Type**

unsigned

Default value

0

The simulator supports 'prefetch-only' DMI requests, which can occur at any time and for any reason and are intended to be invisible to the end execution of the model and to the user.

0

deny all prefetch-only requests

1

- use debug requests for any page table walks
 - form and use debug TLB/cache entries
 - any faults will not record, but deny the prefetch request

2

- treat prefetch-only requests like normal transactions
 - use normal page table walk transactions
 - use and form normal TLB/cache entries
 - faults will alter the programmer-visible state of the SMMU

0 is the safest.

1 treats the access like a debug request and requires that debug page table walks are treated correctly downstream. Any descriptors that need HTTU to allow the transaction to proceed will fail the request.

2 is dangerous, it use real transactions and reports faults that are unphysical. Real transactions can be wait()ed and this disobeys the SystemC spec for `get_direct_mem_ptr()`.

ras**Type**

string

Default value

""

What to instantiate for RAS handling.

Values of this parameter are: * "" – no RAS records * "MMU_600" * "MMU_700" * "MMU_S3"

MMU_600: * only corrected errors reported.

See also `imp_def_ras_allow_non_secure_accesses_if_supports_secure`.

register_accesses_to_root_or_realm_pas_when_no_rme**Type**

uint32_t

Default value

0

When RME is not implemented or disabled by `legacy_tz_en`: 0 – root and realm register PAS accesses are not **RAZ/WI** 1 – root and realm register PAS accesses are treated as RAZ/WI

reset_value_of_SMMU_GBPA**Type**

uint32_t

Default value

0

Reset value of SMMU_GBPA

reset_value_of_SMMU_S_GBPA**Type**

uint32_t

Default value

0

Reset value of SMMU_S_GBPA

rme_ats_request_pa_strategy**Type**

uint32_t

Default value

0

When RME_IMPL == 0, the PA of an ATS Request's response is permitted but not required to undergo a GPT check:

0 – do not check the PA 1 – do the check against the PA 2 – check the PA 50% of the time

Translated transactions are required to always undergo a GPT check whatever happens.

This parameter is ignored if RME_IMPL==1 and the PA is required to be checked.

rme_da_force_better_configuration**Type**

string

Default value

""

RME-DA requires that the SMMU be integrated into a system for which SMMU_IDR0.COHAACC == 1 and SMMU_IDR0.iIDR0.HTTU == both_af_and_dirty (2).

The model has pins:

- conf_system_supports_cohacc
- conf_system_supports_httu

that can control these ID fields.

In addition, RME-DA requires that the fundamental SMMU has certain properties that are configured by its ID codes.

This parameter allows you to selectively ignore the pins and bad ID to produce a good configuration by forcing the required values.

Whether the SMMU has RME-DA or not is identified by SMMU_ROOT_IDR0.REALM_IMPL.

This is a comma-separated list of fields to force when RME-DA is configured by SMMU_ROOT_IDR0.REALM_IMPL:

- in SMMU_IDR0:
 - “Hyp”
 - “S1P”
 - “S2P”
 - “TTF”
 - “NS1ATS”
 - “COHACC”
 - “HTTU”
 - “RME_IMPL”
- “SSIDSIZE” in SMMU_IDR1
- “BBML” in SMMU_IDR3

You can also use “all” to set all.

rme_l0gpt_entry_covers_log2size_in_bytes

Type

uint32_t

Default value

30

Each LOGPT entry covers:

```
2*rme_l0gpt_entry_covers_log2size_in_bytes
```

bytes of address space.

The valid values for this parameter are: * 30, 34, 36, 39

This parameter is reported in an encoded format as the read-only field:

```
SMMU_ROOT_GPT_BASE_CFG.LOGPTSZ
```

This parameter can be overridden by the port `10gptsz_s` when sampled on negedge of reset.

rme_speculation_control

Type

string

Default value

""

This is a comma-separated list of flags that control when and how the model will perform speculation for RME.

root_register_page_offset

Type

uint64_t

Default value

0

This is the offset from `SMMU_BASE` of the Root register file page which is 64 KiB in size. It must not overlap any other part of the register map.

secure_state_controls_access_to_SMMU_S_INIT

Type

bool

Default value

true

With RME access control of the `SMMU_S_INIT` belongs to Root. This parameters allows Root to delegate access control to the secure state, enabling secure software to reset the TLB, clearing out any TLB entries.

If RME is implemented and this parameter is 0, `allow_non_secure_access_to_SMMU_S_INIT` has no effect.

If the SMMU does not implement RME then this parameter is ignored.

seed

Type

uint32_t

Default value

0x12345678

Used to seed the pseudo-random number generator that the SMMU model uses.

separate_tw_msi_qs_port**Type**

bool

Default value

true

True if there is a separate port which is used to walk configuration tables, translation tables, issue MSIs and access the queues. If this is false then `pvbus_m[0]` will be used.

size_of_cd_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding CD structures. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_dpttlb**Type**

uint32_t

Default value

0

The number of entries in the DPT TLB. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_gpttlb**Type**

uint32_t

Default value

0

The number of entries in the GPT TLB. If this is zero then it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_l1cd_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding L1CD descriptors. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_l1ste_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding L1STE descriptors. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_register_file**Type**

uint64_t

Default value

0x100000

This is the power of two size that the register file occupies in the memory map. It is used to generate a mask for the addresses received on pvbus_control_s to decode the desired register offset.

The default for this parameter is 1 MiB.

size_of_ste_cache**Type**

uint32_t

Default value

0

The number of entries in the cache holding STE structures. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

size_of_tlb**Type**

uint32_t

Default value

0

The number of entries in the TLB. If this is zero it is treated as a large number ('infinite') but it is bounded so that the host memory usage of the cache is also bounded.

smmu_msi_device_id**Type**

uint32_t

Default value

0

When appropriately enabled, assume that MSIs that are generated by the SMMU are presented to the GIC with this DeviceID.

See parameters `msi_attribute_transform` and `enable_device_id_checks`.

smmuv33_begin_offset_of_qcp0**Type**

uint32_t

Default value

•

This is the offset from SMMU_BASE of the first QCP page. The architecture requires that if more than one world of QCPs are present then they are in the order non-secure and then secure QCPs and form one continuous address space in the register file.

support_for_httu_when_starts_disallowed**Type**

unsigned

Default value

0

SMMU_IDR0.HTTU describes to the programmer whether the SMMU and system support HTTU. Typically an SMMU that is capable of HTTU will have a configuration pin that says whether the system supports HTTU or not.

The SMMU model determines SMMU_IDR0.HTTU as follows: * If the parameter SMMU_IDR0 indicates any kind of support for HTTU, then the configuration pin turns support on and off between that value and no support for HTTU. * If the parameter SMMU_IDR0 indicates no HTTU support, allow the pin to turn on support to that specified by this parameter.

Values for this parameter are the same as for the SMMU_IDR0.HTTU field: * 0 – no support for HTTU * 1 – AF flag only * 2 – AF flag and DBM update

tlb_when_do_f_tlb_conflict_on_overlap**Type**

unsigned

Default value

0

If a TLB entry is created by a walk and it overlaps an existing entry, there are some architectural situations where the result is known. For all others, then an implementation is allowed to use an **UNPREDICTABLE** combination of the two entries, or it can generate F_TLB_CONFLICT:

0

never generate

1

sometimes generate

2

always generate

Conflicts between global and non-global entries are not detected by the model.

translated_device_id_base

Type

uint32_t

Default value

0

When appropriately enabled, assume that client device accesses are translated to a DeviceID as seen by the GIC of:

```
StreamID + translated_device_id_base
```

See parameter `output_attribute_transform` and `enable_device_id_checks`.

treat_debug_read_accesses_as_speculative_accesses

Type

bool

Default value

false

The SMMU architecture has the concept of speculative accesses. If you set this flag to true, then debug read accesses flowing from the upstream system through the SMMU will be interpreted as speculative.

The difference is that a speculative read will: * participate in HTTU * if it encounters a (non-HTTU) fault will always return abort

Debug writes are still considered as debug accesses. All speculative writes would be aborted and this is not a useful behaviour for the SMMU to emulate.

tw_qs_attribute_transform

Type

string

Default value

""

Transform downstream attributes of table walk and queue transactions.

- "" or "none" – no transform
- How to alter the output attributes. Example:

```
"ExtendedID[35:32]=HWATTR_KIND_0"
```

RHS/LHS Symbols:

- ExtendedID/MasterID/UserFlags

RHS Symbols:

- HWATTR_KIND_0: PBHA information
- kind
 - for a read:
 - 0/1**
L1STE/STE
 - 2/3**
L1CD/CD
 - 4/5**
S1/S2 TTD (including CAS)
 - 6**
CMDQ
 - 7**
VMS
 - 11/12**
LOGPT/L1GPT
 - 13/14**
LODPT/L1DPT
 - for a write
 - 0**
EVENTQ
 - 1:**
PRIQ
- numeric literals.

ExtendedID/MasterID/UserFlags start with values {0, 0xFFFFffff, 0} respectively.

Any bits with no transform are unchanged.

See also `output_attribute_transform` and `msi_attribute_transform`.

unpred_httu_percent_do_discretionary_AF

Type

unsigned

Default value

50

If a descriptor could have a discretionary update of the AF flag on then what is the percentage of the time that the AF update should occur.

unpred_httu_percent_do_discretionary_DBM

Type

unsigned

Default value

50

If a descriptor could have a discretionary DBM update to make the descriptor WriteableDirty then what is the percent of the time time that the DBM update should occur.

unpred_translated_access_out_of_range_of_oas

Type

unsigned

Default value

1

If a Translated Access is presented to the SMMU that is > OAS then it is CONSTRAINED UNPRED as to whether the transaction will either: 0 – be truncated to OAS and go downstream 1 – be aborted, no event written

wait_atos_ticks

Type

uint64_t

Default value

0

This is the time to wait before doing an ATOS operation. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time [0,max(2,(t & 0xFFFFfff)-1)].

wait_cmdq_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing something on the command queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff)) - 1]$.

wait_eventq_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing something on the event queue. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff)) - 1]$.

wait_misc_async_actions_ticks**Type**

uint64_t

Default value

0

This is the time to wait before doing an async action that could be delayed is performed. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff)) - 1]$.

wait_msi_ticks**Type**

uint64_t

Default value

0

This is the time to wait before sending an MSI. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \& 0xFFFFffffff)) - 1]$.

wait_pri_req_ticks**Type**

uint64_t

Default value

0

This is the time to wait before processing a PRI Request. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \ \& \ 0xFFFFffff)) - 1]$.

wait_pri_resp_ticks**Type**

uint64_t

Default value

1

This is the time to wait before sending a PRI Response back to the PCIe subsystem. When a PRI Response is an auto-response then the ATC might immediately make a new ATS request, that immediately fails, immediately makes a PRI Request, or auto-responds, etc. To break this loop, then we introduce a minimum time on all PRI Responses to give other components in the system a chance to run. If bit 32 is set (0x1_0000_0000) then the time waited for is a uniform randomly distributed time $[0, \max(2, (t \ \& \ 0xFFFFffff)) - 1]$.

when_fetch_vms**Type**

unsigned

Default value

0

Architecturally, there is flexibility in how a VMS is cached and thus: * when it will be fetched * the prioritization of F_VMS_FETCH.

Of the many architecturally-allowed options, the model offers two:

0 – fetched and cached immediately after the STE is fetched
1 – fetched and cached immediately after the CD is fetched

In both cases, then the VMS is cached in the STE and CMD_CFGI_VMS_PIDM is a **NOP**.

width_of_agbpa_impdef**Type**

uint32_t

Default value

16

Width of the SMMU_s_AGBPA.IMPDEF field.

3.10.91 SMSC_91C111

10/100 Non-PCI Ethernet Controller(SMSC 91C111). This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1256: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for SMSC_91C111

This model has the following Iris instances:

Table 3-1257: SMSC_91C111 Iris instances

InstanceName	ComponentName
SMSC_91C111	SMSC_91C111
SMSC_91C111.SMSC_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-1258: SMSC_91C111 MTI instances

InstanceName	ComponentName
SMSC_91C111.SMSC_slave	PVBusSlave

SMSC_91C111 contains the following CADI targets:

- SMSC_91C111

About SMSC_91C111

This component provides the register interface of the SMSC part and can be configured to act as an unconnected Ethernet port, or an Ethernet port connected to the host by an Ethernet bridge.

It uses a banked register model of primarily 16-bit registers. There are also indirectly accessible registers for the PHY unit.

If a MAC address is not specified in the `mac_address` parameter, the simulator takes the default MAC address, which is randomly generated. This provides some degree of MAC address uniqueness when running models on multiple hosts on a local network.

DHCP servers allocate the IP addresses, but because they sometimes do this based on the MAC address provided to them, using random MAC addresses might interact unfortunately with some DHCP servers.

See also:

- [1.11.3 Configuring the networking environment for Microsoft Windows](#) on page 48
- [1.11.8 Configuring the networking environment for Linux](#) on page 54

Ports for SMSC_91C111

Table 3-1259: Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	Clock input, typically 25MHz, which sets the master transmit/receive rate.
eth	VirtualEthernet	Master	Ethernet port.
intr	Signal	Master	Interrupt signal.
pvbust	PVBus	Slave	Slave port for register access.
state	ValueState_64	Master	State port to retrieve state of host bridge

Parameters for SMSC_91C111

cache_size

Type

int

Default value

0x10000

Size of cache memory in SMSC MMU.

enabled

Type

bool

Default value

0x0

Host interface connection enabled.

mac_address

Type

string

Default value

"00:02:f7:ef:00:00"

Host/model MAC address.

not_lan911x

Type

bool

Default value

0x0

Gracefully fail SMSC LAN911x driver probe.

promiscuous

Type

bool

Default value

0x1

Put host into promiscuous mode.

3.10.92 SP804_Timer

ARM Dual-Timer Module(SP804). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1260: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for SP804_Timer

This model has the following Iris instances:

Table 3-1261: SP804_Timer Iris instances

InstanceName	ComponentName
SP804_Timer	SP804_Timer
SP804_Timer.busslave	PVBusSlave
SP804_Timer.clk_div0	ClockDivider
SP804_Timer.clk_div1	ClockDivider
SP804_Timer.counter0	CounterModule
SP804_Timer.counter1	CounterModule

This model has the following MTI trace components:

Table 3-1262: SP804_Timer MTI instances

InstanceName	ComponentName
SP804_Timer.busslave	PVBusSlave
SP804_Timer.clk_div0	ClockDivider

InstanceName	ComponentName
SP804_Timer.clk_div1	ClockDivider

SP804_Timer contains the following CADI targets:

- ClockDivider
- CounterModule
- SP804_Timer

Ports for SP804_Timer

Table 3-1263: Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	Clock input, typically 1MHz, driving master count rate.
irq_out0	Signal	Master	Interrupt signaling.
irq_out1	Signal	Master	Interrupt signaling.
pvbus	PVBus	Slave	Slave port for register access.
timer_en[2]	ClockRateControl	Slave	Port for changing the rate of timer n.

Parameters for SP804_Timer

`clk_div0.div`

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

`clk_div0.mul`

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

`clk_div1.div`

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clk_div1.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

3.10.93 SP805_Watchdog

ARM Watchdog Module(SP805). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1264: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for SP805_Watchdog

This model has the following Iris instances:

Table 3-1265: SP805_Watchdog Iris instances

InstanceName	ComponentName
SP805_Watchdog	SP805_Watchdog
SP805_Watchdog.busslave	PVBusSlave
SP805_Watchdog.clocktimer	ClockTimerThread
SP805_Watchdog.clocktimer.timer	ClockTimerThread64
SP805_Watchdog.clocktimer.timer.thread	SchedulerThread
SP805_Watchdog.clocktimer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-1266: SP805_Watchdog MTI instances

InstanceName	ComponentName
SP805_Watchdog.busslave	PVBusSlave

SP805_Watchdog contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- SP805_Watchdog

- SchedulerThread
- SchedulerThreadEvent

Ports for SP805_Watchdog

Table 3-1267: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock input, typically 1MHz, driving master count rate.
irq_out	Signal	Master	Interrupt signaling.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_in	Signal	Slave	Reset signaling.
reset_out	Signal	Master	Reset signaling.

Parameters for SP805_Watchdog

simhalt

Type

bool

Default value

0x0

Halt on reset.

3.10.94 SP810_SysCtrl

PrimeXsys System Controller(SP810) NB: Only EB relevant functionalities are fully implemented. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1268: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for SP810_SysCtrl

This model has the following Iris instances:

Table 3-1269: SP810_SysCtrl Iris instances

InstanceName	ComponentName
SP810_SysCtrl	SP810_SysCtrl
SP810_SysCtrl.busslave	PVBusSlave

InstanceName	ComponentName
SP810_SysCtrl.clkdiv_clk0	ClockDivider
SP810_SysCtrl.clkdiv_clk1	ClockDivider
SP810_SysCtrl.clkdiv_clk2	ClockDivider
SP810_SysCtrl.clkdiv_clk3	ClockDivider

This model has the following MTI trace components:

Table 3-1270: SP810_SysCtrl MTI instances

InstanceName	ComponentName
SP810_SysCtrl.busslave	PVBUSlave
SP810_SysCtrl.clkdiv_clk0	ClockDivider
SP810_SysCtrl.clkdiv_clk1	ClockDivider
SP810_SysCtrl.clkdiv_clk2	ClockDivider
SP810_SysCtrl.clkdiv_clk3	ClockDivider

SP810_SysCtrl contains the following CADI targets:

- [ClockDivider](#)
- [SP810_SysCtrl](#)

Ports for SP810_SysCtrl

Table 3-1271: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock input.
hclkdivsel	ValueState	Master	Define the processor clock/bus clock ratio. Not fully implemented. Using this port has unpredictable results.
npwr	Signal	Slave	Power on reset. Not fully implemented. Using this port has unpredictable results.
pll_en	Signal	Master	PLL enable output. Not fully implemented. Using this port has unpredictable results.
pvbuss	PVBUS	Slave	Slave port for register access.
ref_clk_in	ClockSignal	Slave	Clock source used by the Timer and Watchdog modules.
remap_clear	StateSignal	Master	Remap clear request output.
remap_stat	StateSignal	Slave	Remap status input. Not fully implemented. Using this port has unpredictable results.
sleep_mode	Signal	Master	Control clocks for SLEEP mode. Not fully implemented. Using this port has unpredictable results.
sys_id	ValueState	Slave	Unused port.
sys_mode	ValueState	Slave	Present system mode. Not fully implemented. Using this port has unpredictable results.
sys_stat	ValueState	Slave	System status input. Not fully implemented. Using this port has unpredictable results.
timer_clk_en[4]	ClockRateControl	Master	Timer clock enable n.
wd_clk_en	Signal	Master	Watchdog module clock enable output. Not fully implemented. Using this port has unpredictable results.

Name	Protocol	Type	Description
wd_en	Signal	Slave	Watchdog module enable input. Not fully implemented. Using this port has unpredictable results.

Parameters for SP810_SysCtrl

clkdiv_clk0.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv_clk0.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv_clk1.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv_clk1.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv_clk2.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv_clk2.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv_clk3.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv_clk3.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

sysid**Type**

int

Default value

0x0

System Identification Register.

use_s8**Type**

bool

Default value

0x0

Use Switch 8 (S1-S4).

3.10.95 SSU

Safety Status Unit. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1272: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for SSU

This model has the following Iris instances:

Table 3-1273: SSU Iris instances

InstanceName	ComponentName
SSU	SSU
SSU.pvbus_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-1274: SSU MTI instances

InstanceName	ComponentName
SSU	SSU
SSU.pvbus_slave	PVBusSlave

SSU contains the following CADI targets:

- SSU

Ports for SSU

Table 3-1275: Ports

Name	Protocol	Type	Description
c_error_in	Signal	Slave	Critical interrupts to the SSU
clk_in	ClockSignal	Slave	Clock input
cold_reset_in	Signal	Slave	Cold reset signal
nc_error_in	Signal	Slave	Non critical interrupts to the SSU
pvbus_s	PVBus	Slave	To access FMU model registers
ssu_out	ValueState	Master	SSU output port
warm_reset_in	Signal	Slave	Warm reset signal

Parameters for SSU

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT:2).

sm_implemented

Type

bool

Default value

0x0

Safety Mechanism Implemented.

3.10.96 SecureAlarmManager

Security Alarm Manager. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1276: IP revisions support

Revision	Quality level
0.93	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for SecureAlarmManager

This model has the following Iris instances:

Table 3-1277: SecureAlarmManager Iris instances

InstanceName	ComponentName
SecureAlarmManager	SecureAlarmManager
SecureAlarmManager.apb	PVBusSlave

This model has the following MTI trace components:

Table 3-1278: SecureAlarmManager MTI instances

InstanceName	ComponentName
SecureAlarmManager.apb	PVBusSlave

SecureAlarmManager contains the following CADI targets:

- SecureAlarmManager

Ports for SecureAlarmManager

Table 3-1279: Ports

Name	Protocol	Type	Description
apb	PVBus	Slave	APB Subordinate Interface - Access to registers
clk_in	ClockSignal	Slave	Clock in signal
config_done_trig_ack_in	Signal	Slave	Config done ack signal
config_done_trig_req_out	Signal	Master	Config done req signal
event_in[61]	Signal	Slave	Event in signal
event_status_out[64]	Signal	Master	Event status out signal
nCOLDRESETAON_in	Signal	Slave	Coldreset in signal
reset_in	Signal	Slave	Reset in signal
response_action_out[8]	Signal	Master	Response action out signal

Parameters for SecureAlarmManager

NUM_SAMNEC

Type

int

Default value

0x3

Number of SAM event counters.

NUM_SAMNRA

Type

int

Default value

0x7

Number of SAM response actions.

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.97 SecureICache

SecureICache. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1280: IP revisions support

Revision	Quality level
1.13	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for SecureICache

This model has the following Iris instances:

Table 3-1281: SecureICache Iris instances

InstanceName	ComponentName
SecureICache	SecureICache
SecureICache.DECRYPT_RAM_0	PVBusSlave
SecureICache.DECRYPT_RAM_1	PVBusSlave
SecureICache.HTR_RAM	PVBusSlave
SecureICache.SIC_BusMapper	PVBusMapper
SecureICache.SIC_BusMapper0	PVBusMapper
SecureICache.SIC_BusMapper1	PVBusMapper
SecureICache.ZERO_RAM	PVBusSlave
SecureICache.apb	PVBusSlave

This model has the following MTI trace components:

Table 3-1282: SecureICache MTI instances

InstanceName	ComponentName
SecureICache.DECRYPT_RAM_0	PVBusSlave
SecureICache.DECRYPT_RAM_1	PVBusSlave
SecureICache.HTR_RAM	PVBusSlave
SecureICache.SIC_BusMapper	PVBusMapper
SecureICache.SIC_BusMapper0	PVBusMapper
SecureICache.SIC_BusMapper1	PVBusMapper
SecureICache.ZERO_RAM	PVBusSlave
SecureICache.apb	PVBusSlave

SecureICache contains the following CADI targets:

- SecureICache

Ports for SecureCache

Table 3-1283: Ports

Name	Protocol	Type	Description
apb	PVBus	Slave	APB4 Subordinate Interface - Access to registers
htr_ram_pvbus_s	PVBus	Slave	To Read and Write pre-calculated SHA-256 Digests
irq_out	Signal	Master	To indicate interrupts
pvbus_m	PVBus	Master	To read from External RAM
pvbus_s	PVBus	Slave	Receives Transactions from CPU
reset_in	Signal	Slave	reset

Parameters for SecureCache

SIC_AUTH_ENABLE

Type

bool

Default value

0x0

SIC Authentication enabled [default==false].

SIC_DECRYPT_ENABLE

Type

bool

Default value

0x0

SIC Decryption enabled [default==false].

SIC_DR_CNT

Type

int

Default value

0x1

SIC config: Decryption Region Count (0x0==1, 0x1==2[default], 0x2==4).

SIC_HTR_RAM_SIZE

Type

int

Default value

0x20

SIC config: Hash Tag RAM Size (0x1==1KB, 0x2==2KB, 0x4==4KB, 0x8==8KB, 0x10=16KB, 0x20=32KB[default]).

SIC_MAX_CODE_SIZE

Type

int

Default value

0x400

SIC config: Maximum Code Size supported (n==nKB[default,1024(1MB)]).

SIC_PAGE_RAM_SIZE

Type

int

Default value

0x10

SIC config: Page RAM Size (0x4==4KB, 0x8==8KB[default], 0x10=16KB).

SIC_PAGE_SIZE

Type

int

Default value

0x3

SIC config: Page Size (0x0==128B, 0x1==256B, 0x2=512B, 0x3=1KB[default], 0x4=2KB, 0x5=4KB).

SIC_PMON_EN

Type

bool

Default value

0x0

SIC config: Performance Monitor enable [default==false].

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.98 SystemFMU

System level Fault Management Unit. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1284: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for SystemFMU

This model has the following Iris instances:

Table 3-1285: SystemFMU Iris instances

InstanceName	ComponentName
SystemFMU	SYSTEM_FMU
SystemFMU.pvbus_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-1286: SystemFMU MTI instances

InstanceName	ComponentName
SystemFMU	SYSTEM_FMU
SystemFMU.pvbus_slave	PVBusSlave

SystemFMU contains the following CADI targets:

- SYSTEM_FMU

Ports for SystemFMU

Table 3-1287: Ports

Name	Protocol	Type	Description
c_error_in[26]	Signal	Slave	Critical interrupts from the device side FMUs
c_error_out	Signal	Master	Critical error input from the system FMU
clk_in	ClockSignal	Slave	Clock input
cold_reset_in	Signal	Slave	Cold reset signal
nc_error_in[26]	Signal	Slave	Non critical interrupts from the device side FMUs
nc_error_out	Signal	Master	Non critical error input from the system FMU
pvbus_s	PVBus	Slave	To access FMU model registers
warm_reset_in	Signal	Slave	Warm reset signal

Parameters for SystemFMU

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

upstream_fmuscfg

Type

int

Default value

0x1

Number of upstream FMUs that can be connected to the System level FMU.

3.10.99 System_RAS_Agent

System level RAS agent. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1288: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for System_RAS_Agent

This model has the following Iris instances:

Table 3-1289: System_RAS_Agent Iris instances

InstanceName	ComponentName
System_RAS_Agent	SYSTEM_RAS_AGENT
System_RAS_Agent.PVBusSubordinate	PVBusSlave

This model has the following MTI trace components:

Table 3-1290: System_RAS_Agent MTI instances

InstanceName	ComponentName
System_RAS_Agent.PVBusSubordinate	PVBusSlave

System_RAS_Agent contains the following CADI targets:

- SYSTEM_RAS_AGENT

Ports for System_RAS_Agent

Table 3-1291: Ports

Name	Protocol	Type	Description
apb	PVBus	Slave	To access RAS agent registers
clk_in	ClockSignal	Slave	Input Clock - RAS agent is in this clock domain
cri_in[56]	Signal	Slave	Critical Error Interrupt from the downstream RAS agent
cri_out	Signal	Master	CRI_OUT is the consolidated status of the Critical Error Interrupt from this and the downstream RAS agent(s).
eri_in[56]	Signal	Slave	Error Recovery Interrupt from the downstream RAS agent
eri_out	Signal	Master	consolidated status of the Error Recovery Interrupt from this and the downstream RAS agent(s).
fhi_in[56]	Signal	Slave	Fault Handling Interrupt from the downstream RAS agent
fhi_out	Signal	Master	consolidated status of the Fault Handling Interrupt from this and the downstream RAS agent(s).
reset_in	Signal	Slave	Input reset - Connect to the system cold reset.
valid_in[56]	Signal	Slave	Incoming Valid from a downstream RAS agent indicates the presence of at least one valid error record.
valid_out	Signal	Master	outgoing Valid from the downstream RAS agent(s) contains at least one valid error record.

Parameters for System_RAS_Agent

NUM_DOWNSTREAM_RAS_AGENTS

Type

int

Default value

0x1

Number of downstream RAS agents for which the proxy error record is maintained.

SYNC_ENABLE

Type

int

Default value

0x0

Enables synchronization on the Interrupt lines and valid line before assigning it to the corresponding bits in the ERR<n>STATUS register. 1-bit per downstream RAS Agent.

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.100 TZC_400

TrustZone Address Space Controller. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1292: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.**Iris and MTI instances for TZC_400**

This model has the following Iris instances:

Table 3-1293: TZC_400 Iris instances

InstanceName	ComponentName
TZC_400	TZC_400
TZC_400.apbslave[0]	PVBusSlave
TZC_400.filter0	filter0
TZC_400.filter0.BusMapper	PVBusMapper
TZC_400.filter1	filter1
TZC_400.filter1.BusMapper	PVBusMapper
TZC_400.filter2	filter2
TZC_400.filter2.BusMapper	PVBusMapper
TZC_400.filter3	filter3
TZC_400.filter3.BusMapper	PVBusMapper

This model has the following MTI trace components:

Table 3-1294: TZC_400 MTI instances

InstanceName	ComponentName
TZC_400.apbslave[0]	PVBusSlave
TZC_400.filter0.BusMapper	PVBusMapper
TZC_400.filter1.BusMapper	PVBusMapper
TZC_400.filter2.BusMapper	PVBusMapper
TZC_400.filter3.BusMapper	PVBusMapper

TZC_400 contains the following CADI targets:

- TZC_400

About TZC_400

The TZC-400 determines, under software control, whether a particular bus master is permitted to issue Non-secure accesses to a particular physical address.

The component has:

- Eight address regions in addition to the base region, region 0.
- A programmable control block for security-access permissions configuration through the *Advanced Peripheral Bus* (APB).
- Up to four address filters that share common set region set-up registers.
- Software configurable permission check failure reporting and interrupt signaling.
- Filtering with a *Non-Secure Access ID* (NSAID).
- A gate keeper, to allow or block accesses to the filter unit.
- Configurable reset values of region configuration registers and other key configuration registers.

This component has the following subcomponents:

TZFilterUnits

The TZC-400 has four TZFilterUnits. The `BUILD_CONFIG` register sets the configuration. The `rst_build_config` parameter controls the register. The value of `rst_build_config` varies with the system. See the system design documentation or system integration documentation. For AEMvA, it is `0x3003F08`.

TZDummyDevice

An internal dummy device that mimics RAZ/WI for TZFilterUnits. The system uses it when there is a permission violation and a bus returns Transaction OK.

Differences between the model and the RTL

Unlike the hardware, this component does not have:

- Asynchronous clocks. The model does not need clocks for data transfer, or clock signals.
- *QoS Virtual Network* (QVN) support. Specifically, it does not implement the `vnet` bits[27:24] in `FAIL_ID_<x>` registers.
- Fast Path and Fast Path ID. In the model, transactions occur at similar speeds.
- 256 outstanding accesses globally for each read or write Normal Paths and configurable 8, 16, or 32 outstanding accesses on Fast Path read access. The model does not support QVN. This concept is meaningless for a PV level model.
- Configurable address bus width, data bus width, transaction ID tag, and USER bus width. A single bus implementation, PVBUS, covers these AXI bus hardware implementation details.

This component does not implement:

- The `vnet` bits[27:24] in `FAIL_ID_<x>` registers.

- Any background logic for the speculation control register. This does not affect model behavior.

Configuration

- Configure `master_id_from_label` OR `id_mapping`, `rst_build_config`, and `rst_region_attributes_0` before running the model to set the desired behaviors. Otherwise, the system resets all region configuration registers, `rst_action`, and `rst_gate_keeper` to 0, and resets `rst_build_config` and `rst_region_attributes_0` to sensible default values.
- Configure either `id_mapping` OR `master_id_from_label` at model init, or a warning message appears.
- The syntax of `id_mapping` is:

```
<masterid_0>:<nsaid_0>,<masterid_1>:<nsaid_1>,<masterid_n>:<nsaid_n>
```

Separate the mapping pairs by a comma. The `masterid` is the ID of the bus master, such as the parameter `CLUSTER_ID` on Cortex-A15/7, `cluster_id` port of Cortex-A15/7, or `master_id` parameter for Cortex-M3.

Ports for TZC_400

Table 3-1295: Ports

Name	Protocol	Type	Description
apbslave_s	PVBus	Slave	Bus access for control register.
filter_pvbus_m[4]	PVBus	Master	Outgoing bus traffic from filter units.
filter_pvbus_s[4]	PVBus	Slave	Incoming bus traffic to filter units.
tzc_reset	Signal	Slave	Reset signal from external master.
tzcint	Signal	Master	TrustZone interrupt signal, controlled by ACTION register.

Parameters for TZC_400

diagnostics

Type

int

Default value

0x0

Diagnostics.

id_mapping

Type

string

Default value

"0:0,1:0,2:0,3:0,4:0,5:0,6:0,7:0,8:0,9:0,10:0,11:0,12:0,13:0,14:0,15:0"

Mapping from Master ID to NSAID.

master_id_from_label**Type**

bool

Default value

0x0

Obtain Master ID from label (ignores id_mapping).

rst_action**Type**

int

Default value

0x0

ACTION register value at reset.

rst_build_config**Type**

int

Default value

0x3003f08

BUILD_CONFIG register value at reset.

rst_gate_keeper**Type**

int

Default value

0x0

GATE_KEEPER register value at reset.

rst_region_attributes_0**Type**

int

Default value

0xf

Region 0 Secure attributes.

rst_region_attributes_1**Type**

int

Default value

0x0

Region 1 Secure attributes.

rst_region_attributes_2**Type**

int

Default value

0x0

Region 2 Secure attributes.

rst_region_attributes_3**Type**

int

Default value

0x0

Region 3 Secure attributes.

rst_region_attributes_4**Type**

int

Default value

0x0

Region 4 Secure attributes.

rst_region_attributes_5**Type**

int

Default value

0x0

Region 5 Secure attributes.

rst_region_attributes_6**Type**

int

Default value

0x0

Region 6 Secure attributes.

rst_region_attributes_7**Type**

int

Default value

0x0

Region 7 Secure attributes.

rst_region_attributes_8**Type**

int

Default value

0x0

Region 8 Secure attributes.

rst_region_base_high_1**Type**

int

Default value

0x0

Region 1 base memory address (high 32 bits).

rst_region_base_high_2**Type**

int

Default value

0x0

Region 2 base memory address (high 32 bits).

rst_region_base_high_3**Type**

int

Default value

0x0

Region 3 base memory address (high 32 bits).

rst_region_base_high_4**Type**

int

Default value

0x0

Region 4 base memory address (high 32 bits).

rst_region_base_high_5**Type**

int

Default value

0x0

Region 5 base memory address (high 32 bits).

rst_region_base_high_6**Type**

int

Default value

0x0

Region 6 base memory address (high 32 bits).

rst_region_base_high_7**Type**

int

Default value

0x0

Region 7 base memory address (high 32 bits).

rst_region_base_high_8**Type**

int

Default value

0x0

Region 8 base memory address (high 32 bits).

rst_region_base_low_1**Type**

int

Default value

0x0

Region 1 base memory address (low 32 bits).

rst_region_base_low_2**Type**

int

Default value

0x0

Region 2 base memory address (low 32 bits).

rst_region_base_low_3**Type**

int

Default value

0x0

Region 3 base memory address (low 32 bits).

rst_region_base_low_4**Type**

int

Default value

0x0

Region 4 base memory address (low 32 bits).

rst_region_base_low_5**Type**

int

Default value

0x0

Region 5 base memory address (low 32 bits).

rst_region_base_low_6**Type**

int

Default value

0x0

Region 6 base memory address (low 32 bits).

rst_region_base_low_7**Type**

int

Default value

0x0

Region 7 base memory address (low 32 bits).

rst_region_base_low_8**Type**

int

Default value

0x0

Region 8 base memory address (low 32 bits).

rst_region_id_access_0**Type**

int

Default value

0x0

Region 0 NSAID permissions.

rst_region_id_access_1**Type**

int

Default value

0x0

Region 1 NSAID permissions.

rst_region_id_access_2**Type**

int

Default value

0x0

Region 2 NSAID permissions.

rst_region_id_access_3**Type**

int

Default value

0x0

Region 3 NSAID permissions.

rst_region_id_access_4**Type**

int

Default value

0x0

Region 4 NSAID permissions.

rst_region_id_access_5**Type**

int

Default value

0x0

Region 5 NSAID permissions.

rst_region_id_access_6**Type**

int

Default value

0x0

Region 6 NSAID permissions.

rst_region_id_access_7**Type**

int

Default value

0x0

Region 7 NSAID permissions.

rst_region_id_access_8**Type**

int

Default value

0x0

Region 8 NSAID permissions.

rst_region_top_high_0**Type**

int

Default value

0x0

Region 0 (default) top memory address.

rst_region_top_high_1**Type**

int

Default value

0x0

Region 1 top memory address (high 32 bits).

rst_region_top_high_2**Type**

int

Default value

0x0

Region 2 top memory address (high 32 bits).

rst_region_top_high_3**Type**

int

Default value

0x0

Region 3 top memory address (high 32 bits).

rst_region_top_high_4**Type**

int

Default value

0x0

Region 4 top memory address (high 32 bits).

rst_region_top_high_5**Type**

int

Default value

0x0

Region 5 top memory address (high 32 bits).

rst_region_top_high_6**Type**

int

Default value

0x0

Region 6 top memory address (high 32 bits).

rst_region_top_high_7**Type**

int

Default value

0x0

Region 7 top memory address (high 32 bits).

rst_region_top_high_8**Type**

int

Default value

0x0

Region 8 top memory address (high 32 bits).

rst_region_top_low_1**Type**

int

Default value

0x0

Region 1 top memory address (low 32 bits).

rst_region_top_low_2**Type**

int

Default value

0x0

Region 2 top memory address (low 32 bits).

rst_region_top_low_3**Type**

int

Default value

0x0

Region 3 top memory address (low 32 bits).

rst_region_top_low_4**Type**

int

Default value

0x0

Region 4 top memory address (low 32 bits).

rst_region_top_low_5**Type**

int

Default value

0x0

Region 5 top memory address (low 32 bits).

rst_region_top_low_6**Type**

int

Default value

0x0

Region 6 top memory address (low 32 bits).

rst_region_top_low_7**Type**

int

Default value

0x0

Region 7 top memory address (low 32 bits).

rst_region_top_low_8**Type**

int

Default value

0x0

Region 8 top memory address (low 32 bits).

3.10.101 TZFilterUnit

TrustZone Filter Unit. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1296: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for TZFilterUnit

This model has the following Iris instances:

Table 3-1297: TZFilterUnit Iris instances

InstanceName	ComponentName
TZFilterUnit	TZFilterUnit
TZFilterUnit.BusMapper	PVBusMapper

This model has the following MTI trace components:

Table 3-1298: TZFilterUnit MTI instances

InstanceName	ComponentName
TZFilterUnit.BusMapper	PVBusMapper

TZFilterUnit contains the following CADI targets:

- [TZFilterUnit](#)

Ports for TZFilterUnit

Table 3-1299: Ports

Name	Protocol	Type	Description
control	TZFilterControl	Master	Configuration port.
pvbus_m	PVBus	Master	Master bus port.
pvbus_s	PVBus	Slave	Slave bus port.

3.10.102 TZIC

ARM TrustZone Interrupt Controller(SP890). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1300: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for TZIC

This model has the following Iris instances:

Table 3-1301: TZIC Iris instances

InstanceName	ComponentName
TZIC	TZIC
TZIC.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-1302: TZIC MTI instances

InstanceName	ComponentName
TZIC.busslave	PVBusSlave

TZIC contains the following CADI targets:

- TZIC

About TZIC

The TZIC provides a software interface to the secure interrupt system in a TrustZone® design. It provides secure control of the nFIQ and masks out the interrupt sources chosen for nFIQ from the interrupts that are passed onto a non-secure interrupt controller.

Ports for TZIC

Table 3-1303: Ports

Name	Protocol	Type	Description
fiq_out	Signal	Master	FIQ interrupt to processor.
input[32]	Signal	Slave	32 interrupt input sources.
irq_out[32]	Signal	Master	32 IRQ output ports.
nsfiq_in	Signal	Slave	Connects to the nFIQ output of the non-secure interrupt controller.
pvbuss	PVBus	Slave	Slave port for connection to PV bus master/decoder.
sfiq_in	Signal	Slave	Daisy chaining secure FIQ input, otherwise connects to logic 1 if interrupt controller not daisy chained.

3.10.103 TrustedRAM

Trusted RAM. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1304: IP revisions support

Revision	Quality level
0.4	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for TrustedRAM

This model has the following Iris instances:

Table 3-1305: TrustedRAM Iris instances

InstanceName	ComponentName
TrustedRAM	TrustedRAM
TrustedRAM.apb	PVBusSlave

This model has the following MTI trace components:

Table 3-1306: TrustedRAM MTI instances

InstanceName	ComponentName
TrustedRAM.apb	PVBusSlave

TrustedRAM contains the following CADI targets:

- TrustedRAM

Ports for TrustedRAM

Table 3-1307: Ports

Name	Protocol	Type	Description
apb	PVBus	Slave	APB Subordinate Interface - Access to registers
reset_in	Signal	Slave	Reset in signal

Parameters for TrustedRAM

TRBC_RESET_VALUE

Type

int

Default value

0xb

TRBC Registers Reset Value.

diagnostics

Type

int

Default value
0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.104 VHT_VIOBridge

Arm VHT Virtual I/O interface. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1308: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Ports for VHT_VIOBridge

Table 3-1309: Ports

Name	Protocol	Type	Description
pvbuss_s	PVBus	Slave	Target port for access to VIOBridge registers

Parameters for VHT_VIOBridge

vio_basename

Type
string

Default value
""

Baseline of scripts to use for VIO.

vio_path

Type
string

Default value
""

Path to find python scripts for VIO.

3.10.105 VHT_VSIBridge

Arm VHT Virtual stream interface. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1310: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Ports for VHT_VSIBridge

Table 3-1311: Ports

Name	Protocol	Type	Description
intr	Signal	Master	Interrupt raising signal
pvbus_m	PVBus	Master	Requester port for access to emeory
pvbus_s	PVBus	Slave	Completer port for access to VSIBridge registers

Parameters for VHT_VSIBridge

vsi_basename

Type

string

Default value

""

Baseline of scripts to use for VSI.

vsi_idx

Type

int

Default value

0x0

Index to use for VSI.

vsi_path

Type

string

Default value

""

Path to find python scripts for VSI.

3.10.106 VHT_VSocket

Arm VHT Virtual socket bridge interface. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1312: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Ports for VHT_VSocket

Table 3-1313: Ports

Name	Protocol	Type	Description
pvbuss_m	PVBus	Master	Port for VSocket bridge to access external memory
pvbuss_s	PVBus	Slave	Target port for access to VSocket bridge registers

Parameters for VHT_VSocket

name

Type

string

Default value

""

Name of the component.

3.10.107 v7_VGIC

System VGIC architecture version v7. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1314: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for v7_VGIC

This model has the following Iris instances:

Table 3-1315: v7_VGIC Iris instances

InstanceName	ComponentName
v7_VGIC	v7_VGIC
v7_VGIC.vgic_bus_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-1316: v7_VGIC MTI instances

InstanceName	ComponentName
v7_VGIC	v7_VGIC
v7_VGIC.vgic_bus_slave	PVBusSlave

v7_VGIC contains the following CADI targets:

- v7_VGIC

Ports for v7_VGIC

Table 3-1317: Ports

Name	Protocol	Type	Description
cfgsdisable	Signal	Slave	Disable write access to some GIC registers.
configuration	v7_VGIC_Configuration_Protocol	Slave	Configure the mapping of the core number (from MasterID) to the core interface number.
fiq_in[8]	Signal	Slave	FIQ inputs.
fiq_out[8]	Signal	Master	FIQ outputs.
irq_in[8]	Signal	Slave	IRQ inputs.
irq_out[8]	Signal	Master	IRQ outputs.
ppi_core0[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 0.
ppi_core1[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 1.
ppi_core2[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 2.
ppi_core3[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 3.
ppi_core4[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 4.
ppi_core5[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 5.
ppi_core6[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 6.
ppi_core7[16]	Signal	Slave	Private peripheral interrupts (ID16-ID31) for cpu 7.
pvbus_s	PVBus	Slave	Bus port for accessing distributor registers.
reporting_interface	VGICReportingProtocol	Slave	Logging interface.
reset_signal	Signal	Slave	Reset signal input.
spi[988]	Signal	Slave	SPI inputs.
vfiq_out[8]	Signal	Master	Virtual FIQ outputs.

Name	Protocol	Type	Description
virq_out[8]	Signal	Master	Virtual IRQ outputs.
wakeup_fiq[8]	Signal	Master	Wakeup signal for FIQ.
wakeup_irq[8]	Signal	Master	Wakeup signal for IRQ.

Parameters for v7_VGIC

core-impl-id

Type

int

Default value

0x3902043b

Implementation ID to present for the cores.

dist-impl-id

Type

int

Default value

0x3902043b

Implementation ID to present for the distributor.

enable_log_errors

Type

bool

Default value

0x0

.

enable_log_fatal

Type

bool

Default value

0x0

.

enable_log_warnings

Type

bool

Default value

0x0

enabled**Type**

bool

Default value

0x1

Enable the component. If it is disabled then all register writes will have no effect.

number-of-cores**Type**

int

Default value

0x8

Number of core interfaces to present.

number-of-ints**Type**

int

Default value

0xe0

Number of interrupt pins. Will be rounded down to the nearest multiple of 32.

number-of-lrs**Type**

int

Default value

0x40

Number of list registers.

vgic-version**Type**

int

Default value

0xb

Version number of the VGIC interface.

4. Plug-ins for Fast Models

This chapter describes the plug-ins that are available for Fast Models.

Prebuilt plug-ins can be found at `$PVLIB_HOME/plugins/<OS_compiler>/`. The source code for some of these plug-ins is provided as programming examples, under `$PVLIB_HOME/examples/MTI/`.

4.1 Loading a plug-in

The method of loading a plug-in depends on the type of model being used.

4.1.1 --plugin command-line option

To load a plug-in, use the `--plugin <path_to_plugin>/<plugin_name>` option.

To load more than one plug-in, use multiple `--plugin` options.

Specify plug-in parameters using one or more `-c` options when launching the model, or use a configuration file.

For example the following command:

- Loads the TarmacTrace plug-in.
- Sets the TarmacTrace `trace-file` parameter.

```
./isim_system --plugin $plugin_dir/TarmacTrace.so -C TRACE.TarmacTrace.trace-  
file=tTrace.log
```

Related information

- [scx::scx_parse_and_configure](#)

4.1.2 scx::scx_load_plugin() method

Fast Models that are exported to SystemC can call the method `scx::scx_load_plugin()` to hard code the path to the plug-in, before calling `sc_start()`.

For example:

```
scx::scx_load_plugin("$PVLIB_HOME/plugins/Linux64_GCC-10.3/TarmacTrace.so");
```

Related information

- [scx::scx_load_plugin](#)

4.1.3 FM_TRACE_PLUGINS environment variable

If it is not possible to specify a trace plug-in to the launching tool, use the environment variable `FM_TRACE_PLUGINS`. This variable must be set to the full path of the plug-in.

For example, on Linux:

```
export FM_TRACE_PLUGINS=<installation_path>/plugins/<OS_Compiler>/TarmacTrace.so
```

or on Windows:

```
set FM_TRACE_PLUGINS=<installation_path>\plugins\<OS_Compiler>\<version>\TarmacTrace.dll
```

To set multiple trace plug-ins at the same time, separate them with semicolons, for example:

```
set FM_TRACE_PLUGINS=%PVLIB_HOME%\plugins\Win64_VC2019\Release\TarmacTrace.dll;
%PVLIB_HOME%\plugins\Win64_VC2019\Release\GenericTrace.dll
```

You can also load the same plug-in multiple times. Give each instance a name by adding a prefix `<instancename>=` to each plug-in path or paths.

Specify parameters for plug-ins that you load using `FM_TRACE_PLUGINS`, using the following syntax:

```
|<param0_without_prefix=value>||<param1_without_prefix=value>||
<paramN_without_prefix=value>|<absolute_path_to_plugin.dll>
```

where `<param*_without_prefix=value>` means you must specify the parameter without the prefix that would be used on the command line. For example, use `trace-file=file.txt` instead of `TRACE.TarmacTrace.trace-file=file.txt`.

For example, on Linux:

```
export FM_TRACE_PLUGINS='|trace-file=/home/work/trace.txt||end-instruction-
count=1000|$PVLIB_HOME/plugins/Linux64_GCC-7.3/TarmacTrace.so'
```

or on Windows:

```
set FM_TRACE_PLUGINS=^|trace-file=c:\work\trace.txt^|^|end-instruction-count=1000^|
%PVLIB_HOME%\plugins\Win64_VC2019\Release\TarmacTrace.dll
```

- Do not specify a pipe character `|` at the end of the environment variable value.
- Separate individual parameters with two pipe characters `||`, not one.
- Separate the plug-in from the parameters using a single pipe character `|`.
- Do not specify quotes around paths that contain spaces, or escape spaces. Spaces are resolved automatically.

- Do not specify environment variables within this environment variable.
- Specify the parameters before you specify the plug-in.
- On Windows, you can either set the environment variable using the **Advanced System Settings** window, or if you are using the command line, you might need to escape each pipe character, for example `^|`.
- The parameter values that you set using this environment variable are not displayed by the `--list-params` or `-l` command-line options. This is because the environment variable is processed at a later stage, when launching the simulation.

4.2 Customizing a plug-in

You can customize the behavior of a plug-in using parameters.

Plug-in parameters are set in the same way as model parameters. They have the following format:

```
-C <PLUGIN_TYPE>.<plugin_name>.<parameter>=<value>
```

The `PLUGIN_TYPE` value varies depending on the plug-in type, for example:

```
-C TRACE.TarmacTrace.trace-file=trace.log
```

```
-C CRYPTO.Crypto.verbose=1
```

4.3 ArchMsgTrace

The Architecture Message Trace plug-in prints warning and error messages to `stdout` or to a file when software performs operations that are not recommended, for instance because they are unpredictable.

The plug-in connects to all trace sources that have the `ArchMsg` prefix, which are normal MTI trace sources, but with a specific format. These trace sources can also be used with the `GenericTrace` plug-in, but the `ArchMsgTrace` plug-in has extra capabilities.

When the model emits an `ArchMsg` trace event, `ArchMsgTrace` outputs a message in the format:

```
category: component.hierarchy.name: ...
```

The trace sources have names of the form:

```
component.hierarchy.ArchMsg.category.name[#supplementalEventName]
```

where:

- `category` is usually `Warning`, `Error`, or `Info`.
- `name` is a short string that uniquely identifies the condition.
- `supplementalEventName` is an optional identifier for a supplemental event, which is an event that provides more information about the initial event. For example, if a cache contains mismatching attributes, which triggers an `ArchMsg` trace event, a supplemental event might be emitted for each cache line affected.

The trace source can also include a line that defines a more human-readable description of the event. This line can contain fields which `ArchMsgTrace` replaces in the output string with values from the trace source.

`ArchMsgTrace` can be configured to suppress:

- Specific trace sources.
- Specific categories.
- Repeated events of the same type.

To suppress specific trace sources or categories, use a whitespace-separated list of patterns, optionally including wildcards (`*` and `?`).

Repeated events can only be suppressed if the `ArchMsg` trace source declares a key field.

`ArchMsgTrace` searches for the key field in the following way:

- It looks for the string `"\nPRIMARY KEY <key-field-name>"` in the description of the trace source and uses that field name if the string exists.
- If not found, it looks for a field named `"KEY"`.
- Otherwise, the `ArchMsg` trace source has no key field and cannot be suppressed.

If the `suppress_repeated` parameter is true, the plug-in suppresses repeated events for the same trace source that have the same key field value. For example, the key field might represent the PC and so repeated events for the same PC can be suppressed.

To see a list of all possible `ArchMsg` trace sources that the model can emit, run it with the `ListTraceSources` plug-in. Then search the output for trace sources with the `ArchMsg` prefix.

Some examples of `ArchMsg` trace sources are:

`ArchMsg.Error.BusActiveDuringReset`

A transaction was received at the bus slave port whilst reset was asserted.

`ArchMsg.Warning.cache_contents_unknown`

Execution that depends on unknown cache contents.

`ArchMsg.Warning.warning_atomic_to_unsupported_memory`

Atomic access to an unsupported memory type.

ArchMsg.Warning.decode_unpred_other

Use of unpredictable instruction.

ArchMsg.Warning.recursive_exception

Recursive exception.

Related information[ListTraceSources](#) on page 4754

4.3.1 ArchMsgTrace - parameters

This section describes the parameters for the ArchMsgTrace plug-in.

Each parameter is prefixed with `TRACE.ArchMsgTrace`, for example:

```
TRACE.ArchMsgTrace.exit_on_first_output
```

Table 4-1: ArchMsgTrace parameters

Name	Type	Default value	Allowed values	When set	Description
exit_on_first_output	bool	false	true, false	Init time	Exit the simulation process after the first message has been written.
filter_tags	string	"ALL"	""	Init time	Space-separated list of tags that are matched against the tag(s) of the trace events. The trace event message is printed if any of the tags matches. If the value is empty or ALL, all the messages are printed. Available tags: - ALL - UNPREDICTABLE - IMP_DEF.
suppress_categories	string	"Why"	""	Init time	Space-separated list of categories which should not be printed.
suppress_repeated	bool	true	true, false	Init time	Suppress repeated messages from similar call sites.
suppress_sources	string	""	""	Init time	Space-separated list of components or events that should not be printed.
trace-file	string	""	""	Init time	ArchMsgTrace output file.

4.4 ASTFplugin

ASTFplugin is an MTI plug-in that enables Fast Models to generate trace output in Architectural Structured Trace Format (ASTF).

ASTF is a binary, compressible trace format that captures the architectural execution of each of the CPUs in a system. It supports the collection of traces from complex workloads of up to billions of instructions in length. The format was designed to achieve a balance between compactness, ease of interpretation, and strong forwards and backwards compatibility.

ASTF and associated tools have been developed to support workload tracing, workload analysis, and to drive CPU performance models.

ASTFplugin can be used in combination with [ToggleMTIPlugin](#).

- ASTFplugin is supported on Linux hosts only.
- ASTFplugin and the ASTF specification are in development and further iterations are expected. For the status of ASTFplugin, the version of the specification it supports, and any limitations and known issues, see the Fast Models release notes.

Additional reading

- The ASTF specification is included in the Fast Models package in the `$FVLIB_HOME/Docs/` directory.
- For answers to some common queries about ASTFplugin, see the [ASTFplugin FAQs](#).
- For best practices for preparing an ASTF trace for performance prediction of a workload see [Workload Trace Generation Best Practices](#).
- For how to use a Fast Models FVP to capture an ASTF trace, see [How to generate ASTF traces of workloads running on Fast Models](#).

4.4.1 ASTFplugin - parameters

This section describes the parameters for the ASTFplugin plug-in.

Each parameter is prefixed with `TRACE.ASTFplugin`, for example:

```
TRACE.ASTFplugin.encoding-method
```

Table 4-2: ASTFplugin parameters

Name	Type	Default value	Allowed values	When set	Description
encoding-method	int	0x2	0x0 - 0x2	Runtime	ASTF record encoding method. 0: Uncompressed; 1: Compressed LZMA; 2: Compressed ZLib.
timestamp-enable	bool	false	true, false	Init time	Timestamp records will become part of the output if enabled.
timestamp-period	int	0x5	0x1 - 0x7fffffffffffffffff	Init time	This parameter sets the simulated time between two timestamps in micro-seconds.
trace-file	string	""	""	Runtime	Trace file pathname and prefix to write out to. Will be appended with component path, session number and .astf suffix.
verbosity	int	0x2	0x0 - 0x2	Runtime	Output verbosity level. 0: FATAL; 1: ERROR; 2: WARNING.

4.4.2 ASTFplugin usage notes

Be aware of the following points when using ASTFplugin.

- Load ASTFplugin in the same way as other plug-ins, using the syntax:

```
./isim_system <isim_params> --plugin /path/to/ASTFplugin.so <astf_plugin_params>
```

- ASTFplugin generates trace files with a `.astf` extension. During the simulation, these trace files might be incomplete. Incomplete trace files have a `.astf.part` extension and cannot be processed using the ASTF tools.
- The output trace files have a four digit enumerator field in the name. For example `FVP_Base_Cortex_A55x2.cluster0.cpu0.0000.astf`. This enumerator field is always present, regardless of whether ASTFplugin is used together with ToggleMTIPlugin. If ToggleMTIPlugin instructs ASTFplugin to stop and then resume, a new file is created for each CPU with each enumerator field incremented by one. However, if a CPU was not active when ToggleMTIPlugin instructed ASTFplugin to record, the respective output file is not created.
- ASTFplugin tries to register callbacks for MTI trace sources for the Scalable Vector Extension (SVE). If SVE is not enabled, ASTFplugin reports warnings to the console. You can ignore these warnings if SVE operations do not need to be recorded or if SVE is intended to be disabled.
- To improve performance, ASTFplugin is multithreaded. As the plug-in handles large streams of data, avoid using SMT or Hyper-Threading or running the threads on different sockets on a multi-socket host system. For optimal performance, we recommend you use `taskset` to restrict the model to using a specified set of N+1 host cores where N is the number of cores simulated in the model.

4.4.3 Additional ASTF support in Fast Models

In addition to ASTFplugin, Fast Models includes some other tools and libraries that support ASTF.

- The `trprint`, `trcheck`, `trdd`, `trimage`, and `trpidannotate` tools enable you to process the ASTF trace file. For details, see [ASTF tools](#).
- [ToggleMTIPlugin](#), installed in `$PVLIB_HOME/plugins/<OS_Compiler>/`, can be used together with ASTFplugin to limit trace generation to specific regions of interest.
- libastf library and header files:

`$PVLIB_HOME/astf_tools/lib/libastf.a`

Library for reading and writing ASTF trace files. It exposes both C++ and C interfaces. For documentation, including a basic C++ example, see `$PVLIB_HOME/Docs/astf/libastf-api/libastf-api.txt`.

`$PVLIB_HOME/astf_tools/include/astf.h`

Specifies the C++ and C interfaces to libastf. For documentation of each API function, see `$PVLIB_HOME/Docs/astf/libastf-api/<C++_function_name>.txt`.

`$PVLIB_HOME/astf_tools/include/astf_records.h`

ASTF library record definitions.

- An example Python script, `$PVLIB_HOME/examples/pyIris/inst_count_trace_control.py`. It uses the `iris.debug` Python module to demonstrate using `ToggleMTIPlugin` to limit tracing to specific parts of the application. For usage instructions, run the script with the `-h` option. For more information, see the comments in the source file.

Related information

[Iris Python Debug Scripting User Guide](#)

4.4.4 ASTF tools

The ASTF-related tools `trcheck`, `trdd`, `trimage`, `trpidannotate`, and `trprint` are installed in `$PVLIB_HOME/astf_tools/`. They enable you to process the trace files that ASTFplugin outputs, for example to view them in a human-readable format.

trcheck

Verifies the correctness of the trace files against the semantics defined in the ASTF format specification. For documentation, see `$PVLIB_HOME/Docs/astf/tools/trcheck.txt`.

trdd

Slices, copies, and (re)compresses the trace files. It can cut pieces from a trace file or re-encode a trace file by using a different compression level. For documentation, see `$PVLIB_HOME/Docs/astf/tools/trdd.txt`.

trimage

Analyses and profiles instructions and branches across multiple ASTF files. For documentation, see `$PVLIB_HOME/Docs/astf/tools/trimage.txt`.

trpidannotate

Annotates Context records in the trace files to correct the PID/TID information that was collected during tracing. For documentation, see `$PVLIB_HOME/Docs/astf/tools/trpidannotate.txt`.

trprint

Enables viewing and printing trace files in a human-readable format. For documentation, see `$PVLIB_HOME/Docs/astf/tools/trprint.txt`.

4.5 BranchPrediction

The `BranchPrediction` plug-in enables branch prediction modeling in Fast Models. The `BranchPrediction` plug-in is deprecated. It might be modified or removed in a future release.

Branch prediction is an aspect of Timing Annotation. For more details, see [Timing Annotation](#) in the Fast Models User Guide.

The type of branch predictor to use is selected using the `predictor-type` parameter. It can be one of the following example branch predictors that Arm provides, or a user-defined one:

FixedDirectionPredictor

Always takes a preset fixed direction.

BiModalPredictor

Standard 2-bit strength predictor.

GSharePredictor

Standard global history sharing predictor.

HybridPredictor

Selects the majority result from the bimodal predictor, fixed-direction predictor, and a random predictor.

CortexA53Predictor

Cortex®-A53 branch predictor. This is the default.

4.5.1 BranchPrediction - parameters

This section describes the parameters for the BranchPrediction plug-in.

Each parameter is prefixed with `BranchPrediction.BranchPrediction`, for example:

```
BranchPrediction.BranchPrediction.bpstat-branchcount
```

Table 4-3: BranchPrediction parameters

Name	Type	Default value	Allowed values	When set	Description
bpstat-branchcount	int	-0x1	0x0 - 0x7fffffffffffffffff	Init time	The number of branch instructions to display. Set to -1 to display all branch instructions.
bpstat-pathfilename	string	""	""	Init time	The path and filename of the branch statistics log.
mispredict-latency	int	0x8	0x0 - 0x7fffffffffffffffff	Init time	The number of instructions that are flushed for every misprediction.
predictor-type	string	"CortexA53Predictor"	""	Init time	The type of branch predictor to use.

4.5.2 BranchPrediction output example

This example command line configures and loads the BranchPrediction plug-in:

```
./EVS_Base_Cortex-A73x1 -a __image.axf \
...
--plugin $PVLIB_HOME/plugins/Linux64_GCC-7.3/BranchPrediction.so \
-C BranchPrediction.BranchPrediction.predictor-type=BiModalPredictor \
-C BranchPrediction.BranchPrediction.mispredict-latency=8 \
-C BranchPrediction.BranchPrediction.bpstat-pathfilename=bpstat.txt \
-C BranchPrediction.BranchPrediction.bpstat-branchcount=5
```

This command produces the following log file:

```
Processor Core: ARM_Cortex-A73
Cluster instance: 0
Core instance: 0
Mispredict Latency: 8
Image executed: _image.axf
PredictorType: BiModalPredictor
Total branch calls: 7757
Total Mispredictions: 130
Average prediction accuracy: 0.983241
Conditional Branches: 139
Total unique branch instructions: 289
--Branch instructions--
  PC Addr      Calls    Mispredict Accuracy
[0] 0x0         2         0          1
[1] 0x80000000  1         0          1
[2] 0x8000000c 10         0          1
[3] 0x80000014 10         0          1
[4] 0x8000001c 10         0          1
```

4.5.3 Other ways to report branch mispredictions

These are some alternative ways to report branch mispredictions.

- The `GenericTrace` plug-in can generate MTI trace events that report branch mispredictions. For example:

```
--plugin $PVLIB_HOME/plugins/Linux64_GCC-7.3/GenericTrace.so \
-C TRACE.GenericTrace.trace-sources=BRANCH_MISPREDICT
```

The `BranchPrediction` plug-in must also be loaded to generate these events.

- The `BranchPrediction` plug-in is integrated with the PMU event counters. On a Linux boot simulation, you can track the number of simulated branch mispredictions in an application by loading the `BranchPrediction` plug-in and running the `perf` tool. For example, the following command displays the number of branch mispredictions that are made in an application called `testapp`:

```
perf stat e branch-misses testapp
```

4.6 CADIIPCRemoteConnection

Use this plug-in to make a remote CADI connection to a model.

The remote connection can be from a client on a different host machine, or from a client on the same host but using a specific port.

To enable remote connections, set the `enable_remote_cadi` plug-in parameter to true and specify an IP address to listen to, or `0.0.0.0` to listen to all adapters. Also, you must start a CADI server with the `-s` model parameter.

The default values for this plug-in restrict connections to be from the localhost (127.0.0.1) only.

Related information

4.6.1 CADIIPCRemoteConnection - parameters

This section describes the parameters for the CADIIPCRemoteConnection plug-in.

Each parameter is prefixed with `REMOTE_CONNECTION.CADIIPCRemoteConnection`, for example:

```
REMOTE_CONNECTION.CADIIPCRemoteConnection.enable_remote_cadi
```

Table 4-4: CADIIPCRemoteConnection parameters

Name	Type	Default value	Allowed values	When set	Description
<code>enable_remote_cadi</code>	bool	false	true, false	Init time	Allow connections from remote hosts.
<code>listen_address</code>	string	"127.0.0.1"	""	Init time	If <code>enable_remote_cadi</code> is set, the network address the server listens on. The default is 127.0.0.1.
<code>port</code>	int	0x7b8b	0x1 - 0xffff	Init time	If <code>enable_remote_cadi</code> is set, the TCP port the server listens on. The default is 31627.
<code>range</code>	int	0x0	0x0 - 0x64	Init time	If the requested port is not available, search for the next available port in the range [port:port+range]. The default is zero, which means only try the requested port.

4.7 CDE

Custom Datapath Extension (CDE) allows you to improve performance and efficiency by adding application domain-specific features to embedded processors, while maintaining the advantages of the Arm® software ecosystem.

CDE allows you to add a customizable module inside some Cortex®-M processors. This module is driven by the pre-decoded CDE instructions and shares the same interface as the standard Arithmetic Logic Unit (ALU) of the processor.

Fast Models implements CDE using Model Trace Interface (MTI) plug-ins, with CADI parameters to allow the plug-ins to be configured at runtime. The following Fast Models support CDE:

- [ARMCortexM33CT](#)
- [ARMCortexM52CT](#)
- [ARMCortexM55CT](#)
- [ARMCortexM85CT](#)
- [ARMAEMv8MCT](#)

The following model parameters are exposed for configuring CDE:

has_cde

Controls whether CDE is enabled. If enabled, a plug-in must be provided.

--plugin <path/to/plugin.so>

This option can be specified multiple times, once for each CDE plug-in implementation. Alternatively, plug-ins can be loaded by setting the `FM_PLUGINS` or `FM_TRACE_PLUGINS` environment variable.

cpu.cde_impl_name=<plugin_name>

The CDE implementation name to use with this core. If multiple CDE plug-in implementations are provided, each core can be requested to use a specific plug-in by using `cpu<n>.cde_impl_name=...`

Two example plug-ins are available, CDETester and CDEConstant. They are provided as pre-built libraries and as source code, located in `$PVLIB_HOME/plugins/source/`, to help with implementing your own plug-ins.

4.7.1 CDETester

CDETester is a basic example plug-in that allows you to specify at runtime which CDE instructions are supported by individual coprocessors and to specify the behavior, either nop or undefined.

To specify the instructions that coprocessors support, provide a plug-in parameter of the form:

```
CDE.CDETester.cde_tester_trivial.cps_implemented_instr=0xn
```

where `0xn` represents a hexadecimal bitmask of coprocessors that implement this instruction and `instr` represents a CDE instruction name.

The full list of CDE instruction names is as follows, where `d` represents dual variants and `v` represents vector variants:

- `cx1`
- `cx2`
- `cx3`
- `cx1d`
- `cx2d`
- `cx3d`
- `vcx1`
- `vcx2`
- `vcx3`
- `vcx1v`
- `vcx2v`

- `vcx3v`

Accumulate variants are handled in the same function implementation as the non-accumulate variants.

The bitmask takes the form:

bits [7:0]

For non-accumulate variants.

bits [23:16]

For accumulate variants.

The plug-in also allows control over which coprocessors implement CDE through the `CDE.CDETester.cde_tester_trivial.cps_implemented=0xn` parameter, where `0xn` represents a hexadecimal bitmask of coprocessors that implement CDE.

An example invocation to enable `cx1` and `cx1A` (accumulate) for CP3 might be written as:

```
CDE.CDETester.cde_tester_trivial.cps_implemented=0x8 // enable CDE support for CP3
CDE.CDETester.cde_tester_trivial.cps_implemented_cx1=0x80008 // enable CX1 and CX1A
on CP3 (behaves as nop rather than undef)
```

On Linux, you can retrieve an up-to-date list of parameters from the model by using:

```
-l | grep -i cdetester
```

4.7.2 CDETester - parameters

This section describes the parameters for the CDETester plug-in.

Each parameter is prefixed with `CDE.CDETester`, for example:

```
CDE.CDETester.cde_tester_trivial.cps_implemented
```

Table 4-5: CDETester parameters

Name	Type	Default value	Allowed values	When set	Description
<code>cde_tester_trivial.cps_implemented</code>	int	<code>0xff00ff</code>	<code>0x0 - 0xffffffff</code>	Init time	Bitmask indicating coprocessors implemented.
<code>cde_tester_trivial.cps_implemented_cx1</code>	int	<code>0xff00ff</code>	<code>0x0 - 0xffffffff</code>	Init time	Coprocessor enables CX1 instructions ([23:16] for CX1A, [7:0] for CX1).
<code>cde_tester_trivial.cps_implemented_cx1d</code>	int	<code>0xff00ff</code>	<code>0x0 - 0xffffffff</code>	Init time	Coprocessor enables CX1D instructions ([23:16] for CX1DA, [7:0] for CX1D).
<code>cde_tester_trivial.cps_implemented_cx2</code>	int	<code>0xff00ff</code>	<code>0x0 - 0xffffffff</code>	Init time	Coprocessor enables CX2 instructions ([23:16] for CX2A, [7:0] for CX2).

Name	Type	Default value	Allowed values	When set	Description
cde_tester_trivial.cps_implemented_cx2d	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables CX2D instructions ([23:16] for CX2DA, [7:0] for CX2D).
cde_tester_trivial.cps_implemented_cx3	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables CX3 instructions ([23:16] for CX3A, [7:0] for CX3).
cde_tester_trivial.cps_implemented_cx3d	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables CX3D instructions ([23:16] for CX3DA, [7:0] for CX3D).
cde_tester_trivial.cps_implemented_vcx1	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables VCX1 instructions ([23:16] for VCX1A, [7:0] for VCX1).
cde_tester_trivial.cps_implemented_vcx1v	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables VCX1 (Vector) instructions ([23:16] for VCX1A (Vector), [7:0] for VCX1 (Vector)).
cde_tester_trivial.cps_implemented_vcx2	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables VCX2 instructions ([23:16] for VCX2A, [7:0] for VCX2).
cde_tester_trivial.cps_implemented_vcx2v	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables VCX2 (Vector) instructions ([23:16] for VCX2A (Vector), [7:0] for VCX2 (Vector)).
cde_tester_trivial.cps_implemented_vcx3	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables VCX3 instructions ([23:16] for VCX3A, [7:0] for VCX3).
cde_tester_trivial.cps_implemented_vcx3v	int	0xff00ff	0x0 - 0xffffffff	Init time	Coprocessor enables VCX3 (Vector) instructions ([23:16] for VCX3A (Vector), [7:0] for VCX3 (Vector)).
has_cde_tester_trivial	bool	true	true, false	Init time	Whether the CDETester plugin is implemented (undefs all CDE instructions).

4.7.3 CDEConstant

This is an example plug-in that provides an implementation for every CDE instruction variant, for example [v]cxn, [v]cxnA, and [v]cxnD. Each instruction simply performs an XOR with some arguments and a constant.

To load this plug-in, use the following parameters when launching the model:

```
--plugin path/to/plugin/CDEConstant.so -C cpu.has_cde=1 -C
cpu.cde_impl_name=CDE_CONSTANT
```

4.7.4 CDEConstant - parameters

This section describes the parameters for the CDEConstant plug-in.

Each parameter is prefixed with `cde.CDEConstant`, for example:

```
cde.CDEConstant.has_cde_constant
```

Table 4-6: CDEConstant parameters

Name	Type	Default value	Allowed values	When set	Description
has_cde_constant	bool	true	true, false	Init time	Whether the CDEConstant plugin is implemented.

4.7.5 Implementing a CDE plug-in

Fast Models supports prototyping of custom instructions through a modular plug-in system, which uses the Model Trace Interface (MTI) framework.

Multiple CDE plug-ins can be registered with the model and each core can be instructed which plug-in behavior to use. Run-time configuration of CDE plug-ins is performed using CADI parameters, although plug-in developers can use alternative approaches, for example configuration files.

This guide shows how to implement a basic MTI-based CDE plug-in, using the CDETester plug-in as an example. It is intended to be a quick start to plug-in development, and does not describe details about MTI. To learn more about MTI, see [Model Trace Interface Reference Manual](#). The source code for CDETester can be found in `$PVLIB_HOME/plugins/source/CDETester/`.

A CDE plug-in performs three main tasks:

- MTI and CDE interface registration.
- Handling of parameters passed through the command line or CADI.
- Implementing CDE instructions.

Related information

- [CDETester](#)

4.7.5.1 Prerequisites for implementing a CDE plug-in

To build the CDE plug-in examples, you need the following:

- A compiler that matches the Fast Models build you are using.
- A recent version of CMake.
- An installation of the Fast Models package and libraries.

4.7.5.2 CDE plug-in registration

After a CDE plug-in has been loaded into the model through the `--plugin` argument, or the `FM_TRACE_PLUGINS` environment variable, it must register itself with the CDE interface registry using the MTI framework API.

The CDE interface registry is responsible for:

- Managing all loaded CDE plug-ins.
- Passing any parsed arguments to the relevant CDE plug-in.
- Assigning CDE plug-ins to cores, as requested by the model arguments.

The CDE interface registry requires an interface name and version to be registered through MTI, as shown in `CDETester.cpp` and `CDETesterTrivialImpl.h`.

4.7.5.3 CDE plug-in parameters

After the plug-in has registered itself with the CDE interface registry, the model passes any parsed command-line parameters to the CDE plug-in they are associated with.

The parameters to the `CDETester` example plug-in allow you to specify which custom instructions result in a no operation (nop) for each coprocessor. Any instructions that are not enabled result in an Undefined Instruction exception being raised.

The plug-in handles parameters that it receives from the model in `CDETester.cpp` by passing them through the `CDETesterFactory` interface to the handler implementation in `CDETrivialImpl::consumeParameter()`, defined in `CDETesterTrivialImpl.cpp`.

Related information

- [CDETester](#)

4.7.5.4 CDE plug-in instruction handler interface

After plug-in registration and optional parameter handling, the plug-in should implement handlers for all available CDE instructions, even if it does not intend to implement custom functionality for all instruction variants.

To help you do this, Fast Models provides a utility header, `$PVLIB_HOME/include/ct/CDE/CDEInstHandlerInterface.h`. This header defines the `CDEInstHandlerInterface` class for handling CDE instruction calls, which plug-ins must inherit.

This interface declares pure virtual methods for each CDE instruction variant, for example dual and accumulator, as well as the structures containing decode information and call results. A typical signature follows this pattern:

```
CDEResult64 CDETrivialImpl::exec_cx2_d(const CX2DecodeInfo& decode_info, uint64_t
    rfd_val, uint32_t rn_val)
```

The `CDETester` example plug-in inherits this interface in `CDETesterBaseImpl.h` and implements the instructions in `CDETesterTrivialImpl.h` and `CDETesterTrivialImpl.cpp`.

4.7.5.5 CDE plug-in instruction implementations

Each CDE instruction is mapped to a single function definition, except for accumulate variants, which are handled by checking for the accumulate flag in the parameters passed to the instruction implementations.

The full list of instructions that a plug-in is expected to implement is given in [CDETester](#).

Each instruction implementation accepts as parameters:

- A structure containing decoded instruction opcode parameters, including register numbers and immediate. For example `CX1DecodeInfo`.
- The contents of registers specified in the instruction opcode.

Instruction implementations should return a result structure of varying size, for example `CDEResult32` or `CDEResult64`. This structure indicates whether the instruction is supported, and if so, the return value and the number of cycles taken for execution, which is used in trace and performance analysis.

If a plug-in needs to raise an Undefined Instruction exception for a particular instruction, it can simply return a default-initialized result structure.

For full details of the expected function declarations and parameter types, see the file `$PVLIB_HOME/include/ct/CDE/CDEInstHandlerInterface.h`.

4.7.5.6 Building the CDE plug-in

During plug-in development, either modify the example `CMakeLists.txt` files provided with the CDE plug-ins to reflect any changes to the file structure, or alternatively, use your own build system.

To build the example plug-ins:

1. Run `CMake` on the root directory of the plug-in to generate the project file, for example a Makefile or Visual Studio solution.
2. Run `make`.

4.7.6 CDE API

Reference documentation for the CDE API.

The CDE API is defined in the following header files, which are located in `$PVLIB_HOME/include/ct/CDE/`:

- `CDEFactoryInterface.h`
- `CDEInstHandlerInterface.h`
- `CDERegistryInterface.h`

4.7.6.1 CDEFactoryInterface.h

Defines the interface for obtaining an instance of a `CDEInstHandlerInterface` for a specific core.

4.7.6.1.1 CDE::CDEFactoryInterface class

The factory interface for obtaining an instance of a `CDEInstHandlerInterface` for a specific core.

4.7.6.1.2 CDE::CDEFactoryInterface::instantiateCDEInstHandler()

Instantiate a `CDEInstHandlerInterface` for a given core. The caller owns the result.

```
virtual std::unique_ptr<CDEInstHandlerInterface>  
instantiateCDEInstHandler(std::string component_hierarchy) = 0;
```

component_hierarchy

String representing the hierarchy of the current component.

4.7.6.1.3 CDE::CDEFactoryInterface::CDEImplName()

Return the name of the CDE implementation. A core can use this method to disambiguate multiple CDE implementations in a simulation.

```
virtual std::string CDEImplName() const = 0;
```

4.7.6.1.4 CDE::CDEFactoryInterface::CDEImplDescription()

Description of the CDE implementation.

Return the description of the CDE implementation that can be instantiated.

```
virtual std::string CDEImplDescription() const = 0;
```

4.7.6.1.5 CDE::CDEFactoryInterface::CDEImplProviderName()

Provider name of the CDE implementation.

Return the name of the component providing the CDE implementation, for example a plug-in. This name might be used in informative diagnostic messages.

```
virtual std::string CDEImplProviderName() const = 0;
```

4.7.6.2 CDEInstHandlerInterface.h

Defines the interface for executing CDE instructions.

4.7.6.2.1 CDE::CDEResult32 struct

32-bit result of a CDE instruction.

Members

instr_not_supported

Whether the instruction is supported.

value

Return value of the instruction.

cycles

Number of cycles of instruction execution.

4.7.6.2.2 CDE::CDEResult64 struct

64-bit result of a CDE instruction.

Members

instr_not_supported

Whether the instruction is supported.

value

Return value of the instruction.

cycles

Number of cycles of instruction execution.

4.7.6.2.3 CDE::CDEResult128 struct

128-bit result of a CDE instruction.

Members

instr_not_supported

Whether the instruction is supported.

value_lo

Low 64 bits of the return value of the instruction.

value_hi

High 64 bits of the return value of the instruction.

cycles

Number of cycles of instruction execution.

4.7.6.2.4 CDE::CX1DecodeInfo struct

Decoded information for the cx1 instruction.

Members**accumulate**

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

rd_num

General-purpose destination register number.

4.7.6.2.5 CDE::CX2DecodeInfo struct

Decoded information for the cx2 instruction.

Members**accumulate**

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

rd_num

General-purpose destination register number.

rn_num

General-purpose source register number.

4.7.6.2.6 CDE::CX3DecodeInfo struct

Decoded information for the cx3 instruction.

Members**accumulate**

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

rd_num

General-purpose destination register number.

rn_num

General-purpose source register number.

rm_num

General-purpose source register number.

4.7.6.2.7 [CDE::VCX1DecodeInfo struct](#)

Decoded information for the vcx1 instruction.

Members**accumulate**

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

vd_num

Source and destination vector register number.

4.7.6.2.8 [CDE::VCX2DecodeInfo struct](#)

Decoded information for the vcx2 instruction.

Members**accumulate**

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

vd_num

Source and destination vector register number.

vm_num

Source vector register number.

4.7.6.2.9 CDE::VCX3DecodeInfo struct

Decoded information for the vcx3 instruction.

Members**accumulate**

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

vd_num

Source and destination vector register number.

vn_num

Source vector register number.

vm_num

Source vector register number.

4.7.6.2.10 CDE::CDEInstHandlerInterface class

Interface for executing CDE instructions.

This class defines the following methods for executing CDE instructions:

exec_cx1()

cx1 instruction.

exec_cx1_d()

cx1D instruction.

exec_cx2()

cx1 instruction.

exec_cx2_d()

cx2D instruction.

exec_cx3()

cx3 instruction.

exec_cx3_d()

cx3D instruction.

exec_vcx_1_s()

vcx1 instruction with S register.

exec_vcx_1_d()

vcx1 instruction with D register.

exec_vcx_1_q()

vcx1 instruction with Q register.

exec_vcx_2_s()

vcx2 instruction with S register.

exec_vcx_2_d()

vcx2 instruction with D register.

exec_vcx_2_q()

vcx2 instruction with Q register.

exec_vcx_3_s()

vcx3 instruction with S register.

exec_vcx_3_d()

vcx3 instruction with D register.

exec_vcx_3_q()

vcx3 instruction with Q register.

exec_vcx_1_beatwise()

vcx1 instruction for one beat. Caller handles predicated writeback.

exec_vcx_2_beatwise()

vcx2 instruction for one beat. Caller handles predicated writeback.

exec_vcx_3_beatwise()

vcx3 instruction for one beat. Caller handles predicated writeback.

4.7.6.2.11 CDE::CDEInstHandlerInterface::getCDECoprocessorMask()

Return a bitmask indicating which coprocessor numbers this CDE implementation subsumes.

```
virtual uint8_t getCDECoprocessorMask() = 0;
```

4.7.6.3 CDERegistryInterface.h

Defines the interface to allow components, for instance plug-ins, to contribute CDE implementations to the simulation.

4.7.6.3.1 CDE::CDERegistryInterface class

Interface to register the CDE factory.

```
class CDERegistryInterface : public eslapi::CAInterface
```

This class is the interface to register the CDE factory into the Fast Models simulation component registry.

4.7.6.3.2 CDE::CDERegistryInterface::registerCDEFactory()

Register the CDE factory with the simulation.

```
virtual bool registerCDEFactory(std::ostream& error_stream, CDEFactoryInterface*  
    interface) = 0;
```

error_stream

The error stream.

interface

The CDE factory interface used to register.

4.7.6.3.3 CDE::CDERegistryInterface::unregisterCDEFactory()

Unregister the CDE factory from the simulation.

```
virtual void unregisterCDEFactory(CDEFactoryInterface* interface) = 0;
```

interface

The CDE factory interface used to unregister.

4.7.6.3.4 CDE::CDERegistryInterface::sendToCores()

Instantiate a `CDEInstHandler` and send it to the core.

The core can then call the CDE instruction execution functions provided by the plug-in on that `CDEInstHandler`.

```
virtual bool sendToCores() = 0;
```

4.8 CDELoader

CDELoader is a framework to enable rapid Arm Custom Instruction (ACI) prototyping. It is introduced in Fast Models 11.27 as an alternative to the existing Custom Datapath Extension (CDE) plug-in framework.

To simplify the task of implementing Arm custom instructions, the CDELoader framework handles the required CADI and MTI-related plug-in setup. The ACI developer only needs to provide a shared object, the ACI library.

The framework has the following parts:

CDELoader

A Fast Models plug-in designed to remove the need for MTI setup from ACI development. At runtime, CDELoader loads the shared object and executes the custom instruction implementation it provides.

CDELoader can accept multiple shared objects, allowing each core to specify which one to use. It also supports runtime configuration through an opaque string, which the ACI library can process according to its own requirements.

API layer

A C99 API that defines the interface that the ACI library is bound by. It is located in `$PVLIB_HOME/include/ct/CDE/ACILibraryAPI.h`. It includes functions related to:

- Library creation, deletion, naming, and versioning.
- Custom instruction execution. These are the `aci_exec_*` functions.
- [Custom instruction mnemonics](#).

ACI library

A shared object that provides implementations for the custom instructions and library functions.

As the CDELoader framework uses a C99 API, the library can be written in C or in another language that can produce ABI-compatible shared objects and can interface with C. For example, C++, Rust, Go, or Python, through C extensions.

Languages other than C can require extra wrapper code to ensure proper interaction with the C99 API and to meet the shared object requirements. The implementation and compatibility details might vary depending on the language and toolchain used.

An example ACI library, called ACIConstant, is provided as both a pre-built library and as source code, located in `$PVLIB_HOME/plugins/source/ACIConstant/` to help you implement your own libraries. This plug-in mirrors the example [CDEConstant](#) implementation for the CDE plug-in framework.

This figure shows the framework:

Figure 4-1: CDELoader and ACI library

The following model parameters are exposed for using CDELoader:

-C `cpu.has_cde=[0|1]`

Controls whether this core enables CDE.

-C `cpu.cde_impl_name=<aci_library_name>`

Sets the ACI library name to use with this core. The library name is returned by `aci_get_library_name()`.

If multiple shared objects are provided, each core can request to use a specific implementation by using `cpu<n>.cde_impl_name=...`

--plugin `<path/to/CDELoader.so>`

Loads the CDELoader plug-in. Alternatively, set the `FM_PLUGINS` environment variable to the full path of the plug-in. For more details, see [Loading a plug-in](#).

For the CDELoader plug-in parameters, see [CDELoader - parameters].

For example:

```

./isim_system \
-C cpu.has_cde=1 \
--plugin $plugin_dir/CDELoader.so \
-C cpu.cde_impl_name=ACI_LIBRARY_NAME \ # defined in aci_get_library_name()
-C CDE.CDELoader.aci_object_files="path/to/aci_library_obj_file, path/to/another/
aci_library_obj_file" \
-C CDE.CDELoader.aci_parameters="Opaque string parameter to be processed by the ACI
library"
  
```

4.8.1 CDELoader - parameters

This section describes the parameters for the CDELoader plug-in.

Each parameter is prefixed with `CDE.CDELoader`, for example:

```
CDE.CDELoader.aci_object_files
```

Table 4-7: CDELoader parameters

Name	Type	Default value	Allowed values	When set	Description
aci_object_files	string	""	""	Init time	Comma-separated list of path to shared objects to load.
aci_parameters	string	""	""	Init time	Opaque string parameter to be processed by the ACI library.

4.8.2 ACI library implementation

Each CDE instruction is mapped to a single function definition, except for accumulate variants which are handled by checking for the accumulate flag in the parameters passed to the instruction implementations.

The following table lists the CDE instruction functions that an ACI library must implement. A d suffix represents a dual variant and a v suffix represents a vector variant.

Table 4-8: Mapping CDE instructions to ACI library function definitions

Instruction	ACILibraryAPI.h function
cx1	aci_exec_cx1()
cx2	aci_exec_cx2()
cx3	aci_exec_cx3()
cx1d	aci_exec_cx1_d()
cx2d	aci_exec_cx2_d()
cx3d	aci_exec_cx3_d()
vcx1 (single-register variant)	aci_exec_vx1_s()
vcx2 (single-register variant)	aci_exec_vx2_s()
vcx3 (single-register variant)	aci_exec_vx3_s()
vcx1 (double-register variant)	aci_exec_vx1_d()
vcx2 (double-register variant)	aci_exec_vx2_d()
vcx3 (double-register variant)	aci_exec_vx3_d()
vcx1v	aci_exec_vx1_beatwise()
vcx2v	aci_exec_vx2_beatwise()
vcx3v	aci_exec_vx3_beatwise()

Note

The library must also implement some library-related functions. For full details of the library function definitions, see `$PVLIB_HOME/include/ct/CDE/ACILibraryAPI.h`.

If you do not wish to support a particular instruction or instruction variant, the function implementation can simply return `ACI_STATUS_NOT_IMPLEMENTED`.

The ACI API defines an opaque pointer, `aci_handle`, which, for complex implementations, can be mapped to an object of a class that handles the library functions. For simple and quick implementations, you can ignore the handle pointer.

ACI library dependencies

CDELoader dynamically loads shared objects that are standalone and do not depend on external libraries, for example compiler-specific libraries.

To resolve the external dependencies, either include them statically when compiling the shared object or ensure they exist in a path that is visible to the model. Always list all dependencies for your shared objects and check they are present before running the model.

4.8.3 ACIConstant example ACI library

You can find the source code for an example ACI library which implements `ACILibraryAPI.h` in `$PVLIB_HOME/plugins/source/ACIConstant/ACILibrary.cpp`.

The implementation mirrors the output of the [CDEConstant](#) plug-in.

The example is also provided as a pre-built library. To load this library, add the following parameters when launching the model:

```
--plugin $plugin_dir/CDELoader.so \  
-C cpu.has_cde=1 \  
-C cpu.cde_impl_name=ACI_CONSTANT \  
-C CDE.CDELoader.aci_object_files=$plugin_dir/ACIConstant.so
```

Alternatively, you can build the library yourself using the example Makefile provided with the ACIConstant source code. If you have problems loading the library while running the model, ensure all necessary compiler-specific libraries are visible to the model.

4.8.4 Custom instruction mnemonics

This is an optional feature that allows you to specify meaningful, human-readable mnemonics for your custom instructions to improve the readability of log files.

`ACILibraryAPI.h` declares a struct named `ACIMnemonics` which contains the strings used as custom mnemonics. These strings can be retrieved using the `aci_get_custom_mnemonics()` function, and they can subsequently be used by trace plug-ins loaded with the model.

Refer to the [ACIConstant example ACI library](#) source code for an example on how to define custom mnemonics.

4.8.5 ACI library API

Reference documentation for the ACI library API.

The ACI library API is defined in the header file `ACILibraryAPI.h`, which is located at `$PVLIB_HOME/include/ct/CDE/ACILibraryAPI.h`.

4.8.5.1 ACIHandle

Opaque type specifying a handle for the ACI library. This handle is passed to all the `aci_exec_*` functions.

```
typedef struct ACIHandleInstance* ACIHandle;
```

4.8.5.2 `aci_get_library_version()`

Return the library version, `ACI_API_VERSION`.

This is part of a check conducted by the model to confirm that both it and the library are operating on the same version of this API.

```
ACI_EXPORT uint16_t aci_get_library_version(void);
```

4.8.5.3 `aci_get_library_name()`

Return the library name.

The model parameter `cpu.cde_impl_name` is used to select the library. This parameter can be used to quickly change which library is used when providing multiple libraries. Each core can request to use a specific library by using `cpu<n>.cde_impl_name=...`

```
ACI_EXPORT const char* aci_get_library_name(void);
```

4.8.5.4 `aci_get_coprocessor_mask()`

Provide a bitmask that signifies the coprocessor numbers encompassed by this ACI implementation.

```
ACI_EXPORT uint8_t aci_get_coprocessor_mask(void);
```

4.8.5.5 `aci_set_param()`

Sets the parameter provided to the model for the ACI library.

```
ACI_EXPORT void aci_set_param(const char* parameter);
```

parameter

A generic string that can be processed in any way that fits the library's implementation. This can be set using the model parameter `CDELoader.aci_parameters`.

4.8.5.6 aci_new()

Constructor of the ACI library.

Return a handle object which can be nullptr if there is no handle needed.

```
ACI_EXPORT ACIHandle aci_new(void);
```

4.8.5.7 aci_free()

Destructor of the ACI library.

```
ACI_EXPORT void aci_free(ACIHandle handle);
```

handle

Object to free, can be ignored if there was no handle allocated.

4.8.5.8 ACICX1DecodeInfo struct

Decode information of cx1 instruction.

Members

accumulate

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

rd_num

General-purpose destination register number.

4.8.5.9 aci_exec_cx1()

Instruction CX1.

Return ACI_STATUS_OK on success, or ACI_STATUS_NOT_IMPLEMENTED if instruction is not implemented.

```
ACI_EXPORT ACI_Status aci_exec_cx1(ACIHandle handle,
                                   const ACICX1DecodeInfo* decode_info,
                                   uint32_t rd_val,
                                   uint32_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the CX1 instruction.

rd_val

Value of the destination register.

result

Pointer to the value returned by the CX1 instruction.

4.8.5.10 `aci_exec_cx1_d()`

Instruction CX1D.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_cx1_d(ACIHandle handle,
                                     const ACICX1DecodeInfo* decode_info,
                                     uint64_t rfd_val,
                                     uint64_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the CX1D instruction.

rfd_val

Value of the first of the destination register pair.

result

Pointer to the value returned by the CX1D instruction.

4.8.5.11 `ACICX2DecodeInfo` struct

Decode information of cx2 instruction.

Members

accumulate

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

rd_num

General-purpose destination register number.

rn_num

General-purpose source register number.

4.8.5.12 `aci_exec_cx2()`

Instruction CX2.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_cx2(ACIHandle handle,
                                   const ACICX2DecodeInfo* decode_info,
                                   uint32_t rd_val,
                                   uint32_t rn_val,
                                   uint32_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the CX2 instruction.

rd_val

Value of the destination register.

rn_val

Value of the source register.

result

Pointer to the value returned by the CX2 instruction.

4.8.5.13 `aci_exec_cx2_d()`

Instruction CX2D.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_cx2_d(ACIHandle handle,
                                      const ACICX2DecodeInfo* decode_info,
                                      uint64_t rfd_val,
                                      uint32_t rn_val,
                                      uint64_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the CX2D instruction.

rfd_val

Value of the first of the destination register pair.

rn_val

Value of the source register.

result

Pointer to the value returned by the CX2D instruction.

4.8.5.14 ACICX3DecodeInfo struct

Decode information of cx3 instruction.

Members

accumulate

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

rd_num

General-purpose destination register number.

rn_num

General-purpose source register number.

rm_num

General-purpose source register number.

4.8.5.15 aci_exec_cx3()

Instruction CX3.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_cx3(ACIHandle handle,
                                   const ACICX3DecodeInfo* decode_info,
                                   uint32_t rd_val,
                                   uint32_t rn_val,
                                   uint32_t rm_val,
                                   uint32_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the CX3 instruction.

rd_val

Value of the destination register.

rn_val

Value of the source register.

rm_val

Value of the source register.

result

Pointer to the value returned by the CX3 instruction.

4.8.5.16 aci_exec_cx3_d()

Instruction CX3D.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_cx3_d(ACIHandle handle,
                                     const ACICX3DecodeInfo* decode_info,
                                     uint64_t rfd_val,
                                     uint32_t rn_val,
                                     uint32_t rm_val,
                                     uint64_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the CX3D instruction.

rfd_val

Value of the first of destination register pair.

rn_val

Value of the source register.

rm_val

Value of the source register.

result

Pointer to the value returned by the CX3D instruction.

4.8.5.17 ACIVCX1DecodeInfo struct

Decoded information for the vcx1 instruction.

Members

accumulate

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

vd_num

Source and destination vector register number.

4.8.5.18 `aci_exec_vcx1_s()`

Instruction VCX1 with Single-register.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_vcx1_s(ACIHandle          handle,
                                     const ACIVCX1DecodeInfo* decode_info,
                                     uint32_t            sd_val,
                                     uint32_t*           result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX1 instruction.

sd_val

32-bit value of the floating-point source and destination register.

result

Pointer to the value returned by the VCX1 instruction.

4.8.5.19 `aci_exec_vcx1_d()`

Instruction VCX1 with Double-register.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_vcx1_d(ACIHandle          handle,
                                     const ACIVCX1DecodeInfo* decode_info,
                                     uint64_t            dd_val,
                                     uint64_t*           result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX1 instruction.

dd_val

64-bit value of the floating-point source and destination register.

result

Pointer to the value returned by the VCX1 instruction.

4.8.5.20 `aci_exec_vcx1_beatwise()`

Instruction VCX1 for one beat. Caller handles predicated writeback.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_vcx1_beatwise(ACIHandle handle,
                                             const ACIVCX1DecodeInfo* decode_info,
                                             uint32_t d_val,
                                             uint8_t beat,
                                             uint8_t elmt_mask,
                                             uint32_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX1 instruction.

d_val

32-bit value of the source and destination vector register.

beat

Beat-number to index into the Q regs.

elmt_mask

Element mask.

result

Pointer to the value returned by the VCX1 instruction.

4.8.5.21 `ACIVCX2DecodeInfo` struct

Decoded information for the vcx2 instruction.

Members

accumulate

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

vd_num

Source and destination vector register number.

vm_num

Source vector register number.

4.8.5.22 `aci_exec_vcx2_s()`

Instruction VCX2 with Single-register.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_vcx2_s(ACIHandle handle,
                                     const ACIVCX2DecodeInfo* decode_info,
                                     uint32_t sd_val,
                                     uint32_t sm_val,
                                     uint32_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX2 instruction.

sd_val

32-bit value of the floating-point source and destination register.

sm_val

32-bit value of the floating-point source register.

result

Pointer to the value returned by the VCX2 instruction.

4.8.5.23 `aci_exec_vcx2_d()`

Instruction VCX2 with Double-register.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_vcx2_d(ACIHandle handle,
                                     const ACIVCX2DecodeInfo* decode_info,
                                     uint64_t dd_val,
                                     uint64_t dm_val,
                                     uint64_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX2 instruction.

dd_val

64-bit value of the floating-point source and destination register.

dm_val

64-bit value of the floating-point source register.

result

Pointer to the value returned by the VCX2 instruction.

4.8.5.24 aci_exec_vcx2_beatwise()

Instruction VCX2 for one beat. Caller handles predicated writeback.

Return ACI_STATUS_OK on success, ACI_STATUS_NOT_IMPLEMENTED if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_vcx2_beatwise(ACIHandle handle,
                                             const ACIVCX2DecodeInfo* decode_info,
                                             uint32_t d_val,
                                             uint32_t m_val,
                                             uint8_t beat,
                                             uint8_t elmt_mask,
                                             uint32_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX2 instruction.

d_val

32-bit value of the source and destination vector register.

m_val

32-bit value of the source vector register.

beat

Beat-number to index into the Q regs.

elmt_mask

Element mask.

result

Pointer to the value returned by the VCX2 instruction.

4.8.5.25 ACIVCX3DecodeInfo struct

Decoded information for the vcx3 instruction.

Members

accumulate

Whether to accumulate with existing register contents.

coproc

Number of coproc.

imm

Immediate value.

vd_num

Source and destination vector register number.

vn_num

Source vector register number.

vm_num

Source vector register number.

4.8.5.26 aci_exec_vcx3_s()

Instruction VCX3 with Single-register.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```

ACI_EXPORT ACI_Status aci_exec_vcx3_s(ACIHandle      handle,
                                     const ACIVCX3DecodeInfo* decode_info,
                                     uint32_t          sd_val,
                                     uint32_t          sn_val,
                                     uint32_t          sm_val,
                                     uint32_t*         result);

```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX3 instruction.

sd_val

32-bit value of the floating-point source and destination register.

sn_val

32-bit value of the floating-point source register.

sm_val

32-bit value of the floating-point source register.

result

Pointer to the value returned by the VCX3 instruction.

4.8.5.27 `aci_exec_vcx3_d()`

Instruction VCX3 with Double-register.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_vcx3_d(ACIHandle handle,
                                     const ACIVCX3DecodeInfo* decode_info,
                                     uint64_t dd_val,
                                     uint64_t dn_val,
                                     uint64_t dm_val,
                                     uint64_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX3 instruction.

dd_val

64-bit value of the floating-point source and destination register.

dn_val

64-bit value of the floating-point source register.

dm_val

64-bit value of the floating-point source register.

result

Pointer to the value returned by the VCX3 instruction.

4.8.5.28 `aci_exec_vcx3_beatwise()`

Instruction VCX3 for one beat. Caller handles predicated writeback.

Return `ACI_STATUS_OK` on success, or `ACI_STATUS_NOT_IMPLEMENTED` if instruction not implemented.

```
ACI_EXPORT ACI_Status aci_exec_vcx3_beatwise(ACIHandle handle,
                                              const ACIVCX3DecodeInfo* decode_info,
                                              uint32_t d_val,
                                              uint32_t n_val,
                                              uint32_t m_val,
                                              uint8_t beat,
                                              uint8_t elmt_mask,
                                              uint32_t* result);
```

handle

ACI handle object created by `aci_new()`.

decode_info

Decoded fields for the VCX3 instruction.

d_val

32-bit value of the source and destination vector register.

n_val

32-bit value of the source vector register.

m_val

32-bit value of the source vector register.

beat

Beat-number to index into the Q regs.

elmt_mask

Element mask.

result

Pointer to the value returned by the VCX3 instruction.

4.8.5.29 ACIMnemonics struct

Optional custom mnemonics for the custom instructions.

Members

cx1

Instruction CX1 mnemonic.

cx1a

Instruction CX1 (Accumulator variant) mnemonic.

cx1d

Instruction CX1D mnemonic.

cx1da

Instruction CX1D (Accumulator variant) mnemonic.

cx2

Instruction CX2 mnemonic.

cx2a

Instruction CX2 (Accumulator variant) mnemonic.

cx2d

Instruction CX2D mnemonic.

cx2da

Instruction CX2D (Accumulator variant) mnemonic.

cx3

Instruction CX3 mnemonic.

cx3a

Instruction CX3 (Accumulator variant) mnemonic.

cx3d

Instruction CX3D mnemonic.

cx3da

Instruction CX3D (Accumulator variant) mnemonic.

vcx1_s

Instruction VCX1 (Single-register variant) mnemonic.

vcx1a_s

Instruction VCX1 (Single-register accumulator variant) mnemonic.

vcx1_d

Instruction VCX1 (Double-register variant) mnemonic.

vcx1a_d

Instruction VCX1 (Double-register accumulator variant) mnemonic.

vcx1_v

Instruction VCX1 vector mnemonic.

vcx1a_v

Instruction VCX1 vector (Accumulator variant) mnemonic.

vcx2_s

Instruction VCX2 (Single-register variant) mnemonic.

vcx2a_s

Instruction VCX2 (Single-register accumulator variant) mnemonic.

vcx2_d

Instruction VCX2 (Double-register variant) mnemonic.

vcx2a_d

Instruction VCX2 (Double-register accumulator variant) mnemonic.

vcx2_v

Instruction VCX2 vector mnemonic.

vcx2a_v

Instruction VCX2 vector (Accumulator variant) mnemonic.

vcx3_s

Instruction VCX3 (Single-register variant) mnemonic.

vcx3a_s

Instruction VCX3 (Single-register accumulator variant) mnemonic.

vcx3_d

Instruction VCX3 (Double-register variant) mnemonic.

vcx3a_d

Instruction VCX3 (Double-register accumulator variant) mnemonic.

vcx3_v

Instruction VCX3 vector mnemonic.

vcx3a_v

Instruction VCX3 vector (Accumulator variant) mnemonic.

4.9 Crypto

The `crypto` plug-in enables Armv8 and Armv9 processor models to support the Armv8.0 Cryptographic Extensions and Armv8.3 architected Pointer Authentication algorithms.

The `crypto` plug-in is available for download from the [Arm Developer website](#).

When the plug-in is loaded:

- All Armv8 and Armv9 processors in the system implement all functionality from the Armv8.0 Cryptographic Extensions by default, although you can disable it for specific processors by setting their `CRYPTODISABLE` parameter.
- All Armv8.3 and Armv9 processors in the system implement the architected algorithms for Pointer Authentication and Generic Authentication by default. Plug-in parameters control which processors in the system have architected algorithms enabled.

AEMs, for example, AEMvACT, have parameters that allow you to restrict the `crypto` plug-in features. These parameters use the same encodings as the flags within the AArch32 `ID_ISAR5` and AArch64 `ID_AA64ISAR0_EL1` system registers. You can set these parameters for a specific AEM core using this syntax:

```
-C cpu.cpu<X>.<feature_name>=<value>
```

Where `feature_name` can be one of the following:

- `crypto_aes`, with these possible values:
 - 0**
No AES instructions are implemented
 - 1**
The `AESE`, `AESD`, `AESMC`, and `AESIMC` instructions are implemented
 - 2**
As 1, but in addition, the `PMULL` and `PMULL2` instructions can operate on 64-bit data values. This is the default value.
- `crypto_sha1`, with these possible values:
 - 0**
No SHA-1 instructions are implemented
 - 1**
The `SHA1C`, `SHA1P`, `SHA1M`, `SHA1H`, `SHA1SU0`, and `SHA1SU1` instructions are implemented. This is the default value.

- `crypto_sha256`, with these possible values:
 - 0**
No SHA-256 instructions are implemented
 - 1**
The `SHA256H`, `SHA256H2`, `SHA256SU0`, and `SHA256SU1` instructions are implemented. This is the default value.
- `crypto_sha3`, with these possible values:
 - 0**
No Armv8.4 SHA-3 instructions are implemented. This is the default value.
 - 1**
SHA-3 instructions are implemented if Armv8.4 is enabled.
 - 2**
SHA-3 instructions are implemented.
- `crypto_sha512`, with these possible values:
 - 0**
No Armv8.4 SHA-512 instructions are implemented. This is the default value.
 - 1**
SHA-512 instructions are implemented if Armv8.4 is enabled.
 - 2**
SHA-512 instructions are implemented.
- `crypto_sm3`, with these possible values:
 - 0**
No Armv8.4 SM-3 instructions are implemented. This is the default value.
 - 1**
SM-3 instructions are implemented if Armv8.4 is enabled.
 - 2**
SM-3 instructions are implemented.
- `crypto_sm4`, with these possible values:
 - 0**
No Armv8.4 SM-4 instructions are implemented. This is the default value.
 - 1**
SM-4 instructions are implemented if Armv8.4 is enabled.
 - 2**
SM-4 instructions are implemented.

For example, to disable the AES instructions on core 0:

```
./isim_system --plugin Crypto.so -C cpu.cpu0.crypto_aes=0
```

These parameters are only available for AEMs. For other Armv8-A and Armv9-A models, the behavior is fixed to the default values.

4.9.1 Crypto - parameters

This section describes the parameters for the Crypto plug-in.

Each parameter is prefixed with `CRYPTO.Crypto`, for example:

```
CRYPTO.Crypto.authentication_algorithm
```

Table 4-9: Crypto parameters

Name	Type	Default value	Allowed values	When set	Description
authentication_algorithm	string	"QARMA5"	""	Init time	Choice of PACAlgorithm. Valid values: "QARMA5", "QARMA3". "QARMA3" can be enabled only if the core feature has_qarma3_pac is true. Default value: "QARMA5". The pattern is a comma separated list of glob-style patterns. These patterns are matched against the instance name of cores in the system. If a pattern matches then the Architected algorithm is installed on the core if that core supports ARMv8.3. For example: - "*", install the algorithm on all supported cores - "cluster0.*", install the algorithm on all cores in cluster0 - "cluster0.cpu0" install the algorithm only on cluster0.cpu0 - "cluster0.*,cluster1.cpu1" install the algorithm on all cores in cluster0 and also cluster1.cpu1 - "" (an empty string), do not install the algorithm on any core .
generic_authentication_core_pattern	string	"*"	""	Init time	install the ARMv8.3 Architected Generic Authentication algorithm only on ARMv8.3 cores matching one of these patterns. The pattern is a comma separated list of glob-style patterns. These patterns are matched against the instance name of cores in the system. If a pattern matches then the Architected algorithm is installed on the core if that core supports ARMv8.3. For example: - "*", install the algorithm on all supported cores - "cluster0.*", install the algorithm on all cores in cluster0 - "cluster0.cpu0" install the algorithm only on cluster0.cpu0 - "cluster0.*,cluster1.cpu1" install the algorithm on all cores in cluster0 and also cluster1.cpu1 - "" (an empty string), do not install the algorithm on any core .
pointer_authentication_core_pattern	string	"*"	""	Init time	install the ARMv8.3 Architected Pointer Authentication algorithm only on ARMv8.3 cores matching one of these patterns. The pattern is a comma separated list of glob-style patterns. These patterns are matched against the instance name of cores in the system. If a pattern matches then the Architected algorithm is installed on the core if that core supports ARMv8.3. For example: - "*", install the algorithm on all supported cores - "cluster0.*", install the algorithm on all cores in cluster0 - "cluster0.cpu0" install the algorithm only on cluster0.cpu0 - "cluster0.*,cluster1.cpu1" install the algorithm on all cores in cluster0 and also cluster1.cpu1 - "" (an empty string), do not install the algorithm on any core .
verbose	int	0x0	0x0 - 0x1	Init time	verbosity level. 0, terse. 1, verbose.

4.10 GDBRemoteConnection

The `GDBRemoteConnection` plug-in allows the model to be debugged using GDB. It is included in the Third Party IP add-on package to Fast Models.

For more details about the add-on package, contact [Arm Technical Support](#).

Load the plug-in using the following command-line options:

- `--allow-debug-plugin`, or the short version, `-D`
- `--plugin`

For example:

```
./isim_system --allow-debug-plugin --plugin GDBRemoteConnection.so
```

Then, a suitable GDB can be connected to the model using the GDB `target` command.

`GDBRemoteConnection` supports the following operations:

- Connection to models that contain a single core cluster.
- Read and write of core registers.
- Read and write of memory.
- Run, stop, single step.
- Breakpoints.
- Connection to AArch32 and AArch64 models.

4.10.1 GDBRemoteConnection limitations

This section describes the limitations of the `GDBRemoteConnection` plug-in.

- Connections are only allowed to single-core simulations, not to multiprocessor or multicluster simulations.
- No tracepoint support.
- No parameter support.
- The memory view only shows the current memory space.
- The disassembly only uses the current instruction set.
- Breakpoints can only be set on the current memory space.

You cannot use GDB when debugging software that uses semihosting. When a program tries to use semihosting with the GDB plug-in, the GDB debugger wrongly reports having hit a breakpoint:

```
Program received signal SIGTRAP, Trace/breakpoint trap.
```

When using the `GDBRemoteConnection` plug-in, start the simulation with the `-D` (or `-s`) flag. Attaching the `GDBRemoteConnection` plug-in to a running simulation can cause segmentation faults on the simulation and the GDB client.

4.11 GenericCounter

`GenericCounter` is an example MTI plug-in that prints to stdout the number of occurrences of a specific trace source when the simulation terminates.

`GenericCounter` only counts a single trace source, which is set using the `TRACE.GenericCounter.trace-source` parameter. To count multiple trace sources, load the plug-in multiple times. In this case, each plug-in instance has a unique name which you use instead of `GenericCounter` when setting its parameters. The names are either set implicitly or explicitly. This example sets them explicitly as `counter1` and `counter2`:

```
--plugin counter1=path/to/GenericCounter.so \
--plugin counter2=path/to/GenericCounter.so \
-C TRACE.counter1.trace-source=EXCEPTION \
-C TRACE.counter2.trace-source=READ_ACCESS
```

Otherwise, each plug-in instance has an implicit name which consists of the plug-in name and a sequential suffix, for example `GenericCounter`, `GenericCounter0`, `GenericCounter1` and so on. This example uses the implicit names:

```
--plugin path/to/GenericCounter.so --plugin path/to/GenericCounter.so \
-C TRACE.GenericCounter.trace-source=EXCEPTION \
-C TRACE.GenericCounter0.trace-source=READ_ACCESS
```

The source code for this plug-in is provided in `$PVLIB_HOME/examples/MTI/GenericCounter/`.

4.11.1 GenericCounter - parameters

This section describes the parameters for the `GenericCounter` plug-in.

Each parameter is prefixed with `TRACE.GenericCounter`, for example:

```
TRACE.GenericCounter.print_on_event
```

Table 4-10: GenericCounter parameters

Name	Type	Default value	Allowed values	When set	Description
<code>print_on_event</code>	string	""	""	Init time	If set, print the count information to stdout when <code>print_on_event</code> trace source fires. If empty, only print the count information at the end of the simulation or when the <code>print_stats</code> parameter is written to.
<code>print_stats</code>	int	0x0	0x0 - 0x0	Runtime	On write, print count information to stdout.

Name	Type	Default value	Allowed values	When set	Description
trace-source	string	"INST"	""	Init time	The trace source to be counted. Example: BRA_DIR.

4.12 GenericTrace

GenericTrace is a flexible MTI plug-in that allows you to configure which events are traced, using a comma-separated list of trace sources. Output can be printed to a file or to the console.

Specify one or more trace sources using the `trace-sources` parameter, for example:

```
./FVP_Base_AEMvA \
--plugin $PVLIB_HOME/plugins/Linux64_GCC-7.3/GenericTrace.so \
-C TRACE.GenericTrace.trace-sources=EXCEPTION,EXCEPTION_RETURN
```

To see a list of the available trace sources for each component in the model that provides trace, run the model with the `ListTraceSources` plug-in. See [ListTraceSources](#) for details.

The `trace-sources` parameter provides flexibility:

- To specify trace sources that match a pattern, use the `*` or `?` wildcards, for example:

```
TRACE.GenericTrace.trace-sources=CACHE_*
```

- To trace a specific component only, specify the hierarchical path to it, optionally with wildcards, for example:

```
TRACE.GenericTrace.trace-sources=FVP_Base_AEMvA.cluster0.cpu1.*
```

- To trace specific fields in a trace source, append a field mask. For example to trace only the second field (`pc`) of the `INST` trace source, use:

```
TRACE.GenericTrace.trace-sources=INST=0x2
```

Or, to filter out the 8th field (`ELEMENT_SIZE`) from the `CORE_STORES` trace source, use:

```
TRACE.GenericTrace.trace-sources=CORE_STORES=0xFFFF7F
```

- If no trace sources are specified, `GenericTrace` by default traces all the instructions.

The source code for this plug-in is provided as a programming example in `$PVLIB_HOME/examples/MTI/GenericTrace/source/`.

This plug-in can be used with [ToggleMTIPlugin](#).

4.12.1 GenericTrace - parameters

This section describes the parameters for the GenericTrace plug-in.

Each parameter is prefixed with `TRACE.GenericTrace`, for example:

```
TRACE.GenericTrace.collect-latest-data-only
```

Table 4-11: GenericTrace parameters

Name	Type	Default value	Allowed values	When set	Description
collect-latest-data-only	bool	false	true, false	Init time	Collect only latest N trace source fires and print upon destruction.
enabled	bool	true	true, false	Runtime	If set to true, tracing is enabled.
flush	bool	false	true, false	Runtime	If set to true, the trace file is flushed after every event. This has a performance impact but could be used to better debug crashes.
hide-fieldnames	bool	false	true, false	Runtime	Do not print field names when printing trace output.
latest-data-size	int	0x1	0x0 - 0x7fffffffffffffff	Init time	Size of latest data to store in buffer for capturing only the latest trace source fires.
perf-period	int	0x0	0x0 - 0x7fffffffffffffff	Init time	Print performance information every N instructions. 0 means disabled.
print-timestamp	bool	false	true, false	Runtime	Start each trace entry with the host time.
shorten-paths	bool	true	true, false	Runtime	If set to true, the component paths of trace events are shortened by removing the common prefix. The minimal, non-ambiguous path suffix remains. If all traced sources belong to the same components, no path is logged. Default is true.
simulated-timestamp	bool	false	true, false	Runtime	Start each trace entry with the simulated time.
start-icount	int	0x0	0x0 - 0x7fffffffffffffff	Init time	Start tracing on a certain instruction count. Tracing starts up to 2048 instructions before this count.
stop-icount	int	0x7fffffffffffffff	0x0 - 0x7fffffffffffffff	Init time	Stop tracing on a certain instruction count. Tracing stops up to 2048 instructions after this count.
stop_on_event	bool	false	true, false	Init time	Stop the simulation when any event is triggered.

Name	Type	Default value	Allowed values	When set	Description
trace-file	string	""	""	Runtime	The trace file to write into. If STDERR, prints to stderr. If empty, prints to stdout.
trace-file-limit	int	0x0	0x0 - 0x7fffffffffffffffff	Init time	The limit of the size of the output file in bytes. The simulation is stopped when this size is reached. If 0, it is unlimited.
trace-sources	string	"INST"	""	Runtime	A comma-separated list of trace sources to be traced. A component path can be prepended, with components separated by dots. Both the component path and the trace source name can contain the wildcards * and ?. A field mask as a number in hex or decimal format can be appended with =. Example: my.subsystem.core.cpu*.TRACE_SOURCE=0x08.
verbose	bool	false	true, false	Runtime	Print some debugging information.

4.12.2 GenericTrace plug-in usage example

This example shows how to use the GenericTrace plug-in to trace accesses by the graphics driver to the registers of a GPU register model.

Procedure

1. Use the ListTraceSources plug-in to list the trace sources that the platform provides. It is located in \$PVLIB_HOME/plugins/<OS_compiler>/:

```
{PATH_Model} --plugin $PVLIB_HOME/plugins/Linux64_GCC-9.3/ListTraceSources.so
```

The plug-in prints the following information to the terminal:

- All components that provide trace, including the GPU model, for example:

```
Component (292) providing trace: Kits3_Subsys.css.gpu
```

- The trace sources provided by the GPU model. For example, these are some generic trace sources provided by Mali™ GPU models:

INFO_ReadRegister

Access time, addresses, data, and names of the registers that were read.

INFO_Reset

GPU reset data.

INFO_WriteRegister

Access time, addresses, and names of the registers that were updated, and the data before and after the update.

INFO_IrqGpuControl

ID, name, and state of the IRQ signal from the GPU. The state can be `y` for `set`, or `n` for `clear`.

INFO_IrqJobControl

ID, name, and state of the IRQ signal from the Job Manager on the GPU. The state can be `y` for set, or `n` for clear.

INFO_IrqMmuControl

ID, name, and state of the IRQ signal from the MMU on the GPU. The state can be `y` for set, or `n` for clear.

WARN_ReadToWriteOnlyRegister

Warning messages and addresses for the write-only registers that have been read by the graphics driver.

WARN_WriteToReadOnlyRegister

Warning messages and addresses for the read-only registers that have been written by the graphics driver.

WARN_AccessToUnimplementedRegister

Warning messages and addresses for the invalid registers that have been accessed by the graphics driver.

- To trace all events from the GPU model, launch the platform with the following additional options:

```
--plugin $PVLIB_HOME/plugins/Linux64_GCC-9.3/GenericTrace.so \
-C TRACE.GenericTrace.trace-sources=Kits3_Subsys.css.gpu.* \
-C TRACE.GenericTrace.enabled=1 \
-C TRACE.GenericTrace.verbose=1 \
-C TRACE.GenericTrace.print-timestamp=1 \
-C TRACE.GenericTrace.trace-file=dp-trace-generic.log
```

Where:

- `Kits3_Subsys.css.gpu` is the GPU model listed in Step 1.
- `Kits3_Subsys.css.gpu.*` means trace all the GPU-supported trace sources. Alternatively, (not shown in this example):
 - To trace one specific GPU trace source only, add it as a suffix to the GPU model. For instance, `Kits3_Subsys.css.gpu.INFO_ReadRegister`.
 - To trace multiple specific trace sources, use a comma-separated list. For instance, `Kits3_Subsys.css.gpu.INFO_ReadRegister, Kits3_Subsys.css.gpu.INFO_WriteRegister`.
- The `trace-file` option specifies the log file in which to save the trace output. If it is not used, the trace results are shown on the host terminal.

Results

The host terminal or the log file shows details about the driver-accessed registers, such as the register addresses, data, and the access time. For example:

```
HOST TIME=1557460.545195s INFO ReadRegister: REG_OFFSET=0x0000000000000000

Control" IRQ_STATE=N

```

4.12.3 Mapping between SYSREG_UPDATE trace sources and SPSR registers

For tracing updates to SPSR_* registers, GenericTrace maps the fields in the registers to fields in SYSREG_UPDATE32 or SYSREG_UPDATE64 trace sources.

The mapping is shown in the following table:

Table 4-12: Mapping between SYSREG_UPDATE* trace sources and register encodings for SPSR_* registers

SYSREG_UPDATE32 or SYSREG_UPDATE64 field	Register field
opc0	R
opc	M
CRn	M1
CRm	O
opc2	O

4.13 libete-plugin

The libete-plugin enables the Embedded Trace Extension (ETE) for AEMvA and applicable CPU implementations.

Note

ETE support is integrated into the CT models. We recommend you configure ETE using the model parameters that are prefixed with `ete.`, which are equivalent to the plug-in parameters, instead of using this plug-in. The plug-in is deprecated and will be removed in a future release.

4.13.1 libete-plugin - parameters

This section describes the parameters for the libete-plugin plug-in.

Each parameter is prefixed with `TRACE.libete-plugin`, for example:

```
TRACE.libete-plugin.ASYNC_PACKETS_WHEN_VIEWINST_OFF
```

Table 4-13: libete-plugin parameters

Name	Type	Default value	Allowed values	When set	Description
ASYNC_PACKETS_WHEN_VIEWINST_OFF	bool	false	true, false	Init time	Generate the non-periodic alignment synchronisation packet generation when trace unit is operative.
ATBTRIG	bool	true	true, false	Init time	ATB trigger support.
CCITMIN	int	0x4	0x0 - 0xffff	Init time	Minimum cycle count value.
CCSIZE	int	0xc	0xc - 0x14	Init time	Cycle counter size.
CLAIMTAGS	int	0x8	0x0 - 0x20	Init time	Number of claim tags.
COMMOPT	bool	true	true, false	Init time	Commit mode.
COMMTRANS	bool	false	true, false	Init time	Commit transaction mode.
DEBUG	int	0x2	0x0 - 0xf	Runtime	DEBUG.
DESIGNER	int	0x41	0x0 - 0xff	Init time	DESIGNER value.
ETE_REVISION	int	0x0	0x0 - 0x3	Init time	ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.
EXCEPTION_WITH_CONTEXT	bool	true	true, false	Init time	Whether EXCEPTION_WITH_CONTEXT packet is supported.
EXPLICITLY_COMMIT_PO_ELEMS	bool	false	true, false	Init time	Whether to unilaterally explicitly emit a commit after a PO packet.
IMPDEFEXCEPPERCENTAGE	int	0x0	0x0 - 0x32	Init time	Percentage of IMPDEF exceptions inserted in instruction blocks.
IMPDEF_TRACE_ON	int	0x0	0x0 - 0x3	Init time	Whether trace is flushed and trace on packet generated by events described by bitmap value. bit 0 - PE entering low power state, bit 1 - PE entering debug state.
IMPRECISE_FILTERING	int	0x0	0x0 - 0x14	Init time	Number of instruction blocks traced on a transition in the filtering.

Name	Type	Default value	Allowed values	When set	Description
LPOVERRIDE	bool	true	true, false	Init time	Low power override.
MAXSPEC	int	0x0	0x0 - 0xffffffff	Init time	Maximum speculation depth.
MAX_INST_PER_Q	int	0x1	0x1 - 0x1000	Init time	Maximum limit for the number of instructions implied by a Q element.
NOOVERFLOW	bool	false	true, false	Init time	No overflow.
NUMACPAIRS	int	0x4	0x0 - 0x8	Init time	Number of instruction address comparators pairs.
NUMCIDC	int	0x1	0x0 - 0x8	Init time	Number of context ID comparators.
NUMCNTR	int	0x2	0x0 - 0x4	Init time	Number of counters.
NUMEXTINSEL	int	0x4	0x0 - 0x4	Init time	Number of external input selectors.
NUMPC	int	0x0	0x0 - 0x8	Init time	Number of PE comparators.
NUMSEQSTATE	int	0x4	0x0 - 0x4	Init time	Number of sequencer states.
NUMSSCC	int	0x1	0x0 - 0x8	Init time	Number of single shot comparators.
NUMVMIDC	int	0x1	0x0 - 0x8	Init time	Number of virtual ID comparators.
NumberOfETEEEvents	int	0x2	0x0 - 0x4	Init time	Number of trace events.
NumberOfRSPairs	int	0x8	0x0 - 0x10	Init time	Number of resource selector pairs.
PIDR_CM0D	int	0x0	0x0 - 0xf	Init time	TRCPIDR CM0D value.
PIDR_DESIGNER	int	0x0	0x0 - 0x7ff	Init time	TRCPIDR DESIGNER value.
PIDR_PART	int	0x0	0x0 - 0xfff	Init time	TRCPIDR PART number value.
PIDR_REVAND	int	0x0	0x0 - 0xf	Init time	TRCPIDR REVAND value.
PIDR_REVISION	int	0x0	0x0 - 0xf	Init time	TRCPIDR REVISION value.
QFILT	bool	false	true, false	Init time	Q filtering.
QSUP	int	0x0	0x0 - 0x3	Init time	Q support.
Q_CADENCE	int	0x1	0x1 - 0x1000	Init time	Number of instruction blocks traced between two Q elements.
RAZWI_REG_SEL_TOP_BIT	bool	false	true, false	Init time	Implement Resource Selectors or Resource Selector Pairs bits as RAZ/WI.
REG_ACCESS_ONLY_MODE	bool	false	true, false	Init time	If enabled, all traces are disabled. Plugin only allows register acceses.
RES0_STATEFUL	bool	false	true, false	Init time	Whether RES0 bits are stateful or RAZ/WI.
RETSTACK	int	0x3	0x0 - 0xf	Init time	Return stack depth.
REVISION	int	0x0	0x0 - 0xf	Init time	TRCIDR1 revision value.
SIM_OVERFLOW_GRANULARITY	int	0x64	0xa - 0xffffffff	Init time	Number of instruction blocks in each granule, for simulated overflow.
SIM_OVERFLOW_PERCENTAGE	int	0x0	0x0 - 0x63	Init time	Percentage of instruction blocks lost in each granule, for simulated overflow.
SOURCE_ADDRESS	bool	false	true, false	Init time	Allow generation of source address elements.
STALLCTRL	bool	true	true, false	Init time	Stall control.
SYSSTALL	bool	true	true, false	Init time	System stall.
TRACEIDSIZE	int	0x7	0x0 - 0x7	Init time	Trace ID size.
TRACE_OUTPUT	string	""	""	Init time	File to which to write trace byte stream.

Name	Type	Default value	Allowed values	When set	Description
TRACE_OUTPUT_ENABLE	bool	false	true, false	Init time	ETE Trace output enable: 1=enable, 0=disable.
TRCRSRTA_FORCED_EXCEP	bool	false	true, false	Init time	TRCRSR.TA value for a forcibly traced exception.
TSMARK	bool	false	true, false	Init time	Whether timestamp markers are supported.
TSSIZE	int	0x8	0x8 - 0x8	Init time	Timestamp size.
WFXMODE	bool	true	true, false	Init time	WFX mode.

4.14 ListTraceSources

ListTraceSources is an MTI plug-in that displays a complete and self-documenting list of the trace sources that a model provides, without running the model.

The plug-in prints output for each component in the model, either to stdout or to a file. For example:

```
...
Component (4) providing trace: FVP_VE_Cortex_A7x1.cluster.cpu0 (ARM_Cortex-A7,
11.4.60)
=====
Component is of type "ARM_Cortex-A7"
Version is "11.4.60"
#Sources: 195

Source ASYNC_MEMORY_FAULT (Context ID Register write.)
  Field FAULT type:MTI_UNSIGNED_INT size:4 (Fault status in ESR format)
  Field VADDR type:MTI_SIGNED_INT size:8 (Virtual Address (or 0 if unavailable))
  Field PADDR type:MTI_UNSIGNED_INT size:8 (Physical Address (or 0 if
unavailable))
...

```

The source code for this plug-in is also provided as a programming example in \$PVLIB_HOME/examples/MTI/ListTraceSources/source/.

4.14.1 ListTraceSources - parameters

This section describes the parameters for the ListTraceSources plug-in.

Each parameter is prefixed with TRACE.ListTraceSources, for example:

```
TRACE.ListTraceSources.file
```

Table 4-14: ListTraceSources parameters

Name	Type	Default value	Allowed values	When set	Description
file	string	""	""	Init time	File to write the list of trace sources to. Default is to write to the console.

Name	Type	Default value	Allowed values	When set	Description
print_components_only	bool	false	true, false	Init time	If true, the plug-in prints the trace component information only, not the sources or fields.

4.15 PipelineModel

Use the `PipelineModel` plug-in to estimate the performance of workloads within a Fast Models environment.

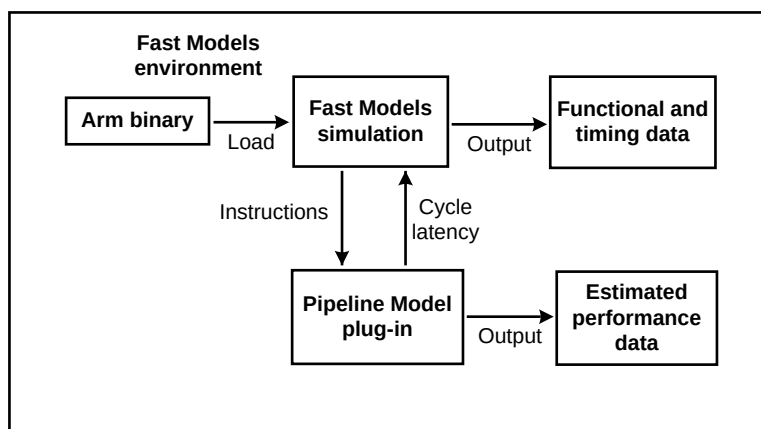

The `PipelineModel` plug-in is deprecated. It might be modified or removed in a future release.

The plug-in models first-order effects of microarchitecture components on the overall Cycles Per Instruction (CPI) value. Examples of such effects are data and structural hazards due to instruction dependencies.

The `PipelineModel` is implemented as a Fast Models plug-in. It processes instruction traces and injects cycle latencies into the simulation. The plug-in is non-intrusive to the functional accuracy of the simulation.

Figure 4-2: Overview of PipelineModel plug-in

Fast Models provides the following prebuilt example PipelineModel plug-ins:

CortexA53PipelineModel

An approximation of the performance characteristics of the in-order, dual issue properties of the Cortex®-A53 processor. The model provides estimated performance characteristics of a given compute-bound workload in terms of Cycles Per Instruction.

The model should not be used as a reference for hardware performance as it has limitations, such as the absence of a cache model.

InOrderPipelineModel

An implementation of a single-issue 4-stage pipelined processor that illustrates the basic components of a CPU. It demonstrates how components such as Fetch, Decode, and Execute can be implemented as a Fast Models plug-in. The source code is provided in `$PVLIB_HOME/plugins/source/PipelineModel/Cores/InOrder/`. It contains a README and a makefile for building the example.

The model does not represent any Arm® core and is intended only as a guide for developing more advanced PipelineModels using Fast Models.

The `PipelineModel` is an aspect of Timing Annotation. For more details, see [Timing Annotation](#) in the Fast Models User Guide.

4.15.1 CortexA53PipelineModel - parameters

This section describes the parameters for the CortexA53PipelineModel plug-in.

Each parameter is prefixed with `PipelineModel.CortexA53PipelineModel`, for example:

```
PipelineModel.CortexA53PipelineModel.core-type
```

Table 4-15: CortexA53PipelineModel parameters

Name	Type	Default value	Allowed values	When set	Description
core-type	string	""	""	Init time	Core type description.
end-pc	string	"0x00000000"	""	Init time	End processing instructions after this pc.
instance-name	string	""	""	Init time	Cluster and core num description.
output	string	""	""	Init time	Defaults to stdout. Specify STDERR or a filename.
start-pc	string	"0x00000000"	""	Init time	Start processing instructions from this pc.

4.15.2 InOrderPipelineModel - parameters

This section describes the parameters for the InOrderPipelineModel plug-in.

Each parameter is prefixed with `PipelineModel.InOrderPipelineModel`, for example:

```
PipelineModel.InOrderPipelineModel.core-type
```

Table 4-16: InOrderPipelineModel parameters

Name	Type	Default value	Allowed values	When set	Description
core-type	string	""	""	Init time	Core type description.
instance-name	string	""	""	Init time	Cluster and core num description.

4.15.3 PipelineModel example

This example shows how the `PipelineModel` plug-in generates data. This example uses a single issue, 6-stage pipeline. The stages are Fetch, Decode, Issue, EX1, EX2, and WR.

		0	1	2	3	4	5	6	7	8	9	10
[0]	ADD R1, R2, R3	IF	ID	IS	X0	X1	WR					
[1]	MUL R4, R1, R2		IF	ID	IS	IS*	X0	X1	WR			
[2]	ADD R5, R4, R6			IF	ID	ID*	IS	IS*	X0	X1	WR	
[3]	ADD R7, R8, R9				IF	IF*	ID	ID*	IS	X0	X1	WR

In this instruction sequence, pipeline stalls are shown with an asterisk. The following stalls occur:

- Instruction [1] stalls one cycle in the Issue stage until R1 has been written.
- Instruction [2] stalls one cycle in the Decode stage due to a structural hazard because the Issuer is still in use by Instruction [1].
- Instruction [2] stalls one cycle in the Issue stage until R4 has been written.
- Instruction [3] stalls one cycle in the Fetch stage due to a structural hazard because the Decoder is still in use by Instruction [2].
- Instruction [3] stalls one cycle in the Decode stage due to a structural hazard because the Issuer is still in use by Instruction [2].

The `PipelineModel` plug-in uses the accumulated stalls for each instruction to calculate the runtime latency as follows:

- Instruction [0] latency = 0 cycles.
- Instruction [1] latency = 1 cycle.
- Instruction [2] latency = 2 cycles.
- Instruction [3] latency = 2 cycles.

In this example, there are five stall cycles in total. At the end of the simulation, the `PipelineModel` plug-in uses the accumulated stalls to produce a total cycle count. It uses the cycle count to determine the final Cycles Per Instruction (CPI) or Instructions Per Cycle (IPC) value.

4.15.4 Naming the plug-in instance

You can optionally assign a name to the plug-in instance. This is useful in a multiprocessor platform if you load the same plug-in multiple times. The assigned name is used to identify which plug-in instance the parameters apply to.

For example, the following commands load the `PipelineModel` plug-in twice and assign the names `CortexA53_0` and `CortexA53_1` to the first and second instances respectively:

```
--plugin CortexA53_0=CortexA53PipelineModel.so
--plugin CortexA53_1=CortexA53PipelineModel.so
```

You can then specify the plug-in instance name in the plug-in parameters. For example:

```
-C PipelineModel.CortexA53_0.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53_0.instance-name=Base.cluster0.cpu0

-C PipelineModel.CortexA53_1.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53_1.instance-name=Base.cluster0.cpu1
```

4.15.5 Example command lines

The following command lines show how to load the `PipelineModel` plug-in with a variety of platforms. Any parameters that are not relevant to the examples have been omitted.

Default usage, with no options

The following command line attaches the plug-in to any instance and sends output to `stdout`:

```
./EVS_Base_Cortex-A53x1.x
...
--plugin CortexA53PipelineModel.so
```

Single cluster, single processor platform

The following command line attaches the plug-in to `cluster0.cpu0`, which is a Cortex®-A53 processor. It outputs the file `stat.txt`:

```
./EVS_Base_Cortex-A53x1.x
...
--plugin CortexA53PipelineModel.so
-C PipelineModel.CortexA53PipelineModel.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53PipelineModel.instance-name=Base.cluster0.cpu0
-C PipelineModel.CortexA53PipelineModel.output=stat.txt
```

Single cluster, multiprocessor platform, default usage

The following command line attaches the plug-in to all Cortex®-A53 processors:

```
./EVS_Base_Cortex-A53x2.x
...
--plugin CortexA53PipelineModel.so
```

Single cluster, multiprocessor platform

The following command line loads two plug-in instances in a dual-processor platform. The first plug-in instance is named `cortexA53_0` and is attached to `cluster0.cpu0`. The second plug-in instance is named `cortexA53_1` and is attached to `cluster0.cpu1`:

```
./EVS_Base_Cortex-A53x2.x
...
--plugin CortexA53_0=CortexA53PipelineModel.so
--plugin CortexA53_1=CortexA53PipelineModel.so
-C PipelineModel.CortexA53_0.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53_0.instance-name=Base.cluster0.cpu0
-C PipelineModel.CortexA53_1.core-type=ARM_Cortex-A53
-C PipelineModel.CortexA53_1.instance-name=Base.cluster0.cpu1
```

Multiclustler, single processor platform

The following command line names the plug-in instance `core1` and attaches it to `cluster1.cpu0`:

```
./EVS_Base_Cortex-A73x1-A53x1.x
...
--plugin Core1=CortexA53PipelineModel.so
-C PipelineModel.Core1.core-type=ARM_Cortex-A53
-C PipelineModel.Core1.instance-name=Base.cluster1.cpu0
```

Plug-in core-type mismatch

The following command line specifies a Cortex®-A55 processor. This mismatches the platform, which is Cortex®-A53. The plug-in will fail to load:

```
./EVS_Base_Cortex-A53x1.x
...
--plugin CortexA53PipelineModel.so
-C PipelineModel.CortexA53PipelineModel.core-type=ARM_Cortex-A55
```

Plug-in instance-name mismatch

The following command line specifies an `instance-name` that does not exist. The plug-in will fail to load:

```
./EVS_Base_Cortex-A53x1.x
...
--plugin CortexA53PipelineModel.so
-C PipelineModel.CortexA53PipelineModel.instance-name=Base.cluster0.cpu2
```

Range processing

The following command line specifies an address range. The `PipelineModel` only processes instructions within this range:

```
-C PipelineModel.CortexA53PipelineModel.start-pc=0x80000001
-C PipelineModel.CortexA53PipelineModel.end-pc=0x8000FFFF
```

If the start and end of the range are identical, the `PipelineModel` processes all instructions. This is the same as not specifying a range at all:

```
-C PipelineModel.CortexA53PipelineModel.start-pc=0x80000001
-C PipelineModel.CortexA53PipelineModel.end-pc=0x80000001
```

Cycle limit

To run the `PipelineModel` with a cycle limit, use the model option `--cyclelimit`. When the cycle limit is reached, the simulation terminates and the output file is generated.

The following command line causes the `PipelineModel` to process all instructions until the specified cycle limit is reached:

```
./EVS_Base_Cortex-A53x1.x
...
--cyclelimit=30000000
--plugin CortexA53PipelineModel.so
```

Note

The `--cyclelimit` option starts counting from the instruction at the beginning of the simulation, not from the instruction at `start-pc`. If the cycle limit has been reached and the `start-pc` has not yet been hit, the `PipelineModel` does not process any instructions.

4.15.6 PipelineModel output

At the end of the simulation, the `PipelineModel` generates a Cycles Per Instruction (CPI) value along with other performance data. You can use this for further analysis.

For example:

```
Elapsed time: 8 seconds
Instructions per second: 484186
Simulated CPU speed: 1.484186 MHz
CPU cycles: 5159984
RAW stalls: 3551018
Instructions issued: 3873492
Instructions retired: 3873491
Loads executed: 921403
Stores executed: 923306
IPC: 0.750679
CPI: 1.33213
```

The CPI value is the primary metric that measures the performance of workloads. It is calculated using the formula:

$$\text{CPI} = \text{cycles elapsed} / \text{instructions retired}$$

The lower the CPI, the better the performance. As a general indication, a CPI of 0.5 on a dual-issue, in-order or out-of-order processor means that an instruction takes 0.5 cycles to complete. In this case, the pipeline units are maximized and no latencies are generated.

Conversely, performance can be measured in Instructions Per Cycle (IPC), where:

$$\text{IPC} = \text{instructions retired} / \text{cycles elapsed}$$

The higher the IPC, the better the performance. As a general indication, an IPC of two on a dual issue, in-order or out-of-order processor means that on average, two instructions commit in each cycle.

4.16 RunTimeParameterTest

`RunTimeParameterTest` is an example MTI plug-in that demonstrates how to add new string, integer, and boolean parameters at runtime.

This plug-in is provided only as source code, in `$PVLIB_HOME/examples/MTI/RunTimeParameterTest/source/`.

4.17 Sidechannel

The Sidechannel plug-in allows communication between the software on the host and software on the target. It is no longer used.

4.18 TarmacText

`TarmacText` is an MTI plug-in that extracts the architectural execution trace, also known as Tarmac, of a processor. `TarmacText` extracts the trace in a textual form and saves it in a file.

`TarmacText` is deprecated. We recommend you only use it if you specifically require the `TarmacText` trace format. Otherwise, use the `TarmacTrace` plug-in instead.

The plug-in allows you to trace multiple components simultaneously, saving the generated traces in different files.

Enable trace generation by setting the `component` parameter to the required component name or space-separated names for multiple components. The default value of `component` is empty, which means the plug-in finds and traces all active processors.

Output filenames are composed of a common prefix, configurable with the `log` parameter, followed by the name of the component, and terminated with the extension `.log`. The default value of the prefix is `tarmac`.

The platform name is trimmed from the component name.

4.18.1 TarmacText - parameters

This section describes the parameters for the TarmacText plug-in.

Each parameter is prefixed with `TRACE.TarmacText`, for example:

```
TRACE.TarmacText.component
```

Table 4-17: TarmacText parameters

Name	Type	Default value	Allowed values	When set	Description
<code>component</code>	string	<code>"*"</code>	""	Init time	A space separated list of component to trace. Supports globbing (see man 7 glob). Does not restrict nor extend the list of components for which the ExecStep Iris EventSource will be published.
<code>evs</code>	string	""	""	Init time	Filename to log the binary tarmac into. Supports the substitution pattern <code>@COMP@</code> .
<code>exec</code>	string	""	""	Init time	Shell command to execute to process the binary tarmac on the fly. Supports the substitution pattern <code>@COMP@</code> . The command must accept on its standard input the tarmac event stream.
<code>flush</code>	bool	<code>false</code>	<code>true</code> , <code>false</code>	Init time	Whether to flush the output files specified by the log parameter as often as possible. Decrease the performances.
<code>log</code>	string	<code>"tarmac.@COMP@.log"</code>	""	Init time	Filename to log the text tarmac into. Supports the substitution pattern <code>@COMP@</code> .
<code>start</code>	int	<code>0</code>	<code>≥0</code>	Init time	The amount of cycles (as defined by the PERIODIC event) to wait for before starting to trace. This can be used to reduce the impact of the tracing on performances until the portion of interest is reached. Does not impact the ExecStep Iris EventSource.

4.19 TarmacTrace

TarmacTrace is an MTI plug-in that prints Tarmac trace to `stdout` or to a file. This section describes the format of the output.

The trace might include instructions executed, program flow, updates to registers, memory accesses made by Arm® cores in the simulation, and other information. Plug-in parameters control the amount and type of information that is traced.

This plug-in can be used with [ToggleMTIPlugin](#).

4.19.1 TarmacTrace - parameters

This section describes the parameters for the TarmacTrace plug-in.

Each parameter is prefixed with `TRACE.TarmacTrace`, for example:

```
TRACE.TarmacTrace.end-instruction-count
```

Table 4-18: TarmacTrace parameters

Name	Type	Default value	Allowed values	When set	Description
end-instruction-count	int	0x0	0x0 - 0x7fffffffffffffff	Init time	The instruction count when the tracing should be stopped. Default is to never stop tracing.
instruction-count-is-per-target	bool	true	true, false	Init time	If true (default) then the start-instruction-count and end-instruction-count parameters apply to individual targets separately. If false, all components start and stop tracing at once when the first component reaches the instruction count.
loadstore-display-width	int	0x8	0x0 - 0x40	Init time	Memory transactions can involve up to 64 bytes. For easier readability these can be broken up into multiple memory access records with a smaller number of bytes. 0 means do not break up any transaction.
quantum-size	int	0x2710	0x1 - 0x7fffffff	Init time	Set the default quantum size used to compute when the tracing should start and stop, in instructions. This is overridden by the <code>CORE_INFO.QUANTUM_SIZE</code> trace source field of the component, if present.
quiet	bool	false	true, false	Init time	Limit output to trace information.
start-instruction-count	int	0x0	0x0 - 0x7fffffffffffffff	Init time	The instruction count when the tracing should start. Default is to trace from the beginning.

Name	Type	Default value	Allowed values	When set	Description
trace-file	string	""	""	Runtime	Trace output file. The default is an empty string, which means stdout unless MTI_TARMAC_LOG is set. STDOUT means stdout. STDERR means stderr. Setting this parameter at runtime causes the current trace file to be flushed and closed and a new one to be opened. Writing at runtime, STDOUT, STDERR, and MTI_TARMAC_LOG are not supported when trace-file-per-comp=1.
trace-file-per-comp	bool	false	true, false	Init time	Write trace to multiple files.
trace-inst-stem	string	""	""	Init time	Base instance path to select a group of instances to trace.
trace_aarch64_vfp_full_width	bool	false	true, false	Init time	Trace a write to an S or D register in AArch64 as a write to the corresponding V register.
trace_atomic	bool	true	true, false	Init time	Trace memory update by atomic operation.
trace_branches	bool	false	true, false	Init time	Trace changes of the program flow like direct or indirect branches and exception returns.
trace_bte	bool	true	true, false	Init time	Trace opcode rejected by BTE.
trace_bus_accesses	bool	false	true, false	Init time	Trace bus accesses by the core. This includes accesses by the caches of the core. This considerably slows down the model.
trace_cache	bool	true	true, false	Init time	Trace cache fills and evictions.
trace_core_registers	bool	true	true, false	Init time	Trace the core registers R0-R14, the CPSR, and the SPSR registers.
trace_cp15	bool	true	true, false	Init time	Trace writes to CP15 registers.
trace_dap	bool	true	true, false	Init time	Trace accesses on the debug access port.
trace_ete	bool	true	true, false	Init time	Trace packets generated by the ETE.
trace_events	bool	true	true, false	Init time	Trace events, for example exceptions and mode changes.
trace_exception_reasons	bool	true	true, false	Init time	Trace INFO_EXCEPTION_REASONS (M-class only so far).
trace_generic_events	bool	false	true, false	Init time	Trace generic events.
trace_gic	bool	true	true, false	Init time	Trace GIC register writes and updates.
trace_gic_reads	bool	false	true, false	Init time	Trace GIC register reads.
trace_gicv3	bool	true	true, false	Init time	Trace GICv3 memory mapped accesses.
trace_gicv3_comms	int	0x0	0x0 - 0x7	Init time	Trace GICv3 communications between cores and distributor. Bitfield; 1 = trace CPU; 2 = trace RD0; 4 = trace internal.
trace_gicv3_its	bool	false	true, false	Init time	Trace GICv3 ITS command execution.
trace_gicv3_reads	bool	false	true, false	Init time	Trace GICv3 memory mapped reads.
trace_gpt	bool	true	true, false	Init time	Trace packets generated by the GPT.
trace_hacdbbs	bool	true	true, false	Init time	Trace packets generated by the HACDBS.

Name	Type	Default value	Allowed values	When set	Description
trace_hdbss	bool	true	true, false	Init time	Trace packets generated by the HDBSS.
trace_instructions	bool	true	true, false	Init time	Trace instructions.
trace_loads_store_memtype	bool	false	true, false	Init time	Show memory type information for core loads and stores.
trace_loads_stores	bool	true	true, false	Init time	Trace loads and stores that are triggered by instructions. These might go into the memory subsystem, into a cache, or into a TCM. This considerably slows down the model.
trace_mask_s_regs	bool	false	true, false	Init time	Represent non-updated bytes as ---- in S-registers trace.
trace_memory	bool	false	true, false	Init time	Trace memory accesses just outside the core.
trace_mmu	bool	true	true, false	Init time	Trace mmu tablewalks and associated information.
trace_mpu_events	bool	false	true, false	Init time	Trace MPU events.
trace_spe	bool	true	true, false	Init time	Trace SPE data written to memory.
trace_tag_loads_stores	bool	true	true, false	Init time	Trace tag loads and stores that are triggered by MTE instructions. These might go into the memory subsystem, into a cache, or into a TCM. This considerably slows down the model.
trace_vfp	bool	true	true, false	Init time	Trace the VFP and Neon registers, including FPSCR and FPEXC.
unbuffered	bool	false	true, false	Init time	Trace events as they arrive and flush each fwrite. Prints IT even when IS should be printed.
updated-registers	bool	false	true, false	Init time	Trace the updated value of registers rather than the written value.
use_inst_end_for_inst_counter	bool	false	true, false	Init time	When using the instruction count as the timestamp, if true, increase the instruction count at INST_END instead of INST. When using the simulation time as the timestamp, this parameter has no effect.
use_instr_cnt_as_timestamp	bool	true	true, false	Init time	Use the instruction count as the timestamp instead of the simulation time.

4.19.2 TarmacTrace file format

This topic describes conventions used in the syntax definitions for each trace type.

In the syntax definition for each trace type:

[X|Y]

Indicates a choice between X and Y.

{X}

Indicates that X is optional or configuration-dependent.

This is the common address definition that is used in the trace command syntax:

```
<vaddr>{:<paddr><psecurity>}
```

where:

<vaddr>

is the virtual address in hexadecimal format. See the note after this list.

<paddr>

is the physical address of the instruction in hexadecimal. See the note after this list. <paddr> is only present if it is different to <vaddr>.

<psecurity>

either **_ns** if the security regime of the physical address is Non-secure, or not present if the regime is Secure.

Note

For 64-bit addresses, the value is written as either:

- 8 hex digits, if the value can be represented in 32 bits.
- 16 hex digits otherwise.

This is the virtual regime definition that is used in the trace command syntax:

```
0x<vbase>{_NS} <el>{ vmid=<vmid>}{, nG asid=<asid>}
```

where:

0x<vbase>

is the virtual address in hexadecimal format.

_NS

if present, specifies that the address is Non-secure. If not present, the address is Secure.

<el>

is the translation regime that owns the mapping. One of:

- **EL1_n**, meaning the Non-secure EL1&0 translation regime.
- **EL2_n**
- **EL1_s**
- **EL3_s**

<vmid>

if present, is the VMID for Non-secure, non-hyp regimes.

nG

if present, specifies that the virtual regime is non-global.

<asid>

if present, is the ASID, for non-global regimes.

4.19.3 Tarmac Trace output example

This example output from the Tarmac Trace plug-in shows various types of trace output, including instruction, memory access, register, translation table walk, and TLB traces.

```
...
89 clk IT (89) 80000164 f9000820 O EL1h_n : STR x0,[x1,#0x10]
89 clk MW8 80002010:000080002010_NS 00000000_80000705
90 clk IT (90) 80000168 d28080a0 O EL1h_n : MOV x0,#0x405
90 clk R X0 00000000000000405
...
98 clk IT (98) 80000188 d5181000 O EL1h_n : MSR SCTL_EL1,x0
98 clk R SCTL_EL1 00000000:00001005
98 clk TTW ITLB LPAE 1:1 000080002010 00000000080000705 : BLOCK ATTRIDX=1 NS=0 AP=0
SH=3 AF=1 nG=0 16E=0 PXN=0 XN=0 ADDR=0x0000000008000000
98 clk TLB FILL cpu0.UTLB 1G 0x80000000_NS EL1_n vmid=0:0x0080000000_NS Normal
InnerShareable Inner=WriteBackWriteAllocate Outer=WriteBackWriteAllocate xn=0 pxn=0
ContiguousHint=0 xs=0
...
```

This trace shows three instructions:

- The first instruction is an `STR`, which stores the 64-bit value from register `x0` to the address in `x1 + 10` byte offset:

```
89 clk IT (89) 80000164 f9000820 O EL1h_n : STR x0,[x1,#0x10]
89 clk MW8 80002010:000080002010_NS 00000000_80000705
```

In more detail:

- `IT` is a label that indicates the type of trace event described by the line. `IT` means instruction taken. To interpret the values in this line, see [Instruction trace](#). For example:
 - `89` means this is the 89th instruction.
 - `clk` means that the preceding number is an instruction count. If `ps` was displayed here instead, this would indicate the first value is a timestamp.
 - `0x80000164` is the address from which the instruction was fetched.
 - `0xf9000820` is the 32-bit opcode of the instruction.
 - `o` indicates the CPU execution state, in this case AArch64.
 - `EL1h_n` indicates the current Exception level and Security state.
 - The rest of the line following the colon is the assembly language representation of the instruction.
- `MW8` indicates an 8-byte memory write. To interpret the values in this line, see [Processor memory access trace](#). For example:
 - `0x80002010` is the virtual address to which the data was written. The value after the colon is the corresponding physical address. In this example, they are the same. The `_NS` suffix indicates that it is Non-secure memory.
 - `0x00000000_80000705` is the value of the data written. Each group of 8 digits is separated using an underscore.

- The second instruction is a `mov`, which moves the value `0x405` into register `x0`:

```
90 clk IT (90) 80000168 d28080a0 0 EL1h_n : MOV x0,#0x405
90 clk R X0 00000000000000405
```

- `R` indicates a register trace. To interpret the values in this line, see [Register trace](#). For example:
 - `x0` is the name of the register being written to.
 - `0x405` is the new value of `x0`, which is the value that was moved by the `mov` instruction.
- The third instruction is an `msr`, which writes the value `0x1005` from register `x0` to System register `SCTLR_EL1`.

Writing to bit 0 of `SCTLR_EL1` enables the MMU, so that all subsequent memory accesses will be done through the MMU.

The next memory access following this instruction is an instruction fetch (not shown), so a Translation Table Walk (TTW) is required to find its address.

Following the TTW, the Translation Lookaside Buffer (TLB) is updated with the new entry that caches some of the values resulting from the TTW, for example region size, base address, cachability and sharability. This appears as a TLB trace:

```
98 clk IT (98) 80000188 d5181000 0 EL1h_n : MSR SCTLR_EL1,x0
98 clk R SCTLR_EL1 00000000:00001005
98 clk TTW ITLB LPAAE 1:1 000080002010 0000000080000705 : BLOCK ATTRIDX=1 NS=0
AP=0 SH=3 AF=1 nG=0 16E=0 PXN=0 XN=0 ADDR=0x0000000080000000
98 clk TLB FILL cpu0.UTLB 1G 0x80000000_NS EL1_n vmid=0:0x0080000000_NS Normal
InnerShareable Inner=WriteBackWriteAllocate Outer=WriteBackWriteAllocate xn=0
pxn=0 ContiguousHint=0 xs=0
```

- `TTW` indicates a translation table walk trace. To interpret the values in this line, see [Translation table walk trace](#). For example:
 - `ITLB` means instruction TLB.
 - `LPAAE` means Large Physical Address Extension (LPAAE)-format translation table entries.
 - `1:1` means Walk stage 1, Walk level 1.
 - `0x000080002010` is the page base address and the page attributes.
 - `0x0000000080000705` is the raw translation table entry.
 - Following the colon is the parsed result. In this case, the LPAAE region descriptor.
- `TLB` indicates a TLB trace. To interpret the values in this line, see [TLB trace](#). For example:
 - `FILL` means a TLB fill operation.
 - `cpu0.UTLB` means the operation is taking place on a Unified TLB, which is shared for I-side and D-side accesses.
 - `1G` means the TLB entry is for a 1GB page.
 - `80000000_ns` means the entry has a page base address of `0x80000000` and is Non-Secure.

- `EL1_n` means the entry is for EL1.
- `vmid=0:0x008000000000_NS` means the entry is tagged with a specific VMID.
- `Normal InnerShareable` means the entry is tagged as Normal Inner-Sharable.
- `Inner` and `outer` are the inner and outer cache attributes for this entry.
- `xn=0` means the entry is tagged NOT Execute Never.
- `pxn=0` means the entry is tagged NOT Privileged Execute Never.
- `ContiguousHint=0` means the entry is not tagged as part of a set of contiguous entries that can be cached as one entry.
- `xs=0` means the page for this TLB entry is NOT XS, indicating either lack of support for FEAT_XS in the core, or it is non-XS memory.

4.19.4 Instruction trace

If enabled, this trace source generates one record for every instruction started.

The records (lines) of the instruction trace have this syntax:

```
<time> <scale> <cpu> [IT|IS] (<inst_id>) <addr> <opcode> [A|T|X|O] <mode>_<security> :
<disasm>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for <time>. `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

[IT|IS]

IT

Instruction passed the condition code (taken).

IS

Instruction failed the condition code (skipped).

<inst_id>

Tick count of this processor, which is equivalent to the number of instructions that are executed, except for certain instructions like `WFI/WFE` (decimal value).

<addr>

Fetch source address for this instruction. Formatted according to the common address definition, see [TarmacTrace file format](#).

<opcode>

16-bit or 32-bit hexadecimal opcode of the instruction.

[A|T|X|O]

Instruction set:

A

A32

T

T32

X

T32EE

O

A64

<mode>

Processor execution mode.

AArch32 modes are `svc`, `irq`, `fiq`, `usr`, `mon`, `sys`, `abt`, `und`, `hyp`.

AArch64 modes are `EL3h`, `EL3t`, `EL2h`, `EL2t`, `EL1h`, `EL1t`, `EL0t`.

<security>

Processor security state (`s` or `ns`).

<disasm>

Disassembly of the instruction.

4.19.5 Program flow trace

If enabled, every executed branch instruction triggers this trace source, which is a more efficient way to reconstruct the program flow than by tracing every instruction.

Output syntax:

```
<time> <scale> {<cpu>} [FD|FI] (<inst_id>) <addr> <targ_addr> [A|T|X|O]
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for `<time>`. `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

[FD|FI]

Program flow change by:

FD

A direct branch.

FI

An indirect branch.

<inst_id>

Tick count of this processor, which is equivalent to the number of instructions that are executed, except for certain instructions like **WFI/WFE** (decimal value).

<addr>

Fetch source address for this instruction. Formatted according to the common address definition, see [TarmacTrace file format](#).

<targ_addr>

Address (virtual) at which the execution continues. Formatted according to the common address definition.

[A|T|X|O]

Instruction set after the branch:

A

A32.

T

T32.

X

T32EE.

O

A64

4.19.6 Register trace

If enabled, this source traces all writes to the processor registers.

This trace source includes writes to core registers **R0** to **R14**, **X0** to **X30**, **CPSR**, and **SPSR**, VFP registers such as **S0** to **S31**, **D0** to **D31**, **FPSCR**, and **FPEXC**, and writes to system registers including **CP14**, **CP15**, and **GIC**. Banked registers are traced separately using the mode as a suffix to the register name, for example **r13** (current register **R13**) and **r13_mon** (banked register **R13**).

Output syntax:

```
<time> <scale> {<cpu>} R <register> <value>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for `<time>`. `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

<register>

Register name. Banked core registers can have a mode appended to them with a single underscore. Banked CP14/CP15 registers have `_s` or `_ns` appended to indicate access of either the Secure or Non-secure banked register.

Note

In Arm®v8 and Arm®v9, when the register name is `cpsr`:

- In AArch64 state, `cpsr` is used to trace PSTATE changes. The bit format of `<value>` follows the SPSR_ELx AArch64 format.
- In AArch32 state, the bit format of `<value>` follows the CPSR format.

<value>

Hexadecimal value that is written to the register (64 bits maximum).

If the SVE plug-in is loaded in the model, there are additional registers in the program view. The output examples below show how these registers are traced when the value changes. These data values can be very large.

```
8463 clk cpu0 IT (8439) 000282c0:0000152282c0_NS 053fc01f O EL1h_n : SEL
z31.B,p0,z0.B,z31.B
8463 clk cpu0 R z31 00000000_00000000_00000000_00000000
```

`R` indicates a register write. `z0` to `z31` are the vector registers. The written data are hexadecimal digits, which are separated by an underscore every 32 bits. The length of the written data varies with the configuration, depending on the vector length.

```
9756 clk cpu0 IT (9732) 01000074:000011000074_NS 2518e3e0 O EL1t_n : PTRUE p0.B,ALL
9756 clk cpu0 R p0 ffff
```

`R` indicates a register write. `p0` to `p15` are the predicate registers. The written data are hexadecimal digits. If they are long enough to require one, the digits are separated by an underscore every 32 bits. The length of the written data varies with the configuration, depending on the vector length. Predicate registers contain 1 bit per byte of vector register length.

4.19.7 Cache maintenance trace

If enabled, traces all cache maintenance operations that the processor initiates.

Output syntax:

```
<time> <scale> <cpu> CACHE MAINTENANCE <side> <operation> <scope> <data> {<pagesize>
<mementype>}
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for <time>. A value of `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

<side>

Data or instruction cache.

<operation>

Clean, invalidate, or both.

<scope>

By MVA or set/way, to Point of Coherency or Point of Unification, Inner Sharable or not.

<data>

Data that is associated with the operation. If the operation is by MVA, formatted according to the common address definition, see [TarmacTrace file format](#), otherwise use raw hexadecimal.

<pagesize>

If the operation is by MVA, this element is the size of the memory region that is described by the TLB entry that contains the MVA.

<memtype>

If the operation is by MVA, this element is the type of memory in the TLB entry that contains the MVA.

4.19.8 Cache content trace

Traces the movement of data into and out of the cache.

Output syntax:

```
<time> <scale> <cpu> CACHE <id> LINE <line> <operation> 0x<paddr><ns>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for <time>. A value of `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

<id>

Level and side, or system identifier, of the cache.

<line>

Identifier of this line uniquely within this cache, expressed in hexadecimal.

<operation>

Notification for this cache line. One of the following options:

ALLOC

(Processor caches) Line contains new read data.

INVAL

(Processor caches) Line contains no data.

DIRTY

(Processor caches) Line contains new write data.

CLEAN

(Processor caches) Write data is written back, still valid for reads.

FILL

(System caches) Line is filled.

EVICT

(System caches) Line is evicted due to space pressure.

CLEAN

(System caches) Line is cleaned due to maintenance operation.

INVAL

(System caches) Line is invalidated due to maintenance operation.

<paddr>

Cache line physical address in hexadecimal.

<ns>

Cacheline security. Blank for Secure regime, or `_ns` for Non-secure regime.

4.19.9 Translation table walk trace

If enabled, this source traces all translation table walks initiated by the processor.

Output syntax:

```
<time> <scale> <cpu> [TTW|TTU] <side> <format> <stage>:<level> <address> <data> :  
<result>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for `<time>`. `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

[TTW|TTU]

Translation table walks (reads) or translation table update (writes).

<side>

Data or instruction TLB.

<format>

VMSA or LPAE format translation table entries.

<stage>

Walk stage, within the range 1-2.

<level>

Walk level, within the range 1-3.

<address>

Physical address of lookup in hexadecimal.

<data>

Raw translation table entry in hexadecimal.

<result>

Parsed result. One of the following options:

ABORTED

The memory access caused a synchronous abort and no data was returned.

FAULT

The data that was returned is not valid for this stage and level.

RESERVED

The data that was returned is not valid for this stage and level.

TABLE {<attr>=<value>}+

Pointer to the next level of lookup, in LPAE format.

BLOCK {<attr>=<value>}

LPAE region descriptor.

SUPERSECTION {<attr>=<value>}

VMSA region descriptor.

SECTION {<attr>=<value>}

VMSA region descriptor.

PAGETABLE {<attr>=<value>}

Pointer to the next level of lookup, in VMSA format.

LARGE PAGE {<attr>=<value>}

VMSA region descriptor.

SMALLPAGE {<attr>=<value>}

VMSA region descriptor.

4.19.10 Granule protection table walk trace

If enabled, this source traces Granule Protection Table (GPT) walks. This event is triggered by GPT lookups.

Output syntax:

```
<time> <scale> <cpu> GPTW [ISIDE|DSIDE] L<level> <address> <descaddr> : <data>
<result>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for <time>. `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

[DSIDE|ISIDE]

Data or instruction TLB.

<level>

GPT fetch level, either 0 or 1.

<address>

Physical address of the lookup.

<descaddr>

Physical address of the GPT descriptor.

<data>

GPT data that was read.

<result>

Parsed result. One of the following values:

BLOCK TYPE=0x01 GPI=<gpi> PGS=<pgs>

GPT descriptor is a Block descriptor. <gpi> is the GPI value of the fetched GPT entry. <pgs> is the physical granule size.

CONTIGUOUS TYPE=0x01 GPI=<gpi> CRS=<crs>

GPT descriptor is a Contiguous descriptor. <gpi> is the GPI value of the fetched GPT entry. <crs> is the contiguous region size.

TABLE TYPE=0x03 ADDR=<addr>

GPT descriptor is a Table descriptor. <addr> is the next-level table address in hexadecimal.

GRANULE TYPE=0x0f GPI=<gpi> PGS=<pgs>

GPT descriptor is a Granule descriptor. <gpi> is the GPI value of the fetched GPT entry. <pgs> is the physical granule size.

INVALID

GPT entry is invalid.

4.19.11 TLB trace

If enabled, this source traces TLB entries that are filled and evicted by the processor.

Output syntax:

```
<time> <scale> <cpu> [TLB|WALKCACHE] FILL <id> <size> <virtualregime>:<paddr>
{<memtype>} {<attr>=<value>}+
```

or

```
<time> <scale> <cpu> [TLB|WALKCACHE] EVICT <id> <size> <virtualregime>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for <time>. `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

<id>

Identifies which TLB or walk cache to trace.

<size>

Size of the region being mapped.

<virtualregime>

Virtual address and regime of the region being mapped, formatted according to the common virtual regime definition.

<paddr>

Physical base address of mapped region, formatted according to the common address definition, see [TarmacTrace file format](#).

<memtype>

For TLB entries, the memory type of the result. One of the following options:

Device-[G|nG] [R|nR] [E|nE] {(<alias>) }

Device memory, where:

[G|nG]

Gathering or nongathering.

[R|nR]

Reordering or nonreordering.

[E|nE]

Early write acknowledgement or not.

<alias>

Device-nGnRnE was previously known as StronglyOrdered.

Normal [NonShareable|Shareable] Inner=<cachetype> Outer=<cachetype>

Normal memory, where:

[NonShareable|Shareable]

Shareability

<cachetype>**[NonCacheable|WriteBack|WriteThrough] {NonReadAllocate} {Non}
{WriteAllocate}****[NonCacheable|WriteBack|WriteThrough]**

Cacheability

{NonReadAllocate}

For cacheable memory, Read allocate hint. (Read allocate is assumed if not specified.)

{Non}{WriteAllocate}

For cacheable memory, Write allocate hint.

4.19.12 Event trace

If enabled, traces exceptions, interrupts, and exception returns. In AArch64, it also traces changes to the SPSel and to the current exception level, by generating a CoreEvent_ModeChange.

Output syntax:

<time> <scale> {<cpu>} E <value> {<mode>} {<value1>} <number> <desc>

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the TRACE.TarmacTrace.use_instr_cnt_as_timestamp parameter.

<scale>

Unit for <time>. ps means simulation time, clk means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

<value>

A value that is associated with the event, formatted according to the common address definition, see [TarmacTrace file format](#).

<mode>

For mode change events only, the new mode being entered.

<value1>

Where available, the hexadecimal representation of a second value that is associated with the event.

<number>

Event number.

<desc>

Event name.

In the following table, the CoreEvent_CURRENT_* and CoreEvent_LOWER_* events cover all the ways in which exception entry can happen in AArch64 state. For example, CoreEvent_CURRENT_SPx_SYNC corresponds to a synchronous exception taken from Current Exception level with SP_ELx, x>0.

CoreEvent_LOWER_64_IRQ corresponds to an IRQ or vIRQ taken from Lower Exception level, where the implemented level immediately lower than the target level is using AArch64.

Table 4-19: Supported values for value, number, and desc

Number	Event description	Value
0x00000001	CoreEvent_Reset	-
0x00000002	CoreEvent_UndefinedInstr	-
0x00000003	CoreEvent_SWI	SWI number
0x00000004	CoreEvent_PrefetchAbort	-
0x00000005	CoreEvent_DataAbort	-
0x00000007	CoreEvent_IRQ	-
0x00000008	CoreEvent_FIQ	-
0x0000000E	CoreEvent_ImpDataAbort	-
0x00000019	CoreEvent_ModeChange	New mode
0x00000080	CoreEvent_CURRENT_SPO_SYNC	-
0x00000081	CoreEvent_CURRENT_SPO_IRQ	-
0x00000082	CoreEvent_CURRENT_SPO_FIQ	-
0x00000083	CoreEvent_CURRENT_SPO_ABORT	-
0x00000084	CoreEvent_CURRENT_SPx_SYNC	-
0x00000085	CoreEvent_CURRENT_SPx_IRQ	-
0x00000086	CoreEvent_CURRENT_SPx_FIQ	-
0x00000087	CoreEvent_CURRENT_SPx_ABORT	-
0x00000088	CoreEvent_LOWER_64_SYNC	-
0x00000089	CoreEvent_LOWER_64_IRQ	-

Number	Event description	Value
0x0000008A	CoreEvent_LOWER_64_FIQ	-
0x0000008B	CoreEvent_LOWER_64_ABORT	-
0x0000008C	CoreEvent_LOWER_32_SYNC	-
0x0000008D	CoreEvent_LOWER_32_IRQ	-
0x0000008E	CoreEvent_LOWER_32_FIQ	-
0x0000008F	CoreEvent_LOWER_32_ABORT	-

4.19.13 Processor memory access trace

If enabled, this source traces processor data accesses.

Output syntax:

```
<time> <scale> {<cpu>} M<rw><sz><attrib> <addr><data>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for <time>. `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

<rw>

R

Read access.

W

Write access.

<sz>

Size of the data transfer in bytes (1, 2, 4, 8).

<attrib>

Optional access attribute:

X

Exclusive access.

T

Translated (unprivileged) access.

L

Locked access (SWP, SWPB instructions).

_CAS<suffix>

Compare and swap operation, where <suffix> is either *c* or *d*. *_CASc* shows the value to compare and *_CASd* shows the value that will be written to memory if the comparison matches.

The value that is stored in memory as a result of a compare and swap operation is shown by an *MU* trace source.

<addr>

Virtual address that is used to access memory. Formatted according to the common address definition, see [TarmacTrace file format](#).

<data>

Hexadecimal value of data transferred. The data padding is according to the size of the transfer. Data of 64 bits or more contains an underscore (*_*) separator every eight characters (32 bits).

4.19.14 Processor memory update trace

If enabled, this source traces memory update accesses caused by atomic operations.

Output syntax:

```
<time> <scale> {<cpu>} MU<sz>_<atomic_op> <addr> <data>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for <time>. *ps* means simulation time, *clk* means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

<sz>

Size of the data transfer in bytes (1, 2, 4, 8, 16).

<atomic_op>

Atomic operation performed on this memory address:

ADD

Atomic add operation.

BIC

Atomic bit clear operation.

CASc

Atomic compare and swap operation.

EOR

Atomic exclusive or operation.

ORR

Atomic bit set operation.

SMAX

Atomic signed max operation.

SMIN

Atomic signed min operation.

SWP

Atomic swap operation.

UMAX

Atomic unsigned max operation.

UMIN

Atomic unsigned min operation.

<addr>

Physical address that is used to access memory. Formatted according to the common address definition, see [TarmacTrace file format](#).

<data>

Hexadecimal value of data that is stored in memory as a result of the atomic operation. Data of 64 bits or more contains an underscore (_) separator every eight characters (32 bits).

4.19.15 Memory bus trace

If enabled, this source traces transactions that are initiated through the memory bus master port of the processor. These accesses use physical addresses.

Output syntax:

```
<time> <scale> {<cpu>} B<rw><sz><fd><lk><p><s> I<wrcbs> O<wrcbs> <master_id> <addr>
<data>
```

<time>

Either the simulation time timestamp or the instruction count, depending on the value of the `TRACE.TarmacTrace.use_instr_cnt_as_timestamp` parameter.

<scale>

Unit for <time>. `ps` means simulation time, `clk` means instruction count.

<cpu>

Processor, or other component, that gave the instruction.

<rw>**R**

Read access.

W

Write access.

<sz>

Size of the data transfer in bytes.

<fd>**I**

Opcode fetch.

D

Data load/store or an MMU access.

<lk>**L**

Locked access.

X

Exclusive access.

_, underscore

Normal access.

<p>**P**

Privileged access.

_, underscore

Normal access.

<s>**S**

Secure access.

N

Non-secure access.

I<wrcbs>

Inner cache attributes. See o<wrcbs>.

O<wrcbs>

Outer cache attributes:

<w>**W**

Allocate on write.

_, underscore

No allocate on write.

<r>**R**

Allocate on read.

_, underscore

No allocate on read.

<c>**C**

Cacheable access.

_, underscore

Non-cacheable access.

******B**

Bufferable access.

_, underscore

Non-bufferable access.

<s>**S**

Shareability access.

_, underscore

Non-shareability access.

<master_id>

Master ID of the transaction.

<addr>

Physical address that is used to access memory, in hexadecimal format.

<data>

Hexadecimal value of data transferred. The data padding is according to the size of the transfer. Byte ordering is from lowest to highest byte. This ordering means that for accesses in little endian mode, the data occurs mirrored compared to the register/memory access records.

4.20 ToggleMTIPlugin

ToggleMTIPlugin is an MTI plug-in that can be used to limit the generation of trace by another plug-in to specific areas of interest.

Generating trace output throughout a simulation session can reduce simulation speed and result in very large trace files. ToggleMTIPlugin helps to avoid these problems by enabling you to toggle trace generation during the simulation. Toggling trace means that if trace is on, it is turned off, and vice versa.

ToggleMTIPlugin can be used with the following plug-ins:

- ASTFplugin
- GenericTrace
- TarmacTrace

4.20.1 ToggleMTIPlugin - parameters

This section describes the parameters for the ToggleMTIPlugin plug-in.

Each parameter is prefixed with `TRACE.ToggleMTIPlugin`, for example:

```
TRACE.ToggleMTIPlugin.diagnostics
```

Table 4-20: ToggleMTIPlugin parameters

Name	Type	Default value	Allowed values	When set	Description
diagnostics	bool	false	true, false	Init time	Print diagnostics.
disable_mti_from_start	bool	false	true, false	Init time	Enable or disable MTI callbacks from start of simulation.
disable_mti_runtime	bool	false	true, false	Runtime	Enable or disable MTI callbacks at runtime.
hlt_imm16	int	0xf000	0x0 - 0xffff	Init time	16-bit integer used in HLT instruction meant to be used by this plugin.
use_hlt	bool	true	true, false	Init time	If true, use HLT #imm16 instruction to toggle MTI behavior.

4.20.2 How to use ToggleMTIPlugin

As with other plug-ins, load ToggleMTIPlugin using the `--plugin` command-line option when launching the model.

Note

- When loading ToggleMTIPlugin and any other trace plug-ins using the `--plugin` option, ToggleMTIPlugin must be the last plug-in to be specified on the command line.

-
- We recommend you disable trace generation from the start of the simulation, using the plug-in parameter `disable_mti_from_start=1`, then enable it when execution reaches the region of interest.
-

There are two alternative ways to use ToggleMTIPlugin. You cannot use both in the same simulation session. Use the `use_hlt` plug-in parameter to control which one to use:

- `use_hlt = 1`

To use this method, set the `hlt_imm16` plug-in parameter to an integer value. The application will use this value as the operand in `HLT` instructions to toggle MTI callbacks.

You must also set the following parameters on the core model that is running the application:

`enable_trace_special_hlt_imm16`

Set to true to enable the parameter `trace_special_hlt_imm16`.

`trace_special_hlt_imm16`

Specifies the integer value that is used as the operand to `HLT` instructions to cause the usual `HLT` execution to be skipped. If the value matches the value specified in the `hlt_imm16` plug-in parameter, tracing is toggled.

- `use_hlt = 0`

To use this method, set the runtime plug-in parameter `disable_mti_runtime` during the simulation session to either true to disable tracing, or false to enable tracing. Changes to the `disable_mti_runtime` parameter are ignored unless `use_hlt` is zero.

To change `disable_mti_runtime` at runtime, use a debugger, for example Model Debugger or use the `iris.debug` Python module. The example Python script `$PVLIB_HOME/examples/pyIris/inst_count_trace_control.py`, demonstrates how to do this.

5. Fast Models examples

The following top-level example directories are installed under `$PVLIB_HOME/examples`.

Table 5-1: Fast Models examples directories

Directory name	Description
CADI	Example C++ applications that demonstrate how to use the CADI debug API. Note: CADI is deprecated and will be replaced by the Iris debug API.
LISA	LISA+ source code and project files for FVPs.
LISAPlus	Example LISA+ components that show how to capture and generate MTI trace, remap PVBUS transactions, and handle burst transactions.
MTI	MTI plug-in examples that show how to extract and use trace information from models. The following examples are also available as pre-built libraries under <code>\$PVLIB_HOME/plugins</code> : <ul style="list-style-type: none"> GenericCounter. GenericTrace. ListTraceSources.
SystemCExport	<ul style="list-style-type: none"> Source code and makefiles for EVS platform examples and SVPs. LISA+ source for bridges and EVS components. Header files required for exporting LISA+ protocols to SystemC.

Note

On Microsoft Windows, the Fast Models installer creates a copy of the examples in `%USERPROFILE%\ARM\FastModelsPortfolio_%FM-VERSION%\examples\`. This copy allows you to save configuration changes to the examples without needing Administrator permissions.

5.1 CADI examples

Example CADI clients that demonstrate how to use the CADI API to perform common debugger operations. These include instantiating a new simulation, connecting to a running simulation, accessing memory and registers, setting breakpoints, and registering callbacks for asynchronous feedback from the simulation.

Each of these examples has a `readme.txt` that describes the example, how to run it, and in some cases, gives the expected output. The following CADI examples are provided:

Table 5-2: CADI examples

Example	Description
breakpoints	Sets a code breakpoint at a specific address in the application that is running on the model.
cache_dump	Displays information about the caches in the running simulation.

Example	Description
<code>cadi_lib</code>	Implements a shared library that contains a CADI simulation. You can load the library into Model Shell and connect a CADI-compliant debugger to it.
<code>cadi_server</code>	Implements an executable that contains a CADI simulation. It loads the plug-in library <code>CADIIPCRemoteConnection.so</code> , which enables you to connect a CADI-compliant debugger to it. You can run the <code>connecting_running_target</code> CADI example to mimic this connection.
<code>connecting_instantiating_model</code>	Instantiates a simulation that is a shared library, prints a list of all targets in the simulation, and connects to one of them.
<code>connecting_remote_target</code>	Connects to a remote simulation that has been configured to allow remote connections. The IP address and listening port are passed as parameters to the CADI client.
<code>connecting_running_target</code>	Connects to a running CADI target.
<code>disassembly</code>	Prints the disassembly of the instruction at the PC address in the application that is running on the model.
<code>memory</code>	Displays memory space information. Reads and displays some values from memory in the application that is running on the model.
<code>mti</code>	Loads the TarmacTrace MTI plug-in into the application that is running on the model and displays some tarmac trace output.
<code>registers</code>	Reads and displays register information for a CPU target in the model and reads and writes a specific register.
<code>tlb_dump</code>	Connects to a model and displays the contents of the TLBs.

5.2 LISA examples

LISA+ source and project files for FVPs.

The LISA platform examples are Integrated SIMulators (ISIMs). For more information about building and running them, see [Build and run an FVP example](#).

The following LISA examples are provided:

Table 5-3: LISA examples

Example	Description
<code>BusComponents</code>	Example LISA+ components that demonstrate different ways of using the <code>PVBus</code> interface.
<code>Common</code>	FVP-specific LISA+ components that are common to different types of FVPs.
<code>CSS</code>	Source and project files for Reference Design FVPs. These FVPs model compute subsystems (CSS) that target specific market segments. Reference software stacks are available for them, see Arm Ecosystem FVPs for more information.

Example	Description
FVP_Base	Source and project files for Base Platform FVP examples. For information about the Base Platform, see Base Platform .
FVP_BaseR	Source and project files for BaseR Platform FVP examples.
FVP_Base_RevC	Source and project files for Base Platform RevC FVP examples. For information about the Base Platform RevC, see Base Platform RevC .
FVP_Coproc_Demo	Example implementation of the <code>Coprocessor</code> interface. Registers the coprocessor with a ARMCortexM33CT or ARMAEMv8MCT model. For more information, see CoprocBusProtocol protocol .
FVP_MPS2	Source and project files for MPS2-based example platforms. For information about the MPS2 platforms, see Microcontroller Prototyping System 2 .
FVP_MPS3	Source and project files for MPS3-based example platforms that support the Arm®Corstone™ SSE-300 Example Subsystem. For more information, see MPS2 Platform FVPs in the FVP Reference Guide and Arm Corstone SSE-300 Example Subsystem Technical Reference Manual .
FVP_VE	Source and project files for VE FVPs. For information about the VE platform, see Versatile Express Model .
VP_PChannel	Shows how to create power controllers to control the power state of the cores and cluster, using the <code>PChannel</code> protocol. For information about <code>PChannel</code> , see PChannel protocol .

5.3 Build and run an FVP example

The FVP examples are located under `$PVLIB_HOME/examples/LISA/.f ### Before you begin`
{.section}

About this task

Follow these instructions to build and run one of the Base Platform FVP examples.

Note

These examples build an executable platform model, which is sometimes referred to as an ISIM (Integrated SIMulator).

Procedure

1. These examples are built using System Canvas from a System Generator (SimGen) project file, with a `.sgproj` extension. To start System Canvas, open a terminal and type `sgcanvas`.
2. In System Canvas, select **File > Load Project...** to load the `.sgproj` file for the example you want to build. This example uses `$PVLIB_HOME/examples/LISA/FVP_Base/Build_Cortex-A55/FVP_Base_Cortex-A55.sgproj`.

Figure 5-1: System Canvas Open Project dialog box

- When the project has finished loading, select the build configuration from the Active Project Configuration drop-down menu on the main toolbar:

Figure 5-2: Select Active Project Configuration menu

- Click **Build** to build the FVP executable.
If you changed the active project configuration, click **Yes** when prompted to save the modified project file. The output from the build process is shown in the output window at the bottom of System Canvas. If the build is successful, the last message displayed is **Model Build process completed successfully**.
- The generated executable is named `isim_system`. In this example, it is created in `$PVLIB_HOME/examples/LISA/FVP_Base/Build_Cortex-A55/Linux64-Release-GCC-9.3`.
- You can run `isim_system` either from the terminal or from within System Canvas:
 - To run `isim_system` from the terminal:
 - Navigate to the directory where it is located.
 - To see a full list of command-line options for `isim_system`, run it with the `--help` option:

```
./isim_system --help
```

- The following example command-line shows how to load an application on `isim_system`:

```
./isim_system -a FVP_Base_Cortex_A55.cluster0.*=$PVLIB_HOME/images/  
image.axf -C bp.secure_memory=0
```

where:

-a

is the name of the application to load. Optionally it also specifies which core instances to run it on, in this case all cores in cluster0.

-C

is a configuration parameter. To see a full list of the available parameters, run the model with the `--list-params` option. To specify multiple parameters, it can be more convenient to place them in a text file, each parameter on a new line, and pass them to the model when starting it using `--config-file <filename>`.

- The ISIM starts running, displaying the output in a CLCD window.
- To exit the simulation, press **Ctrl+C**.
- To run `isim_system` in System Canvas:
 - Click Run.
 - In the Run dialog box, select the **ISIM system** checkbox, then enter the following command under **Full command line**:

```
"%ISIM%" -a FVP_Base_Cortex_A55.cluster0.*=$PVLIB_HOME/images/image.axf -C  
bp.secure_memory=0
```

Figure 5-3: System Canvas Run dialog box

- Click OK. The ISIM starts running, displaying the output in a CLCD window.
- To exit the simulation, click **Kill**.

Next steps

See the [System Canvas tutorial](#) in the Fast Models Tools User Guide for information on modifying, rebuilding, and debugging the example.

[System Canvas tutorial](#)

[Fast Models glossary](#)

[LISA examples](#) on page 4788

5.4 LISAPlus examples

Source code and System Canvas project files for some example LISA+ components.

Table 5-4: LISAPlus examples

Example	Description
CapturingTraceFromLISA	Instantiates and uses an MTI plug-in from a LISA+ component. Uses the SimpleTrace plug-in as an example.
GeneratingTraceFromLISA	Generates MTI trace information from a LISA+ component.
PVBusBursts	Uses a PVBusMaster to generate burst read transactions, which are handled by a PVBusSlave.
RemappingWithPVBusMapper	Uses the PVBusMapper component to remap transactions based on their attributes.

Related information

[PVBusMapper](#) on page 158

[PVBusMaster](#) on page 159

[PVBusSlave](#) on page 162

5.5 MTI examples

Example MTI plug-ins that show how to use MTI to extract and use trace information from models.

The following MTI examples are provided:

Table 5-5: MTI examples

Example	Description
CallTrace	Displays a function call sequence by tracing the PC field of INST trace sources, then compares the output with values in a symbol table. See the readme for more information.
CountingCacheStats	Registers counters for cache-related trace sources, for example CACHE_READ_HIT. Prints the cache stats before terminating.
DCCTrace	Prints the value of DBGDTRXX_ELO when data is written. Updates the TXFull bit in MDSCR to indicate the data was read. See the readme for more information.
GenericCounter	Registers a counter for trace sources. Prints the counter value for each INST trace source before terminating. This example is also available as a pre-built library, see GenericCounter .
GenericTrace	A flexible plug-in that traces one or more trace sources specified by the user. Prints the trace to a text file or to stdout. This example is also available as a pre-built library, see GenericTrace .
ITMtrace	Captures instrumentation trace macrocell (ITM) packets, which enables you to use ITM with a Cortex®-M class model. For more information about this plug-in, see Trace Cortex-M software with the Instrumentation Trace Macrocell (ITM) on Arm Community.

Example	Description
ListTraceSources	Displays either the trace sources provided by all trace components in the model, or just the trace components, to a text file or to stdout, without running the simulation. For more information, see <code>readme.txt</code> . This example is also available as a pre-built library, see ListTraceSources .
RunTimeParameterTest	Uses MTI to set runtime parameters.
SimpleTrace	Simple trace plug-in that prints a trace of the PC.
SoftwareTrigger	Traces SEMIHOSTING_PRECALL trace events, intercepts semihosting calls, and prints out register information. For more information, see the <code>readme</code> .
TraceOnBreak	Similar to the SimpleTrace example, but prints the PC value only when a breakpoint is hit.

Related information

[Fast Models Model Trace Interface Reference Manual](#)

5.6 SystemCExport examples

Components and platform models that are created by exporting LISA+ components or platforms to SystemC. Also, bridge components for converting transactions between LISA+ protocols and SystemC.

Table 5-6: SystemCExport examples

Directory	Description
Bridges	LISA+ source for bridge components.
Common	Source files and makefile rules that are common to the EVS and SVP examples.
Common/ Protocols	Header files that are required for the export of LISA+ protocols to SystemC.
EVS_Components	LISA+ files and project files for EVS (Exported Virtual Subsystem) components. These are LISA+ components with a SystemC wrapper and bridges that allow them to be used in a SystemC simulation.
EVS_Platforms	<p>LISA+ source and makefiles for EVS platform examples.</p> <p>An EVS platform is a LISA+ platform that has been exported as a SystemC object to allow it to be integrated into a SystemC simulation.</p> <p>The EVS platform examples are minimal platforms that are designed for a specific use case, for example running the Dhrystone benchmark application or booting Linux.</p> <p>The Dhrystone images <code>dhrystone_v8.axf</code> and <code>dhrystone.axf</code> for Armv7, are provided in the Fast Models Third Party IP package. They are loaded from <code>\$PVLIB_HOME/images/</code>.</p> <p>For more information about building EVS platforms, see Build and run an EVS platform example.</p>

Directory	Description
SVP_Platforms	<p>SVPs (SystemC Virtual Platforms) are platform models in which each component or subsystem has been individually exported to SystemC using the Fast Models Multiple Instantiation (MI) feature. For more information, see Building an SVP in the Fast Models User Guide.</p> <p>SVP platforms can be modified by replacing EVS components with other Fast Models EVSs, or with native SystemC components. There are three subdirectories:</p> <p>SVP_Base Armv8 Base Platform SVPs.</p> <p>SVP_bigLITTLE Armv7 big.LITTLE™ SVP, containing Cortex®-A15 and Cortex®-A7 clusters.</p> <p>SVP_LinuxBoot Minimal Armv7 platform that is suitable for booting Linux, containing a Cortex®-A15 cluster.</p>

5.7 Build and run an EVS platform example

The SystemCExport examples are located under `$PVLIB_HOME/examples/SystemCExport/`.

Before you begin

Ensure the following:

- You have installed Fast Models and SystemC 2.3.4 and have set the environment variables as described in [Installation](#) in the Fast Models User Guide.
- You have set up a Fast Models license, either using FlexNet Licensing or [User-Based Licensing](#).
- You are using a supported Operating System and have set up a compatible toolchain, from those listed in [Requirements for Fast Models](#) in the Fast Models User Guide.

About this task

Follow these instructions to build and run one of the EVS platform examples.

These instructions also apply to the SVP platform examples, which are located in `$PVLIB_HOME/examples/SystemCExport/SVP_Platforms`.

Procedure

1. These examples are built using a Makefile. Open a terminal and navigate to the directory containing the example, and run `make`, specifying the build configuration, for example:

```
cd $PVLIB_HOME/examples/SystemCExport/EVS_Platforms/EVS_Base/Build_Cortex-A55
make rel_gcc93_64
```

This command creates the target executable `EVS_Base_Cortex-A55.x` and copies the shared objects that are required to run it into the current directory.

2. To see a full list of command-line options for the EVS platform, run it with the `--help` option:

```
./EVS_Base_Cortex-A55.x --help
```

The following example command-line shows how to load an application on the platform:

```
./EVS_Base_Cortex-A55.x \  
-a Base.cluster0.*=$PVLIB_HOME/images/image.axf \  
-C Base.bp.secure_memory=0
```

where:

-a

is the name of an application to load. Optionally it also specifies which core instances to run it on, in this case all cores in cluster0.

-C

is a configuration parameter. To see a full list of the available parameters, run the model with the `--list-params` option. To specify multiple parameters, it can be more convenient to place them in a text file, each parameter on a new line, and pass them to the model when starting it using `--config-file <filename>`.

3. The simulation starts running, displaying the output in a CLCD window.
4. To exit the simulation, press **Ctrl+C**.

Next steps

See the [System Canvas tutorial](#) in the Fast Models Tools User Guide for information on modifying, rebuilding, and debugging the example.

6. Base Platform

The Base Platform system model allows early development, distribution, and demonstration of software deliverables. A range of Base Platform FVPs are supplied as source code examples in Fast Models and as pre-built executables in the FVP Standard Library package.

For a list of the Base and BaseR Platform FVPs and the instances in them, see [Base Platform FVPs](#) and [BaseR Platform FVPs](#) in the FVP Reference Guide.

See `$PVLIB_HOME/examples/LISA/FVP_Base/` for LISA+ source and project files for the Base Platform FVP examples.

The standard peripheral set enables software development and porting. The platform is an evolution of the VE Fixed Virtual Platforms (FVPs), based on the Arm® Versatile Express (VE) hardware development platform.

It provides:

- Two configurable clusters of up to eight core models that implement:
 - AArch64 at all exception levels.
 - Configurable AArch32 support at all exception levels.
 - Configurable support for little and big endian at all exception levels.
 - Generic timers.
 - Self-hosted debug.
 - CADI debug.
 - GICv3 memory-mapped processor interfaces and distributor.
- Peripherals for multimedia or networking environments.
- Four PL011 UARTs.
- A CoreLink™ CCI-400 Cache Coherent Interconnect, or CCI-550 in Base Platform RevC.
- Architectural GICv3 model.
- High Definition LCD Display Controller, 1920*1080 resolution at 60fps, with single I2S and four stereo channels.
- 64MB NOR flash and board peripherals.
- CoreLink™ TZC-400 TrustZone® Address Space Controller.

Related information

- [LISA examples](#)

6.1 Base Platform RevC

Base Platform RevC is an evolution of the Base Platform, enhanced to support exploration of system-level virtualization.

Base Platform RevC has the following additions to the Base Platform:

- A PCIeRootComplex with these address regions:
 - A PCI-E config region at 0x0040000000 to 0x004ffffffffff. The PCI-E config region implements ECAM.
 - A PCI-E memory region at 0x0050000000 to 0x005ffffffffff.
 - A PCI-E memory region at 0x4000000000 to 0x7ffffffffff.
- An SMMUv3AEM with a control region at 0x002B400000 to 0x002B4FFFFFF.

The SMMUv3 is placed so that accesses to memory by PCI devices acting as bus masters are affected by it.

- A DMA330x4 with a control region at 0x002B500000 to 0x002B5FFFFFF.
- A Corelink™ CCI550 Cache Coherent Interconnect. Base Platform has a CCI-400.
- An AHCI controller model including a SATA disk model.
- An SMMUv3TestEngine component with a control region at 0x002bfe0000 to 0x002bffffffffff. This component is a traffic generator that acts as a (secure) device upstream of the SMMUv3.
- Two PCIe virtio devices are above the SMMU. By default they are configured to be device 0 and 2 on bus 0.
- The PCIe devices use a DeviceID that is the same as their RequestorID (BDF).
- Base Platform RevC AEMvA FVPs include a Mali_G76 GPU.
- Base Platform RevC AEMvA FVPs implement Armv8.0 by default, which does not support the Statistical Profiling Extension (SPE). To include SPE, add parameter `cluster0.has_arm_v8-3=1`, or similar, to the command line.

LISA+ source and project files for Base Platform RevC FVPs are located in `$PVLIB_HOME/examples/LISA/FVP_Base_RevC/`.

The FVP_Base_RevC-2xAEMvA model is freely available and does not require a license from Arm. You can download it from [Fixed Virtual Platforms](#) on Arm Developer.

Related information

- [Base Platform memory map](#)
- [Base Platform interrupt assignments](#)

6.1.1 Base Platform RevC block diagram

This diagram shows the main components in Base Platform RevC. The platform shown is FVP_Base_RevC-2xAEMvA.

Figure 6-1: Base Platform RevC block diagram

6.1.2 BasePlatformPCIRevC component

This component is an integrated PCIe subsystem which forms part of the Base Platform RevC. It incorporates an SMMUv3, a PCIe, an AHCI controller, and two PCI devices which wrap a pair of virtio PCI block devices. This model is written in LISA+.

Note

- You can include this component in a platform model, but Arm does not support using its subcomponents to create your own PCIe platform.
- The PCIe is not an implementation of any specific IP, but a functional, and limited, implementation of the PCIe standard.

BasePlatformPCIRRevC is composed of the following model components:

pci.pvbus2pci

The bridge from the Programmer's View bus to the PCI bus.

pci.pcidevice<n>

A wrapper around the underlying virtio block device. There are two block devices in the system, 0 and 1.

pci.pcivirtioblockdevice<n>

The instances of the virtio block device component.

pci.ahci_pci.ahci

An AHCI_SATA component with the following features:

- Each AHCI controller supports up to 32 simulated SATA disks. The configuration parameter `image_path` is a comma-separated list of one or more disk images.
- Supports 64-bit addresses.
- Supports plain, linear disk images, but also works with sparse files.

Some interesting options are:

- If the following options are set to non-zero values, they print messages about the operation of the bridge. The higher the value, the more verbose the component is:

```
pci.pvbus2pci.diagnostics=0x0 # (int) default = '0x0': Diagnostics level: [0x0..0x4]
pci.pcidevice<N>.diagnostics=0x0 # (int) default = '0x0': Diagnostics level:
[0x0..0x4]
```

- Each PCI device uses three BARs; one for config space, one for the MSI-X table structure and one for the MSI-X Pending Bit Array. Each of these can be configured to be 32 bits or 64 bits wide.

The Bus and Device number can be configured for each PCI device. If the device advertises MSI-X, support can be configured.

```
pci.pcidevice<N>.bus=0x0 # (int ) default = '0x0' : Bus number for this device :
[0x0..0xFF]
pci.pcidevice<N>.device=0x0 # (int ) default = '0x0' : Device number on this bus :
[0x0..0x1F]
pci.pcidevice<N>.bar0_64bit=0 # (bool) default = '0' : If BAR 0 is 64 bits wide, if
region size is nonzero
pci.pcidevice<N>.msix_support=0 # (bool) default = '0' : Enable device support for
MSI-X
pci.pcidevice<N>.bar2_64bit=0 # (bool) default = '0' : If BAR 2 is 64 bits wide, if
region size is nonzero
pci.pcidevice<N>.bar4_64bit=0 # (bool) default = '0' : If BAR 4 is 64 bits wide, if
region size is nonzero
```

- The following option configures the image file that the virtio block device exposes:

```
pci.pcivirtioblockdevice<N>.image_path="" # (string) default = '' : image file path
```

- There are two `PVBusLogger`s in the `pdbus2pci` component. One is in front of the Configuration space and one is in front of the Device space:

```
FVP_Base_AEMvA_AEMvA-PCI.pci.pvbus2pci.devicellogger
FVP_Base_AEMvA_AEMvA-PCI.pci.pvbus2pci.cfglogger
```

- There is one `PVBusLogger` in the `pcidevice` component. This reports on DMA accesses by the PCI device:

```
FVP_Base_AEMvA_AEMvA-PCI.pci.pcidevice0.dmalogger
```

- There is a `PVBusLogger` downstream of the SMMU. This reports on the transactions after they have been transformed by the SMMU:

```
FVP_Base_AEMvA_AEMvA-PCI.pci.smmullogger
```

Use the [GenericTrace](#) plug-in to capture traces from the loggers. For example, to see all accesses to device space, add the following options to the command line:

```
--plugin GenericTrace.so
-C TRACE.GenericTrace.trace-sources="FVP_Base_AEMvA_AEMvA-PCI.pci.pvbus2pci.devicellogger.*"
```

Use the [ListTraceSources](#) plug-in to list all the available trace sources in the model.

- To supply the AHCI controller with one or more SATA disk images, use the `image_path` parameter. For example:

```
-C pci.ahci_pci.ahci.image_path=disk1tb.img,disk8tb.img
```

Table 6-1: BasePlatformPCIRevC ports

Name	Protocol	Type	Description
<code>smmu_incoming_pvbus_s</code>	PVBus	Slave	Input port to smmu incoming device traffic slave based on PVBus protocol.
<code>pdbus_address_map_s</code>	PVBus	Slave	Input port to service transactions based on the PVBus protocol.
<code>pdbus_address_map_m</code>	PVBus	Master	Output port to send out PVBus transactions that are not handled by this component.
<code>system_reset</code>	Signal	Slave	Input port to handle reset signals. It is used to reset the internal state of this component.
<code>sev_out</code>	Signal	Peer	Port to send out a notification of the occurrence of an event as <code>sg::Signal</code> to a peer.
<code>interrupts[224]</code>	Signal	Master	Array of output ports of type <code>sg::Signal</code> to send out interrupts generated by this component.
<code>pdbus_pci_dma_m</code>	PVBus	Master	Output port to send out any DMA (of PVBus protocol) accesses originating from this component.
<code>clk_in</code>	ClockSignal	Slave	Input port to connect to a ClockSignal provider.

Table 6-2: BasePlatformPCIRevC parameters

Name	Type	Allowed values	Default value	Description
ITS0-base	uint64_t	0 - 0xFFFFFFFFFFFFFFFF	0x2f020000	The ITS0 Base address.
pci_smmuv3. mmu.SMMU_IDR1	uint32_t	0 - 0xFFFFFFFF	0xe739d10	SMMU_IDR1.
pci_smmuv3. mmu.smmu_ msi_device_id	uint32_t	0 - 0xFFFFFFFF	0x10000	When appropriately enabled, assume that MSIs that are generated by the SMMU are presented to the GIC with this DeviceID. See parameters <code>msi_attribute_transform</code> and <code>enable_device_id_checks</code> .

Related information[SMMUv3AEM](#) on page 4597[VirtioBlockDevice](#) on page 3291

6.1.3 Base Platform RevC PCIeRootComplex

This component is an abstraction that represents the root of a PCIe device tree.

The addressable regions are also available as the following model parameters:

- PCIE_CFG_START, PCIE_CFG_END
- PCIE_MEM0_START, PCIE_MEM0_END
- PCIE_MEM1_START, PCIE_MEM1_END

PCIe device types:

Bridge

For example Root Port, Switch.

Endpoint

For example AHCI_SATA, SMMUv3TestEngine.

The PCIe device tree has the following properties:

- It always has PCIeRootComplex (RC) as its root.
- RC can connect to a Bridge or to an EndPoint.

PCIe device tree specification:

- The entire PCIe device tree can be specified through the model parameter `hierarchy_file_name` whose format is JSON. If no file is supplied, a default tree is assumed.

- Start the model and use the MTI trace source `ROOT_COMPLEX_HIERARCHY` to see the exact tree and parameter used for each device in the default tree. For example:

```
-C TRACE.GenericTrace.trace-
sources="FVP_Base_RevC_2xAEMvA.pci.pcie_rc.ROOT_COMPLEX_HIERARCHY"
```

- The top-level devices of the default tree are: `AHCI_SATA`, `HostBridge`, `ROOTPORT0`, `ROOTPORT1`, `ROOTPORT2`, `ROOTPORT3`, `SMMUv3TestEngine0`, `SMMUv3TestEngine1`. `ROOTPORT1-4` are of type `PCIEBridge` with parameter `port_type = 4`.

Error responses from PCIe devices:

- AMBA SLVERR (TX_ABORT) to PCIe Completer Abort (CA)
- AMBA DECERR (TX_DECODEABORT) to PCIe Unsupported Request (UR)

6.1.4 Base Platform RevC SMMUv3AEM

This is an architectural model implementing the SMMUv3.0 and SMMUv3.1 architectures which are for I/O virtualization of devices. The SMMU is placed so that accesses to memory by PCI devices acting as bus masters are affected by it.

The SMMU has the following features:

- Memory that is mapped to the range `0x2B400000-0x2B4FFFFFF`.
- Interrupts with IRQ IDs in the range 103-111.
- The event output pin of the SMMU is passed to the clusters.
- The downstream ports of the SMMU attach to the coherent bus infrastructure and so are coherent with the core clusters. All cores and the SMMU are in the same shareability domain. There is no distinction between the inner and outer shareability domains.
- The parameters of the SMMU determine its capabilities and have default values which can be overwritten if necessary.
- The SMMU is configured to only accept 16-bit StreamIDs and there is a 1:1 correspondence between RequestorID and StreamID.
- By default, the SMMU uses DeviceID `0x10000` to identify itself to the GIC (`pci.pci_smmuv3.mmu.smmu_msi_device_id`).

The parameter `gic_distributor.ITS-device-bits` is set to 17 by default to support the 17-bit DeviceIDs.

The SMMU has the following limitations:

- It does not support RAS.
- The PMU has limited functionality. Only a subset of the architecturally mandatory events are supported, as indicated by the `SMMU_PMC_CBEID0` fields. The PMU is intended for demonstration purposes only and for driver development.

6.1.5 Base Platform RevC PCIe device assignment

Every PCIe Endpoint can be enabled to support this feature which makes the Endpoint assignable to a Trusted Compute Base (TCB).

When an Endpoint is assigned to a TCB, it can be configured to both handle and generate memory transactions to specific memory regions.

The model has the following features:

- DOE read/write mailbox.
- SPDMM messages including FINISH_RESPONSE. There is no encryption of messages yet.
- IDE capability on device and root-port.
- Secure-SPDM. There is no MAC, encryption.
- TDISP messages and state machine.

To enable the device assignment feature in a PCIe RootPort, use the `rootportda_supported` parameter. To enable the feature in a PCIe Endpoint, use the following parameters:

doe_supported

Enables the PCIe extended capability called Data Object Exchange.

ide_supported

Enables the PCIe extended capability called Integrity and Data Encryption. This parameter also exists on the PCIe RootPort. The FVP does not model any encryption details but responds appropriately for “IDE” request messages.

x509_cert_der_filename

Filename containing an X-509 certificate issued for this DOE device in DER format. This certificate should contain the corresponding public key of the pair containing parameter `<rsa_priv_key_pem_filename>`.

rsa_priv_key_pem_filename

Filename containing a RSA private key, in PEM, for this DOE device. The corresponding RSA public key should be used to create parameter `<x509_cert_der_filename>`.

dmtf_meas_spec_info

Information about the DMTF measurement specification format. See the DMTF measurement specification format table for more information. Use the following format for the content of each line in this file:

`index_num_in_dec,dmtf_meas_spec_value_type,measurement_filename`

For example:

```
0,8,meas1.txt
1,9,meas2.txt
10,0,meas3.txt
```

6.1.6 Base Platform RevC legacy PCI interrupts

Each PCI device is hardwired to use INTA, with a value of 1 in the `interrupt_pin` register. This is required by the PCI specification for single-function devices.

The interrupts in the PCI host bridge are mapped according to section 2.2.6 of the PCI Local Bus Specification Revision 3.0, using the following formula, where the values for DeviceInterrupt are INTA = 0, INTB = 1, INTC = 2, INTD = 3:

$$\text{BridgeInterrupt} = (\text{Device} + \text{DeviceInterrupt}) \% 4$$

This formula produces the following mappings:

Table 6-3: Mapping BridgeInterrupts to DeviceInterrupts

BridgeInterrupt ID	DeviceInterrupt
200	INTA
201	INTB
202	INTC
203	INTD
207	SERR

6.1.7 Base Platform RevC MSI-X

The model optionally implements MSI-X, depending on whether the parameter `msix_support` is set. If set, an MSI-X capability is advertised as a PCI capability.

The Virtio specification is not fully compliant with the PCI specification and the virtio block device cannot be used in a 'pure polling' mode where MSI-X is always masked and only polling the Pending Bit Array is used.

The MSIs produced by the models, when directed to the GIC, have their payload rewritten to carry the DeviceID of the originating device to the GIC.

6.2 Base Platform startup configuration for v9 cores

Use the parameters `pctl.use_in_cluster_ppu` and `cluster.core_power_on_by_default` to configure startup of Arm®v9 cores in the Base Platform.

The following table shows the effect of each combination of these parameters.

Table 6-4: Configuring startup behavior for v9 cores in the Base Platform

Parameter configuration	Base Platform behavior	Recommended?
<code>pctl.use_in_cluster_ppu=true</code> <code>cluster.core_power_on_by_default=true</code>	All cores start up regardless of the PPU configuration done by the power controller. This configuration is invalid.	No
<code>pctl.use_in_cluster_ppu=false</code> <code>cluster.core_power_on_by_default=true</code>	Power controller loses the ability to do power state transitions altogether. All cores start running at once.	No
<code>pctl.use_in_cluster_ppu=true</code> <code>cluster.core_power_on_by_default=false</code>	<p>Only cores that are mentioned in the startup quad parameter are brought up.</p> <p>This configuration has the limitation that the RVBAR address must be supplied as a parameter on the command line.</p> <p>The application start address initialized by the application loader is overridden by the reset vector address provided in the parameter.</p>	Yes, but note the limitation described
<code>pctl.use_in_cluster_ppu=false</code> <code>cluster.core_power_on_by_default=false</code>	Wrong configuration. No core starts up.	No

6.3 Base Platform memory

This section describes the memory of the Base Platform.

6.3.1 Base Platform memory map

The Base Platform memory map is based on the Versatile™ Express RS2 memory map with extensions.

For an explanation of the values in the Security column, see [Base Platform secure memory](#).

Table 6-5: Base Platform memory map

Peripheral	Start address	Size	End address	Security
Trusted Boot ROM, secure flash, IntelStrataFlashJ3	0x00_0000_0000	64MB	0x00_03FF_FFFF	S
Trusted SRAM. 512KB is the default size. To set SRAM to 256KB instead, set the parameter <code>bp.secure_sram_size</code> to 0.	0x00_0400_0000	512KB	0x00_0407_FFFF	S
Trusted DRAM	0x00_0600_0000	32MB	0x00_07FF_FFFF	S

[BaseR Platform memory map](#) on page 4809

6.3.2 Base Platform secure memory

Use the `bp.secure_memory` parameter to enable security checking on memory transactions by the TZC-400.

Table 6-6: Secure and Non-secure access permissions

Security	<code>bp.secure_memory=false</code>	<code>bp.secure_memory=true</code>
S	Secure and Non-secure access permitted.	Secure access is permitted, Non-secure access aborts.
S/NS	Secure and Non-secure access permitted.	Secure and Non-secure access permitted.
P	Secure and Non-secure access permitted.	Access conditions are programmable by the TZC-400.

Note

- The default state of the TZC-400 is to abort all accesses, even from Secure state.
- Setting both `bp.secure_memory` and `bp.has_rme` parameters to 1 is invalid and produces a warning message.

Table 6-7: NSAIDs and filters that masters present to the TZC-400

Component	Non-Secure Access Identity (NSAID)	TZC-400 filter unit number (0-3)
Cluster 0	9	0
Cluster 1	9	0
VirtioNetMMIO	9	0
VirtioP9Device	8	0
VirtioBlockDevice	8	0
PL111_CLCD	7	2
HDLCD0	2	2

6.3.3 BaseR Platform memory map

The BaseR Platform copies its memory map from the Base Platform, but swaps the upper 2GB of address space with the lower 2GB.

Therefore:

- Any peripherals in the memory range `0x0` to `0x7FFFFFFF` in the Base Platform are available at the same offset in the memory range `0x80000000` to `0xFFFFFFFF` in the BaseR Platform.
- Memory in the range `0x80000000` to `0xFFFFFFFF` in the Base Platform is available at the same offset in the range `0x0` to `0x7FFFFFFF` in the BaseR Platform. For example, DRAM in the Base Platform memory map starts at address `0x80000000`. In the BaseR Platform, this is mapped to 0.

The reason for this difference is that in the Arm®v8-R architecture, the upper 2GB of memory does not have execution permissions by default. So, code could not run from DRAM after reset if DRAM started at address `0x80000000`.

If the TCMs are enabled, for example with the parameter `-c cluster0.cpu0.tcm.a.enable=1`, then they are located at address 0. To move TCMs away from 0, use the parameters `itcm_base` and `dtcm_base`. For example:

```
-C cluster0.cpu0.itcm_base=0x8000 -C cluster0.cpu0.dtcn_base=0x18000
```

Related information

[Base Platform memory map](#) on page 4806

6.3.4 Base Platform DRAM

The multiple DRAM regions do not alias each other and form a contiguous 4PB area. The total amount of DRAM on the Base Platform system model is configurable. This ability affects where usable DRAM appears.

If the Base Platform system model has `bp.dram_size=4`, the default, then 2GB of DRAM is accessible at `0x00_8000_0000` to `0x00_FFFF_FFFF`, and the remaining 2GB is accessible at `0x08_8000_0000` to `0x08_FFFF_FFFF`.

If, instead, the Base Platform system model has `bp.dram_size=8`, then 2GB of DRAM is accessible at `0x00_8000_0000` to `0x00_FFFF_FFFF` and the remaining 6GB is accessible at `0x08_8000_0000` to `0x09_FFFF_FFFF`.

The default contents of RAM not otherwise written by the simulation is a repeating sequence of the following 64-bit value: `CFDFDFDFDFDFDFCF`.

Memory is allocated on demand, and performance degrades if very large amounts of memory are used.

6.4 Base Platform interrupt assignments

The platform assigns the Shared Peripheral Interrupts (SPIs) and Private Peripheral Interrupts (PPIs) on the GIC.

- SPI and PPI numbers are mapped onto GIC interrupt IDs as described in the Arm Generic Interrupt Controller Specification.
- IRQ IDs 103-111, 192-194, and 200-207 apply to the Base Platform RevC only.

Table 6-8: SPI GIC assignments

IRQ ID	SPI offset	Device
32	0	Watchdog, SP805.
34	2	Dual-Timer 0, SP804.
35	3	Dual-Timer 1, SP804.
36	4	Real-time Clock, PL031.

31	15	Trace Buffer Unit (TRBU) interrupt

6.5 Base Platform clocks

This table shows the clock frequencies of the Base Platform peripherals.

Table 6-10: Peripheral clock frequencies in the Base Platform

Device	Clock
Clusters	100MHz
REFCLK CNTControl, Generic Timer	100MHz
AP_REFCLK CNTCTL, Generic Timer	100MHz
Dual-Timer 0-1, SP804	35MHz

Device	Clock
VE system registers	24MHz
UART 0-3, PL011	24MHz
KMI 0-1, PL050	24MHz
MCI, PL180	24MHz
AACI, PL041	24MHz
Ethernet, SMSC 91C111	24MHz
Watchdog, SP805	24MHz
Color LCD Controller, PL111	23.75MHz
HD LCD Controller, PL370	10MHz
Trusted Watchdog, SP805	32.768kHz
Real-time Clock, PL031	1Hz

6.6 Base Platform parameters

This section describes the parameters.

Table 6-11: Base Platform parameters

Parameter	Type	Allowed values	Default value	Description
<code>bp.dram_size</code>	int	2, 4, or 8-4000000	4	Size of main memory in gigabytes: 2, 4, or any value between 8 and 4000000.
<code>bp.proc_id<n></code> . Some platforms do not expose this parameter.	uint32_t	-	Platform-specific	Processor ID for VE_SysRegs SYS_PROCID<n>.
<code>bp.secure_memory</code>	bool	true, false	true	The security state of the processor limits access to peripherals and RAM. See Note below table.
<code>bp.variant</code> . Some platforms do not expose this parameter.	uint32_t	0x0-0xF	Platform-specific	Board variant for VE_SysRegs SYS_ID.
<code>cache_state_modelled</code>	bool	true, false	true	Enable d-cache and i-cache state for all components.

When loading an image on an EVS, you might see the following message:

Note

```
Warning: Base.cluster0.cpu0: Uncaught exception, thread terminated
In file: gen/scx_scheduler_mapping.cpp:523
In process: Base.thread_p_5 @ 0 s
```

This warning means that the image is attempting to run from DRAM, which is access-controlled by the TZC_400 component. To disable security checking by the TZC_400, specify `-c Base.bp.secure_memory=false` when running the EVS.

Table 6-12: Base Platform debug parameters

Parameter	Type	Allowed values	Default value	Description
dbgen	bool	true, false	true	Debug authentication signal, dbgen.
niden	bool	true, false	true	Debug authentication signal, niden.
spiden	bool	true, false	true	Debug authentication signal, spiden.
spniden	bool	true, false	true	Debug authentication signal, spniden.

6.7 Base Platform components

These component models implement some of the functionality of the Versatile Express (VE) hardware.

A complete model implementation of a Base Platform system model includes both Base Platform-specific components and generic components such as buses and timers. To see a list of all the component instances in the model, run it with the `--list-instances` option.

6.7.1 Base Platform Base_PowerController component

This section describes the Base_PowerController component.

6.7.1.1 Base_PowerController control interface

The Base Platform Power Controller component provides a basic register interface for software to control the power-up and power-down of cores in the cluster.

Identify cores in the system to the Base_PowerController by writing 24 bits in MPIDR format, providing the following levels of affinity:

Bits [23:16]

Affinity level 2.

Bits [15:8]

Affinity level 1.

Bits [7:0]

Affinity level 0.

Examples of affinity usage are `not_applicable/cluster/processor` and `cluster/processor/thread`.

To identify which cores to power up at startup, use parameter `pctl.startup`.

Specify core affinities with a dotted-quad. Wildcards are allowed. The format depends on the architecture:

- In Armv8.1 and earlier, use:

```
-C pctl.startup=0.0.Y.X
```

where X refers to the core number and Y refers to the cluster number. For example 0.0.0.0 refers to cluster0.cpu0 and 0.0.1.1 refers to cluster1.cpu1. Use wildcards to indicate all cores at an affinity level. For example, to turn on all the cores in cluster 0, use 0.0.0.*.

- In Armv8.2 and later, use:

```
-C pctl.startup=0.Z.Y.X
```

where X refers to the thread number, Y refers to the core number, and Z refers to the cluster number.

6.7.1.2 Base_PowerController registers

This section describes the registers.

Register summary

This section describes the power control registers in order of offset from the base memory address.

Table 6-13: Base_PowerController register summary

Offset	Name	Type	Reset	Width	Description
0x00	PPOFFR	RW	0x---	32	Power Control Processor Off Register
0x04	PPONR	RW	0x---	32	Power Control Processor On Register
0x08	PCOFFR	RW	0x---	32	Power Control Cluster Off Register
0x0C	PWKUPR	RW	0x---	32	Power Control Wakeup Register
0x10	PSYSR	RW	0x---	32	Power Control SYS Status Register

PPOFFR

The Power Control Processor Off Register (PPOFFR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Processor SUSPEND command when PWKUPR and the GIC are programmed appropriately to provide wakeup events from IRQ and FIQ events to that processor.

Usage constraints

Processor must make power-off requests only for itself.

Configurations

Available in all configurations.

Attributes

See the register summary table.

Figure 6-2: Power Control Processor Off Register bit assignments**Table 6-14: Power Control Processor Off Register bit assignments**

Bits	Name	Function
[31:24]	-	Reserved.
[23:0]	ID	MPIDR format affinity value of the processor to be switched off. Programming error if MPIDR != self.

PPONR

The Power Control Processor On Register (PPONR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Brings up a processor from low-power mode.

Usage constraints

Processor must make power-on requests only for other powered-off processors in the system.

Configurations

Available in all configurations.

Attributes

See the register summary table.

Figure 6-3: Power Control Processor On Register bit assignments**Table 6-15: Power Control Processor On Register bit assignments**

Bits	Name	Function
[31:24]	-	Reserved.
[23:0]	ID	MPIDR format affinity value of the processor to be switched on. Programming error if MPIDR == self.

PCOFFR

The Power Control Cluster Off Register (PCOFFR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Turns the cluster off.

Usage constraints

Cluster must make power-off requests only for itself.

PSYSR

The Power Control SYS Status Register (PSYSR) characteristics are: purpose, usage constraints, configurations, and attributes.

Purpose

Provides information on the powered status of a given core. Software writes bits [23:0] for the required core and reads the value along with the associated status in bits [31:24].

Usage constraints

There are no usage constraints.

Configurations

Available in all configurations.

Attributes

See the register summary table.

Figure 6-6: Power Control SYS Status Register bit assignments

Table 6-18: Power Control SYS Status Register bit assignments

Bits	Name	Function
[31]	L2	Read-only. A value of 1 indicates that affinity level 2 is active/on. If affinity level 2 is not implemented this bit is RAZ .
[30]	L1	Read-only. A value of 1 indicates that affinity level 1 is active/on. If affinity level 1 is not implemented this bit is RAZ .
[29]	L0	Read-only. A value of 1 indicates that affinity level 0 is active/on.
[28]	WEN	Read-only. A value of 1 indicates wakeup interrupts, return from SUSPEND, enabled for this processor. This is an alias of PWKUPR.WEN for this core.
[27]	PC	Read-only. A value of 1 indicates pending cluster off, the cluster enters low-power mode the next time it raises signal STANDBYWFIL2.

Bits	Name	Function
[26]	PP	Read-only. A value of 1 indicates pending processor off, the processor enters low-power mode the next time it raises signal STANDBYWFI.
[25:24]	WK	Read-only. Indicates the reason for LEVEL0 power on: 0b00 Cold power-on. 0b01 System reset pin. 0b10 Wake by PPONR. 0b11 Wake by GIC WakeRequest signal.
[23:0]	ID	MPIDR format affinity value.

6.7.2 Base Platform DebugAccessPort component

This section describes the DebugAccessPort component which models the Debug Access Port (DAP) for external debug connections.

6.7.2.1 DebugAccessPort ports

This section describes the ports.

Table 6-19: DebugAccessPort ports

Name	Protocol	Type	Description
ap_pvbuss_m[2]	PVBus	Master	Debug-access port to bus master channels 0 and 1.
clock	ClockSignal	Slave	Clock input.
paddrdbg31	Signal	Master	Output signal that indicates which master the access came from, AP0 or AP1. Configurable.

6.7.2.2 DebugAccessPort parameters

This section describes the parameters.

Table 6-20: Base Platform DebugAccessPort parameters

Name	Type	Allowed values	Default value	Description
ap0_rom_base_address	uint64_t	0-0xffffffffffffffff	0	ROM base address for AP0.
ap1_rom_base_address	uint64_t	0-0xffffffffffffffff	0	ROM base address for AP1.
ap0_has_debug_rom	bool	true, false	false	AP0 has a Debug ROM.
ap1_has_debug_rom	bool	true, false	false	AP1 has a Debug ROM.

Name	Type	Allowed values	Default value	Description
ap0_set_paddrdbg31	bool	true, false	false	Set paddrdbg31 signal during accesses on AP0.
ap1_set_paddrdbg31	bool	true, false	false	Set paddrdbg31 signal during accesses on AP1.

6.7.3 Simulator visualization - parameters

This section describes the parameters.

Table 6-21: Simulator visualization parameters

Parameter	Allowed values	Default value	Description
cluster0_name	-	"Cluster0"	Cluster0 name.
cluster1_name	-	"Cluster1"	Cluster1 name.
cluster2_name	-	"Cluster2"	Cluster2 name.
cluster3_name	-	"Cluster3"	Cluster3 name.
cpu_name	-	""	Processor name displayed in window title.
diagnostics	true, false	false	Print diagnostic messages.
disable_visualisation	true, false	false	Enable or disable visualization.
rate_limit-enable	true, false	false	Restrict simulation speed so that simulation time more closely matches real time rather than running as fast as possible.
recorder. checkInstructionCount	true, false	true	Checks instruction count in recording file against actual instruction count during playback.
recorder. playbackFileName	-	""	Playback filename. An empty string disables playback.
recorder. recordingFileName	-	""	Recording filename. An empty string disables recording.
recorder. recordingTimeBase	-	0x5F5E100	Timebase in 1/s relative to the master clock. Used for recording. For example, 100 000 000 means 10 nanoseconds resolution simulated time for a 1Hz master clock. Higher values give a higher time resolution. Playback time base is always taken from the playback file.
recorder.verbose	-	0	Enables verbose messages. 0, no messages. 1, normal. 2, more detail.
trap_key	Valid ATKeyCode key value. See \$PVLIB_HOME/include/components/KeyCode.h for a list of values.	0x4a	Trap key that works with left Ctrl to toggle mouse display. The default is the left Alt key, so pressing Left Alt and Left Ctrl simultaneously toggles the mouse display.
window_title	-	"Fast Models - CLCD %cpu%"	Window title. cpu_name replaces %cpu%.

6.7.4 VE_SysRegs component

This section describes the VE system registers component.

6.7.4.1 VE_SysRegs parameters

This table describes the VE_SysRegs parameters.

Table 6-22: VE_SysRegs parameters

Name	Type	Default value	Description
exit_on_shutdown	bool	false	Used to shut down the system. See the Note after the table.
mmbSiteDefault	int	1	Default MultiMedia Bus (MMB) source (0=motherboard, 1=daughterboard 1, 2=daughterboard 2).
sys_proc_id0	int	0x0c000000	Processor ID register at CoreTile Express Site 1.
sys_proc_id1	int	0xff000000	Processor ID at CoreTile Express Site 2.
tilePresent	bool	true	Tile fitted.
user_switches_value	int	0	User switches.

When `exit_on_shutdown` is `true`, if software uses the `sys_CFGCTRL` function `sys_CFG_SHUTDOWN`, then the simulator shuts down and exits. For more information on the `sys_CFGCTRL` function values, see the Motherboard Express µATX V2M-P1 Technical Reference Manual.

6.7.4.2 VE_SysRegs registers

This table describes the configuration registers.

Table 6-23: VE_SysRegs registers

Name	Offset	Access	Description
SYS_ID	0x00	Read/write	System identity
SYS_SW	0x04	Read/write	Bits[7:0] map to switch S6
SYS_LED	0x08	Read/write	Bits[7:0] map to user LEDs
SYS_100HZ	0x24	Read only	100Hz counter
SYS_FLAGS	0x30	Read/write	General purpose flags
SYS_FLAGSCLR	0x34	Write only	Clear bits in general purpose flags
SYS_NVFLAGS	0x38	Read/write	General purpose non-volatile flags
SYS_NVFLAGSCLR	0x3C	Write only	Clear bits in general purpose non-volatile flags
SYS_MCI	0x48	Read only	MCI
SYS_FLASH	0x4C	Read/write	Flash control
SYS_CFGSW	0x58	Read/write	Boot select switch
SYS_24MHZ	0x5C	Read only	24MHz counter

Name	Offset	Access	Description
SYS_MISC	0x60	Read/write	Miscellaneous control flags
SYS_DMA	0x64	Read/write	DMA peripheral map
SYS_PROCID0	0x84	Read/write	Processor ID
SYS_PROCID1	0x88	Read/write	Processor ID
SYS_CFGDATA	0xA0	Read/write	Data to be read/written from/to motherboard controller
SYS_CFGCTRL	0xA4	Read/write	Control data transfer to motherboard controller
SYS_CFGSTAT	0xA8	Read/write	Status of data transfer to motherboard

6.8 Base Platform VE compatibility

Arm expects software that ran on the previous VE model to be compatible with this system model, but you might need to apply some configuration options.

6.8.1 Base Platform GICv2

This system model uses GICv3 by default. You can configure it to support GICv2 or GICv2m.

To configure the model as GICv2m, set the following parameters:

```
-C gicv3.gicv2-only=1 \
-C cluster0.gic.GICD-offset=0x10000 \
-C cluster0.gic.GICC-offset=0x2F000 \
-C cluster0.gic.GICH-offset=0x4F000 \
-C cluster0.gic.GICH-other-CPU-offset=0x50000 \
-C cluster0.gic.GICV-offset=0x6F000 \
-C cluster0.gic.PERIPH-size=0x80000 \
-C cluster1.gic.GICD-offset=0x10000 \
-C cluster1.gic.GICC-offset=0x2F000 \
-C cluster1.gic.GICH-offset=0x4F000 \
-C cluster1.gic.GICH-other-CPU-offset=0x50000 \
-C cluster1.gic.GICV-offset=0x6F000 \
-C cluster1.gic.PERIPH-size=0x80000 \
-C gic_distributor.GICD-alias=0x2c010000
```

To configure the model as GICv2, set the following parameters:

```
-C gicv3.gicv2-only=1 \
-C cluster0.gic.GICD-offset=0x1000 \
-C cluster0.gic.GICC-offset=0x2000 \
-C cluster0.gic.GICH-offset=0x4000 \
-C cluster0.gic.GICH-other-CPU-offset=0x5000 \
-C cluster0.gic.GICV-offset=0x6000 \
-C cluster0.gic.PERIPH-size=0x8000 \
-C cluster1.gic.GICD-offset=0x1000 \
-C cluster1.gic.GICC-offset=0x2000 \
-C cluster1.gic.GICH-offset=0x4000 \
-C cluster1.gic.GICH-other-CPU-offset=0x5000 \
-C cluster1.gic.GICV-offset=0x6000 \
-C cluster1.gic.PERIPH-size=0x8000 \
-C gic_distributor.GICD-alias=0x2c010000
```

To configure MSI frames for GICv2m, parameters are available to set the base address and configuration of each of 16 possible frames. Eight frames are Secure and eight frames are Non-secure:

```
-C gic_distributor.MSI_S-frame0-base=ADDRESS \
-C gic_distributor.MSI_S-frame0-min-SPI=NUM \
-C gic_distributor.MSI_S-frame0-max-SPI=NUM
```

In this example, you can replace `msi_s` with `MSI_NS`, for NS frames, and you can replace `frame0` with `frame1` to `frame7` for each of the possible 16 frames. If the base address is not specified for a given frame, or the SPI numbers are out of range, the corresponding frame is not instantiated.

6.8.2 Base Platform GICv3

If a Base Platform includes an implementation of the GICv3 system registers, it is enabled by default.

The GIC distributor and CPU (core) interface have parameters that allow configuration of the model to match different implementation options. Use `--list-params` to get a full list. Configuration options for the GIC model must be available under:

- `cluster[0-n].gic.*`
- `cluster[0-n].gicv3.*`
- `gic_distributor.*`

6.8.3 Base Platform system global counter

The Generic Timer registers of the cores do not operate by default.

The model provides a memory-mapped interface to the system global counter, and enables the free-running timer from reset. However, the architectural requirement is that such a counter is not enabled at reset. As a result, the Generic Timer registers of the cores do not operate unless either:

- Software enables the counter peripheral by writing the `FCREQ[0]` and `EN` bits in `CNTCR` at `0x2a430000`. Arm recommends this approach.
- The `-c bp.refcounter.non_arch_start_at_default=1` parameter is set. This approach provides compatibility with older software.

6.8.4 Disable security in the Base Platform

Base Platform FVPs have an enhanced security map for peripherals. By default, it restricts access to some peripherals.

Software must program the TZC-400 to make any accesses to DRAM, because the reset configuration blocks all accesses.

For backward compatibility with software that cannot program the TZC-400, this parameter setting permits all accesses regardless of security state:

```
-C bp.secure_memory=false
```

Related information

[Base Platform memory map](#) on page 4806

6.9 Base Platform unsupported VE features

This system model does not support software that relies on some features of the VE model.

6.9.1 Base Platform memory aliasing at 0x08_00000000

The VE model permits an alias of the 2GB region of DRAM between addresses 0x80000000 and 0xFFFFFFFF with addresses 0x08_00000000 to 0x08_7FFFFFFF. The Base Platform does not have this alias and the region 0x08_00000000 to 0x08_7FFFFFFF is Reserved.

6.9.2 Boot ROM alias at 0x00_0800_0000 in the Base Platform

In the VE model, the region at 0x00_0800_0000 was an alias of the trusted boot ROM at 0x00_0000_0000. It is now an independent region of NOR flash.

6.9.3 Changed parameters in the Base Platform

Most parameter names in the VE model have been simplified in the Base Platform.

Components that were previously in motherboard or daughterboard groups are now in a `bp` group. The model does not recognize the previous parameter names.

In a change to the previous default, the Base Platform models the core cache state by default. You can disable this using a single parameter for all cores in the simulation, using the `cache_state_modelled` parameter:

```
-C cache_state_modelled=0
```

Cortex® Base Platforms do not model the cache state by default.

7. Microcontroller Prototyping System 2

This chapter describes the MPS2 system model.

7.1 MPS2

The Microcontroller Prototyping System 2 (MPS2) Fixed Virtual Platforms (FVPs) implement a subset of the functionality of the Arm Versatile Express V2M-MPS2 and V2M-MPS2+ motherboard hardware.

For a list of the MPS2 Platform FVPs and the instances in them, see [MPS2 Platform FVPs](#) in the FVP Reference Guide.

LISA+ source and project files for some MPS2 FVP examples are available in the `$FVLIB_HOME/examples/LISA/FVP_MPS2/` directory.

MPS2 platforms include MPS2-specific components and generic components, such as buses and timers. They are sufficiently accurate to boot the Keil RTX RTOS and run the Blinky application.

To list the model parameters and their types, allowed values, default values, and descriptions, run the model with the `--list-params` argument.

Related information

[AN400 - ARM Cortex-M7 SMM on V2M-MPS2](#)

7.2 MPS2 platform types

Configure the MPS2 FVP platform type using the `fvf_mps2.platform_type` parameter.

It has the following possible values:

0

This value is the default. The FVP acts as a V2M-MPS2 system, with the additions for v8-M, as specified in the Arm®v8-M MPS2 System Specification (ECM 0468897), v0.8. This specification is confidential and is available only to licensed Arm customers. For details, contact your Arm support representative.

1

The FVP acts as an IoT Kit on an MPS2+ board. For details, see the following documents:

- [Cortex®-M23 processor Arm®v8-M IoT Kit User Guide \(ECM 0635473\)](#).
- [Cortex®-M33 processor Arm®v8-M IoT Kit User Guide \(ECM 0601256\)](#).

2

The FVP acts as an Arm® CoreLink™ SSE-200 Subsystem on an MPS2+ board. For details, see [AN521 - Example SSE-200 Subsystem for MPS2+ Application Note](#).

7.3 MPS2 memory maps

This section describes the MPS2 memory maps.

7.3.1 MPS2 memory map for models without the Armv8-M additions

This section describes the MPS2 memory map for older cores, without the Armv8-M additions.

For standard Arm peripherals, see the TRM for that device.

- A bus error is generated for accesses to memory areas not shown in this table.
- Any memory device that does not occupy the total region is aliased within that region.

Table 7-1: Memory map for models without the Armv8-M additions

Description	Modeled	Address range
Ethernet. Through ahb_to_extmem16. Offset 0x0 to 0x0FE for CSRs, 0x100 to 0x1FE for FIFO.	Partial	0xA0000000 to 0xA00FFFFF
PSRAM (16MB)	Yes	0x60000000 to 0x60FFFFFF
VGA Image (512x128) (AHB)	Yes	0x41100000 to 0x4110FFFF
VGA Console (AHB)	Yes	0x41000000 to 0x4100FFFF
Block RAM (boot time). Reserved 64KB, 16K implemented. This memory is wrapped through the region.	Yes	0x40200000 to 0x402FFFFF
Reserved	N/A	0x40030000 to 0x401FFFFF
SCC register	Yes	0x4002F000 to 0x4002FFFF
Reserved	N/A	0x40029000 to 0x4002EFFF
FPGA System Control & I/O, APB	Yes	0x40028000 to 0x40028FFF
Reserved	N/A	0x40025000 to 0x40027FFF
Audio I2S, APB	Partial	0x40024000 to 0x40024FFF
SBCon (Audio Configuration), APB	Yes	0x40023000 to 0x40023FFF
SBCon (Touch for LCD module), APB	Partial	0x40022000 to 0x40022FFF
PL022 (SPI for LCD module), APB	Partial	0x40021000 to 0x40021FFF

Description	Modeled	Address range
PL022 (SPI), APB	Yes	0x40020000 to 0x40020FFF
CMSDK system controller	Yes	0x4001F000 to 0x4001FFFF
Reserved for extra GPIO & other AHB peripherals	N/A	0x40012000 to 0x4001EFFF
CMSDK AHB GPIO #1	Yes	0x40011000 to 0x40011FFF
CMSDK AHB GPIO #0	Yes	0x40010000 to 0x40010FFF
CMSDK APB subsystem	Yes	0x40000000 to 0x4000FFFF
Reserved	N/A	0x20800000 to 0x20FFFFFF
ZBTSRAM 2 & 3 (2x32-bit). Reserved 8MB, 4MB available. The two SRAM blocks are interleaved.	Yes	0x20000000 to 0x207FFFFF
Reserved	N/A	0x01010000 to 0x1FFFFFFF
Reserved	N/A	0x00800000 to 0x00FFFFFF
ZBTSRAM 1 (64-bit). Wrapped. Only 4MB ZBTSRAM fitted.	Yes	0x00400000 to 0x007FFFFF
ZBTSRAM 1 (64-bit)	Yes	0x00004000 to 0x003FFFFF
Mappable memory. When <code>zbt_boot_ctrl = 0</code> , ZBTSRAM 1 is mapped to this region. Otherwise, <code>Remap_ctrl = 0</code> maps Block RAM and <code>Remap_ctrl = 1</code> maps ZBTSRAM 1. The V2M-MPS2 board microcontroller controls the <code>zbt_boot_ctrl</code> signal. The <code>zbt_boot_ctrl</code> signal overrides the boot option to enable use of the ZBT RAM.	Yes	0x00000000 to 0x00003FFF

7.3.2 MPS2 memory map for models with the Armv8-M additions

This section describes the MPS2 memory map for newer cores, with the Armv8-M additions.

For standard Arm peripherals, see the TRM for that device.

- A bus error is generated for accesses to memory areas not shown in this table.
- Any memory device that does not occupy the total region is aliased within that region.

Table 7-2: Memory map for models with the Armv8-M additions

Description	IDAU	Modeled	Address range
ZBTSRAM 1 (4MB) in Non-secure (NS) world. Reserved 8MB, only 4MB implemented. VTOR initialization value to be configurable in LAC. Second half (4MB) aliased to first half (4MB).	NS	Yes	0x00000000 to 0x007FFFFFFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0x00800000 to 0x0FFFFFFF
ZBTSRAM 1 (4MB) in Secure (S) world. Reserved 8MB, only 4MB implemented. Second half (4MB) aliased to first half (4MB).	S	Yes	0x10000000 to 0x107FFFFFFF
Not used. Default expansion port: bus error.	S	N/A	0x10800000 to 0x1FFFFFFF
ZBTSRAM 2 and ZBTSRAM 3 (4MB) in NS world. Reserved 8MB, only 4MB implemented. For IoT subsystems, different cores have different memory sizes. Second half (4MB) aliased to first half (4MB).	NS	Yes	0x20000000 to 0x207FFFFFFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0x20800000 to 0x20FFFFFFF
PSRAM (32MB)	NS	Yes	0x21000000 to 0x22FFFFFFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0x23000000 to 0x23FFFFFFF
MTB SRAM. Reserved 64KB, only 16KB implemented. Aliased to 0x0 for booting in RTL simulation.	NS	Yes	0x24000000 to 0x2400FFFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0x24010000 to 0x2FFFFFFF
ZBTSRAM 2 and ZBTSRAM 3 (4MB) in S world. Reserved 8MB, only 4MB implemented. Second half (4MB) aliased to first half (4MB).	S	Yes	0x30000000 to 0x307FFFFFFF
Not used. Default expansion port: bus error.	S	N/A	0x30800000 to 0x30FFFFFFF
Not used. No memory gating unit on PSRAM (16MB) path because it is shared with Ethernet control. Default expansion port: bus error.	S	N/A	0x31000000 to 0x31FFFFFFF
Not used. Default expansion port: bus error.	S	N/A	0x30800000 to 0x3FFFFFFF
Timer 0. Non-secure CMSDK APB subsystem.	NS	Yes	0x40000000 to 0x40000FFF
Timer 1. Non-secure CMSDK APB subsystem.	NS	Yes	0x40001000 to 0x40001FFF
Dual Timer. Non-secure CMSDK APB subsystem.	NS	Yes	0x40002000 to 0x40002FFF
Not used. Non-secure CMSDK APB subsystem.	NS	N/A	0x40003000 to 0x40003FFF
UART #0. Non-secure CMSDK APB subsystem.	NS	Yes	0x40004000 to 0x40004FFF
UART #1. Non-secure CMSDK APB subsystem.	NS	Yes	0x40005000 to 0x40005FFF
UART #2. Non-secure CMSDK APB subsystem.	NS	Yes	0x40006000 to 0x40006FFF

Description	IDAU	Modeled	Address range
Not used. Non-secure CMSDK APB subsystem.	NS	N/A	0x40007000 to 0x40007FFF
Watchdog. Non-secure CMSDK APB subsystem.	NS	Yes	0x40008000 to 0x40008FFF
Not used. Non-secure CMSDK APB subsystem.	NS	N/A	0x40009000 to 0x4000F000
GPIO #0.	NS	Yes	0x40010000 to 0x40010FFF
GPIO #1.	NS	Yes	0x40011000 to 0x40011FFF
GPIO #2.	NS	Yes	0x40012000 to 0x40012FFF
GPIO #3.	NS	Yes	0x40013000 to 0x40013FFF
Default slave inside AHB peripheral subsystem. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	Yes	0x40014000 to 0x40017FFF
DMA Controller #0.	NS	Yes	0x40018000 to 0x40018FFF
DMA Controller #1.	NS	Yes	0x40019000 to 0x40019FFF
Default slave inside AHB peripheral subsystem. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	Yes	0x4001A000 to 0x4001EFFF
CMSDK system controller. PMU control and remap registers unused. Only reset option (lockup reset) and rest info available.	NS	Yes	0x4001F000 to 0x4001FFFF
Not used. Non-secure FPGA APB subsystem (unused APB space: RAZ/WI).	NS	N/A	0x40020000 to 0x40020FFF
PL022 (SPI for LCD). Non-secure FPGA APB subsystem (unused APB space: RAZ/WI).	NS	Partial	0x40021000 to 0x40021FFF

Not used. Default expansion port: bus error.	S	N/A	0x90000000 to 0x9FFFFFFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0xA0000000 to 0xAFFFFFFF
Not used. Default expansion port: bus error.	S	N/A	0xB0000000 to 0xBFFFFFFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0xC0000000 to 0xCFFFFFFF
Not used. Default expansion port: bus error.	S	N/A	0xD0000000 to 0xDFFFFFFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0xE0000000 to 0xEFFFFFFF
System ROM table. Exempted from checking.	Exempt	Yes	0xF0000000 to 0xF0000FFF
Not used. Default expansion port: bus error.	Exempt	N/A	0xF0001000 to 0xF000FFFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0xF0100000 to 0xF01FFFFF
MTB SFR address space.	NS	Yes	0xF0200000 to 0xF0200FFF
Reserved. This region is non-executable.	NS	N/A	0xF0210000 to 0xF0213FFF
Not used. Default expansion port (MPS2 AHB subsystem): bus error or RAZ/WI .	NS	N/A	0xF0214000 to 0xF0217FFF

7.4 MPS2 interrupt assignments

This section describes the interrupt assignments.

Table 7-3: Interrupt assignments

Number	Interrupt
NMI	Watchdog.
0	UART 0 receive interrupt.
1	UART 0 transmit interrupt.
2	UART 1 receive interrupt.
3	UART 1 transmit interrupt.
4	UART 2 receive interrupt.
5	UART 2 transmit interrupt.
6	GPIO 0, 2 combined interrupt.
7	GPIO 1, 3 combined interrupt.
8	Timer 0.
9	Timer 1.
10	Dual Timer.
11	SPI #1 (LCD). The LCD had shared SPI #0 and SPI #1.
12	UART overflow (0, 1, 2).
13	Ethernet.
14	Audio I2S.
15	Touch screen.
16-31	GPIO 0 individual interrupts.
32-47	GPIO 1 individual interrupts. ArmR8-M additions.
48	SPI #0. ArmR8-M addition.
49	Reserved.
50	TRNG (Secure). ArmR8-M addition.
51	Unique ID and Secure storage (Secure). ArmR8-M addition.
52	DMA controller #0.
53	DMA controller #1.
54	SecureErrorIRQ. ArmR8-M addition. Detection of Non-secure access to Secure address spaces (including other bus masters). Generated by Memory Gating unit, Peripheral Gating units, bus gasket for legacy bus masters.

7.5 MPS2 - differences between models and hardware

This section describes the features of the hardware that the models do not implement, or implement with significant differences.

MPS2 implements most devices. Some peripherals have minimal implementations:

- The Ethernet module in the model is a LAN91C111. The hardware provides a LAN9220.

- The Audio module is **RAZ/WI**.
- The STMPE811 touchscreen module only reports touch positions.
- The model of the Ampire LCD module supports a subset of the graphics modes.

You can display images and text on an emulated VGA output, images on the LCD, and text on the UART.

RX overrun mode

The CMSDK_UART component has a parameter `rx_overrun_mode` that controls how to handle the transfer of characters into the UART RX FIFO when the `RX_OVERRUN` flag is set in the STATE register. It has the following possible values:

0

This is the default value. Never block the transfer of the next character into the RX FIFO even if it means losing multiple characters. This is the same behavior as the hardware. It might be useful when evaluating software design, for example to indicate whether the UART can be serviced quickly enough.

In this mode, as in the hardware, the `RX_OVERRUN` flag serves only to alert software to the fact that characters have been lost and that some sort of corrective action, or recovery procedure might be required.

1

Pause the transfer of characters into the RX FIFO before any characters are lost. This makes the serial connection lossless even if the software does not make any attempt to service the UART in a timely fashion.

In this mode, the transfer of characters can be resumed by reading a character from the DATA register, so no special action is required by software.

2

Pause the transfer of characters into the UART RX FIFO after the first character is lost due to overrun.

In this mode, clearing the `RX_OVERRUN` flag resumes the transfer of characters. This requires the software to write to the STATE or INT register to clear the flag. Precisely one character will have been lost. This is the legacy behavior of the UART.

Arm®v8-M

The model does not support MTB, ETM, and TPIU. MTB RAM is absent.

In the Memory Gating Unit, the model provides a configurable block size. For performance reasons, the minimum block size in the model is 4096 bytes. Hardware and later models might allow smaller block sizes. Software must use the `BLK_CFG` register to determine block size.

Timing

FVPs enable software applications to run in a functionally accurate simulation. However, because of the relative balance of fast simulation speed over timing accuracy, there are situations where the models might behave unexpectedly.

If your code interacts with real world devices such as timers and keyboards, data arrives in the modeled device in real world, or wall clock, time. However, simulation time can run faster than the wall clock. So, a single key press might be interpreted as several repeated key presses, or a single mouse click might be interpreted as a double click.

To avoid this mismatch, the FVPs provide the Rate Limit feature. Enabling Rate Limit forces the model to run at wall clock time. For interactive applications, Arm recommends enabling Rate Limit. Use the Rate Limit button in the CLCD display or the `rate_limit-enable` model instantiation parameter.

8. Versatile Express Model

This chapter describes the components of Fast Models that are specific to the Versatile™ Express (VE) model of the hardware platform.

8.1 VE

The Versatile Express (VE) FVPs are functionally-accurate system models for software execution. A range of VE FVPs are supplied as standalone products and as examples in Fast Models.

For a list of the VE Platform FVPs that are included in the FVP Standard Library package, see [VE Platform FVPs](#) in the FVP Reference Guide. The package can be downloaded from [Fixed Virtual Platforms](#).

LISA+ source and project files for the VE FVPs are available in the `$PVLIB_HOME/examples/LISA/FVP_VE/` directory.

Arm produces the VE hardware development platform. The Motherboard Express µAdvanced Technology Extended (ATX) V2M-P1 is the basis for an integrated software and hardware development system. This system is also based on the Arm Symmetric MultiProcessor (SMP) system architecture.

The VE FVPs are system models implemented in software. Each model contains:

- A virtual implementation of the Arm VE motherboard.
- A single daughterboard containing one or more Arm processors.
- Associated interconnections.

The motherboard provides:

- Peripherals for multimedia or networking environments.
- Access to motherboard peripherals and functions through a static memory bus to simplify access from daughterboards.
- High-performance PCI-Express slots for expansion cards.
- Consistent memory maps with different processor daughterboards that simplify software development and porting.
- Automatic detection and configuration of attached CoreTile Express and LogicTile Express daughterboards.
- Automatic shutdown for over-temperature or power supply failure.
- No system power-on for unconfigurable daughterboards.
- Power sequencing of system.
- Drag and drop file updating of configuration files.
- Support of either a 12V power-supply unit or an external ATX power supply.

- Support of FPGA and processor daughterboards to provide custom peripherals, early access to processor designs, or production test chips.

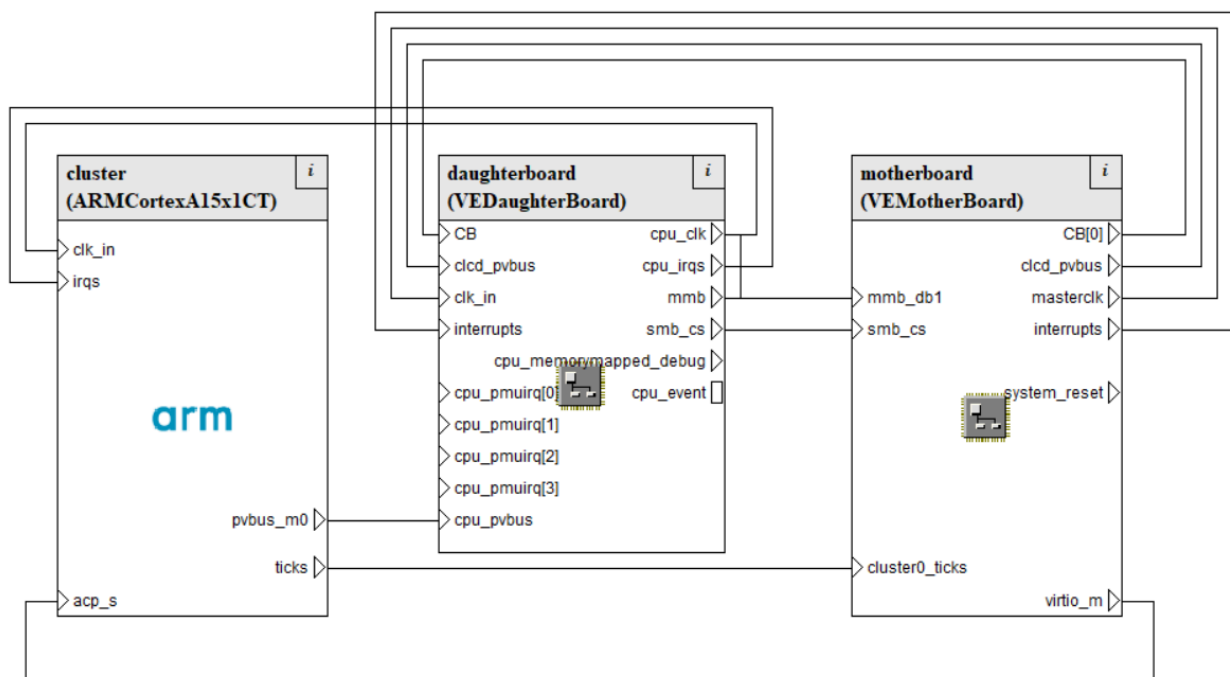

Arm bases the models on the VE platform memory map, but does not intend them to be accurate representations of a specific VE hardware revision. The VE FVPs support selected peripherals. The models are sufficiently complete and accurate to boot the same operating system images as the VE hardware.

VE FVPs provide functionally accurate models for software execution. However, the models sacrifice timing accuracy to increase simulation speed. Key deviations from hardware are:

- Approximate timing.
- Simplified buses.
- No implementations for processor caches and the related write buffers.

8.2 VE memory map for Cortex-A series

The global memory map for the Cortex®-A series VE model is based on the hardware Versatile™ Express RS1 memory map with the RS2 extensions.

Note

The VE FVP implementation of memory does not require the memory controller to have the correct values. If you run applications on hardware, ensure that the memory controller is set up properly. Otherwise, applications that run on the FVP might fail on hardware.

Table 8-1: Cortex®-A series platform model memory map

Name	Modeled	Address range	Size
NOR FLASH0 (CS0)	Yes	0x00_00000000-0x00_03FFFFFF	64MB
Reserved	-	0x00_04000000-0x00_07FFFFFF	64MB
NOR FLASH0 alias (CS0)	Yes	0x00_08000000-0x00_0BFFFFFF	64MB
NOR FLASH1 (CS4)	Yes	0x00_0C000000-0x00_0FFFFFFF	64MB
Unused (CS5)	-	0x00_10000000-0x00_13FFFFFF	-
PSRAM (CS1) - unused	No	0x00_14000000-0x00_17FFFFFF	-
Peripherals (CS2). See Table: CS2 region peripheral memory map, below.	Yes	0x00_18000000-0x00_1BFFFFFF	64MB
Peripherals (CS3). See Table: CS2 region peripheral memory map, below.	Yes	0x00_1C000000-0x00_1FFFFFFF	64MB
CoreSight™ and peripherals	No	0x00_20000000-0x00_2CFFFFFF. See Note after table.	-
Graphics space	No	0x00_2D000000-0x00_2D00FFFF	-
System SRAM	Yes	0x00_2E000000-0x00_2EFFFFFF	64KB
Ext AXI	No	0x00_2F000000-0x00_7FFFFFFF	-
4GB DRAM (in 32-bit address space). See Note after table.	Yes	0x00_80000000-0x00_FFFFFFFF	2GB
Unused	-	0x01_00000000-0x07_FFFFFFFF	-
4GB DRAM (in 36-bit address space). See Note after table.	Yes	0x08_00000000-0x08_FFFFFFFF	4GB
Unused	-	0x09_00000000-0x7F_FFFFFFFF	-
4GB DRAM (in 40-bit address space). See Note after table.	Yes	0x80_00000000-0xFF_FFFFFFFF	4GB

Note

- The private peripheral address 0x2c000000 is mapped in the CoreSight™ and peripherals region. Use the parameter PERIPHBASE to map the peripherals to a different address.
- The model contains a single 4GB block of DRAM, which is aliased across the three different DRAM regions. In other words, it can be accessed at three different physical addresses, which are all mapped to the same area of DRAM. For example, a write to address 0x00_80000000 is visible to reads at address 0x80_00000000. The lowest of the physical address regions is only 2GB in size.

The model has a `secure_memory` option. When you enable this option, the memory map changes for a number of peripherals.

Table 8-2: CS2 region peripheral memory map for `secure_memory` option

Peripheral	Address range	Functionality with <code>secure_memory</code> enabled
NOR FLASH0 (CS0)	0x00_00000000-0x00_0001FFFF	Secure RO, aborts on non-secure accesses.
Reserved	0x00_04000000-0x00_0401FFFF	Secure SRAM, aborts on non-secure accesses.
NOR FLASH0 alias (CS0)	0x00_08000000-0x00_7DFFFFFF	Normal memory map, aborts on secure accesses.
Ext AXI	0x00_7e000000-0x00_7FFFFFFF	Secure DRAM, aborts on non-secure accesses.
4GB DRAM (in 32-bit address space)	0x00_80000000-0xFF_FFFFFFFF	Normal memory map, aborts on secure accesses.

Table 8-3: CS2 region peripheral memory map

Peripheral	Modeled	Address range	Size	GIC Int. See Note after table.
VRAM - aliased	Yes	0x00_18000000-0x00_19FFFFFF	32MB	-
Ethernet (SMSC 91C111)	Yes	0x00_1A000000-0x00_1AFFFFFF	16MB	47
USB - unused	No	0x00_1B000000-0x00_1BFFFFFF	16MB	-

Use these interrupt signal values to program your interrupt controller. They are the SPI number plus 32. Add 32 to the interrupt number from the peripherals to form the interrupt number that the GIC sees. GIC interrupts 0-31 are for internal use.

Table 8-4: CS3 region peripheral memory map

Peripheral	Modeled	Address range	Size	GIC Int. See Note after table.

Reserved	-	0x00_1C200000-0x00_1FFFFFFF	64KB	-

Use these interrupt signal values to program your interrupt controller. They are the SPI number plus 32. Add 32 to the interrupt number from the peripherals to form the interrupt number that the GIC sees. GIC interrupts 0-31 are for internal use.

8.3 VE memory map for Cortex-R series

The Versatile™ Express RS1 memory map with the RS2 extensions is the base of the global memory map for the Cortex®-R series platform model.

Table 8-5: Cortex®-R series VE FVP memory map

Memory	Modeled	Address range
DRAM	Yes	0x00000000-0x3FFFFFFF
FLASH0	Yes	0x40000000-0x43FFFFFF
FLASH1	Yes	0x44000000-0x47FFFFFF
PSRAM	Yes	0x48000000-0x4BFFFFFF
RAM	No	0x4C000000-0x4FFFFFFF
PL390 GIC CPU Interface. Cortex®-R4 and Cortex®-R5 models only.	Yes	0xAE000000-0xAE000FFF
PL390 GIC Distributor. Cortex®-R4 and Cortex®-R5 models only.	Yes	0xAE001000-0xAE001FFF
VE System Registers	Yes	0xB0000000-0xB000FFFF
SP810	Yes	0xB0010000-0xB001FFFF
PL041 AACI	Yes	0xB0040000-0xB004FFFF
PL180 MCI	Yes	0xB0050000-0xB005FFFF
PL050 KMIO	Yes	0xB0060000-0xB006FFFF
PL050 KMI1	Yes	0xB0070000-0xB007FFFF
PL011 UART0	Yes	0xB0090000-0xB009FFFF
PL011 UART1	Yes	0xB00A0000-0xB00AFFFF
PL011 UART2	Yes	0xB00B0000-0xB00BFFFF
PL011 UART3	Yes	0xB00C0000-0xB00CFFFF

Memory	Modeled	Address range
SP805 WATCHDOG	Yes	0xB00F0000-0xB00FFFFF
TIMER_0_1	Yes	0xB0110000-0xB011FFFF
TIMER_2_3	Yes	0xB0120000-0xB012FFFF
PL031 Real Time Clock	Yes	0xB0170000-0xB017FFFF
Compact Flash	No	0xB01A0000-0xB01AFFFF
PL011 UART4	Yes	0xB01B0000-0xB01BFFFF
PL111 CLCD	Yes	0xB01F0000-0xB01FFFFFF. See Note after table
RAM	No	0xB4000000-0xBBFFFFFF
Video RAM	Yes	0xBC000000-0xBDFFFFFF
Ethernet (SMSC 91C111)	Yes	0xBE000000-0xBEFFFFFF
USB	No	0xBF000000-0xBFFFFFFF

For Cortex®-R4 and Cortex®-R5 models, the range for PL111 CLCD is 0xA0000000-0xA0010000

8.4 VE interrupt assignments for Cortex-A series

The platform routes the following Shared Peripheral Interrupts (SPIs) to the GIC.

Table 8-6: SPI GIC assignments

IRQ ID	SPI offset	Device
32	0	Watchdog, SP805
34	2	Dual timer 0/1, SP804
35	3	Dual timer 2/3, SP804
36	4	Real-time Clock, PL031
37	5	UART0, PL011
38	6	UART1, PL011
39	7	UART2, PL011
40	8	UART3, PL011
41	9	MCI, PL180, MCIINTRO
42	10	MCI, PL180, MCIINTR1
43	11	AACI, PL041
44	12	KMI - Keyboard, PL050
45	13	KMI - Mouse, PL050
46	14	Color LCD Controller, PL111
47	15	Ethernet, SMSC 91C111
74	42	Virtio block device
75	43	Virtio P9 device

IRQ ID	SPI offset	Device
92	60	CPU 0 PMU
93	61	CPU 1 PMU
94	62	CPU 2 PMU
95	63	CPU 3 PMU
117	85	HDLCD

8.5 VE interrupt assignments for Cortex-R series

These tables describe the interrupt assignments for Cortex-R4, Cortex-R5, Cortex-R7 and Cortex-R8.

Table 8-7: Interrupt assignments for Cortex-R4 and Cortex-R5

GIC IRQ ID	SPI offset	Device
32	0	Watchdog, SP805
34	2	Dual timer 0/1, SP804
35	3	Dual timer 2/3, SP804
36	4	Real-time Clock, PL031
41	9	MCI, PL180, MCIINTRO
42	10	MCI, PL180, MCIINTR1
43	11	AACI, PL041
44	12	KMI - Keyboard, PL050
45	13	KMI - Mouse, PL050
47	15	Ethernet, SMSC 91C111
75	16	Level 2 Cache Controller, PL310 Combined interrupt
76	14	Color LCD Controller, PL111
96	5	UART0, PL011
97	6	UART1, PL011
98	7	UART2, PL011
99	8	UART3, PL011

Table 8-8: Interrupt assignments for Cortex-R7 and Cortex-R8

GIC IRQ ID	SPI offset	Device
32	0	Watchdog, SP805
34	2	Dual timer 0/1, SP804
35	3	Dual timer 2/3, SP804
36	4	Real-time Clock, PL031
37	5	UART0, PL011
38	6	UART1, PL011
39	7	UART2, PL011
40	8	UART3, PL011

GIC IRQ ID	SPI offset	Device
41	9	MCI, PL180, MCIINTR0
42	10	MCI, PL180, MCIINTR1
43	11	AACI, PL041
44	12	KMI - Keyboard, PL050
45	13	KMI - Mouse, PL050
46	14	Color LCD Controller, PL111
47	15	Ethernet, SMSC 91C111

8.6 VE parameters

This section describes the VE FVP instantiation parameters.

8.6.1 VE instantiation parameters

This table describes the instantiation parameters for VE models.

Table 8-9: VE instantiation parameters

Component	Parameter	Type	Allowed values	Default value	Description
ve_sysregs	user_switches_value	Integer	See VE switch S6 .	0	Switch S6 setting.
flashloader0	fname	String	Valid filename	""	Path to flash image file.
flashloader1	fname	String	Valid filename	""	Path to flash image file.
mmc	p_mmc_file	String	Valid filename	mmc.dat	Multimedia card filename.
pl111_clcd	pixel_double_limit	Integer	-	12c	Sets threshold in horizontal pixels below which pixels sent to framebuffer are doubled in size in both dimensions.
sp810_sysctrl	use_s8	Boolean	true, false	false	Indicates whether to read boot_switches_value.

8.6.2 VE secure memory parameters

This table describes the VE FVP secure memory parameters that you can change when you start the model.

Table 8-10: VE secure memory parameters

Name	Type	Allowed values	Default value	Description
daughterboard.secure_memory	Boolean	true, false	false	<p>false</p> <p>The platform behaves as before.</p> <p>true</p> <p>The address space is segregated according to the security mode of the core. Some memory blocks near the bottom of the address space are available to Secure transactions only. The rest of the address space is available to Non-secure transactions only.</p>

8.6.3 VE switch S6

This section describes the behavior and default positions of the VE system model switch.

Switch S6 is equivalent to the Boot Monitor configuration switch on the VE hardware.

If you have the standard Arm® Boot Monitor flash image loaded, the setting of switch S6-1 changes what happens on model reset. Otherwise, the function of switch S6 is implementation dependent.

To write the switch position directly to the S6 parameter in the model, you must convert the switch settings to an integer value from the equivalent binary, where 1 is on and 0 is off.

Table 8-11: Default positions of VE system model switch

Switch	Default position	Function in default position
S6-1	OFF	Displays prompt permitting Boot Monitor command entry after system start.
S6-2	OFF	See STDIO redirection, below.
S6-3	OFF	See STDIO redirection, below.
S6-4 to S6-8	OFF	Reserved for application use.

If S6-1 is in the ON position, the Boot Monitor executes the boot script that was loaded into flash. If there is no script, the Boot Monitor prompt is displayed.

The settings of S6-2 and S6-3 affect STDIO source and destination on model reset.

Table 8-12: STDIO redirection

S6-2	S6-3	Output	Input	Description
OFF	OFF	UART0	UART0	STDIO autodetects whether to use semihosting I/O or a UART. If a debugger is connected, STDIO is redirected to the debugger output window, otherwise STDIO goes to UART0.
OFF	ON	UART0	UART0	STDIO is redirected to UART0, regardless of semihosting settings.

S6-2	S6-3	Output	Input	Description
ON	OFF	CLCD	Keyboard	STDIO is redirected to the CLCD and keyboard, regardless of semihosting settings.
ON	ON	CLCD	UART0	STDIO output is redirected to the LCD and input is redirected to UART0, regardless of semihosting settings.

8.7 VE components

A complete model implementation of the VE platform includes both VE-specific components and generic components, such as buses and timers.

To see a list of all the component instances in the model, run it with the `--list-instances` option.

The generic components are documented in Fast Models components.

8.7.1 VEVisualisation component

This component can generate events from the host mouse or keyboard when the visualization window is in focus. For example, you can toggle the switch elements from the visualization window.

Figure 8-2: VE FVP CLCD visualization window

When a suitable application or system image loads, and configures the PL111_CLCD controller registers, the window expands to show the contents of the framebuffer.

Figure 8-3: VE FVP CLCD with brot.axf image

The VESimulation LISA+ component can be found in the `$PVLIB_HOME/examples/LISA/FVP_VE/LISA/` directory.

Note

Using this component can reduce simulation performance. Use the `rate_limit-enable` parameter to control simulation speed.

8.7.1.1 VEEVisualisation ports

This section describes the VEEVisualisation component ports.

Table 8-13: VEEVisualisation ports

Name	Protocol	Type	Description
boot_switch	ValueState	Slave	Provides state for the eight Boot DIP switches on the right side of the CLCD status bar.
clock_50Hz	ClockSignal	Slave	50Hz clock input.
cluster0_ticks[4]	InstructionCount	Slave	Connection from processor model in cluster 0 to show its current instruction count.
cluster1_ticks[4]	InstructionCount	Slave	Connection from processor model in cluster 1 to show its current instruction count.
daughter_leds	ValueState	Slave	A read/write port to read and set the value of the LEDs. 1 bit per LED, LSB left-most, up to 32 LEDs available. The LEDs appear only when parameter <code>daughter_led_count</code> is set to nonzero.
daughter_user_switches	ValueState	Slave	A read port to return the value of the daughter user switches. Write to this port to set the value of the switches, and use during reset only. LSB is left-most, up to 32 switches available.
keyboard	KeyboardStatus	Master	Output port providing key change events when the visualization window is in focus.
lcd	LCD	Slave	Connection from a CLCD controller for visualization of the frame buffer.
lcd_layout	LCDLayoutInfo	Master	Layout information for alphanumeric LCD display.
leds	ValueState	Slave	Displays state using the eight colored LEDs on the status bar.
mouse	MouseStatus	Master	Output port providing mouse movement and button events when the visualization window is in focus.
touch_screen	MouseStatus	Master	Provides mouse events when the visualization window is in focus.
user_switches	ValueState	Slave	Provides state for the eight User DIP switches on the left side of the CLCD status bar, equivalent to switch S6 on VE hardware.

8.7.1.2 VEEVisualisation parameters

This section describes the configuration parameters.

The syntax to use in a configuration file or on the command line is:

```
motherboard.vis.<parameter>=<value>
```

Note

Setting the `rate_limit-enable` parameter to `true` prevents the simulation from running too fast on fast workstations and enables timing loops and mouse actions to work correctly. However, it reduces the overall simulation speed. If your priority is high simulation speed, set `rate_limit-enable` to `false`, which is the default.

Table 8-14: VEEVisualisation parameters

Name	Type	Allowed values	Default value	Description
cluster0_name	string	-	Cluster0	Label for cluster 0 performance values.

Name	Type	Allowed values	Default value	Description
cluster1_name	string	-	Cluster1	Label for cluster 1 performance values.
cluster2_name	string	-	Cluster2	Label for cluster 2 performance values.
cluster3_name	string	-	Cluster3	Label for cluster 3 performance values.
cpu_name	string	-	-	Processor name displayed in window title.
daughter_led_count	int	0-32	0	Set to nonzero to display up to 32 LEDs. See the <code>daughter_leds</code> port.
daughter_user_switch_count	int	0-32	0	Set this parameter to display up to 32 switches. See the <code>daughter_user_switches</code> port.
diagnostics	bool	true, false	false	Print diagnostic messages.
disable_visualisation	bool	true, false	false	Disable the VEVisualisation component on model startup.
rate_limit-enable	bool	true, false	false	Restrict simulation speed so that simulation time more closely matches real time rather than running as fast as possible.
recorder.checkInstructionCount	bool	true, false	true	Check instruction count in recording file against actual instruction count during playback.
recorder.playbackFileName	string	-	""	Playback filename (empty string disables playback).
recorder.recordingFileName	string	-	""	Recording filename (empty string disables recording).
recorder.recordingTimeBase	int	-	0x5F5E100	Timebase in 1/s (relative to the master clock where 100000000 means 10 nanoseconds resolution simulated time for a 1Hz master clock) for recording. Higher values give higher time resolution, playback timebase is always taken from the playback file.
recorder.verbose	int	-	0	Enable verbose messages (1=normal, 2=even more).
trap_key	int	Valid ATKeyCode key value. See <code>\$PVLIB_HOME/include/components/KeyCode.h</code> for a list of values.	0x4A	Trap key that works with left Ctrl key to toggle mouse display. The default is the left Alt key, so press Left Alt and Left Ctrl simultaneously to toggle the mouse display.
window_title	string	-	"Fast Models - CLCD %cpu%"	Window title. <code>cpu_name</code> replaces <code>%cpu%</code> .

8.7.1.3 VEVisualisation verification and testing

This component passes tests by use as an I/O device for booting Linux and other operating systems.

8.7.1.4 VEEVisualisation performance

Arm expects the elements in the status bar to have little effect on the performance of PV systems. However, applications that often redraw the contents of the frame buffer might incur overhead through GUI interactions on the host OS.

8.7.1.5 VEEVisualisation library dependencies

This component relies on the Simple DirectMedia Layer (SDL) libraries, specifically `libSDL2-2.0.so.0.10.0`.

This library is bundled with Fast Models and is also available as an rpm for Red Hat Enterprise Linux. On Windows, the library is called `SDL2.dll`.

Related information

[Simple DirectMedia Layer \(SDL\) cross-platform development library](#)

8.8 VE_SysRegs component

This section describes the VE system registers component.

8.8.1 VE_SysRegs

This LISA+ component is a model of the VE status and system control registers.

8.8.2 VE_SysRegs ports

This table describes the VE_SysRegs ports.

Table 8-15: VE_SysRegs ports

Name	Protocol	Type	Description
<code>cb[0-1]</code>	<code>VECBProtocol</code>	Master	The Configuration Bus (CB) controls the power and reset sequence.
<code>clock_24Mhz</code>	<code>ClockSignal</code>	Slave	Reference clock for internal counter register.
<code>clock_100Hz</code>	<code>ClockSignal</code>	Slave	Reference clock for internal counter register.
<code>clock_CLCD</code>	<code>ClockRateControl</code>	Master	The clock for the LCD controller.
<code>lcd</code>	<code>LCD</code>	Master	Multimedia bus interface output to the LCD.
<code>leds</code>	<code>ValueState</code>	Master	Displays state of the <code>SYS_LED</code> register using the eight colored LEDs on the status bar.
<code>mmb[0-2]</code>	<code>LCD</code>	Slave	Multimedia bus interface input.
<code>mmc_card_present</code>	<code>StateSignal</code>	Slave	Indicates the presence of a MultiMedia Card (MMC) image.
<code>pvbuss</code>	<code>PVBus</code>	Slave	Slave port for connection to PV bus master/decoder.

Name	Protocol	Type	Description
system_reset	Signal	Master	Signal to the platform a complete system reset. Writes to the System Configuration registers can trigger the reset signal.
user_switches	ValueState	Master	Provides state for the eight User DIP switches on the left side of the CLCD status bar, equivalent to switch S6 on VE hardware.

8.8.3 VE_SysRegs parameters

This table describes the VE_SysRegs parameters.

Table 8-16: VE_SysRegs parameters

Name	Type	Default value	Description
exit_on_shutdown	bool	false	Used to shut down the system. See the Note after the table.
mmbSiteDefault	int	1	Default MultiMedia Bus (MMB) source (0=motherboard, 1=daughterboard 1, 2=daughterboard 2).
sys_proc_id0	int	0x0c000000	Processor ID register at CoreTile Express Site 1.
sys_proc_id1	int	0xff000000	Processor ID at CoreTile Express Site 2.
tilePresent	bool	true	Tile fitted.
user_switches_value	int	0	User switches.

When `exit_on_shutdown` is `true`, if software uses the `sys_cfgctrl` function `sys_cfg_shutdown`, then the simulator shuts down and exits. For more information on the `sys_cfgctrl` function values, see the Motherboard Express µATX V2M-P1 Technical Reference Manual.

8.8.4 VE_SysRegs registers

This table describes the configuration registers.

Table 8-17: VE_SysRegs registers

Name	Offset	Access	Description
SYS_ID	0x00	Read/write	System identity
SYS_SW	0x04	Read/write	Bits[7:0] map to switch S6
SYS_LED	0x08	Read/write	Bits[7:0] map to user LEDs
SYS_100HZ	0x24	Read only	100Hz counter
SYS_FLAGS	0x30	Read/write	General purpose flags
SYS_FLAGSCLR	0x34	Write only	Clear bits in general purpose flags
SYS_NVFLAGS	0x38	Read/write	General purpose non-volatile flags
SYS_NVFLAGSCLR	0x3C	Write only	Clear bits in general purpose non-volatile flags
SYS_MCI	0x48	Read only	MCI
SYS_FLASH	0x4C	Read/write	Flash control

Name	Offset	Access	Description
SYS_CFGSW	0x58	Read/write	Boot select switch
SYS_24MHZ	0x5C	Read only	24MHz counter
SYS_MISC	0x60	Read/write	Miscellaneous control flags
SYS_DMA	0x64	Read/write	DMA peripheral map
SYS_PROCID0	0x84	Read/write	Processor ID
SYS_PROCID1	0x88	Read/write	Processor ID
SYS_CFGDATA	0xA0	Read/write	Data to be read/written from/to motherboard controller
SYS_CFGCTRL	0xA4	Read/write	Control data transfer to motherboard controller
SYS_CFGSTAT	0xA8	Read/write	Status of data transfer to motherboard

8.8.5 VE_SysRegs - verification and testing

This component was tested as part of the Versatile™ Express model.

8.9 Differences between the VE hardware and the system models

This section describes features of the hardware that the models do not implement, or implement with significant differences.

Related information

[Fast Models accuracy](#) on page 23

[Processor implementation](#) on page 28

8.9.1 Memory map

The model represents the memory map of the hardware VE platform, but is not an accurate representation of a specific revision.

The memory map in the supplied model is sufficiently complete and accurate to boot the same operating system images as for the VE hardware.

In the memory map, memory regions that are not explicitly occupied by a peripheral or by memory are unmapped. This includes regions otherwise occupied by a peripheral that is not implemented, and those areas that are documented as reserved. Accessing these regions from the host processor results in the model presenting a warning.

8.9.2 Memory aliasing

The model implements address-space aliasing of the DRAM. This means that the same physical memory locations are visible at different addresses.

The lower 2GB of the DRAM is accessible at 0x00_80000000. The full 4GB of DRAM is accessible at 0x08_00000000 and again at 0x80_00000000. The aliasing of DRAM then repeats from 0x81_00000000 up to 0xFF_FFFFFFFF.

8.9.3 VE hardware features absent

These FVPs do not implement the following features of the hardware:

- Two-wire serial bus interfaces.
- USB interfaces.
- PCI Express interfaces.
- Compact flash.
- Digital Visual Interface (DVI).
- Debug and test interfaces.
- Dynamic Memory Controller (DMC).
- Static Memory Controller (SMC).

Related information

[VE memory map for Cortex-A_series](#) on page 4837

8.9.4 VE hardware features different

These Fixed Virtual Platforms only partially implement some features of the hardware.

The partially implemented features might not work as you expect. Check the model release notes for the latest information.

Sound

The VE FVPs implement the PL041 AACI PrimeCell and the audio CODEC as in the VE hardware, but with a limited number of sample rates.

Product and document information

Read the information in these sections to understand the release status of the product and documentation, and the conventions used in Arm documents.

Product status

All products and services provided by Arm require deliverables to be prepared and made available at different levels of completeness. The information in this document indicates the appropriate level of completeness for the associated deliverables.

Product completeness status

The information in this document is Final, that is for a developed product.

Revision history

These sections can help you understand how the document has changed over time.

Document release information

The Document history table gives the issue number and the released date for each released issue of this document.

Change history

For technical changes to this documentation, see the [Fast Models Release Notes](#).

Conventions

The following subsections describe conventions used in Arm documents.

Glossary

The Arm Glossary is a list of terms used in Arm documentation, together with definitions for those terms. The Arm Glossary does not contain terms that are industry standard unless the Arm meaning differs from the generally accepted meaning.

See the Arm Glossary for more information: developer.arm.com/glossary.

Typographic conventions

Arm documentation uses typographical conventions to convey specific meaning.

Convention	Use
<i>italic</i>	Citations.
bold	Interface elements, such as menu names. Terms in descriptive lists, where appropriate.

Convention	Use
monospace	Text that you can enter at the keyboard, such as commands, file and program names, and source code.
monospace <u>underline</u>	A permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.
<and>	Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example: <div>MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2></div>
SMALL CAPITALS	Terms that have specific technical meanings as defined in the <i>Arm® Glossary</i> . For example, IMPLEMENTATION DEFINED , IMPLEMENTATION SPECIFIC , UNKNOWN , and UNPREDICTABLE .

We recommend the following. If you do not follow these recommendations your system might not work.

Your system requires the following. If you do not follow these requirements your system will not work.

You are at risk of causing permanent damage to your system or your equipment, or harming yourself.

This information is important and needs your attention.

A useful tip that might make it easier, better or faster to perform a task.

A reminder of something important that relates to the information you are reading.

Useful resources

This document contains information that is specific to this product. See the following resources for other useful information.

Access to Arm documents depends on their confidentiality:

- Non-Confidential documents are available at developer.arm.com/documentation. Each document link in the following tables goes to the online version of the document.
- Confidential documents are available to licensees only through the product package.

Arm product resources	Document ID	Confidentiality
A-Profile Architecture	–	Non-Confidential
AMBA-PV Extensions to TLM User Guide	100962	Non-Confidential
AN521 Example SSE-200 Subsystem for MPS2+ Application Note	DAI 0521	Non-Confidential
Arm® Architecture Models	–	Non-Confidential
Arm® Corstone™ SSE-300 Example Subsystem Technical Reference Manual	101773	Non-Confidential
Arm® Cortex®-M23 Armv8-M IoT Kit User Guide	ECM 0635473	Non-Confidential
Arm® Cortex®-M33 processor Armv8-M IoT Kit FVP User Guide	ECM 0601256	Non-Confidential
Arm® Cortex®-M7 SMM on V2M-MPS2 Application Note 400	DAI 0400	Non-Confidential
Arm® DynamIQ Shared Unit Technical Reference Manual	100453	Non-Confidential
Arm® Socrates™	–	Non-Confidential
ASTFplugin FAQs	108074	Non-Confidential
Component Architecture Debug Interface User Guide	100963	Non-Confidential
Fast Models Fixed Virtual Platforms (FVP) Reference Guide	100966	Non-Confidential
Fast Models Model Trace Interface Reference Manual	DUI 0819	Non-Confidential
Fast Models User Guide	100965	Non-Confidential
Fixed Virtual Platforms	–	Non-Confidential
How to generate ASTF traces of workloads running on Fast Models	109193	Non-Confidential
Introduction to SVE2	102340	Non-Confidential
LISA+ Language for Fast Models Reference Guide	101092	Non-Confidential
Model Debugger for Fast Models User Guide	100968	Non-Confidential
Motherboard Express µATX V2M-P1 Technical Reference Manual	DUI 0447	Non-Confidential
Product Download Hub	–	Non-Confidential
Workload Trace Generation Best Practices	107983	Non-Confidential

Arm architecture and specifications	Document ID	Confidentiality
AMBA® Low Power Interface Specification	IHI 0068	Non-Confidential
Armv7-M Architecture Reference Manual	DDI 0403	Non-Confidential
Arm® Architecture Reference Manual Armv7-A and Armv7-R edition	DDI 0406	Non-Confidential
Arm® Architecture Reference Manual for A-profile architecture	DDI 0487	Non-Confidential

Arm architecture and specifications	Document ID	Confidentiality
<i>Arm® Architecture Reference Manual Supplement, The Scalable Vector Extension</i>	DDI 0584	Non-Confidential
<i>Arm® Generic Interrupt Controller Architecture version 2.0 - Architecture Specification</i>	IHI 0048	Non-Confidential
<i>Arm® Power Policy Unit Architecture Specification</i>	DEN 0051	Non-Confidential
<i>Arm® Realm Management Extension (RME) System Architecture</i>	DEN 0129	Non-Confidential

Non-Arm resources	Document ID	Organization
<i>Accellera Systems Initiative</i>	–	http://www.accellera.org
<i>GitHub</i>	–	Github
<i>Intel Download Center, Intel StrataFlash Memory (J3) datasheet</i>	–	Intel
<i>MultiMedia Card Association specification</i>	–	JEDEC
<i>Simple DirectMedia Layer Cross-platform Development Library</i>	–	Simple DirectMedia Layer
<i>Virtual I/O Device (VIRTIO) Version 1.0</i>	–	OASIS Open
