Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_actlr2

Type

bool

Default value

0x1

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

subcluster0.has_dot_product

Type

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.has_ete

Type

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster0.icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster0.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster0.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster0.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.ras_extra_configurations**Type**

string

Default value

```
"[ { \"Index\": 1, \"ERXMISCO_mask\": 0xFFFFc0003fc3, \"ERXMISC1_mask\":  
0x03F870003FF30f07, \"ERXPFGCTL_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISCO_mask  
\": 0xFFFFe007ffc0, \"ERXMISCO_reset\": 0x2, \"ERXSTATUS_IERR_mask\": 0x300 ,  
\"ERXMISC1_mask\": 0x0FF8700ffff31f0f, \"ERXPFGCTL_reset\": 0x1000 } ]"
```

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}].

subcluster0.ras_pfg_clock_mhz

Type

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

subcluster0.revision_number

Type

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled

Type

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster1.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`subcluster1.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster1.ete.ETE_REVISION**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

subcluster1.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster1.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster1.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster1.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

subcluster1.ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster1.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

subcluster1.has_statistical_profiling**Type**

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster1.icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster1.icache-miss_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster1.icache-prefetch_enabled

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster1.icache-read_access_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster1.icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-size`

Type

int

Default value

0x8000

L1 I-Cache size in bytes.

`subcluster1.instruction_tlb_size`

Type

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

`subcluster1.memory_tagging_support_level`

Type

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster1.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.41 ARMCortexA520CT_CortexA720CT_CortexX4CT

ARMCortexA520CT_CortexA720CT_CortexX4CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-349: IP revisions support

Revision	Quality level
CortexA520 r0p1	Full support
CortexA720 r0p1	Full support
CortexX4 r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA520CT_CortexA720CT_CortexX4CT

This model has the following Iris instances:

Table 3-350: ARMCortexA520CT_CortexA720CT_CortexX4CT Iris instances

InstanceName	ComponentName
ARMCortexA520CT_CortexA720CT_CortexX4CT	Cluster_ARM_CortexA520_CortexA720_CortexX4_Heterogeneous
ARMCortexA520CT_CortexA720CT_CortexX4CT.AMU	PVBUSLogger
ARMCortexA520CT_CortexA720CT_CortexX4CT.AMU.mapper	PVBUSMapper
ARMCortexA520CT_CortexA720CT_CortexX4CT.DAP	PVBUSLogger

InstanceName	ComponentName
ARMCortexA520CT_CortexA720CT_CortexX4CT.DAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU	DSU
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_core0	PPUv1
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_core1	PPUv1
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_core1.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_core2	PPUv1
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_core2.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.mpam_busslave	PVBusSlave

ARMCortexA520CT_CortexA720CT_CortexX4CT contains the following CADI targets:

- ARM_Cortex-A520
- ARM_Cortex-A720
- ARM_Cortex-X4
- Cluster_ARM_CortexA520_CortexA720_CortexX4_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A520
- Subcluster_ARM_Cortex-A720
- Subcluster_ARM_Cortex-X4
- TlbCadi

About ARMCortexA520CT_CortexA720CT_CortexX4CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-12 (ARMCortexA520CT).

subcluster1.NUM_CORES

Possible values are 1-12 (ARMCortexA720CT).

subcluster2.NUM_CORES

Possible values are 1-12 (ARMCortexX4CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-11]` for cores in `subcluster0`.
- `<port_name>[12-23]` for cores in `subcluster1`.
- `<port_name>[24-35]` for cores in `subcluster2`.

All instances in the Master cross trigger matrix port array, `cti[36]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu11` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu11` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu11` identify cores in `subcluster2`.

For information about the cores in this model, see:

- [ARMCortexA520CT](#).
- [ARMCortexA720CT](#).
- [ARMCortexX4CT](#).

Ports for ARMCortexA520CT_CortexA720CT_CortexX4CT

Table 3-352: Ports

Name	Protocol	Type	Description
<code>acp_s[2]</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTART0MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART2MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART3MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).

Name	Protocol	Type	Description
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[36]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[36]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[36]	Signal	Master	Timer signals to SOC
CNTHVIRQ[36]	Signal	Master	Timer signals to SOC.
CNTHVSIQ[36]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[36]	Signal	Master	Timer signals to SOC.
CNTPSIQ[36]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[36]	Signal	Master	Timer signals to SOC.
commirq[36]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[36]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[36]	PChannel	Master	Core PCSM signals
core_powerdown_out[36]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[36]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[36]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[36]	Signal	Slave	Disable cryptography extensions after reset.
cti[36]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.

Name	Protocol	Type	Description
ctidbgirq[36]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[36]	Signal	Master	No power-down request.
dbgpwrupreq[36]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[36]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[36]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[36]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[36]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[36]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[36]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[36]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[36]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[36]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[36]	Signal	Slave	Per core System Error physical pins.

Name	Protocol	Type	Description
spiden	Signal	Slave	External debug interface.
ticks[36]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[36]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[36]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[36]	Signal	Slave	Virtualised FIQ.
virq[36]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[36]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA520CT_CortexA720CT_CortexX4CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type

Type

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_complex_mapping

Type

string

Default value

```
"{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1":
{ "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4,
5], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache
" :{"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists
":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":
"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"} }"
```

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" :{"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : { "exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

core_power_on_by_default

Type

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l3cache-size`

Type

int

Default value

0x80000

L3 Cache size in bytes.

`l3cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_issue_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-ways`

Type

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

`l3cache-write_access_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster0.core_cache_protection**Type**

int

Default value

0x1

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

subcluster0.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster0.etc.CLAIMTAGS`**Type**

int

Default value

0x4

Number of claim tags.

`subcluster0.etc.MAX_INST_PER_Q`**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

`subcluster0.etc.PIDR_CM0D`**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_act1r2**Type**

bool

Default value

0x1

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

subcluster0.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster0.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster0.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster0.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.ras_extra_configurations**Type**

string

Default value

```
"[ { \"Index\": 1, \"ERXMISCO_mask\": 0xFFFFc0003fc3, \"ERXMISC1_mask\":  
0x03F870003FF30f07, \"ERXPFGCTL_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISCO_mask  
\": 0xFFFFe007ffc0, \"ERXMISCO_reset\": 0x2, \"ERXSTATUS_IERR_mask\": 0x300 ,  
\"ERXMISC1_mask\": 0x0FF8700ffff31f0f, \"ERXPFGCTL_reset\": 0x1000 } ]"
```

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}].

subcluster0.ras_pfg_clock_mhz**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

subcluster0.revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions

are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`subcluster1.cpuX.l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`subcluster1.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster1.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster1.ete.ETE_REVISION**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

subcluster1.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster1.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster1.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster1.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

subcluster1.ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_enhanced_pan

Type

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster1.has_ete

Type

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.has_large_va

Type

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

subcluster1.has_statistical_profiling

Type

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster1.icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-maintenance_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster1.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster1.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster1.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster1.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions

are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

subcluster1.walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.CPUCFR

Type

int

Default value

0x0

Value of CPU Configuration Register.

subcluster2.NUM_CORES

Type

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster2.cpi_div

Type

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster2.cpi_mul

Type

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster2.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster2.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster2.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster2.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster2.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster2.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster2.cpuX.l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`subcluster2.cpuX.l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster2.cpuX.l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster2.cpuX.l2cache-ways`

Type

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

`subcluster2.cpuX.l2cache-write_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster2.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster2.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster2.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster2.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster2.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster2.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster2.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster2.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster2.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster2.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster2.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster2.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster2.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster2.dcache-size`

Type

int

Default value

0x10000

L1 D-Cache size in bytes.

`subcluster2.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster2.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster2.dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster2.ecv_support_level**Type**

int

Default value

0x2

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

subcluster2.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster2.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster2.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster2.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster2.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster2.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster2.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster2.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster2.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster2.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster2.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster2.ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster2.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster2.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster2.has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster2.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster2.has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster2.has_v8_7_spe_inverted_filtering**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events.

subcluster2.has_v8_7_spe_previous_branch_target**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented.

subcluster2.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster2.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster2.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`subcluster2.icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`subcluster2.icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster2.icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`subcluster2.icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster2.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster2.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster2.mpam_has_altsp**Type**

bool

Default value

0x0

MPAM Whether MPAMIDR_EL1.HAS_ALTSP bit is set or clear.

subcluster2.mpamidr_has_force_ns**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster2.mpamidr_has_sdeflt**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster2.mpamidr_has_tidr**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear. Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster2.pmu-num_counters**Type**

int

Default value

0x1f

Number of PMU counters implemented.

subcluster2.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster2.tcr_txsz_undersize_should_fault**Type**

bool

Default value

0x0

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

subcluster2.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster2.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster2.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.42 ARMCortexA520CT_CortexA725CT

ARMCortexA520CT_CortexA725CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-353: IP revisions support

Revision	Quality level
CortexA520 r0p1	Full support
CortexA725 r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA520CT_CortexA725CT

This model has the following Iris instances:

Table 3-354: ARMCortexA520CT_CortexA725CT Iris instances

InstanceName	ComponentName
ARMCortexA520CT_CortexA725CT	Cluster_ARM_Cortex-A520_CortexA725_Heterogeneous
ARMCortexA520CT_CortexA725CT.AMU	PVBusLogger
ARMCortexA520CT_CortexA725CT.AMU.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.DAP	PVBusLogger

ARMCortexA520CT_CortexA725CT contains the following CADI targets:

- ARM_Cortex-A520
- ARM_Cortex-A725
- Cluster_ARM_Cortex-A520_CortexA725_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A520
- Subcluster_ARM_Cortex-A725
- TlbCadi

About ARMCortexA520CT_CortexA725CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-13 (ARMCortexA520CT).

subcluster1.NUM_CORES

Possible values are 1-13 (ARMCortexA725CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-12]` for cores in subcluster0.
- `<port_name>[13-25]` for cores in subcluster1.

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in subcluster0.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in subcluster1.

For information about the cores in this model, see:

- [3.5.39 ARMCortexA520CT](#) on page 1859.
- [3.5.48 ARMCortexA725CT](#) on page 2269.

Ports for ARMCortexA520CT_CortexA725CT

Table 3-356: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[26]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[26]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[26]	Signal	Master	Timer signals to SOC

Name	Protocol	Type	Description
CNTHVIRQ[26]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[26]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[26]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[26]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[26]	Signal	Master	Timer signals to SOC.
commirq[26]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[26]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[26]	PChannel	Master	Core PCSM signals
core_powerdown_out[26]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[26]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[26]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[26]	Signal	Slave	Disable cryptography extensions after reset.
cti[26]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[26]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[26]	Signal	Master	No power-down request.
dbgprupreq[26]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[26]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[26]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[26]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[26]	Signal	Master	Interrupt signal from the statistical profiling unit.

Name	Protocol	Type	Description
pmuirq[26]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[26]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[26]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[26]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[26]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[26]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[26]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[26]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[26]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[26]	Signal	Slave	Virtualised FIQ.
virq[26]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[26]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA520CT_CortexA725CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_complex_mapping**Type**

string

Default value

```
"{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1":
{"cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4,
5], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache
" :{"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists
```

```
\":1, \"size\": \"16MB\"}}, \"complex5\": { \"cores\": [10, 11], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\"}}, \"complex6\": { \"cores\": [12, 13], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\"}} }
```

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {\"complex0\": { \"cores\" : [0, 1], \"l2-cache\" : {\"exists\":1, \"size\":16MB}}, ... , \"complexN\": { \"cores\" : [<core_list>], \"l2-cache\" : {\"exists\":1, \"size\":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

core_power_on_by_default

Type

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

enable_simulation_performance_optimizations

Type

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_peripheral_port

Type

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster0.core_cache_protection**Type**

int

Default value

0x1

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`subcluster0.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster0.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster0.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster0.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_actlr2**Type**

bool

Default value

0x1

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster0.icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-size`

Type

int

Default value

0x8000

L1 I-Cache size in bytes.

`subcluster0.memory_tagging_support_level`

Type

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

`subcluster0.pmu-num_counters`

Type

int

Default value

0x6

Number of PMU counters implemented.

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.ras_extra_configurations**Type**

string

Default value

```
"[ { \"Index\": 1, \"EXMISCO_mask\": 0xFFFFc0003fc3, \"EXMISC1_mask\":  
0x03F870003FF30f07, \"ERXPFGCTL_reset\": 0x1000 }, { \"Index\": 2, \"EXMISCO_mask  
\": 0xFFFFe007ffc0, \"EXMISCO_reset\": 0x2, \"ERXSTATUS_IERR_mask\": 0x300 ,  
\"EXMISC1_mask\": 0x0FF8700ffff31f0f, \"ERXPFGCTL_reset\": 0x1000 } ]"
```

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for EXMISCn masks - these are 64 bit masks covering the 64 bit registers EXMISCn_EL1. E.g. [{"Index": 0, "EXMISCO_mask": 0x0, "EXMISCO_reset": 0x0, "EXMISC1_mask": 0x0, "EXMISC1_reset": 0x0, "EXMISC2_mask": 0x0, "EXMISC2_reset": 0x0, "EXMISC3_mask": 0x0, "EXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "EXMISCO_mask": 0x0, "EXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}].

subcluster0.ras_pfg_clock_mhz**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

subcluster0.revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

subcluster1.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster1.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster1.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster1.ete.ETE_REVISION**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

subcluster1.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster1.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster1.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x1

Return stack depth.

subcluster1.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster1.ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster1.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

subcluster1.has_statistical_profiling**Type**

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster1.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster1.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster1.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster1.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster1.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster1.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.43 ARMCortexA520CT_CortexA725CT_CortexX925CT

ARMCortexA520CT_CortexA725CT_CortexX925CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-357: IP revisions support

Revision	Quality level
CortexA520 r0p1	Full support
CortexA725 r0p0	Preliminary support
CortexX925 r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA520CT_CortexA725CT_CortexX925CT

This model has the following Iris instances:

Table 3-358: ARMCortexA520CT_CortexA725CT_CortexX925CT Iris instances

InstanceName	ComponentName
ARMCortexA520CT_CortexA725CT_CortexX925CT	Cluster_ARM_Cortex-A520_CortexA725_CortexX925_Heterogeneous
ARMCortexA520CT_CortexA725CT_CortexX925CT.AMU	PVBusLogger
ARMCortexA520CT_CortexA725CT_CortexX925CT.AMU.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT_CortexX925CT.DAP	PVBusLogger
ARMCortexA520CT_CortexA725CT_CortexX925CT.DAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT_CortexX925CT.DSU	DSU
ARMCortexA520CT_CortexA725CT_CortexX925CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT_CortexA725CT_CortexX925CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520CT_CortexA725CT_CortexX925CT.DSU.PPU_core0	PPUv1
ARMCortexA520CT_CortexA725CT_CortexX925CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA520CT_CortexA725CT_CortexX925CT.DSU.PPU_core1	PPUv1

ARMCortexA520CT_CortexA725CT_CortexX925CT.subcluster2.cpu0.l2cache.upstream[1]	PVBusSlave

ARMCortexA520CT_CortexA725CT_CortexX925CT contains the following CADI targets:

- ARM_Cortex-A520
- ARM_Cortex-A725
- ARM_Cortex-X925
- Cluster_ARM_Cortex-A520_CortexA725_CortexX925_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A520
- Subcluster_ARM_Cortex-A725
- Subcluster_ARM_Cortex-X925
- TlbCadi

About ARM_CortexA520CT_CortexA725CT_CortexX925CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-12 (ARM_CortexA520CT).

subcluster1.NUM_CORES

Possible values are 1-12 (ARM_CortexA725CT).

subcluster2.NUM_CORES

Possible values are 1-12 (ARM_CortexX925CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-11]` for cores in subcluster0.
- `<port_name>[12-23]` for cores in subcluster1.
- `<port_name>[24-35]` for cores in subcluster2.

All instances in the Master cross trigger matrix port array, `cti[36]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu11` identify cores in subcluster0.
- `subcluster1.cpu0` to `subcluster1.cpu11` identify cores in subcluster1.
- `subcluster2.cpu0` to `subcluster2.cpu11` identify cores in subcluster2.

For information about the cores in this model, see:

- [3.5.39 ARM_CortexA520CT](#) on page 1859.

- [3.5.48 ARMCortexA725CT](#) on page 2269.
- [3.5.74 ARMCortexX925CT](#) on page 2808.

Ports for ARMCortexA520CT_CortexA725CT_CortexX925CT

Table 3-360: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AENDOMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTOMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[36]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsn_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[36]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[36]	Signal	Master	Timer signals to SOC
CNTHVIRQ[36]	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
CNTHVSIRQ[36]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[36]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[36]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[36]	Signal	Master	Timer signals to SOC.
commirq[36]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[36]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[36]	PChannel	Master	Core PCSM signals
core_powerdown_out[36]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[36]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[36]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[36]	Signal	Slave	Disable cryptography extensions after reset.
cti[36]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[36]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[36]	Signal	Master	No power-down request.
dbgprupreq[36]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[36]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s[36]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[36]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[36]	Signal	Master	Interrupt signal from the statistical profiling unit.

Name	Protocol	Type	Description
pmuirq[36]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[36]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[36]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[36]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[36]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[36]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[36]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[36]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[36]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[36]	Signal	Slave	Virtualised FIQ.
virq[36]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[36]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA520CT_CortexA725CT_CortexX925CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamlQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

subcluster0.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster0.core_cache_protection**Type**

int

Default value

0x1

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`subcluster0.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster0.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster0.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster0.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_actlr2**Type**

bool

Default value

0x1

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster0.icache-read_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-size`**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

`subcluster0.memory_tagging_support_level`**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

`subcluster0.pmu-num_counters`**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.ras_extra_configurations**Type**

string

Default value

```
"[ { \"Index\": 1, \"EXMISCO_mask\": 0xFFFFc0003fc3, \"EXMISCO1_mask\":  
0x03F870003FF30f07, \"ERXPFGCTL_reset\": 0x1000 }, { \"Index\": 2, \"EXMISCO_mask  
\": 0xFFFFe007ffc0, \"EXMISCO_reset\": 0x2, \"ERXSTATUS_IERR_mask\": 0x300 ,  
\"EXMISCO1_mask\": 0x0FF8700ffff31f0f, \"ERXPFGCTL_reset\": 0x1000 } ]"
```

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for EXMISCn masks - these are 64 bit masks covering the 64 bit registers EXMISCn_EL1. E.g. [{"Index": 0, "EXMISCO_mask": 0x0, "EXMISCO_reset": 0x0, "EXMISCO1_mask": 0x0, "EXMISCO1_reset": 0x0, "EXMISCO2_mask": 0x0, "EXMISCO2_reset": 0x0, "EXMISCO3_mask": 0x0, "EXMISCO3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "EXMISCO_mask": 0x0, "EXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}].

subcluster0.ras_pfg_clock_mhz**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

subcluster0.revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

subcluster1.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster1.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster1.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster1.ete.ETE_REVISION**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

subcluster1.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster1.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster1.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x1

Return stack depth.

subcluster1.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster1.ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster1.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

subcluster1.has_statistical_profiling**Type**

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster1.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster1.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster1.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster1.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster1.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster1.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster2.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster2.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster2.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster2.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster2.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster2.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster2.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster2.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster2.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster2.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster2.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster2.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster2.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster2.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster2.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster2.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster2.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster2.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster2.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster2.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster2.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster2.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster2.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster2.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster2.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster2.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster2.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster2.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster2.ecv_support_level**Type**

int

Default value

0x2

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

subcluster2.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster2.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster2.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster2.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster2.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster2.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster2.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster2.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster2.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster2.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster2.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster2.ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster2.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster2.force_zero_mpam_partid_and_pmg

Type

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster2.has_enhanced_pan

Type

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster2.has_ete

Type

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster2.has_mt_pmu_disable_feature

Type

int

Default value

0x0

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, 0xF: The feature is disabled and is represented by value 0xF in ID_AA64DFR0_EL1.MTPMU.

subcluster2.has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster2.has_v8_7_spe_inverted_filtering**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events.

subcluster2.has_v8_7_spe_previous_branch_target**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented.

subcluster2.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster2.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster2.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster2.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster2.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster2.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster2.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster2.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster2.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster2.mpam_has_altsp**Type**

bool

Default value

0x0

MPAM Whether MPAMIDR_EL1.HAS_ALTSP bit is set or clear.

subcluster2.mpamidr_has_force_ns**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster2.mpamidr_has_sdeflt**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster2.mpamidr_has_tidr**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear. Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster2.pmu-num_counters**Type**

int

Default value

0x1f

Number of PMU counters implemented.

subcluster2.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster2.tcr_txsz_undersize_should_fault**Type**

bool

Default value

0x0

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

subcluster2.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster2.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster2.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.44 ARMCortexA710CT

ARMCortexA710CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-361: IP revisions support

Revision	Quality level
r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA710CT

This model has the following Iris instances:

Table 3-362: ARMCortexA710CT Iris instances

InstanceName	ComponentName
ARMCortexA710CT	Cluster_ARM_Cortex-A710

ARMCortexA710CT contains the following CADI targets:

- ARM_Cortex-A710
- Cluster_ARM_Cortex-A710
- PVCache
- TlbCadi

About ARMCortexA710CT

The model supports the following features:

- DynamIQ Shared Unit-110 (DSU-110) system registers.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- PChannel for the cluster and for each core.
- BROADCASTPERSIST pin.
- Optional peripheral port.
- L3Cache partition.
- Per-core clock.
- Utility bus.
- AArch32 at EL0.

Support for the following features is planned for a future release:

- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (the Arm TLM2 extensions) bus protocols.
- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, and nPMBIRQ signals.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.

- Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- Error correction or detection features.
- Self-test features (MBIST).
- Snoop filtering.

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA710CT

Table 3-364: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[12]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal

Name	Protocol	Type	Description
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[12]	Signal	Master	Timer signals to SOC
CNTHVIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[12]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[12]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[12]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[12]	Signal	Master	Timer signals to SOC.
commirq[12]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[12]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[12]	PChannel	Master	Core PCSM signals
core_powerdown_out[12]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[12]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[12]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[12]	Signal	Slave	Disable cryptography extensions after reset.
cti[12]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[12]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[12]	Signal	Master	No power-down request.
dbgpwrupreq[12]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[12]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.

Name	Protocol	Type	Description
gicreset	Signal	Master	An output from PPU's that can be used to reset GICCLK domain components
gicv3_redistributor_s[12]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[12]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[12]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[12]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[12]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[12]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[12]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[12]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[12]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[12]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[12]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[12]	Signal	Slave	Virtualised FIQ.
virq[12]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[12]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA710CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT

Type

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x1

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x2

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_peripheral_port

Type

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x8000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l3cache-size`**Type**

int

Default value

0x0

L3 Cache size in bytes.

`l3cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_issue_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-write_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory_tagging_support_level**Type**

int

Default value

0x2

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop

Type
int
Default value
0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency

Type
int
Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.45 **ARMCortexA715CT**

ARMCortexA715CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-365: IP revisions support

Revision	Quality level
r1p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA715CT

This model has the following Iris instances:

Table 3-366: ARMCortexA715CT Iris instances

InstanceName	ComponentName
ARMCortexA715CT	Cluster_ARM_Cortex-A715

ARMCortexA715CT contains the following CADI targets:

- ARM_Cortex-A715
- Cluster_ARM_Cortex-A715
- PVCache
- TlbCadi

About ARMCortexA715CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- DynamIQ r3p0.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.
- Utility bus.
- Support for Interrupt signals from SPE is added as `pmbirq[8]`.

Support for the following features is planned for a future release:

- TRBE.
- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols.
- Core-Complex.
- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRRET`, `COREINSTRRUN`, or `nPMBIRQ` signals.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

The `cfgsdisable` signal will be removed in a future release.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.

- Cache stashing capability.
- Embedded Logic Analyzer (ELA).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Limitations

- Some of the SVE instructions do not raise undefined exceptions when SP is used as a source register.

Ports for ARMCortexA715CT

Table 3-368: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[12]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal

Name	Protocol	Type	Description
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[12]	Signal	Master	Timer signals to SOC
CNTHVIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[12]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[12]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[12]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[12]	Signal	Master	Timer signals to SOC.
commirq[12]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[12]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[12]	PChannel	Master	Core PCSM signals
core_powerdown_out[12]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[12]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[12]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[12]	Signal	Slave	Disable cryptography extensions after reset.
cti[12]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[12]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[12]	Signal	Master	No power-down request.
dbgpwrupreq[12]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[12]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.

Name	Protocol	Type	Description
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[12]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[12]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[12]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[12]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[12]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[12]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[12]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[12]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[12]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[12]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[12]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[12]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[12]	Signal	Slave	Virtualised FIQ.
virq[12]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Name	Protocol	Type	Description
vsei[12]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A715CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

`cpi_div`**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

`cpuX.CFGTE`**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

`cpuX.CRYPTODISABLE`**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

error_record_feature_register**Type**

string

Default value

```
"[{\"ED\":0x2,\"IMPDEF_3_2\":0x1,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x2,\"TS\":0x0,\"Visibility\":\"Cluster\"},{\"ED\":0x2,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0}],"
```

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x1

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_statistical_profiling

Type

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x8000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use $(n * \text{accumulator value})$ to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

pseudo_fault_generation_feature_register**Type**

string

Default value

```
"[{\"OF\":true, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1,
  \"CI\":true, \"ER\":false, \"PN\":true, \"AV\":false, \"MV\":true, \"SYN\":true, \"R\":true},{\"OF
  \":false, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1, \"CI
  \":false, \"ER\":false, \"PN\":false, \"AV\":false, \"MV\":false, \"SYN\":false, \"R\":true}]"
```

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and

NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.46 ARM Cortex A720AECT

ARM Cortex A720AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-369: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM Cortex A720AECT

This model has the following Iris instances:

Table 3-370: ARM Cortex A720AECT Iris instances

InstanceName	ComponentName
ARM Cortex A720AECT	Cluster_ARM_Cortex-A720AE
ARM Cortex A720AECT.AMU	PVBusLogger
ARM Cortex A720AECT.AMU.mapper	PVBusMapper
ARM Cortex A720AECT.DAP	PVBusLogger
ARM Cortex A720AECT.DAP.mapper	PVBusMapper
ARM Cortex A720AECT.DSU	DSU

ARMCortexA720AECT.ext_bus.mapper	PVBusMapper
ARMCortexA720AECT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexA720AECT contains the following CADI targets:

- ARM_Cortex-A720AE
- Cluster_ARM_Cortex-A720AE
- PVCache
- TlbCadi

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, cpu0 and cpu1 identify the available cores and associated ports, not cpu0 and cpu2.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA720AECT

Table 3-372: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[14]	PChannel	Master	Core PCSM signals
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgpwrupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.

Name	Protocol	Type	Description
pmbirq[14]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA720AECT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cluster_split_lock_config**Type**

int

Default value

0x1

Default SPLIT/LOCKED config. The valid values are: 1 - Only LOCKED mode support, 4 - Only SPLIT mode support, 5 - SPLIT or MIXED mode support. Valid only when enable_ae_features is true.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`default_opmode`**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamlQ diagnostic messages.

enable_lock_step**Type**

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.ETE_REVISION**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_impdef_transient_fault_protection**Type**

bool

Default value

0x1

Support the Transient Fault Protection (TFP) flop parity errors through RAS registers (FEAT_TFP).

has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`icache-maintenance_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.47 ARMCortexA720CT

ARMCortexA720CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-373: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA720CT

This model has the following Iris instances:

ARMCortexA720CT contains the following CADI targets:

- ARM_Cortex-A720
- Cluster_ARM_Cortex-A720
- PVCache
- TlbCadi

About ARMCortexA720CT

The model supports the following features:

- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- Internal PPU support is present.
- A P-Channel for the cluster and for each core.
- BROADCASTPERSIST pin.
- Optional peripheral port.
- Memory-mapped register access to MPAM.
- Per-core clock.
- Utility bus.

Support for the following features is planned for a future release:

- DSU-120 system features are not fully implemented.
- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols.
- Core-Complex.
- BROADCASTCACHEMAINTPOU pin

- COREINSTRET and COREINSTRRUN signals.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not supported but signals are implemented.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Cache stashing capability.

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA720CT

Table 3-376: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.

Name	Protocol	Type	Description
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[14]	PChannel	Master	Core PCSM signals
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgpwrupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[14]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA720CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-size`**Type**

int

Default value

0x80000

L2 Cache size in bytes.

`cpuX.l2cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.ETE_REVISION**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

`icache-state_modelled`**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`instruction_tlb_size`**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

`l3cache-has_mpam`**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

`l3cache-hit_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l3cache-size

Type

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

l3cache-snoop_issue_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-ways

Type

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory_tagging_support_level

Type

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_acp

Type

int

Default value

0x0

Number of ACP ports.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP

Type
bool

Default value
0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.48 ARMCortexA725CT

ARMCortexA725CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-377: IP revisions support

Revision	Quality level
rOp0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA725CT

This model has the following Iris instances:

Table 3-378: ARMCortexA725CT Iris instances

InstanceName	ComponentName
ARMCortexA725CT	Cluster_ARM_Cortex-A725
ARMCortexA725CT.AMU	PVBusLogger
ARMCortexA725CT.AMU.mapper	PVBusMapper
ARMCortexA725CT.DAP	PVBusLogger
ARMCortexA725CT.DAP.mapper	PVBusMapper
ARMCortexA725CT.DSU	DSU
ARMCortexA725CT.DSU.PPU_cluster	PPUv1
ARMCortexA725CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA725CT.DSU.PPU_core0	PPUv1
ARMCortexA725CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA725CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA725CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA725CT.DSU.shared_cache	PVCache
ARMCortexA725CT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMCortexA725CT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMCortexA725CT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMCortexA725CT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMCortexA725CT.DSU.shared_cache.upstream[4]	PVBusSlave
ARMCortexA725CT.DSU.utility_slave[0]	PVBusSlave

ARMCortexA725CT.ext_bus	PVBusLogger
ARMCortexA725CT.ext_bus.mapper	PVBusMapper
ARMCortexA725CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexA725CT contains the following CADI targets:

- ARM_Cortex-A725
- Cluster_ARM_Cortex-A725
- PVCache
- TlbCadi

Ports for ARMCortexA725CT

Table 3-380: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmpchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[14]	PChannel	Master	Core PCSM signals
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgpwrupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.

Name	Protocol	Type	Description
pmbirq[14]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA725CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMPO input signal).

AEND1_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.ETE_REVISION**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x1

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use $(n * \text{accumulator value})$ to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP

Type
bool

Default value
0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.49 **ARMCortexA725CT_CortexX925CT**

ARMCortexA725CT_CortexX925CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-381: IP revisions support

Revision	Quality level
CortexA725 r0p0	Preliminary support
CortexX925 r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA725CT_CortexX925CT

This model has the following Iris instances:

Table 3-382: ARMCortexA725CT_CortexX925CT Iris instances

InstanceName	ComponentName
ARMCortexA725CT_CortexX925CT	Cluster_ARM_CortexA725_CortexX925_Heterogeneous
ARMCortexA725CT_CortexX925CT.AMU	PVBusLogger
ARMCortexA725CT_CortexX925CT.AMU.mapper	PVBusMapper
ARMCortexA725CT_CortexX925CT.DAP	PVBusLogger
ARMCortexA725CT_CortexX925CT.DAP.mapper	PVBusMapper
ARMCortexA725CT_CortexX925CT.DSU	DSU
ARMCortexA725CT_CortexX925CT.DSU.PPU_cluster	PPUv1
ARMCortexA725CT_CortexX925CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.PPU_core0	PPUv1
ARMCortexA725CT_CortexX925CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.PPU_core1	PPUv1
ARMCortexA725CT_CortexX925CT.DSU.PPU_core1.busslave	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA725CT_CortexX925CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.shared_cache	PVCache
ARMCortexA725CT_CortexX925CT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.shared_cache.upstream[4]	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.shared_cache.upstream[5]	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.shared_cache.upstream[6]	PVBusSlave
ARMCortexA725CT_CortexX925CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA725CT_CortexX925CT.MMAP	PVBusLogger
ARMCortexA725CT_CortexX925CT.MMAP.mapper	PVBusMapper
ARMCortexA725CT_CortexX925CT.RAS	PVBusLogger
ARMCortexA725CT_CortexX925CT.RAS.mapper	PVBusMapper
ARMCortexA725CT_CortexX925CT.ext_bus	PVBusLogger
ARMCortexA725CT_CortexX925CT.ext_bus.mapper	PVBusMapper
ARMCortexA725CT_CortexX925CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA725CT_CortexX925CT.subcluster0	Subcluster_ARM_Cortex-A725
ARMCortexA725CT_CortexX925CT.subcluster0.cpu0	ARM_Cortex-A725

ARMCortexA725CT_CortexX925CT contains the following CADI targets:

- ARM_Cortex-A725
- ARM_Cortex-X925

- Cluster_ARM_CortexA725_CortexX925_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A725
- Subcluster_ARM_Cortex-X925
- TlbCadi

About ARMCortexA725CT_CortexX925CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-13 (ARMCortexA725CT).

subcluster1.NUM_CORES

Possible values are 1-13 (ARMCortexX925CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-12]` for cores in `subcluster0`.
- `<port_name>[13-25]` for cores in `subcluster1`.

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [3.5.48 ARMCortexA725CT](#) on page 2269.
- [3.5.74 ARMCortexX925CT](#) on page 2808.

Ports for ARMCortexA725CT_CortexX925CT

Table 3-384: Ports

Name	Protocol	Type	Description
<code>acp_s[2]</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDOMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[26]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[26]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[26]	Signal	Master	Timer signals to SOC
CNTHVIRQ[26]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[26]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[26]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[26]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[26]	Signal	Master	Timer signals to SOC.
commirq[26]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[26]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.

Name	Protocol	Type	Description
core_pcsmpchannel[26]	PChannel	Master	Core PCSM signals
core_powerdown_out[26]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[26]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[26]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[26]	Signal	Slave	Disable cryptography extensions after reset.
cti[26]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[26]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[26]	Signal	Master	No power-down request.
dbgpwrupreq[26]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[26]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[26]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[26]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[26]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[26]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[26]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[26]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.

Name	Protocol	Type	Description
pvbush_m0	PVBus	Master	The core will generate bus requests on this port.
pvbush_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[26]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[26]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[26]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[26]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[26]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[26]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[26]	Signal	Slave	Virtualised FIQ.
virq[26]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[26]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA725CT_CortexX925CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used

instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

subcluster0.CPUCFR

Type

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES

Type

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.max_code_cache_mb`**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster0.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster0.ete.CLAIMTAGS`**Type**

int

Default value

0x4

Number of claim tags.

`subcluster0.ete.ETE_REVISION`**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

`subcluster0.ete.MAX_INST_PER_Q`**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster0.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster0.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x1

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster0.ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster0.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

subcluster0.has_statistical_profiling**Type**

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

subcluster0.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster0.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster0.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster0.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster0.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster1.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-ways`**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

`subcluster1.cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.max_code_cache_mb`**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster1.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster1.ecv_support_level`**Type**

int

Default value

0x2

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

`subcluster1.ete.CLAIMTAGS`**Type**

int

Default value

0x4

Number of claim tags.

`subcluster1.ete.MAX_INST_PER_Q`**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster1.ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3). Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster1.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.has_mt_pmu_disable_feature**Type**

int

Default value

0x0

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, 0xF: The feature is disabled and is represented by value 0xF in ID_AA64DFR0_EL1.MTPMU.

subcluster1.has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster1.has_v8_7_spe_inverted_filtering**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events.

subcluster1.has_v8_7_spe_previous_branch_target**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented.

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster1.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster1.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster1.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster1.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster1.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster1.mpam_has_altsp**Type**

bool

Default value

0x0

MPAM Whether MPAMIDR_EL1.HAS_ALTSP bit is set or clear.

subcluster1.mpamidr_has_force_ns**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster1.mpamidr_has_sdeflt**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster1.mpamidr_has_tidr**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

subcluster1.pmu-num_counters**Type**

int

Default value

0x1f

Number of PMU counters implemented.

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster1.tcr_txsz_undersize_should_fault**Type**

bool

Default value

0x0

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat_PAC_as_NOP

Type
bool

Default value
0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster1.walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.50 ARMCortexM0CT

ARMCortexM0CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-385: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM0CT

This model has the following Iris instances:

Table 3-386: ARMCortexM0CT Iris instances

InstanceName	ComponentName
ARMCortexM0CT	ARM_Cortex-M0
ARMCortexM0CT.acp_mapper	PVBusMapper
ARMCortexM0CT.ext_bus	PVBusLogger
ARMCortexM0CT.ext_bus.mapper	PVBusMapper
ARMCortexM0CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-387: ARMCortexM0CT MTI instances

InstanceName	ComponentName
ARMCortexM0CT	ARM_Cortex-M0
ARMCortexM0CT.acp_mapper	PVBusMapper
ARMCortexM0CT.ext_bus	PVBusLogger
ARMCortexM0CT.ext_bus.mapper	PVBusMapper
ARMCortexM0CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexM0CT contains the following CADI targets:

- ARM_Cortex-M0

Differences between the model and the RTL

This model does not have a parameter that is equivalent to the RAR integration option. The architecturally-required register state is reset.

This model exposes a VTOR register through CADI but this register does not exist in the IP.

Armv6-M is a subset of Armv7-M. Arm does not guarantee that all Armv7-M-specific behavior is absent from Armv6-M Fast Models cores. Therefore, Arm does not guarantee that code that runs on Armv7-M cores but fails on Armv6-M cores will also fail on Armv6-M Fast Models cores.

Ports for ARMCortexM0CT

Table 3-388: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	Value	Master	Current execution priority.
edbgrq	Signal	Slave	External debug request.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[32]	Signal	Slave	This signal array delivers signals to the NVIC.

Name	Protocol	Type	Description
intnmi	Signal	Slave	Configure non maskable interrupt.
lockup	Signal	Master	Asserted when the processor is in lockup state.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
stcalib	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARM Cortex M0CT

BIGENDINIT

Type

bool

Default value

0x0

Initialize processor to big endian mode.

BKPT

Type

int

Default value

0x4

Number of breakpoint unit comparators implemented.

DBG

Type

bool

Default value

0x1

Set whether debug extensions are implemented.

NUM_IRQ**Type**

int

Default value

0x20

Number of user interrupts.

SYST**Type**

bool

Default value

0x1

Enable support for SysTick timer functionality.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

WPT**Type**

int

Default value

0x2

Number of watchpoint unit comparators implemented.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit

Type
int

Default value
0x20700000

Virtual address of top of heap.

semihosting-stack_base

Type
int

Default value
0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit

Type
int

Default value
0x20700000

Virtual address of stack limit.

3.5.51 ARMCortexM0PlusCT

ARMCortexM0PlusCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-389: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM0PlusCT

This model has the following Iris instances:

Table 3-390: ARMCortexM0PlusCT Iris instances

InstanceName	ComponentName
ARMCortexM0PlusCT	ARM_Cortex-M0+
ARMCortexM0PlusCT.acp_mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexM0PlusCT.ext_bus	PVBusLogger
ARMCortexM0PlusCT.ext_bus.mapper	PVBusMapper
ARMCortexM0PlusCT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-391: ARMCortexM0PlusCT MTI instances

InstanceName	ComponentName
ARMCortexM0PlusCT	ARM_Cortex-M0plus
ARMCortexM0PlusCT.acp_mapper	PVBusMapper
ARMCortexM0PlusCT.ext_bus	PVBusLogger
ARMCortexM0PlusCT.ext_bus.mapper	PVBusMapper
ARMCortexM0PlusCT.l2_flusher	AsyncCacheFlushUnit

ARMCortexM0PlusCT contains the following CADI targets:

- ARM_Cortex-M0+

Differences between the model and the RTL

This model does not have a parameter that is equivalent to the RAR integration option. The architecturally required register state is reset.

This model does not have a parameter that is equivalent to the RAR integration option. The architecturally-required register state is reset.

This model exposes a VTOR register through CADI but this register does not exist in the IP.

Armv6-M is a subset of Armv7-M. Arm does not guarantee that all Armv7-M-specific behavior is absent from Armv6-M Fast Models cores. Therefore, Arm does not guarantee that code that runs on Armv7-M cores but fails on Armv6-M cores will also fail on Armv6-M Fast Models cores.

Ports for ARMCortexM0PlusCT

Table 3-392: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
cpuwait	Signal	Slave	CPUWAIT extends effect of reset when true
currpri	Value	Master	Current execution priority.
edbgrq	Signal	Slave	External debug request.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[32]	Signal	Slave	This signal array delivers signals to the NVIC.

Name	Protocol	Type	Description
intnmi	Signal	Slave	Configure non maskable interrupt.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
lockup	Signal	Master	Asserted when the processor is in lockup state.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
stcalib	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARMCortexM0PlusCT

BIGENDINIT

Type

bool

Default value

0x0

Initialize processor to big endian mode.

BKPT

Type

int

Default value

0x4

Number of breakpoint unit comparators implemented.

DBG**Type**

bool

Default value

0x1

Set whether debug extensions are implemented.

IOP**Type**

bool

Default value

0x0

Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in.

IRQDIS**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n].

NUM_IRQ**Type**

int

Default value

0x20

Number of user interrupts.

NUM_MPU_REGION**Type**

int

Default value

0x0

Number of MPU regions.

SYST**Type**

bool

Default value

0x1

Enable support for SysTick timer functionality.

USER**Type**

bool

Default value

0x0

Enable support for Unprivileged/Privileged Extension.

VTOR**Type**

bool

Default value

0x0

Include Vector Table Offset Register.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

WPT**Type**

int

Default value

0x2

Number of watchpoint unit comparators implemented.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base

Type
int

Default value
0x0

Virtual address of heap base.

semihosting-heap_limit

Type
int

Default value
0x20700000

Virtual address of top of heap.

semihosting-stack_base

Type
int

Default value
0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit

Type
int

Default value
0x20700000

Virtual address of stack limit.

3.5.52 ARMCortexM3CT

ARMCortexM3CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-393: IP revisions support

Revision	Quality level
r2p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexM3CT

This model has the following Iris instances:

Table 3-394: ARM CortexM3CT Iris instances

InstanceName	ComponentName
ARM CortexM3CT	ARM_Cortex-M3
ARM CortexM3CT.acp_mapper	PVBusMapper
ARM CortexM3CT.ext_bus	PVBusLogger
ARM CortexM3CT.ext_bus.mapper	PVBusMapper
ARM CortexM3CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-395: ARM CortexM3CT MTI instances

InstanceName	ComponentName
ARM CortexM3CT	ARM_Cortex-M3
ARM CortexM3CT.acp_mapper	PVBusMapper
ARM CortexM3CT.ext_bus	PVBusLogger
ARM CortexM3CT.ext_bus.mapper	PVBusMapper
ARM CortexM3CT.l2_flusher	AsyncCacheFlushUnit

ARM CortexM3CT contains the following CADI targets:

- ARM_Cortex-M3

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The WIC is not currently implemented.
- Power control is not implemented, so the processor does not set the SLEEPING or SLEEPDEEP signals. It does not support powering down of the processor.
- Only the minimal level of debug support is provided (no DAP, FPB, DWT, or halting debug capability).
- Debug-related components are not implemented.
- The unimplemented registers are the processor debug registers, system debug registers, debug interface port registers, TPIU registers, and ETM registers.
- The processor must still be clocked even if it has asserted the sleeping or sleepdeep signals.
- Disabling processor features using the Auxiliary Control Register is not supported.
- Only a single pvbus_m master port is provided. This combines the ICode, DCode, and System bus interfaces of the RTL. The external PPB bus is provided by the pv_ppbus_m master port.
- In privileged mode, STRT and LDRT to the PPB region are not forbidden access.
- No support for ETM, TPIU, or HTM.

- There is no supported equivalent of the RESET_ALL_REGS configuration setting in RTL (that forces all registers to have a well-defined value on reset).
- The RTL implements the ROM table as an external component on the External Private Peripheral Bus. In the CT model, the ROM table is implemented internally as a fallback if an external PPB access in the ROM table address region aborts. This permits the default ROM table to be overridden (by implementing an external component connected to the external PPB to handle accesses to these addresses) without requiring every user of the processor to implement and connect a ROM table component.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called ITM. The ITM trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Field value	Description	Supported by model
ITM_SYNC	Synchronization packet	Not supported.
ITM_P_OVERFLOW	Protocol: Overflow packet	Not supported.
ITM_P_LOCAL_TIMESTAMP	Protocol: Local timestamp packets	Not supported.
ITM_P_GLOBAL_TIMESTAMP	Protocol: Global timestamp packets	Not supported.
ITM_P_EXTEN	Protocol: Extension packet	Not supported.
ITM_S_INSTRUMENTATION	Source: Instrumentation packet	Supported.
ITM_S_DWT_EVENT_COUNTER	Hardware source: Event counter wrapping	Not supported.
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Ports for ARM CortexM3CT

Table 3-397: Ports

Name	Protocol	Type	Description
ahb_ap	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	Value	Master	Current execution priority.
edbgrq	Signal	Slave	External debug request.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[240]	Signal	Slave	This signal array delivers signals to the NVIC.
intnmi	Signal	Slave	Configure non maskable interrupt.

Name	Protocol	Type	Description
lockup	Signal	Master	Asserted when the processor is in lockup state.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pdbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
stcalib	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARM CortexM3CT

BB_PRESENT

Type

bool

Default value

0x1

Enable bitbanding.

BIGENDINIT

Type

bool

Default value

0x0

Initialize processor to big endian mode.

DBGLVL

Type

int

Default value

0x3

0: No debug; 1: Minimal debug; 2: Full debug without DWT address matching; 3: Full debug support with DWT data-comparators.

LVL_WIDTH**Type**

int

Default value

0x3

Number of bits of interrupt priority.

NUM_IRQ**Type**

int

Default value

0x10

Number of user interrupts.

NUM_MPU_REGION**Type**

int

Default value

0x8

Number of MPU regions.

TRACE_LVL**Type**

int

Default value

0x1

Level of instrumentation trace supported. 0: No trace, 1: Standard trace. ITM, TPIU and DWT triggers and counters present, 2: Full trace. ITM, TPIU, ETM and DWT triggers and counters present.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base

Type
int

Default value
0x0

Virtual address of heap base.

semihosting-heap_limit

Type
int

Default value
0x20700000

Virtual address of top of heap.

semihosting-stack_base

Type
int

Default value
0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit

Type
int

Default value
0x20700000

Virtual address of stack limit.

3.5.53 ARMCortexM4CT

ARMCortexM4CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-398: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexM4CT

This model has the following Iris instances:

Table 3-399: ARM CortexM4CT Iris instances

InstanceName	ComponentName
ARM CortexM4CT	ARM_Cortex-M4
ARM CortexM4CT.acp_mapper	PVBusMapper
ARM CortexM4CT.ext_bus	PVBusLogger
ARM CortexM4CT.ext_bus.mapper	PVBusMapper
ARM CortexM4CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-400: ARM CortexM4CT MTI instances

InstanceName	ComponentName
ARM CortexM4CT	ARM_Cortex-M4
ARM CortexM4CT.acp_mapper	PVBusMapper
ARM CortexM4CT.ext_bus	PVBusLogger
ARM CortexM4CT.ext_bus.mapper	PVBusMapper
ARM CortexM4CT.l2_flusher	AsyncCacheFlushUnit

ARM CortexM4CT contains the following CADI targets:

- ARM_Cortex-M4

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The Wakeup Interrupt Controller (WIC) is not implemented.
- Power control is not implemented. Powering down of the processor is not supported. The processor must still be clocked even if it has asserted the sleeping or sleepdeep signals.
- Only the minimal level of debug support is provided (no DAP, FPB, DWT, or halting debug capability).
- No debug-related components are implemented.
- The unimplemented registers are the processor debug registers, system debug registers, debug interface port registers, TPIU registers, and ETM registers.
- No support for ETM, TPIU, or HTM.
- There is no supported equivalent of the RESET_ALL_REGS configuration setting in RTL (that forces all registers to have a well-defined value on reset).
- Disabling processor features using the Auxiliary Control Register is not supported.
- Only a single pvbus_m master port is provided. This combines the ICode, DCode, and System bus interfaces of the RTL. The external PPB bus is provided by the pv_ppbus_m master port.

- In privileged mode, STRT and LDRT to the PPB region are not forbidden access.
- The RTL implements the ROM table as an external component on the External Private Peripheral Bus. In the CT model, the ROM table is implemented internally as a fallback if an external PPB access in the ROM table address region aborts. This permits the default ROM table to be overridden (by implementing an external component connected to the external PPB to handle accesses to these addresses) without requiring every user of the processor to implement and connect a ROM table component.
- Because the CT model does not provide a DAP port or halting debug capability, the dbgen signal is ignored.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called ITM. The ITM trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Field value	Description	Supported by model
ITM_SYNC	Synchronization packet	Not supported.
ITM_P_OVERFLOW	Protocol: Overflow packet	Not supported.
ITM_P_LOCAL_TIMESTAMP	Protocol: Local timestamp packets	Not supported.
ITM_P_GLOBAL_TIMESTAMP	Protocol: Global timestamp packets	Not supported.
ITM_P_EXTEN	Protocol: Extension packet	Not supported.
ITM_S_INSTRUMENTATION	Source: Instrumentation packet	Supported.
ITM_S_DWT_EVENT_COUNTER	Hardware source: Event counter wrapping	Not supported.
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Ports for ARMCortexM4CT

Table 3-402: Ports

Name	Protocol	Type	Description
ahb_ap	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	Value	Master	Current execution priority.
dbgen	Signal	Slave	Disallow (DAP) debugger access.
edbgrq	Signal	Slave	External debug request.

Name	Protocol	Type	Description
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpudisable	Signal	Slave	Configure core with no FPU on reset.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
intisr[240]	Signal	Slave	This signal array delivers signals to the NVIC.
intnmi	Signal	Slave	Configure non maskable interrupt.
lockup	Signal	Master	Asserted when the processor is in lockup state.
mpudisable	Signal	Slave	Configure core with no MPU on reset.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
stcalib	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARM CortexM4CT

BB_PRESENT

Type

bool

Default value

0x1

Enable bitbanding.

BIGENDINIT

Type

bool

Default value

0x0

Initialize processor to big endian mode.

DBGLVL**Type**

int

Default value

0x3

0: No debug; 1: Minimal debug; 2: Full debug without DWT address matching; 3: Full debug support with, DWT can compare data as well as address.

LVL_WIDTH**Type**

int

Default value

0x3

Number of bits of interrupt priority.

NUM_IRQ**Type**

int

Default value

0x10

Number of user interrupts.

NUM_MPU_REGION**Type**

int

Default value

0x8

Number of MPU regions.

TRACE_LVL**Type**

int

Default value

0x1

Level of instrumentation trace supported. 0: No trace, 1: Standard trace. ITM, TPIU and DWT triggers and counters present, 2: Full trace. ITM, TPIU, ETM and DWT triggers and counters present.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base**Type**

int

Default value

0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0x20700000

Virtual address of stack limit.

vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

3.5.54 ARMCortexM7CT

ARMCortexM7CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-403: IP revisions support

Revision	Quality level
r1p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM7CT

This model has the following Iris instances:

Table 3-404: ARMCortexM7CT Iris instances

InstanceName	ComponentName
ARMCortexM7CT	ARM_Cortex-M7
ARMCortexM7CT.acp_mapper	PVBusMapper
ARMCortexM7CT.ext_bus	PVBusLogger
ARMCortexM7CT.ext_bus.mapper	PVBusMapper
ARMCortexM7CT.l1_incoherent_interconnect	PVCache
ARMCortexM7CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave

InstanceName	ComponentName
ARMCortexM7CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexM7CT.l1dcache	PVCache
ARMCortexM7CT.l1dcache.upstream[0]	PVBusSlave
ARMCortexM7CT.l1icache	PVCache
ARMCortexM7CT.l1icache.upstream[0]	PVBusSlave
ARMCortexM7CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-405: ARMCortexM7CT MTI instances

InstanceName	ComponentName
ARMCortexM7CT	ARM_Cortex-M7
ARMCortexM7CT.acp_mapper	PVBusMapper
ARMCortexM7CT.ext_bus	PVBusLogger
ARMCortexM7CT.ext_bus.mapper	PVBusMapper
ARMCortexM7CT.l1_incoherent_interconnect	PVCache
ARMCortexM7CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexM7CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexM7CT.l1dcache	PVCache

InstanceName	ComponentName
ARMCortexM7CT.l1dcache.upstream[0]	PVBusSlave
ARMCortexM7CT.l1icache	PVCache
ARMCortexM7CT.l1icache.upstream[0]	PVBusSlave
ARMCortexM7CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexM7CT contains the following CADI targets:

- ARM_Cortex-M7

Differences between the model and the RTL

- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- ECC support is hardware-specific so is not modeled.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called ITM. The ITM trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Field value	Description	Supported by model
ITM_SYNC	Synchronization packet	Not supported.
ITM_P_OVERFLOW	Protocol: Overflow packet	Not supported.
ITM_P_LOCAL_TIMESTAMP	Protocol: Local timestamp packets	Not supported.
ITM_P_GLOBAL_TIMESTAMP	Protocol: Global timestamp packets	Not supported.
ITM_P_EXTEN	Protocol: Extension packet	Not supported.
ITM_S_INSTRUMENTATION	Source: Instrumentation packet	Supported.
ITM_S_DWT_EVENT_COUNTER	Hardware source: Event counter wrapping	Not supported.
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Ports for ARMCortexM7CT

Table 3-407: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
ahbp_m	PVBus	Master	The core will generate Vendor System data accesses on this port.
ahbs	PVBus	Slave	External master (e.g. DMA) can write TCMs (whether or not enabled in xTCMCR).
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.

Name	Protocol	Type	Description
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
cpuwait	Signal	Slave	When this signal is HIGH out of reset, it forces the processor into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven LOW
currpri	Value	Master	Current execution priority.
dap_s	PVBus	Slave	Debug Access Port (DAP).
dbgen	Signal	Slave	Invasive debug enable.
dbgrestart	Signal	Slave	External debug request.
dbgrestarted	Signal	Master	External debug request.
edbgrq	Signal	Slave	External debug request.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpudisable	Signal	Slave	Configure core with no FPU on reset.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
halted	Signal	Master	External debug request.
initahbpen	Signal	Slave	Enable AHBP on the next reset
initvtor	Value	Slave	Initial value of the Vector Table Offset Register (VTOR)
intisr[240]	Signal	Slave	This signal array delivers signals to the NVIC.
intnmi	Signal	Slave	Configure non maskable interrupt.
lockup	Signal	Master	Asserted when the processor is in lockup state.
mpudisable	Signal	Slave	Configure core with no MPU on reset.
niden	Signal	Slave	Non-invasive debug enable.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
stcalib	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARM CortexM7CT

BIGENDINIT

Type

bool

Default value

0x0

Initialize processor to big endian mode.

CFG_AHBPSZ**Type**

int

Default value

0x0

Size of the AHBP port memory region. 0=AHBP disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB.

CTI**Type**

bool

Default value

0x0

CTI (Cross Trigger Interface) included.

CTI_irq0_pin**Type**

int

Default value

0x4

CTI interrupt request 0 pin.

CTI_irq1_pin**Type**

int

Default value

0x5

CTI interrupt request 1 pin.

DBGLVL**Type**

int

Default value

0x1

0: 2 DWT, 4 FPB; 1: 4 DWT, 8 FPB comparators.

DP_FLOAT

Type

bool

Default value

0x1

Support 8-byte floats.

INITAHBPEN

Type

bool

Default value

0x0

The AHBP enable state at reset.

INITVTOR

Type

int

Default value

0x0

vector-table offset at reset.

LVL_WIDTH

Type

int

Default value

0x3

Number of bits of interrupt priority.

NUM_IRQ

Type

int

Default value

0x20

Number of user interrupts.

NUM_MPU_REGION**Type**

int

Default value

0x10

Number of MPU regions.

TRC**Type**

bool

Default value

0x1

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

dcache-size**Type**

int

Default value

0x8000

L1 D-cache size in bytes.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dtcm_enable**Type**

bool

Default value

0x0

Enable DTCM at reset.

dtcm_size**Type**

int

Default value

0x100

DTCM size in KB.

icache-size**Type**

int

Default value

0x8000

L1 I-cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

itcm_enable**Type**

bool

Default value

0x0

Enable ITCM at reset.

itcm_size**Type**

int

Default value

0x100

ITCM size in KB.

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base**Type**

int

Default value

0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0x20700000

Virtual address of stack limit.

vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

3.5.55 ARMCortexM23CT

ARMCortexM23CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-408: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM23CT

This model has the following Iris instances:

Table 3-409: ARMCortexM23CT Iris instances

InstanceName	ComponentName
ARMCortexM23CT	ARM_Cortex-M23
ARMCortexM23CT.acp_mapper	PVBusMapper
ARMCortexM23CT.ext_bus	PVBusLogger
ARMCortexM23CT.ext_bus.mapper	PVBusMapper
ARMCortexM23CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-410: ARMCortexM23CT MTI instances

InstanceName	ComponentName
ARMCortexM23CT	ARM_Cortex-M23
ARMCortexM23CT.acp_mapper	PVBusMapper
ARMCortexM23CT.ext_bus	PVBusLogger
ARMCortexM23CT.ext_bus.mapper	PVBusMapper
ARMCortexM23CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexM23CT contains the following CADI targets:

- ARM_Cortex-M23

Differences between the CT model and RTL implementations

The model does not support MTB, ETM, or TPIU. MTB RAM is absent on the model.

Ports for ARMCortexM23CT

Table 3-411: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
core_dside_bus_gasket_in	PVBus	Slave	-
core_dside_bus_gasket_out	PVBus	Master	-
cpuwait	Signal	Slave	Clear = Core goes through reset sequence as normal, Set = Core waits out of reset.
currpri	Value	Master	Current execution priority.
dap_s	PVBus	Slave	Debug Access Port (DAP).
dbgen	Signal	Slave	Invasive debug control signals. Debug enable, Set=enabled, Clear=disabled
dbgrestart	Signal	Slave	External request to leave debug state
dbgrestartd	Signal	Master	Acknowledge for DBGRESTART
edbgrq	Signal	Slave	External debug request.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
halted	Signal	Master	Core is in halt mode debug state
hreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	Value_64	Slave	64 bit number to invalid IDAU memory range (start_address<<32 end_address)
initvtor	Value	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initvtorns	Value	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.

Name	Protocol	Type	Description
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
irq[240]	Signal	Slave	This signal array delivers signals to the NVIC.
lockup	Signal	Master	Asserted when the processor is in lockup state.
niden	Signal	Slave	Non-invasive debug enable, Set=enabled, Clear=disabled
nmi	Signal	Slave	Configure non maskable interrupt.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
spiden	Signal	Slave	Secure Debug enable , Set=enabled, Clear=disabled
spniden	Signal	Slave	Secure Non-invasive debug enable, Set=enabled, Clear=disabled
stcalib	Value	Slave	This is the calibration value for the Secure (or only, when ARMv8-M Security Extensions are not included) SysTick timer.
stcalibns	Value	Slave	This is the calibration value for the Non-Secure SysTick timer. When ARMv8-M Security Extensions are not included, this port will be ignored.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	Signal	Master	Acknowledge signal for WICENREQ
wicenreq	Signal	Slave	Request for deep sleep to be WIC-based deep sleep.
wicsense[483]	Signal	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Parameters for ARMCortexM23CT

BE

Type

bool

Default value

0x0

Initialize processor to big endian mode.

BKPT**Type**

int

Default value

0x4

Number of breakpoint unit comparators implemented.

CTI**Type**

bool

Default value

0x0

CTI (Cross Trigger Interface) included.

CTI_irq0_pin**Type**

int

Default value

0x4

CTI interrupt request 0 pin.

CTI_irq1_pin**Type**

int

Default value

0x5

CTI interrupt request 1 pin.

DBG**Type**

bool

Default value

0x1

Set whether debug extensions are implemented.

INITVTOR**Type**

int

Default value

0x0

Secure vector-table offset at reset.

INITVTORNS**Type**

int

Default value

0x0

Non-Secure vector-table offset at reset.

IOP**Type**

bool

Default value

0x0

Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in.

IRQDIS0**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0].

IRQDIS1**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32].

IRQDIS2**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64].

IRQDIS3**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96].

IRQDIS4**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128].

IRQDIS5**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160].

IRQDIS6**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192].

IRQDIS7**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224].

MPU_NS**Type**

int

Default value

0x8

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions.

MPU_S**Type**

int

Default value

0x8

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored.

NUMIRQ**Type**

int

Default value

0x10

Number of user interrupts.

SAU**Type**

int

Default value

0x4

Number of SAU regions (0 => no SAU).

SAU_CTRL.ALLNS**Type**

bool

Default value

0x0

At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set.

SAU_CTRL.ENABLE**Type**

bool

Default value

0x0

Enable SAU at reset.

SAU_REGION0.BADDR**Type**

int

Default value

0x0

Base address of SAU region0 at reset.

SAU_REGION0.ENABLE**Type**

bool

Default value

0x0

Enable SAU region0 at reset.

SAU_REGION0.LADDR**Type**

int

Default value

0x0

Limit address of SAU region0 at reset.

SAU_REGION0.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region0 at reset.

SAU_REGION1.BADDR**Type**

int

Default value

0x0

Base address of SAU region1 at reset.

SAU_REGION1.ENABLE**Type**

bool

Default value

0x0

Enable SAU region1 at reset.

SAU_REGION1.LADDR**Type**

int

Default value

0x0

Limit address of SAU region1 at reset.

SAU_REGION1.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region1 at reset.

SAU_REGION2.BADDR**Type**

int

Default value

0x0

Base address of SAU region2 at reset.

SAU_REGION2.ENABLE**Type**

bool

Default value

0x0

Enable SAU region2 at reset.

SAU_REGION2.LADDR**Type**

int

Default value

0x0

Limit address of SAU region2 at reset.

SAU_REGION2.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region2 at reset.

SAU_REGION3.BADDR**Type**

int

Default value

0x0

Base address of SAU region3 at reset.

SAU_REGION3.ENABLE**Type**

bool

Default value

0x0

Enable SAU region3 at reset.

SAU_REGION3.LADDR**Type**

int

Default value

0x0

Limit address of SAU region3 at reset.

SAU_REGION3.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region3 at reset.

SAU_REGION4.BADDR**Type**

int

Default value

0x0

Base address of SAU region4 at reset.

SAU_REGION4.ENABLE**Type**

bool

Default value

0x0

Enable SAU region4 at reset.

SAU_REGION4.LADDR**Type**

int

Default value

0x0

Limit address of SAU region4 at reset.

SAU_REGION4.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region4 at reset.

SAU_REGION5.BADDR**Type**

int

Default value

0x0

Base address of SAU region5 at reset.

SAU_REGION5.ENABLE**Type**

bool

Default value

0x0

Enable SAU region5 at reset.

SAU_REGION5.LADDR**Type**

int

Default value

0x0

Limit address of SAU region5 at reset.

SAU_REGION5.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region5 at reset.

SAU_REGION6.BADDR**Type**

int

Default value

0x0

Base address of SAU region6 at reset.

SAU_REGION6.ENABLE**Type**

bool

Default value

0x0

Enable SAU region6 at reset.

SAU_REGION6.LADDR**Type**

int

Default value

0x0

Limit address of SAU region6 at reset.

SAU_REGION6.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region6 at reset.

SAU_REGION7.BADDR**Type**

int

Default value

0x0

Base address of SAU region7 at reset.

SAU_REGION7.ENABLE**Type**

bool

Default value

0x0

Enable SAU region7 at reset.

SAU_REGION7.LADDR**Type**

int

Default value

0x0

Limit address of SAU region7 at reset.

SAU_REGION7.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region7 at reset.

SECEXT**Type**

bool

Default value

0x1

Whether the ARMv8-M Security Extensions are included.

SYST**Type**

int

Default value

0x2

Include SysTick timer functionality (0=Absent, 1=Secure only, 2=Secure and NS).

VTOR**Type**

bool

Default value

0x1

Include Vector Table Offset Register.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

WICLINES**Type**

int

Default value

0x12

Number of lines supported by the WIC interface.

WPT**Type**

int

Default value

0x4

Number of watchpoint unit comparators implemented.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

has_core_dside_bus_gasket**Type**

bool

Default value

0x0

STL gasket enabled.

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base**Type**

int

Default value

0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0x20700000

Virtual address of stack limit.

3.5.56 ARMCortexM33CT

ARMCortexM33CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-412: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM33CT

This model has the following Iris instances:

Table 3-413: ARMCortexM33CT Iris instances

InstanceName	ComponentName
ARMCortexM33CT	ARM_Cortex-M33
ARMCortexM33CT.acp_mapper	PVBusMapper
ARMCortexM33CT.ext_bus	PVBusLogger
ARMCortexM33CT.ext_bus.mapper	PVBusMapper
ARMCortexM33CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-414: ARMCortexM33CT MTI instances

InstanceName	ComponentName
ARMCortexM33CT	ARM_Cortex-M33
ARMCortexM33CT.acp_mapper	PVBusMapper
ARMCortexM33CT.ext_bus	PVBusLogger
ARMCortexM33CT.ext_bus.mapper	PVBusMapper
ARMCortexM33CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexM33CT contains the following CADI targets:

- ARM_Cortex-M33

Differences between the model and the RTL

The model does not support the following:

- ETM, MTB, CTI, or TPIU. MTB RAM is absent on the model.
- The power control (Q-Channel) interface.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called ITM. The ITM trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Field value	Description	Supported by model
ITM_SYNC	Synchronization packet	Not supported.
ITM_P_OVERFLOW	Protocol: Overflow packet	Not supported.
ITM_P_LOCAL_TIMESTAMP	Protocol: Local timestamp packets	Not supported.
ITM_P_GLOBAL_TIMESTAMP	Protocol: Global timestamp packets	Not supported.
ITM_P_EXTEN	Protocol: Extension packet	Not supported.
ITM_S_INSTRUMENTATION	Source: Instrumentation packet	Supported.
ITM_S_DWT_EVENT_COUNTER	Hardware source: Event counter wrapping	Not supported.
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Ports for ARM CortexM33CT

Table 3-416: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions. Referred to in some documents as 'CLKIN'.
coproc_bus	CoprocBusProtocol	Slave	Co-Processor Interface
cpuwait	Signal	Slave	Stall the CPU out of reset
currns	Signal	Master	Current Security state of the processor
currpri	Value	Master	Current execution priority.
dbgen	Signal	Slave	Invasive debug enable
dbgrestart	Signal	Slave	Request for synchronised exit from halt mode
dbgrestartd	Signal	Master	Handshakes with DBGRESTART
edbgrq	Signal	Slave	External request to enter halt mode
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).

Name	Protocol	Type	Description
halted	Signal	Master	Indicates that the processor is in halt mode
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	Value_64	Slave	64 bit number to invalid IDAU memory range (start_address<<32 end_address)
initnsvtor	Value	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initsvtor	Value	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
intnum	Value	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
irq[480]	Signal	Slave	This signal array delivers signals to the NVIC.
locknsmpu	Signal	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	Signal	Slave	Cortex-M33-specific LOCKNSVTOR, LOCKSVTAIRCR, LOCKSMPU, LOCKNSMPU, LOCKSAU. Disable writes to VTOR_NS
locksau	Signal	Slave	Disable writes to the SAU_* registers
locksmpu	Signal	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	Signal	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
lockup	Signal	Master	Asserted when the processor is in lockup state.
niden	Signal	Slave	Non-invasive debug enable
nmi	Signal	Slave	Configure non maskable interrupt.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
spiden	Signal	Slave	Secure invasive debug enable
spniden	Signal	Slave	Secure non-invasive debug enable
stcalib[2]	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	Signal	Master	Acknowledge signal for WICENREQ
wicenreq	Signal	Slave	Request for deep sleep to be WIC-based deep sleep.

Name	Protocol	Type	Description
wicsense[483]	Signal	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Parameters for ARM Cortex M33CT

BIGENDINIT

Type

bool

Default value

0x0

Initialize processor to big endian mode.

CDEMAPPEDONCP

Type

int

Default value

0xff

Bit N specifies whether the instruction for coprocessor N (CP7:CP0) is redirected to the CDE module.

CDERTLID

Type

int

Default value

0x20

Value of ID_AFR0.CDERTLID.

CFGNOCECP

Type

int

Default value

0x0

Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor.

CPIF

Type

bool

Default value

0x1

Specifies whether the external coprocessor interface is included.

CPNSPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state.

CPSPPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state.

CTI**Type**

bool

Default value

0x0

CTI (Cross Trigger Interface) included.

CTI_irq0_pin**Type**

int

Default value

0x4

CTI interrupt request 0 pin.

CTI_irq1_pin**Type**

int

Default value

0x5

CTI interrupt request 1 pin.

DBG_LVL

Type

int

Default value

0x2

0: Minimal debug; 1: 2 Watchpoints, 4 Breakpoint comparators; 2: 4 Watchpoints, 8 Breakpoint comparators.

DSP

Type

bool

Default value

0x1

Set whether the model has the DSP extension.

FPU

Type

bool

Default value

0x1

Set whether the model has VFP support.

INITNSVTOR

Type

int

Default value

0x0

Non-Secure vector-table offset at reset.

INITSVTOR

Type

int

Default value

0x0

Secure vector-table offset at reset.

IRQDIS0**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0].

IRQDIS1**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32].

IRQDIS10**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320].

IRQDIS11**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352].

IRQDIS12**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384].

IRQDIS13**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416].

IRQDIS14**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448].

IRQDIS2**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64].

IRQDIS3**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96].

IRQDIS4**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128].

IRQDIS5**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160].

IRQDIS6**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192].

IRQDIS7**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224].

IRQDIS8**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256].

IRQDIS9**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288].

IRQLVL**Type**

int

Default value

0x3

Number of bits of interrupt priority.

ITM**Type**

bool

Default value

0x1

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included.

LOCK_NS_MPU**Type**

bool

Default value

0x0

Lock down of Non-Secure MPU registers write.

LOCK_SAU**Type**

bool

Default value

0x0

Lock down of SAU registers write.

LOCK_S_MPU**Type**

bool

Default value

0x0

Lock down of Secure MPU registers write.

MPU_NS**Type**

int

Default value

0x8

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions.

MPU_S**Type**

int

Default value

0x8

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored.

NUMIRQ**Type**

int

Default value

0x20

Number of user interrupts.

SAU**Type**

int

Default value

0x4

Number of SAU regions (0 => no SAU).

SAU_CTRL.ALLNS**Type**

bool

Default value

0x0

At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set.

SAU_CTRL.ENABLE**Type**

bool

Default value

0x0

Enable SAU at reset.

SAU_REGION0.BADDR**Type**

int

Default value

0x0

Base address of SAU region0 at reset.

SAU_REGION0.ENABLE**Type**

bool

Default value

0x0

Enable SAU region0 at reset.

SAU_REGION0.LADDR**Type**

int

Default value

0x0

Limit address of SAU region0 at reset.

SAU_REGION0.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region0 at reset.

SAU_REGION1.BADDR**Type**

int

Default value

0x0

Base address of SAU region1 at reset.

SAU_REGION1.ENABLE**Type**

bool

Default value

0x0

Enable SAU region1 at reset.

SAU_REGION1.LADDR**Type**

int

Default value

0x0

Limit address of SAU region1 at reset.

SAU_REGION1.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region1 at reset.

SAU_REGION2.BADDR**Type**

int

Default value

0x0

Base address of SAU region2 at reset.

SAU_REGION2.ENABLE**Type**

bool

Default value

0x0

Enable SAU region2 at reset.

SAU_REGION2.LADDR**Type**

int

Default value

0x0

Limit address of SAU region2 at reset.

SAU_REGION2.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region2 at reset.

SAU_REGION3.BADDR**Type**

int

Default value

0x0

Base address of SAU region3 at reset.

SAU_REGION3.ENABLE**Type**

bool

Default value

0x0

Enable SAU region3 at reset.

SAU_REGION3.LADDR**Type**

int

Default value

0x0

Limit address of SAU region3 at reset.

SAU_REGION3.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region3 at reset.

SAU_REGION4.BADDR**Type**

int

Default value

0x0

Base address of SAU region4 at reset.

SAU_REGION4.ENABLE**Type**

bool

Default value

0x0

Enable SAU region4 at reset.

SAU_REGION4.LADDR**Type**

int

Default value

0x0

Limit address of SAU region4 at reset.

SAU_REGION4.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region4 at reset.

SAU_REGION5.BADDR**Type**

int

Default value

0x0

Base address of SAU region5 at reset.

SAU_REGION5.ENABLE**Type**

bool

Default value

0x0

Enable SAU region5 at reset.

SAU_REGION5.LADDR**Type**

int

Default value

0x0

Limit address of SAU region5 at reset.

SAU_REGION5.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region5 at reset.

SAU_REGION6.BADDR**Type**

int

Default value

0x0

Base address of SAU region6 at reset.

SAU_REGION6.ENABLE**Type**

bool

Default value

0x0

Enable SAU region6 at reset.

SAU_REGION6.LADDR**Type**

int

Default value

0x0

Limit address of SAU region6 at reset.

SAU_REGION6.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region6 at reset.

SAU_REGION7.BADDR**Type**

int

Default value

0x0

Base address of SAU region7 at reset.

SAU_REGION7.ENABLE**Type**

bool

Default value

0x0

Enable SAU region7 at reset.

SAU_REGION7.LADDR**Type**

int

Default value

0x0

Limit address of SAU region7 at reset.

SAU_REGION7.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region7 at reset.

SECEXT**Type**

bool

Default value

0x1

Whether the ARMv8-M Security Extensions are included.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

WICLINES**Type**

int

Default value

0x23

Number of lines supported by the WIC interface.

cde_impl_name**Type**

string

Default value

""

Name of the CDE implementation for this core (implementation contributed by MTI plugin).

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

has_cde**Type**

bool

Default value

0x0

Enables Custom Datapath Extensions.

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base

Type
int

Default value
0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit

Type
int

Default value
0x20700000

Virtual address of stack limit.

vfp-enable_at_reset

Type
bool

Default value
0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

3.5.57 ARMCortexM35PCT

ARMCortexM35PCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-417: IP revisions support

Revision	Quality level
r1p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM35PCT

This model has the following Iris instances:

Table 3-418: ARMCortexM35PCT Iris instances

InstanceName	ComponentName
ARMCortexM35PCT	ARM_Cortex-M35P

InstanceName	ComponentName
ARMCortexM35PCT.acp_mapper	PVBusMapper
ARMCortexM35PCT.ext_bus	PVBusLogger
ARMCortexM35PCT.ext_bus.mapper	PVBusMapper
ARMCortexM35PCT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-419: ARMCortexM35PCT MTI instances

InstanceName	ComponentName
ARMCortexM35PCT	ARM_Cortex-M35P
ARMCortexM35PCT.acp_mapper	PVBusMapper
ARMCortexM35PCT.ext_bus	PVBusLogger
ARMCortexM35PCT.ext_bus.mapper	PVBusMapper
ARMCortexM35PCT.l2_flusher	AsyncCacheFlushUnit

ARMCortexM35PCT contains the following CADI targets:

- ARM_Cortex-M35P

Differences between the model and the RTL

- The model does not support the following:
 - ETM, MTB, CTI, or TPIU. MTB RAM is absent on the model.
 - Caches.
 - The co-processor interface.
 - The power control (Q-Channel) interface.
- The model does not implement any physical security features.
- Bits[3:0] of the Anti-tampering Features Control Register are supported for read/write. No functionality is implemented.
- Read/write access to the Anti-tampering Features Control Register is supported using SECKEY. No functionality is implemented.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called ITM. The ITM trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Field value	Description	Supported by model
ITM_SYNC	Synchronization packet	Not supported.
ITM_P_OVERFLOW	Protocol: Overflow packet	Not supported.
ITM_P_LOCAL_TIMESTAMP	Protocol: Local timestamp packets	Not supported.

Field value	Description	Supported by model
ITM_P_GLOBAL_TIMESTAMP	Protocol: Global timestamp packets	Not supported.
ITM_P_EXTEN	Protocol: Extension packet	Not supported.
ITM_S_INSTRUMENTATION	Source: Instrumentation packet	Supported.
ITM_S_DWT_EVENT_COUNTER	Hardware source: Event counter wrapping	Not supported.
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Ports for ARMCortexM35PCT

Table 3-421: Ports

Name	Protocol	Type	Description
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions. Referred to in some documents as 'CLKIN'.
coproc_bus	CoprocBusProtocol	Slave	Co-Processor Interface
cpuwait	Signal	Slave	Stall the CPU out of reset
currns	Signal	Master	Current Security state of the processor
currpri	Value	Master	Current execution priority.
dbgen	Signal	Slave	Invasive debug enable
dbgrestart	Signal	Slave	Request for synchronised exit from halt mode
dbgrestarted	Signal	Master	Handshakes with DBGRESTART
edbgrq	Signal	Slave	External request to enter halt mode
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
halted	Signal	Master	Indicates that the processor is in halt mode
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	Value_64	Slave	64 bit number to invalid IDAU memory range (start_address<<32 end_address)
initnsvtor	Value	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.

Name	Protocol	Type	Description
initsvtor	Value	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
intnum	Value	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
irq[480]	Signal	Slave	This signal array delivers signals to the NVIC.
LOCKATFCR	Signal	Slave	Port Lock ATFCR register
locknsmpu	Signal	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	Signal	Slave	Disable writes to VTOR_NS
locksau	Signal	Slave	Disable writes to the SAU_* registers
locksmpu	Signal	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	Signal	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
lockup	Signal	Master	Asserted when the processor is in lockup state.
niden	Signal	Slave	Non-invasive debug enable
nmi	Signal	Slave	Configure non maskable interrupt.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pdbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
spiden	Signal	Slave	Secure invasive debug enable
spniden	Signal	Slave	Secure non-invasive debug enable
stcalib[2]	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	Signal	Master	Acknowledge signal for WICENREQ
wicenreq	Signal	Slave	Request for deep sleep to be WIC-based deep sleep.
wicsense[483]	Signal	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Parameters for ARM CortexM35PCT

ATFINITEN

Type

bool

Default value

0x0

ATFCR is enabled when the core goes out of reset.

BIGENDINIT**Type**

bool

Default value

0x0

Initialize processor to big endian mode.

CPIF**Type**

bool

Default value

0x1

Specifies whether the external coprocessor interface is included.

CPNSPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state.

CPSPPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state.

CTI**Type**

bool

Default value

0x0

CTI (Cross Trigger Interface) included.

CTI_irq0_pin**Type**

int

Default value

0x4

CTI interrupt request 0 pin.

CTI_irq1_pin**Type**

int

Default value

0x5

CTI interrupt request 1 pin.

DBGLVL**Type**

int

Default value

0x2

0: Minimal debug; 1: 2 Watchpoints, 4 Breakpoint comparators; 2: 4 Watchpoints, 8 Breakpoint comparators.

DSP**Type**

bool

Default value

0x1

Set whether the model has the DSP extension.

FPU**Type**

bool

Default value

0x1

Set whether the model has VFP support.

INITNSVTOR**Type**

int

Default value

0x0

Non-Secure vector-table offset at reset.

INITSVTOR**Type**

int

Default value

0x0

Secure vector-table offset at reset.

IRQDIS0**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0].

IRQDIS1**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32].

IRQDIS10**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320].

IRQDIS11**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352].

IRQDIS12**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384].

IRQDIS13**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416].

IRQDIS14**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448].

IRQDIS2**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64].

IRQDIS3**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96].

IRQDIS4**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128].

IRQDIS5**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160].

IRQDIS6**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192].

IRQDIS7**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224].

IRQDIS8**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256].

IRQDIS9**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288].

IRQLVL**Type**

int

Default value

0x3

Number of bits of interrupt priority.

ITM**Type**

bool

Default value

0x1

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included.

LOCK_NS_MPU**Type**

bool

Default value

0x0

Lock down of Non-Secure MPU registers write.

LOCK_SAU**Type**

bool

Default value

0x0

Lock down of SAU registers write.

LOCK_S_MPU**Type**

bool

Default value

0x0

Lock down of Secure MPU registers write.

MPU_NS**Type**

int

Default value

0x8

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions.

MPU_S**Type**

int

Default value

0x8

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored.

NUMIRQ**Type**

int

Default value

0x20

Number of user interrupts.

SAU**Type**

int

Default value

0x4

Number of SAU regions (0 => no SAU).

SAU_CTRL.ALLNS**Type**

bool

Default value

0x0

At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set.

SAU_CTRL.ENABLE**Type**

bool

Default value

0x0

Enable SAU at reset.

SAU_REGION0.BADDR**Type**

int

Default value

0x0

Base address of SAU region0 at reset.

SAU_REGION0.ENABLE**Type**

bool

Default value

0x0

Enable SAU region0 at reset.

SAU_REGION0.LADDR**Type**

int

Default value

0x0

Limit address of SAU region0 at reset.

SAU_REGION0.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region0 at reset.

SAU_REGION1.BADDR**Type**

int

Default value

0x0

Base address of SAU region1 at reset.

SAU_REGION1.ENABLE**Type**

bool

Default value

0x0

Enable SAU region1 at reset.

SAU_REGION1.LADDR**Type**

int

Default value

0x0

Limit address of SAU region1 at reset.

SAU_REGION1.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region1 at reset.

SAU_REGION2.BADDR**Type**

int

Default value

0x0

Base address of SAU region2 at reset.

SAU_REGION2.ENABLE**Type**

bool

Default value

0x0

Enable SAU region2 at reset.

SAU_REGION2.LADDR**Type**

int

Default value

0x0

Limit address of SAU region2 at reset.

SAU_REGION2.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region2 at reset.

SAU_REGION3.BADDR**Type**

int

Default value

0x0

Base address of SAU region3 at reset.

SAU_REGION3.ENABLE**Type**

bool

Default value

0x0

Enable SAU region3 at reset.

SAU_REGION3.LADDR**Type**

int

Default value

0x0

Limit address of SAU region3 at reset.

SAU_REGION3.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region3 at reset.

SAU_REGION4.BADDR**Type**

int

Default value

0x0

Base address of SAU region4 at reset.

SAU_REGION4.ENABLE**Type**

bool

Default value

0x0

Enable SAU region4 at reset.

SAU_REGION4.LADDR**Type**

int

Default value

0x0

Limit address of SAU region4 at reset.

SAU_REGION4.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region4 at reset.

SAU_REGION5.BADDR**Type**

int

Default value

0x0

Base address of SAU region5 at reset.

SAU_REGION5.ENABLE**Type**

bool

Default value

0x0

Enable SAU region5 at reset.

SAU_REGION5.LADDR**Type**

int

Default value

0x0

Limit address of SAU region5 at reset.

SAU_REGION5.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region5 at reset.

SAU_REGION6.BADDR**Type**

int

Default value

0x0

Base address of SAU region6 at reset.

SAU_REGION6.ENABLE**Type**

bool

Default value

0x0

Enable SAU region6 at reset.

SAU_REGION6.LADDR**Type**

int

Default value

0x0

Limit address of SAU region6 at reset.

SAU_REGION6.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region6 at reset.

SAU_REGION7.BADDR**Type**

int

Default value

0x0

Base address of SAU region7 at reset.

SAU_REGION7.ENABLE**Type**

bool

Default value

0x0

Enable SAU region7 at reset.

SAU_REGION7.LADDR**Type**

int

Default value

0x0

Limit address of SAU region7 at reset.

SAU_REGION7.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region7 at reset.

SECEXT**Type**

bool

Default value

0x1

Whether the ARMv8-M Security Extensions are included.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

WICLINES**Type**

int

Default value

0x23

Number of lines supported by the WIC interface.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffffffff

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base

Type
int

Default value
0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit

Type
int

Default value
0x20700000

Virtual address of stack limit.

vfp-enable_at_reset

Type
bool

Default value
0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

3.5.58 ARMCortexM52CT

CortexM52CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-422: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM52CT

This model has the following Iris instances:

Table 3-423: ARMCortexM52CT Iris instances

InstanceName	ComponentName
ARMCortexM52CT	ARM_Cortex-M52

InstanceName	ComponentName
ARMCortexM52CT.acp_mapper	PVBusMapper
ARMCortexM52CT.ext_bus	PVBusLogger
ARMCortexM52CT.ext_bus.mapper	PVBusMapper
ARMCortexM52CT.l1_incoherent_interconnect	PVCache
ARMCortexM52CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexM52CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexM52CT.l1dcache	PVCache
ARMCortexM52CT.l1dcache.upstream[0]	PVBusSlave
ARMCortexM52CT.l1icache	PVCache
ARMCortexM52CT.l1icache.upstream[0]	PVBusSlave
ARMCortexM52CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-424: ARMCortexM52CT MTI instances

InstanceName	ComponentName
ARMCortexM52CT	ARM_Cortex-M52
ARMCortexM52CT.acp_mapper	PVBusMapper
ARMCortexM52CT.ext_bus	PVBusLogger
ARMCortexM52CT.ext_bus.mapper	PVBusMapper
ARMCortexM52CT.l1_incoherent_interconnect	PVCache
ARMCortexM52CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave

ARMCortexM52CT.11icache.upstream[0]	PVBusSlave
ARMCortexM52CT.12_flusher	AsyncCacheFlushUnit

ARMCortexM52CT contains the following CADI targets:

- ARM_Cortex-M52

About ARMCortexM52CT

This model supports the M-Profile Vector Extension (MVE) and the Custom Datapath Extension (CDE). For more information, see [CDE](#).

Ports for ARMCortexM52CT

Table 3-425: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
ahbp_m	PVBus	Master	The core will generate Vendor System data accesses on this port.
ahbs	PVBus	Slave	Slave AHB - External master (e.g. DMA) can write to TCMs (whether or not enabled in xTCMCR)
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions. Referred to in some documents as 'CLKIN'.
coproc_bus	CoprocBusProtocol	Slave	Co-Processor Interface

Name	Protocol	Type	Description
core_dside_bus_gasket_in	PVBus	Slave	-
core_dside_bus_gasket_out	PVBus	Master	-
cpuwait	Signal	Slave	Stall the CPU out of reset
currns	Signal	Master	Current Security state of the processor
currpri	Value	Master	Current execution priority.
dbgen	Signal	Slave	Invasive debug enable
dbgrestart	Signal	Slave	Request for synchronised exit from halt mode
dbgrestarted	Signal	Master	Handshakes with DBGRESTART
edbgrq	Signal	Slave	External request to enter halt mode
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIX, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
halted	Signal	Master	Indicates that the processor is in halt mode
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	Value_64	Slave	64 bit number to invalid IDAU memory range (start_address<<32 end_address)
initnsvtor	Value	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initpahben	Signal	Slave	Enable P-AHB on the next reset
initsvtor	Value	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
inittcmem[2]	Signal	Slave	Reset configuration port - TCM enable initialisation out of reset Bit[0] HIGH = ITCM is enabled Bit[1] HIGH = DTCM is enabled
intnum	Value	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
irq[480]	Signal	Slave	This signal array delivers signals to the NVIC.
lockdcaic	Signal	Slave	Disable access to instruction cache direct cache access registers
lockdtgu	Signal	Slave	Disable writes to registers associated with the DTGU
lockitgu	Signal	Slave	Disable writes to registers associated with the ITGU
locknsmpu	Signal	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	Signal	Slave	Cortex-M52-specific LOCKNSVTOR, LOCKSVTAIRCR, LOCKSMPU, LOCKNSMPU, LOCKSAU. Disable writes to VTOR_NS
lockpahb	Signal	Slave	P-AHB related ports Disable writes to PAHBCR
locksau	Signal	Slave	Disable writes to the SAU_* registers

Name	Protocol	Type	Description
locksmpu	Signal	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	Signal	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
locktcm	Signal	Slave	Disable writes to registers associated with the TCM
lockup	Signal	Master	Asserted when the processor is in lockup state.
niden	Signal	Slave	Non-invasive debug enable
nmi	Signal	Slave	Configure non maskable interrupt.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
prequest	PChannel	Slave	Low Power Interface
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pdbus_m	PVBus	Master	The core will generate bus requests on this port.
qrequest	PChannel	Slave	-
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
spiden	Signal	Slave	Secure invasive debug enable
spniden	Signal	Slave	Secure non-invasive debug enable
stcalib[2]	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	Signal	Master	Acknowledge signal for WICENREQ
wicenreq	Signal	Slave	Request for deep sleep to be WIC-based deep sleep.
wicsense[483]	Signal	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Parameters for ARMCortexM52CT

CDEMAPPEDONCP

Type

int

Default value

0xff

Bit N specifies whether the instruction for coprocessor N (CP7:CP0) is redirected to the CDE module.

CDERTLID**Type**

int

Default value

0x20

Value of ID_AFR0.CDERTLID.

CFGBIGEND**Type**

bool

Default value

0x0

Initialize processor to big endian mode.

CFGCPUINST**Type**

int

Default value

0x0

CPU instance number. This is part of the TCM base address, in bits 25:24.

CFGDTCMSZ**Type**

int

Default value

0x9

Size of the data TCM. 0=No DTCM implemented. Otherwise=Size of DTCM=pow(2, CFGDTCMSZ - 1) KB. Minimum size is 4KB.

CFGITCMSZ**Type**

int

Default value

0x9

Size of the instruction TCM. 0=No ITCM implemented. Otherwise=Size of ITCM=pow(2, CFGITCMSZ - 1) KB. Minimum size is 4KB.

CFGMEMALIAS**Type**

int

Default value

0x0

Memory address alias bit for the ITCM, DTCM and P-AHB regions. 0=No alias, 1=Alias bit 26, 2=Alias bit 27, 4=Alias bit 28.

CFGNOCDECP**Type**

int

Default value

0x0

Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor.

CFGPACBTI**Type**

bool

Default value

0x0

Enables support for the Pointer Authentication and Branch Target Identification (PACBTI) Extension. FALSE: Disabled, TRUE:PAC implemented using the QARMA3 algorithm with BTI.

CFGPAHBSZ**Type**

int

Default value

0x0

Size of the P-AHB peripheral port memory region. 0=P-AHB disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB.

CPIF**Type**

bool

Default value

0x1

Specifies whether the external coprocessor interface is included.

CPNSPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state.

CPSPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state.

CTI**Type**

bool

Default value

0x0

CTI (Cross Trigger Interface) included.

CTI_irq0_pin**Type**

int

Default value

0x4

CTI interrupt request 0 pin.

CTI_irq1_pin**Type**

int

Default value

0x5

CTI interrupt request 1 pin.

DBGLVL**Type**

int

Default value

0x2

0: Minimal debug; 1: 2 Watchpoints, 4 Breakpoint comparators; 2: 4 Watchpoints, 8 Breakpoint comparators; 3: 8 Watchpoints, 8 Breakpoint comparators.

DCACHESZ**Type**

int

Default value

0xf

Whether the D-cache is included and, if included, the size of it. Bit 0: 0=No D-cache included, 1=D-cache included. Bits [4:1]: 0x0=4KB D-cache, 0x1=8KB D-cache, 0x3=16KB D-cache, 0x7=32KB D-cache, 0xF=64KB D-cache.

DTGU**Type**

bool

Default value

0x0

DTCM Security Gate Unit included.

DTGUBLKSZ**Type**

int

Default value

0x3

DTCM gate unit block size. Size=pow(2, DTGUBLKSZ + 5) bytes.

DTGUMAXBLKS**Type**

int

Default value

0x0

Maximum number of DTCM gate unit blocks. Number of blocks=pow(2, DTGUMAXBLKS).

ECOREVNUM**Type**

int

Default value

0x0

ECO Revision number.

ERRDEVID.NUM**Type**

int

Default value

0x1

RAS: Number of implemented error record indexes, 0 to 1.

ETM**Type**

bool

Default value

0x1

Support for ETM trace. false : No ETM trace included, true: ETM trace included.

FPMVE**Type**

int

Default value

0x5

Set whether the model has FP and / or MVE support. 0: No FP and MVE support. 1: FP half and single precision. 2: FP half, single and double precision. 3: MVE integer. 4: FP half and single precision and MVE integer. 5: FP half, single and double precision and MVE floating point.

ICACHESZ**Type**

int

Default value

0x3f

Whether the I-cache is included and, if included, the size of it. Bit 0: 0=No I-cache included, 1=I-cache included. Bits [6:1]: 0x0=1KB I-cache (only with unified cache), 0x1=2KB I-cache (only

with unified cache), 0x3=4KB I-cache, 0x7=8KB I-cache, 0xF=16KB I-cache, 0x1F=32KB I-cache, 0x3F=64KB I-cache.

INITNSVTOR**Type**

int

Default value

0x0

Non-Secure vector-table offset at reset.

INITPAHBEN**Type**

bool

Default value

0x0

The P-AHB enable state at reset.

INITSVTOR**Type**

int

Default value

0x0

Secure vector-table offset at reset.

INITTCMEN**Type**

int

Default value

0x3

The TCM enable state at reset. Bit 0 corresponds to ITCM enable state, bit 1 corresponds to DTCM enable state.

IRQDIS0**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0].

IRQDIS1**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32].

IRQDIS10**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320].

IRQDIS11**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352].

IRQDIS12**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384].

IRQDIS13**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416].

IRQDIS14**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448].

IRQDIS2**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64].

IRQDIS3**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96].

IRQDIS4**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128].

IRQDIS5**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160].

IRQDIS6**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192].

IRQDIS7**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224].

IRQDIS8**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256].

IRQDIS9**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288].

IRQLVL**Type**

int

Default value

0x3

Number of bits of interrupt priority.

ITGU**Type**

bool

Default value

0x0

ITCM Security Gate Unit included.

ITGUBLKSZ**Type**

int

Default value

0x3

ITCM gate unit block size. Size= $\text{pow}(2, \text{ITGUBLKSZ} + 5)$ bytes.

ITGUMAXBLKS**Type**

int

Default value

0x0

Maximum number of ITCM gate unit blocks. Number of blocks= $\text{pow}(2, \text{ITGUMAXBLKS})$.

ITM**Type**

bool

Default value

0x1

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included.

IWIC**Type**

bool

Default value

0x1

Include support for Internal Wake-up Interrupt Controller.

LOCKDTGU**Type**

bool

Default value

0x0

Lock down of Data TGU registers write.

LOCKITGU**Type**

bool

Default value

0x0

Lock down of Instruction TGU registers write.

LOCKTCM**Type**

bool

Default value

0x0

Lock down of TCM registers write.

LOCK_NS_MPU**Type**

bool

Default value

0x0

Lock down of Non-Secure MPU registers write.

LOCK_SAU**Type**

bool

Default value

0x0

Lock down of SAU registers write.

LOCK_S_MPU**Type**

bool

Default value

0x0

Lock down of Secure MPU registers write.

MPU_NS**Type**

int

Default value

0x8

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions.

MPU_S**Type**

int

Default value

0x8

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored.

NUMIRQ**Type**

int

Default value

0x20

Number of user interrupts.

SAU**Type**

int

Default value

0x4

Number of SAU regions (0 => no SAU).

SECEXT**Type**

bool

Default value

0x1

Whether the ARMv8-M Security Extensions are included.

UCACHE**Type**

bool

Default value

0x0

Whether the I-cache acts as a unified cache (ICACHESZ is used for the size).

WICLINES**Type**

int

Default value

0x23

Number of lines supported by the WIC interface.

cde_impl_name**Type**

string

Default value

""

Name of the CDE implementation for this core (implementation contributed by MTI plugin).

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

delay_faultmask_update**Type**

bool

Default value

0x0

Delay FAULTMASK update to context sync.

delay_sysreg_update**Type**

bool

Default value

0x0

Delay some system register updates (e.g. SHCSR) to context sync.

ecc_on**Type**

bool

Default value

0x0

Enable Error Correcting Code.

has_cde**Type**

bool

Default value

0x0

Enables Custom Datapath Extensions.

has_core_dside_bus_gasket**Type**

bool

Default value

0x0

STL gasket enabled.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base**Type**

int

Default value

0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0x20700000

Virtual address of stack limit.

trace_style

Type
int

Default value
0x2

MVE instruction trace style: Add 16 for [**-] beat trace. Add 32 for tracing IMPLIED LOB instructions. Add 64 to change opcode of implied BF to 0xBF00.

vfp-enable_at_reset

Type
bool

Default value
0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

3.5.59 **ARMCortexM55CT**

CortexM55CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-426: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM55CT

This model has the following Iris instances:

Table 3-427: ARMCortexM55CT Iris instances

InstanceName	ComponentName
ARMCortexM55CT	ARM_Cortex-M55
ARMCortexM55CT.acp_mapper	PVBusMapper
ARMCortexM55CT.ext_bus	PVBusLogger
ARMCortexM55CT.ext_bus.mapper	PVBusMapper
ARMCortexM55CT.l1_incoherent_interconnect	PVCache
ARMCortexM55CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave

InstanceName	ComponentName
ARMCortexM55CT.11_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexM55CT.11_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexM55CT.11dcache	PVCache
ARMCortexM55CT.11dcache.upstream[0]	PVBusSlave
ARMCortexM55CT.11licache	PVCache
ARMCortexM55CT.11licache.upstream[0]	PVBusSlave
ARMCortexM55CT.12_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-428: ARMCortexM55CT MTI instances

InstanceName	ComponentName
ARMCortexM55CT	ARM_Cortex-M55
ARMCortexM55CT.acp_mapper	PVBusMapper
ARMCortexM55CT.ext_bus	PVBusLogger
ARMCortexM55CT.ext_bus.mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexM55CT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexM55CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexM55CT.l1dcache	PVCache
ARMCortexM55CT.l1dcache.upstream[0]	PVBusSlave
ARMCortexM55CT.l1icache	PVCache
ARMCortexM55CT.l1icache.upstream[0]	PVBusSlave
ARMCortexM55CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexM55CT contains the following CADI targets:

- ARM_Cortex-M55

About ARMCortexM55CT

The model supports Custom Datapath Extension (CDE). For more information, see [CDE](#).

The model does not support the following functionality:

- Cross Trigger Interface (CTI).
- Programmable MBIST controller (PMC-100).
- Error Correcting Code (ECC).
- Q-Channel.

The following interfaces and registers are not modeled:

- ITM and ETM trace and trace synchronization and trigger interface signals.
- Dual-core lock-step operation.
- Interrupt latencies.
- Memory System Control Register (MSCR).
- Prefetcher Control Register (PFCR).
- Direct cache access registers.

Differences between the model and the RTL

In hardware, PMU_CCNTR is an alias of the DWT_CYCCNT register, so they contain the same values. In the model, PMU_CCNTR is implemented differently to DWT_CYCCNT, so they contain different values. The value held in DWT_CYCCNT is not representative of hardware.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called ITM. The ITM trace source has an `ITM_PACKET_TYPE` field. The following table shows which packet types the model supports:

Field value	Description	Supported by model
ITM_SYNC	Synchronization packet	Not supported.
ITM_P_OVERFLOW	Protocol: Overflow packet	Not supported.
ITM_P_LOCAL_TIMESTAMP	Protocol: Local timestamp packets	Not supported.
ITM_P_GLOBAL_TIMESTAMP	Protocol: Global timestamp packets	Not supported.
ITM_P_EXTEN	Protocol: Extension packet	Not supported.
ITM_S_INSTRUMENTATION	Source: Instrumentation packet	Supported.
ITM_S_DWT_EVENT_COUNTER	Hardware source: Event counter wrapping	Not supported.
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Ports for ARM CortexM55CT

Table 3-430: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
ahbp_m	PVBus	Master	The core will generate Vendor System data accesses on this port.
ahbs	PVBus	Slave	Slave AHB - External master (e.g. DMA) can write to TCMs (whether or not enabled in xTCMCR)
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions. Referred to in some documents as 'CLKIN'.
coproc_bus	CoprocBusProtocol	Slave	Co-Processor Interface
core_dside_bus_gasket_in	PVBus	Slave	-
core_dside_bus_gasket_out	PVBus	Master	-
cpuwait	Signal	Slave	Stall the CPU out of reset
currns	Signal	Master	Current Security state of the processor
currpri	Value	Master	Current execution priority.
dbgen	Signal	Slave	Invasive debug enable
dbgrestart	Signal	Slave	Request for synchronised exit from halt mode

Name	Protocol	Type	Description
dbgrestarted	Signal	Master	Handshakes with DBGRESTART
edbgrq	Signal	Slave	External request to enter halt mode
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
halted	Signal	Master	Indicates that the processor is in halt mode
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	Value_64	Slave	64 bit number to invalid IDAU memory range (start_address<<32 end_address)
initnsvtor	Value	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initpahben	Signal	Slave	Enable P-AHB on the next reset
initsvtor	Value	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
inittcmem[2]	Signal	Slave	Reset configuration port - TCM enable initialisation out of reset Bit[0] HIGH = ITCM is enabled Bit[1] HIGH = DTCM is enabled
intnum	Value	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
irq[480]	Signal	Slave	This signal array delivers signals to the NVIC.
lockdcaic	Signal	Slave	Disable access to instruction cache direct cache access registers
lockdtgu	Signal	Slave	Disable writes to registers associated with the DTGU
lockitgu	Signal	Slave	Disable writes to registers associated with the ITGU
locknsmpu	Signal	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	Signal	Slave	Cortex-M55-specific LOCKNSVTOR, LOCKSVTAIRCR, LOCKSMPU, LOCKNSMPU, LOCKSAU. Disable writes to VTOR_NS
lockpahb	Signal	Slave	P-AHB related ports Disable writes to PAHBRCR
locksau	Signal	Slave	Disable writes to the SAU_* registers
locksmpu	Signal	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	Signal	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
locktcm	Signal	Slave	Disable writes to registers associated with the TCM
lockup	Signal	Master	Asserted when the processor is in lockup state.
niden	Signal	Slave	Non-invasive debug enable
nmi	Signal	Slave	Configure non maskable interrupt.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
prequest	PChannel	Slave	Low Power Interface

Name	Protocol	Type	Description
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
qrequest	PChannel	Slave	-
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
spiden	Signal	Slave	Secure invasive debug enable
spniden	Signal	Slave	Secure non-invasive debug enable
stcalib[2]	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	Signal	Master	Acknowledge signal for WICENREQ
wicenreq	Signal	Slave	Request for deep sleep to be WIC-based deep sleep.
wicsense[483]	Signal	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Parameters for ARM CortexM55CT

CDEMAPPEDONCP

Type

int

Default value

0xff

Bit N specifies whether the instruction for coprocessor N (CP7:CP0) is redirected to the CDE module.

CDERTLID

Type

int

Default value

0x20

Value of ID_AFR0.CDERTLID.

CFGBIGEND

Type

bool

Default value

0x0

Initialize processor to big endian mode.

CFGDTCMSZ**Type**

int

Default value

0x9

Size of the data TCM. 0=No DTCM implemented. Otherwise=Size of DTCM=pow(2, CFGDTCMSZ - 1) KB. Minimum size is 4KB.

CFGITCMSZ**Type**

int

Default value

0x9

Size of the instruction TCM. 0=No ITCM implemented. Otherwise=Size of ITCM=pow(2, CFGITCMSZ - 1) KB. Minimum size is 4KB.

CFGMEMALIAS**Type**

int

Default value

0x0

Memory address alias bit for the ITCM, DTCM and P-AHB regions. 0=No alias, 1=Alias bit 24, 2=Alias bit 25, 4=Alias bit 26, 8=Alias bit 27, 16=Alias bit 28.

CFGNOCDECP**Type**

int

Default value

0x0

Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor.

CFGPAHBSZ**Type**

int

Default value

0x0

Size of the P-AHB peripheral port memory region. 0=P-AHB disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB.

CPIF**Type**

bool

Default value

0x1

Specifies whether the external coprocessor interface is included.

CPNSPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state.

CPSPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state.

CTI**Type**

bool

Default value

0x0

CTI (Cross Trigger Interface) included.

CTI_irq0_pin**Type**

int

Default value

0x4

CTI interrupt request 0 pin.

CTI_irq1_pin**Type**

int

Default value

0x5

CTI interrupt request 1 pin.

DBGLVL**Type**

int

Default value

0x2

0: Minimal debug; 1: 2 Watchpoints, 4 Breakpoint comparators; 2: 4 Watchpoints, 8 Breakpoint comparators; 3: 8 Watchpoints, 8 Breakpoint comparators.

DCACHESZ**Type**

int

Default value

0xf

Whether the D-cache is included and, if included, the size of it. Bit 0: 0=No D-cache included, 1=D-cache included. Bits [4:1]: 0x0=4KB D-cache, 0x1=8KB D-cache, 0x3=16KB D-cache, 0x7=32KB D-cache, 0xF=64KB D-cache.

DTGU**Type**

bool

Default value

0x0

DTCM Security Gate Unit included.

DTGUBLKSZ**Type**

int

Default value

0x3

DTCM gate unit block size. Size= $\text{pow}(2, \text{DTGUBLKSZ} + 5)$ bytes.

DTGUMAXBLKS**Type**

int

Default value

0x0

Maximum number of DTCM gate unit blocks. Number of blocks= $\text{pow}(2, \text{DTGUMAXBLKS})$.

ECOREVNUM**Type**

int

Default value

0x0

ECO Revision number.

ERRDEVID . NUM**Type**

int

Default value

0x1

RAS: Number of implemented error record indexes, 0 to 1.

ETM**Type**

bool

Default value

0x1

Support for ETM trace. false : No ETM trace included, true: ETM trace included.

FPU**Type**

bool

Default value

0x1

Set whether the model has VFP support.

ICACHESZ**Type**

int

Default value

0xf

Whether the I-cache is included and, if included, the size of it. Bit 0: 0=No I-cache included, 1=I-cache included. Bits [4:1]: 0x0=4KB I-cache, 0x1=8KB I-cache, 0x3=16KB I-cache, 0x7=32KB I-cache, 0xF=64KB I-cache.

INITNSVTOR**Type**

int

Default value

0x0

Non-Secure vector-table offset at reset.

INITPAHBEN**Type**

bool

Default value

0x0

The P-AHB enable state at reset.

INITSVTOR**Type**

int

Default value

0x0

Secure vector-table offset at reset.

INITTCMEN**Type**

int

Default value

0x3

The TCM enable state at reset. Bit 0 corresponds to ITCM enable state, bit 1 corresponds to DTCM enable state.

IRQDIS0**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0].

IRQDIS1**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32].

IRQDIS10**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320].

IRQDIS11**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352].

IRQDIS12**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384].

IRQDIS13**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416].

IRQDIS14**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448].

IRQDIS2**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64].

IRQDIS3**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96].

IRQDIS4**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128].

IRQDIS5**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160].

IRQDIS6**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192].

IRQDIS7**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224].

IRQDIS8**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256].

IRQDIS9**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288].

IRQLVL**Type**

int

Default value

0x3

Number of bits of interrupt priority.

ITGU**Type**

bool

Default value

0x0

ITCM Security Gate Unit included.

ITGUBLKSZ**Type**

int

Default value

0x3

ITCM gate unit block size. Size= $\text{pow}(2, \text{ITGUBLKSZ} + 5)$ bytes.

ITGUMAXBLKS**Type**

int

Default value

0x0

Maximum number of ITCM gate unit blocks. Number of blocks= $\text{pow}(2, \text{ITGUMAXBLKS})$.

ITM**Type**

bool

Default value

0x1

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included.

IWIC**Type**

bool

Default value

0x1

Include support for Internal Wake-up Interrupt Controller.

LOCKDTGU**Type**

bool

Default value

0x0

Lock down of Data TGU registers write.

LOCKITGU**Type**

bool

Default value

0x0

Lock down of Instruction TGU registers write.

LOCKTCM**Type**

bool

Default value

0x0

Lock down of TCM registers write.

LOCK_NS_MPU**Type**

bool

Default value

0x0

Lock down of Non-Secure MPU registers write.

LOCK_SAU**Type**

bool

Default value

0x0

Lock down of SAU registers write.

LOCK_S_MPU**Type**

bool

Default value

0x0

Lock down of Secure MPU registers write.

MPU_NS**Type**

int

Default value

0x8

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions.

MPU_S**Type**

int

Default value

0x8

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored.

MVE**Type**

int

Default value

0x1

Set whether the model has MVE support. If FPU = 0: 0=MVE not included, 1=Integer subset of MVE included. If FPU = 1: 0=MVE not included, 1=Integer subset of MVE included, 2=Integer and half and single precision floating point MVE included.

NUMIRQ**Type**

int

Default value

0x20

Number of user interrupts.

SAU**Type**

int

Default value

0x4

Number of SAU regions (0 => no SAU).

SECEXT**Type**

bool

Default value

0x1

Whether the ARMv8-M Security Extensions are included.

WICLINES**Type**

int

Default value

0x23

Number of lines supported by the WIC interface.

cde_impl_name**Type**

string

Default value

""

Name of the CDE implementation for this core (implementation contributed by MTI plugin).

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

delay_faultmask_update**Type**

bool

Default value

0x0

Delay FAULTMASK update to context sync.

delay_sysreg_update**Type**

bool

Default value

0x0

Delay some system register updates (e.g. SHCSR) to context sync.

ecc_on**Type**

bool

Default value

0x0

Enable Error Correcting Code.

has_cde**Type**

bool

Default value

0x0

Enables Custom Datapath Extensions.

has_core_dside_bus_gasket**Type**

bool

Default value

0x0

STL gasket enabled.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base**Type**

int

Default value

0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit

Type
int

Default value
0x20700000

Virtual address of stack limit.

trace_style

Type
int

Default value
0x2

MVE instruction trace style: Add 16 for [**-] beat trace. Add 32 for tracing IMPLIED LOB instructions. Add 64 to change opcode of implied BF to 0xBF00.

vfp-enable_at_reset

Type
bool

Default value
0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

3.5.60 **ARMCortexM85CT**

CortexM85CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-431: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexM85CT

This model has the following Iris instances:

Table 3-432: ARMCortexM85CT Iris instances

InstanceName	ComponentName
ARMCortexM85CT	ARM_Cortex-M85
ARMCortexM85CT.acp_mapper	PVBusMapper
ARMCortexM85CT.ext_bus	PVBusLogger
ARMCortexM85CT.ext_bus.mapper	PVBusMapper
ARMCortexM85CT.l1_incoherent_interconnect	PVCache
ARMCortexM85CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexM85CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexM85CT.l1dcache	PVCache
ARMCortexM85CT.l1dcache.upstream[0]	PVBusSlave
ARMCortexM85CT.l1icache	PVCache
ARMCortexM85CT.l1icache.upstream[0]	PVBusSlave
ARMCortexM85CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-433: ARMCortexM85CT MTI instances

InstanceName	ComponentName
ARMCortexM85CT	ARM_Cortex-M85
ARMCortexM85CT.acp_mapper	PVBusMapper
ARMCortexM85CT.ext_bus	PVBusLogger
ARMCortexM85CT.ext_bus.mapper	PVBusMapper
ARMCortexM85CT.l1_incoherent_interconnect	PVCache
ARMCortexM85CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave

InstanceName	ComponentName
ARMCortexM85CT.11_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexM85CT.11_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexM85CT.11dcache	PVCache
ARMCortexM85CT.11dcache.upstream[0]	PVBusSlave
ARMCortexM85CT.11icache	PVCache
ARMCortexM85CT.11icache.upstream[0]	PVBusSlave
ARMCortexM85CT.12_flusher	AsyncnCacheFlushUnit

ARMCortexM85CT contains the following CADI targets:

- ARM_Cortex-M85

Ports for ARMCortexM85CT

Table 3-434: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
ahbp_m	PVBus	Master	The core will generate Vendor System data accesses on this port.
ahbs	PVBus	Slave	Slave AHB - External master (e.g. DMA) can write to TCMs (whether or not enabled in xTCMCR)
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions. Referred to in some documents as 'CLKIN'.
coproc_bus	CoprocBusProtocol	Slave	Co-Processor Interface
core_dside_bus_gasket_in	PVBus	Slave	-

Name	Protocol	Type	Description
core_dside_bus_gasket_out	PVBus	Master	-
cpuwait	Signal	Slave	Stall the CPU out of reset
currns	Signal	Master	Current Security state of the processor
currpri	Value	Master	Current execution priority.
dbgen	Signal	Slave	Invasive debug enable
dbgrestart	Signal	Slave	Request for synchronised exit from halt mode
dbgrestarted	Signal	Master	Handshakes with DBGRESTART
edbgrq	Signal	Slave	External request to enter halt mode
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
halted	Signal	Master	Indicates that the processor is in halt mode
idau	PVBus	Master	The core will generate IDAU requests on this port.
idau_invalidate_region	Value_64	Slave	64 bit number to invalid IDAU memory range (start_address<<32 end_address)
initnsvtor	Value	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initpahben	Signal	Slave	Enable P-AHB on the next reset
initsvtor	Value	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
inittcmem[2]	Signal	Slave	Reset configuration port - TCM enable initialisation out of reset Bit[0] HIGH = ITCM is enabled Bit[1] HIGH = DTCM is enabled
intnum	Value	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
irq[480]	Signal	Slave	This signal array delivers signals to the NVIC.
lockdcaic	Signal	Slave	Disable access to instruction cache direct cache access registers
lockdtgu	Signal	Slave	Disable writes to registers associated with the DTGU
lockitgu	Signal	Slave	Disable writes to registers associated with the ITGU
locknsmpu	Signal	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	Signal	Slave	Cortex-M85 specific LOCKNSVTOR, LOCKSVTAIRCR, LOCKSMPU, LOCKNSMPU, LOCKSAU. Disable writes to VTOR_NS
lockpahb	Signal	Slave	P-AHB related ports Disable writes to PAHBCR
locksau	Signal	Slave	Disable writes to the SAU_* registers
locksmpu	Signal	Slave	Disable writes to the Secure MPU_* registers

Name	Protocol	Type	Description
locksvtaircr	Signal	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
locktcm	Signal	Slave	Disable writes to registers associated with the TCM
lockup	Signal	Master	Asserted when the processor is in lockup state.
niden	Signal	Slave	Non-invasive debug enable
nmi	Signal	Slave	Configure non maskable interrupt.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
prequest	PChannel	Slave	Low Power Interface
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
qrequest	PChannel	Slave	-
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
spiden	Signal	Slave	Secure invasive debug enable
spniden	Signal	Slave	Secure non-invasive debug enable
stcalib[2]	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
wicenack	Signal	Master	Acknowledge signal for WICENREQ
wicenreq	Signal	Slave	Request for deep sleep to be WIC-based deep sleep.
wicsense[483]	Signal	Master	Indicates which input events can cause the WIC to generate the WAKEUP signal.

Parameters for ARM CortexM85CT

CDEMAPPEDONCP

Type

int

Default value

0xff

Bit N specifies whether the instruction for coprocessor N (CP7:CP0) is redirected to the CDE module.

CDERTLID

Type

int

Default value

0x20

Value of ID_AFR0.CDERTLID.

CFGBIGEND**Type**

bool

Default value

0x0

Initialize processor to big endian mode.

CFGCPUINST**Type**

int

Default value

0x0

CPU instance number. This is part of the TCM base address, in bits 25:24.

CFGDTCMSZ**Type**

int

Default value

0x9

Size of the data TCM. 0=No DTCM implemented. Otherwise=Size of DTCM=pow(2, CFGDTCMSZ - 1) KB. Minimum size is 4KB.

CFGITCMSZ**Type**

int

Default value

0x9

Size of the instruction TCM. 0=No ITCM implemented. Otherwise=Size of ITCM=pow(2, CFGITCMSZ - 1) KB. Minimum size is 4KB.

CFGMEMALIAS**Type**

int

Default value

0x0

Memory address alias bit for the ITCM, DTCM and P-AHB regions. 0=No alias, 1=Alias bit 24, 2=Alias bit 25, 4=Alias bit 26, 8=Alias bit 27, 16=Alias bit 28.

CFGNOCDCECP**Type**

int

Default value

0x0

Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor.

CFGPAACBTI**Type**

bool

Default value

0x0

Enables support for the Pointer Authentication and Branch Target Identification (PACBTI) Extension. FALSE: Disabled, TRUE:PAC implemented using the QARMA3 algorithm with BTI.

CFGPAHBSZ**Type**

int

Default value

0x0

Size of the P-AHB peripheral port memory region. 0=P-AHB disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB.

CPIF**Type**

bool

Default value

0x1

Specifies whether the external coprocessor interface is included.

CPNSPRESENT**Type**

int

Default value`0xff`

Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state.

CPSPRESENT**Type**`int`**Default value**`0xff`

Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state.

CTI**Type**`bool`**Default value**`0x0`

CTI (Cross Trigger Interface) included.

CTI_irq0_pin**Type**`int`**Default value**`0x4`

CTI interrupt request 0 pin.

CTI_irq1_pin**Type**`int`**Default value**`0x5`

CTI interrupt request 1 pin.

DBGLVL**Type**`int`**Default value**`0x2`

1: 4 Watchpoints, 4 Breakpoint comparators; 2: 8 Watchpoints, 8 Breakpoint comparators.

DCACHESZ

Type

int

Default value

0xf

Whether the D-cache is included and, if included, the size of it. Bit 0: 0=No D-cache included, 1=D-cache included. Bits [4:1]: 0x0=4KB D-cache, 0x1=8KB D-cache, 0x3=16KB D-cache, 0x7=32KB D-cache, 0xF=64KB D-cache.

DTGU

Type

bool

Default value

0x0

DTCM Security Gate Unit included.

DTGUBLKSZ

Type

int

Default value

0x3

DTCM gate unit block size. Size=pow(2, DTGUBLKSZ + 5) bytes.

DTGUMAXBLKS

Type

int

Default value

0x0

Maximum number of DTCM gate unit blocks. Number of blocks=pow(2, DTGUMAXBLKS).

ECOREVNUM

Type

int

Default value

0x0

ECO Revision number.

ERRDEVID.NUM**Type**

int

Default value

0x1

RAS: Number of implemented error record indexes, 0 to 1.

ETM**Type**

bool

Default value

0x1

Support for ETM trace. false : No ETM trace included, true: ETM trace included.

FPU**Type**

bool

Default value

0x1

Set whether the model has VFP support.

ICACHESZ**Type**

int

Default value

0xf

Whether the I-cache is included and, if included, the size of it. Bit 0: 0=No I-cache included, 1=I-cache included. Bits [4:1]: 0x0=4KB I-cache, 0x1=8KB I-cache, 0x3=16KB I-cache, 0x7=32KB I-cache, 0xF=64KB I-cache.

INITNSVTOR**Type**

int

Default value

0x0

Non-Secure vector-table offset at reset.

INITPAHBEN**Type**

bool

Default value

0x0

The P-AHB enable state at reset.

INITSVTOR**Type**

int

Default value

0x0

Secure vector-table offset at reset.

INITTCMEN**Type**

int

Default value

0x3

The TCM enable state at reset. Bit 0 corresponds to ITCM enable state, bit 1 corresponds to DTCM enable state.

IRQDIS0**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0].

IRQDIS1**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32].

IRQDIS10**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320].

IRQDIS11**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352].

IRQDIS12**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384].

IRQDIS13**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416].

IRQDIS14**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448].

IRQDIS2**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64].

IRQDIS3**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96].

IRQDIS4**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128].

IRQDIS5**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160].

IRQDIS6**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192].

IRQDIS7**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224].

IRQDIS8**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256].

IRQDIS9**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288].

IRQLVL**Type**

int

Default value

0x3

Number of bits of interrupt priority.

ITGU**Type**

bool

Default value

0x0

ITCM Security Gate Unit included.

ITGUBLKSZ**Type**

int

Default value

0x3

ITCM gate unit block size. Size= $\text{pow}(2, \text{ITGUBLKSZ} + 5)$ bytes.

ITGUMAXBLKS**Type**

int

Default value

0x0

Maximum number of ITCM gate unit blocks. Number of blocks= $\text{pow}(2, \text{ITGUMAXBLKS})$.

ITM**Type**

bool

Default value

0x1

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included.

IWIC**Type**

bool

Default value

0x1

Include support for Internal Wake-up Interrupt Controller.

LOCKDTGU**Type**

bool

Default value

0x0

Lock down of Data TGU registers write.

LOCKITGU**Type**

bool

Default value

0x0

Lock down of Instruction TGU registers write.

LOCKTCM**Type**

bool

Default value

0x0

Lock down of TCM registers write.

LOCK_NS_MPU**Type**

bool

Default value

0x0

Lock down of Non-Secure MPU registers write.

LOCK_SAU**Type**

bool

Default value

0x0

Lock down of SAU registers write.

LOCK_S_MPU**Type**

bool

Default value

0x0

Lock down of Secure MPU registers write.

MPU_NS**Type**

int

Default value

0x8

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions.

MPU_S**Type**

int

Default value

0x8

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored.

MVE**Type**

int

Default value

0x1

Set whether the model has MVE support. If FPU = 0: 0=MVE not included, 1=Integer subset of MVE included. If FPU = 1: 0=MVE not included, 1=Integer subset of MVE included, 2=Integer and half and single precision floating point MVE included.

NUMIRQ**Type**

int

Default value

0x20

Number of user interrupts.

SAU**Type**

int

Default value

0x4

Number of SAU regions (0 => no SAU).

SECEXT**Type**

bool

Default value

0x1

Whether the ARMv8-M Security Extensions are included.

WICLINES**Type**

int

Default value

0x23

Number of lines supported by the WIC interface.

cde_impl_name**Type**

string

Default value

""

Name of the CDE implementation for this core (implementation contributed by MTI plugin).

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

delay_faultmask_update**Type**

bool

Default value

0x0

Delay FAULTMASK update to context sync.

delay_sysreg_update**Type**

bool

Default value

0x0

Delay some system register updates (e.g. SHCSR) to context sync.

ecc_on**Type**

bool

Default value

0x0

Enable Error Correcting Code.

has_cde**Type**

bool

Default value

0x0

Enables Custom Datapath Extensions.

has_core_dside_bus_gasket**Type**

bool

Default value

0x0

STL gasket enabled.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CPUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base**Type**

int

Default value

0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0x20700000

Virtual address of stack limit.

trace_style**Type**

int

Default value

0x2

MVE instruction trace style: Add 16 for [**--] beat trace. Add 32 for tracing IMPLIED LOB instructions. Add 64 to change opcode of implied BF to 0xBF00.

vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

3.5.61 ARM CortexR4CT

ARM CortexR4CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-435: IP revisions support

Revision	Quality level
r1p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexR4CT

This model has the following Iris instances:

Table 3-436: ARM CortexR4CT Iris instances

InstanceName	ComponentName
ARM CortexR4CT	ARM_Cortex-R4
ARM CortexR4CT.acp_mapper	PVBusMapper
ARM CortexR4CT.cpu0.l1dcache	PVCache
ARM CortexR4CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARM CortexR4CT.cpu0.l1icache	PVCache
ARM CortexR4CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARM CortexR4CT.ext_bus	PVBusLogger
ARM CortexR4CT.ext_bus.mapper	PVBusMapper
ARM CortexR4CT.l1_incoherent_interconnect	PVCache
ARM CortexR4CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave

InstanceName	ComponentName
ARMCortexR4CT.11_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexR4CT.11_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexR4CT.11_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexR4CT.11_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexR4CT.12_flusher	AsyncCacheFlushUnit

ARMCortexR4CT contains the following CADI targets:

- ARM_Cortex-R4
- PVMCache

About ARMCortexR4CT

- The model implements the `cfgie` port, although it is optional in hardware.
- `pmbus_s` is the slave port to access the TCM RAM. Bits [3:0] of the user flags in the transaction are used to select the TCM:

1

selects the ATCM.

2

selects the BTCM.

Any other value is reserved.

- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- There is a single memory port combining instruction, data, DMA and peripheral access.
- ECC and parity schemes are not supported (although the registers might be present).
- The dual core redundancy configuration is not supported.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- The hardware refers to the TCMs as “A” and “B”. The model refers to these as “i” and “d”.
- The RTL permits two data TCMs, B0 and B1, to be configured for extra bandwidth. These are not modeled.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.

Vectored Interrupt Controller (VIC) ports

The ARMCortexR4CT and ARMCortexR5xnCT models implement a simplified model of the Vectored Interrupt Controller (VIC) port.

The protocol consists of two ports:

- The `vic_addr` port signals the vectored interrupt address from the external VIC.
- The `vic_ack` port signals the VIC that an interrupt has been detected and is being serviced.

The expected interrupt sequence is:

1. The software enables the VIC interface by setting the VE bit in the CP15 control register and setting up suitable interrupt routines.
2. The VIC asserts IRQ.
3. Some time later, the processor detects and responds to the IRQ by asserting `vic_ack`.
4. The VIC writes the vector address to the processor using `vic_addr`.
5. The processor de-asserts `vic_ack`.
6. The processor transfers control to the vectored address returned from the VIC.

The interaction between the processor and the VIC is untimed after the processor acknowledges the interrupt, so certain interrupt sequences cannot occur in the code translation processor models.

Ports for ARMCortexR4CT

Table 3-438: Ports

Name	Protocol	Type	Description
<code>cfgend0</code>	Signal	Slave	Configure BE8 mode after a reset.
<code>cfgie</code>	Signal	Slave	Configure big endian instruction format after a reset.
<code>cfgnmfi</code>	Signal	Slave	Configure FIQs as non-maskable after a reset.
<code>cfgte</code>	Signal	Slave	Configure exceptions to be taken in thumb mode after a reset.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>cpuhalt</code>	Signal	Slave	Raising this signal will put the core into halt mode.
<code>fiq</code>	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
<code>initramd</code>	Signal	Slave	Configure DTCM enabled after a reset.
<code>initrami</code>	Signal	Slave	Configure ITCM enabled after a reset.
<code>irq</code>	Signal	Slave	This signal drives the CPU's interrupt handling.
<code>loczrama</code>	Signal	Slave	Location of ATCM at reset.
<code>pmuirq</code>	Signal	Master	Interrupt signal from performance monitoring unit.
<code>pvbus_m</code>	PVBus	Master	The core will generate bus requests on this port.
<code>pvbus_s</code>	PVBus	Slave	Slave access to TCMs.
<code>reset</code>	Signal	Slave	Raising this signal will put the core into reset mode.
<code>standbywfi</code>	Signal	Master	Signal from the core that it is waiting in standby for an interrupt.

Name	Protocol	Type	Description
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
vic_ack	Signal	Master	Vic acknowledge port to primary VIC.
vic_addr	Value	Slave	Vic address port from primary VIC.
vinithi	Signal	Slave	Configure high vectors after a reset.

Parameters for ARM CortexR4CT

CFGEND0

Type

bool

Default value

0x0

Initialize to BE8 endianness.

CFGIE

Type

bool

Default value

0x0

Set the reset value of the instruction endian bit.

CFGNMF1

Type

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

CFGTE

Type

bool

Default value

0x0

Initialize to take exceptions in T32 state. Model starts in T32 state.

INITRAMD**Type**

bool

Default value

0x0

Set or reset the INITRAMD signal.

INITRAMI**Type**

bool

Default value

0x0

Set or reset the INITRAMI signal.

LOCZRAMI**Type**

bool

Default value

0x0

Set or reset the LOCZRAMI signal.

NUM_MPU_REGION**Type**

int

Default value

0x8

Number of MPU regions.

VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

dcache-size**Type**

int

Default value

0x10000

Set D-cache size in bytes.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dtcm0_base**Type**

int

Default value

0x800000

Base address of DTCM at startup.

dtcm0_size**Type**

int

Default value

0x8

Size of DTCM in KB.

icache-size**Type**

int

Default value

0x10000

Set I-cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

implements_vfp**Type**

bool

Default value

0x1

Set whether the model has been built with VFP support.

itcm0_base**Type**

int

Default value

0x0

Base address of ITCM at startup.

itcm0_size**Type**

int

Default value

0x8

Size of ITCM in KB.

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

scheduler_mode**Type**

int

Default value

0x0

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!.

semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

3.5.62 ARMCortexR5x1CT

ARMCortexR5x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-439: IP revisions support

Revision	Quality level
r1p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexR5x1CT

This model has the following Iris instances:

Table 3-440: ARMCortexR5x1CT Iris instances

InstanceName	ComponentName
ARMCortexR5x1CT	Cluster_ARM_Cortex-R5
ARMCortexR5x1CT.acp_mapper	PVBusMapper
ARMCortexR5x1CT.cpu0	ARM_Cortex-R5
ARMCortexR5x1CT.cpu0.l1dcache	PVCache
ARMCortexR5x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexR5x1CT.cpu0.l1icache	PVCache

ARMCortexR5x1CT contains the following CADI targets:

- ARM_Cortex-R5

- Cluster_ARM_Cortex-R5

About ARMCortexR5x1CT

An ARMCortexR5x2CT component also exists.

The per-core parameters are preceded by cpun., where n identifies the core (0 or 1).

The allowed values for the LOCK_STEP parameter are:

0

Disable. Set for two independent cores.

1

Lock Step. Appears to the system as two cores but is internally modeled as a single core.

3

Split Lock. Appears to the system as two cores but can be statically configured from reset either as two independent cores or two locked cores. For the model, these are equivalent to Disable and Lock Step, respectively, except for the value of build options registers. The model does not support dynamically splitting and locking the cluster.

pvb_{us}_s is the slave port to access the TCM RAM of CPU n. Bits [3:0] of the user flags in the transaction are used to select the TCM:

1

Selects the ATCM of CPU 0

2

Selects the BTCM of CPU 0

3

Selects the ATCM of CPU 1

4

Selects the BTCM of CPU 1

Any other value is reserved.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The RR bit in the SCTL_R is ignored.
- The Low Latency Peripheral Port is not modeled.
- The model only has a single bus master port combining instruction, data, DMA and peripheral accesses. The CP15 control registers associated with peripheral buses preserve values but do not have any other effect.
- The model only supports static split lock and not dynamic split lock. Contact Arm for details.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.

- The model cannot experience an ECC error and does not support fault injection into the system, so Arm does not provide the ability to set error schemes for the caches or TCMs. Contact Arm if you require a particular value in the Build Options registers.

Vectored Interrupt Controller (VIC) ports

The ARMCortexR4CT and ARMCortexR5xnCT models implement a simplified model of the Vectored Interrupt Controller (VIC) port.

The protocol consists of two ports:

- The `vic_addr` port signals the vectored interrupt address from the external VIC.
- The `vic_ack` port signals the VIC that an interrupt has been detected and is being serviced.

The expected interrupt sequence is:

- The software enables the VIC interface by setting the VE bit in the CP15 control register and setting up suitable interrupt routines.
- The VIC asserts IRQ.
- Some time later, the processor detects and responds to the IRQ by asserting `vic_ack`.
- The VIC writes the vector address to the processor using `vic_addr`.
- The processor de-asserts `vic_ack`.
- The processor transfers control to the vectored address returned from the VIC.

The interaction between the processor and the VIC is untimed after the processor acknowledges the interrupt, so certain interrupt sequences cannot occur in the code translation processor models.

Ports for ARMCortexR5x1CT

Table 3-442: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	ACP slave port.
<code>cfgatcmsz[2]</code>	Value	Slave	ATCM size.
<code>cfgbtcmsz[2]</code>	Value	Slave	BTCLM Size.
<code>cfgend[2]</code>	Signal	Slave	This signal is for EE bit initialisation. This is CFGEE in RTL but <code>cfgend</code> here fastsim consistency reasons.
<code>cfgnmfi[2]</code>	Signal	Slave	Controls non-maskable Fast Interrupts.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>cpuhalt[2]</code>	Signal	Slave	Raising this signal will put the core into halt mode.
<code>event[2]</code>	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
<code>fiq[2]</code>	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
<code>groupid</code>	Value	Slave	Group ID used for MPIDR.
<code>initrama[2]</code>	Signal	Slave	If ATCM is enabled at reset.
<code>initramb[2]</code>	Signal	Slave	If BTCLM is enabled at reset.

Name	Protocol	Type	Description
irq[2]	Signal	Slave	This signal drives the CPU's interrupt handling.
loczrama[2]	Signal	Slave	Location of ATCM at reset.
pmuirq[2]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
pvbus_s[1]	PVBus	Slave	tcm slave port.
reset[2]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[2]	Signal	Master	This signal indicate if a core is in wfe state RTL calls this WFEPIPESTOPPED.
standbywfi[2]	Signal	Master	This signal indicates if a core is in WFI state RTL uses WFIPIPESTOPPED.
teinit[2]	Signal	Slave	Default exception handling state.
ticks[2]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vic_ack[2]	Signal	Master	Vic acknowledge port to primary VIC.
vic_addr[2]	Value	Slave	Vic address port from primary VIC.
vinithi[2]	Signal	Slave	This signal controls of the location of the exception vectors at reset.

Parameters for ARMCortexR5x1CT

GROUP_ID

Type

int

Default value

0x0

Value read in GROUP ID register field, bits[15:8] of the MPIDR.

INST_ENDIAN

Type

bool

Default value

0x1

Controls whether the model supports the instruction endianness bit.

LOCK_STEP

Type

int

Default value

0x0

Affects dual-processor configurations only, and ignored by single-processor configurations.

MICRO_SCU**Type**

bool

Default value

0x1

Controls whether the effects of the MicroSCU are modeled.

NUM_BREAKPOINTS**Type**

int

Default value

0x3

Controls with how many breakpoint pairs the model has been configured. This only affects the build options registers, because debug is not modeled.

NUM_MPU_REGION**Type**

int

Default value

0xc

Sets the number of MPU regions.

NUM_WATCHPOINTS**Type**

int

Default value

0x2

Controls with how many watchpoint pairs the model has been configured. This only affects the build options registers, because debug is not modeled.

SLSPLIT**Type**

bool

Default value

0x0

Sets whether the model starts in split mode or locked mode.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGATCMSZ**Type**

int

Default value

0xe

Sets the size of the ATCM.

cpuX.CFGBTCMSZ**Type**

int

Default value

0xe

Sets the size of the BTCM.

cpuX.CFGEND**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

cpuX.CFGIE**Type**

bool

Default value

0x0

Set the reset value of the instruction endian bit.

cpuX.CFGNMFI**Type**

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

cpuX.DP_FLOAT**Type**

bool

Default value

0x1

Sets whether double-precision instructions are available.

cpuX.INITRAMA**Type**

bool

Default value

0x0

Initialize with TCMA enabled.

cpuX.INITRAMB**Type**

bool

Default value

0x0

Initialize with TCMB enabled.

cpuX.LOCZRAMA**Type**

bool

Default value

0x0

Initialize with LOCZRAMA set to 1.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.atcm_base**Type**

int

Default value

0x40000000

Model-specific. Sets the base address of the ATCM (forced to 0 if LOCZRAMA is 1).

cpuX.btcn_base**Type**

int

Default value

0x0

Model-specific. Sets the base address of the BTCM (forced to 0 if LOCZRAMA is 0).

cpuX.dcache-size**Type**

int

Default value

0x10000

Set D-cache size in bytes.

cpuX.icache-size**Type**

int

Default value

0x10000

Set I-cache size in bytes.

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether model has VFP support.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

reported_patch_level

Type
int

Default value
0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number

Type
int

Default value
0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

scheduler_mode

Type
int

Default value
0x0

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!.

3.5.63 **ARMCortexR7x1CT**

ARMCortexR7x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-443: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexR7x1CT

This model has the following Iris instances:

Table 3-444: ARMCortexR7x1CT Iris instances

InstanceName	ComponentName
ARMCortexR7x1CT	Cluster_ARM_Cortex-R7
ARMCortexR7x1CT.acp_mapper	PVBusMapper
ARMCortexR7x1CT.cpu0	ARM_Cortex-R7

ARMCortexR7x1CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexR7x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexR7x1CT contains the following CADI targets:

- ARM_Cortex-R7
- Cluster_ARM_Cortex-R7
- PVCache

About ARMCortexR7x1CT

An ARMCortexR7x2CT component also exists.

The per-core parameters are preceded by cpun., where n identifies the core (0 or 1).

pvbus_s is the slave port to access the TCM RAM of CPU n. Bits [3:0] of the user flags in the transaction are used to select the TCM:

0

Selects the ITCM of CPU 0

1

Selects the DTCM of CPU 0

2

Selects the ITCM of CPU 1

3

Selects the DTCM of CPU 1

Any other value is reserved.

When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.

The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- This component does not implement address filtering within the SCU. The enable bit for this feature is ignored.
- The GIC does not respect the CFGSDISABLE signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of WFI to wake up.
- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexR7x1CT

Table 3-446: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>cfgend[1]</code>	Signal	Slave	This signal if for EE bit initialisation.

Name	Protocol	Type	Description
cfgnmfi[1]	Signal	Slave	This signal disables FIQ mask in CPSR.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	Legacy FIQ request input line.
fiqout[1]	Signal	Master	Output of individual processor nFIQ from the interrupt controller.
fpuflags[1]	ValueState	Master	Floating-Point Unit output flags.
halt[1]	Signal	Slave	Raising this signal will put the core into halt mode. Equivalent to the hardware nCPUHALT[N:0] signal.
initram[1]	Signal	Slave	This signal enables the processor to boot from the instruction TCM.
ints[480]	Signal	Slave	Interrupt distributor interrupt lines.
irq[1]	Signal	Slave	Legacy IRQ request input line.
irqout[1]	Signal	Master	Output of individual processor nIRQ from the interrupt controller.
mfilteren	Signal	Slave	This signal enables filtering of address ranges between master bus ports.
mfilterend	Value	Slave	This port sets end of region mapped to pvbus_m1.
mfilterstart	Value	Slave	This port sets start of region mapped to pvbus_m1.
periphbase	Value	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down at least by factor of two.
periphreset	Signal	Slave	This signal resets timer and interrupt controller.
pfilterend	Value	Slave	This port sets end of region mapped to pvbus_mp.
pfilterstart	Value	Slave	This port sets start of region mapped to pvbus_mp.
pmuirq[2]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_m1	PVBus	Master	The core will generate bus requests on this port.
pvbus_mp	PVBus	Master	The core will generate bus requests on this port.
pvbus_s	PVBus	Slave	tcm slave port
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
scureset	Signal	Slave	This signal resets SCU.
smpnamp[1]	Signal	Master	This signals AMP or SMP mode for each Cortex-R7 processor.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[1]	Signal	Slave	This signal provides default exception handling state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
wdreset[1]	Signal	Slave	This signal resets individual watchdog.
wdresetreq[1]	Signal	Master	CPU watchdog reset requests.

Parameters for ARMCortexR7x1CT

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

LOCK_STEP

Type

int

Default value

0x0

Affects dual-processor configurations only, and ignored by single-processor configurations. 0 - Disable. Set for two independent processors. 1 - Lock Step. Appears to the system as two processors but is internally modeled as a single processor. 3 - Split Lock. Appears to the system as two processors but can be statically configured from reset either as two independent processors or two locked processors. For the model, these are equivalent to Disable and Lock Step, respectively, except for the value of build options registers. The model does not support dynamically splitting and locking the processor.

MFILTEREN

Type

bool

Default value

0x0

Enables filtering of address ranges.

MFILTEREND

Type

int

Default value

0x0

Specifies the end address for address filtering.

MFILTERSTART

Type

int

Default value

0x0

Specifies the start address for address filtering.

NUM_MPU_REGION**Type**

int

Default value

0xc

Sets the number of MPU regions.

PERIPHBASE**Type**

int

Default value

0xae000000

Base address of peripheral memory space.

PFILTEREND**Type**

int

Default value

0x0

Specifies the end address for peripheral port address filtering.

PFILTERSTART**Type**

int

Default value

0xffff0000

Specifies the start address for peripheral port address filtering.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

`cpuX.CFGNMFI`**Type**

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

`cpuX.DP_FLOAT`**Type**

bool

Default value

0x1

Sets whether double-precision instructions are available.

`cpuX.INITRAM`**Type**

bool

Default value

0x0

Enable the processor to boot from the instruction TCM.

cpuX . POWERCTLI**Type**

int

Default value

0x0

Default power control state for processor.

cpuX . SMPnAMP**Type**

bool

Default value

0x0

Set whether the processor is part of a coherent domain.

cpuX . TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX . VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX . dcache-size**Type**

int

Default value

0x8000

Set D-cache size in bytes.

cpuX.dtcn_size**Type**

int

Default value

0x8

DTCM size in KB.

cpuX.icache-size**Type**

int

Default value

0x8000

Set I-cache size in bytes.

cpuX.itcm_size**Type**

int

Default value

0x8

ITCM size in KB.

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.tcm-present**Type**

bool

Default value

0x1

Disables the DTCM and ITCM.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether model has VFP support.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dic-spi_count**Type**

int

Default value

0x40

Number of shared peripheral interrupts implemented.

ecc_on**Type**

bool

Default value

0x0

Enable Error Correcting Code.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number

Type
int

Default value
0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

scheduler_mode

Type
int

Default value
0x0

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!.

3.5.64 **ARMCortexR8x1CT**

ARMCortexR8x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-447: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexR8x1CT

This model has the following Iris instances:

Table 3-448: ARMCortexR8x1CT Iris instances

InstanceName	ComponentName
ARMCortexR8x1CT	Cluster_ARM_Cortex-R8
ARMCortexR8x1CT.acp_mapper	PVBusMapper
ARMCortexR8x1CT.cpu0	ARM_Cortex-R8
ARMCortexR8x1CT.cpu0.l1dcache	PVCache
ARMCortexR8x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexR8x1CT.cpu0.l1icache	PVCache

InstanceName	ComponentName
ARMCortexR8x1CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexR8x1CT.ext_bus	PVBusLogger
ARMCortexR8x1CT.ext_bus.mapper	PVBusMapper
ARMCortexR8x1CT.l1_incoherent_interconnect	PVCache
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexR8x1CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexR8x1CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-449: ARMCortexR8x1CT MTI instances

InstanceName	ComponentName
ARMCortexR8x1CT.acp_mapper	PVBusMapper
ARMCortexR8x1CT.cpu0	ARM_Cortex-R8
ARMCortexR8x1CT.cpu0.l1dcache	PVCache
ARMCortexR8x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexR8x1CT.cpu0.l1licache	PVCache
ARMCortexR8x1CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexR8x1CT.ext_bus	PVBusLogger
ARMCortexR8x1CT.ext_bus.mapper	PVBusMapper

ARMCortexR8x1CT.11_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexR8x1CT.12_flusher	AsyncCacheFlushUnit

ARMCortexR8x1CT contains the following CADI targets:

- ARM_Cortex-R8
- Cluster_ARM_Cortex-R8
- PVCache

About ARMCortexR8x1CT

The following components also exist:

ARMCortexR8x2CT. ARMCortexR8x3CT. ARMCortexR8x4CT.

The per-core parameters are preceded by cpun., where n identifies the core (0-3).

pvbus_s is the slave port to access the TCM RAM of CPU n. Bits [3:0] of the user flags in the transaction are used to select the TCM:

0

- selects the ITCM of CPU 0. 1
- selects the DTCM of CPU 0. 2
- selects the ITCM of CPU 1. 3
- selects the DTCM of CPU 1. 4
- selects the ITCM of CPU 2. 5
- selects the DTCM of CPU 2. 6
- selects the ITCM of CPU 3. 7
- selects the DTCM of CPU 3.

Any other value is reserved.

The semihosting-cwd parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The semihosting-cwd parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing .. or using absolute paths.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- This component does not implement address filtering within the SCU. The enable bit for this feature is ignored.
- The GIC does not respect the CFGSDISABLE signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of WFI to wake up.
- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.
- The vfp-enable_at_reset option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexR8x1CT

Table 3-450: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgnmfi[1]	Signal	Slave	This signal disables FIQ mask in CPSR.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.

Name	Protocol	Type	Description
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	Legacy FIQ request input line.
fiqout[1]	Signal	Master	Output of individual processor nFIQ from the interrupt controller.
fpfilterend0	Value	Slave	This port sets end of region mapped to pvbus_mfp0.
fpfilterend1	Value	Slave	This port sets end of region mapped to pvbus_mfp1.
fpfilterend2	Value	Slave	This port sets end of region mapped to pvbus_mfp2.
fpfilterend3	Value	Slave	This port sets end of region mapped to pvbus_mfp3.
fpfilterstart0	Value	Slave	This port sets start of region mapped to pvbus_mfp0.
fpfilterstart1	Value	Slave	This port sets start of region mapped to pvbus_mfp1.
fpfilterstart2	Value	Slave	This port sets start of region mapped to pvbus_mfp2.
fpfilterstart3	Value	Slave	This port sets start of region mapped to pvbus_mfp3.
fpuflags[1]	ValueState	Master	Floating-Point Unit output flags.
halt[1]	Signal	Slave	Raising this signal will put the core into halt mode. Equivalent to the hardware nCPUHALT[N:0] signal.
initram[1]	Signal	Slave	This signal enables the processor to boot from the instruction TCM.
ints[480]	Signal	Slave	Interrupt distributor interrupt lines.
irq[1]	Signal	Slave	Legacy IRQ request input line.
irqout[1]	Signal	Master	Output of individual processor nIRQ from the interrupt controller.
mfilteren	Signal	Slave	This signal enables filtering of address ranges between master bus ports.
mfilterend	Value	Slave	This port sets end of region mapped to pvbus_m1.
mfilterstart	Value	Slave	This port sets start of region mapped to pvbus_m1.
periphbase	Value	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down at least by factor of two.
periphreset	Signal	Slave	This signal resets timer and interrupt controller.
pfilterend	Value	Slave	This port sets end of region mapped to pvbus_mp.
pfilterstart	Value	Slave	This port sets start of region mapped to pvbus_mp.
pmuirq[2]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	AXI master port 0.
pvbus_m1	PVBus	Master	AXI master port 1.
pvbus_mfp0	PVBus	Master	Fast peripheral port for core 0.
pvbus_mfp1	PVBus	Master	Fast peripheral port for core 1.
pvbus_mfp2	PVBus	Master	Fast peripheral port for core 2.
pvbus_mfp3	PVBus	Master	Fast peripheral port for core 3.
pvbus_mp	PVBus	Master	Shared peripheral port.
pvbus_s	PVBus	Slave	tcm slave port.
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
scureset	Signal	Slave	This signal resets SCU.
smpnamp[1]	Signal	Master	This signals AMP or SMP mode for each Cortex-R8 processor.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.

Name	Protocol	Type	Description
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[1]	Signal	Slave	This signal provides default exception handling state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
wdreset[1]	Signal	Slave	This signal resets individual watchdog.
wdresetreq[1]	Signal	Master	CPU watchdog reset requests.

Parameters for ARM Cortex R8x1CT

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

FPFILTEREND0

Type

int

Default value

0x0

Specifies the end address for the fast peripheral port address filtering.

FPFILTEREND1

Type

int

Default value

0x0

Specifies the end address for the fast peripheral port address filtering.

FPFILTEREND2

Type

int

Default value

0x0

Specifies the end address for the fast peripheral port address filtering.

FPFILTEREND3**Type**

int

Default value

0x0

Specifies the end address for the fast peripheral port address filtering.

FPFILTERSTART0**Type**

int

Default value

0xffff00000

Specifies the start address for the fast peripheral port address filtering.

FPFILTERSTART1**Type**

int

Default value

0xffff00000

Specifies the start address for the fast peripheral port address filtering.

FPFILTERSTART2**Type**

int

Default value

0xffff00000

Specifies the start address for the fast peripheral port address filtering.

FPFILTERSTART3**Type**

int

Default value

0xffff00000

Specifies the start address for the fast peripheral port address filtering.

LOCK_STEP**Type**

int

Default value

0x0

Affects dual-processor configurations only, and ignored by single-processor configurations. 0 - Disable. Set for two independent processors. 1 - Lock Step. Appears to the system as two processors but is internally modeled as a single processor. 3 - Split Lock. Appears to the system as two processors but can be statically configured from reset either as two independent processors or two locked processors. For the model, these are equivalent to Disable and Lock Step, respectively, except for the value of build options registers. The model does not support dynamically splitting and locking the processor.

MFILTEREN**Type**

bool

Default value

0x0

Enables filtering of address ranges.

MFILTEREND**Type**

int

Default value

0x0

Specifies the end address for address filtering.

MFILTERSTART**Type**

int

Default value

0x0

Specifies the start address for address filtering.

NUM_MPU_REGION**Type**

int

Default value

0xc

Sets the number of MPU regions.

PERIPHBASE**Type**

int

Default value

0xae000000

Base address of peripheral memory space.

PFILTEREND**Type**

int

Default value

0x0

Specifies the end address for peripheral port address filtering.

PFILTERSTART**Type**

int

Default value

0xffff0000

Specifies the start address for peripheral port address filtering.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

cpuX.CFGNMFI**Type**

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

cpuX.DP_FLOAT**Type**

bool

Default value

0x1

Sets whether double-precision instructions are available.

cpuX.INITRAM**Type**

bool

Default value

0x0

Enable the processor to boot from the instruction TCM.

cpuX.POWERCTLI**Type**

int

Default value

0x0

Default power control state for processor.

cpuX.SMPnAMP**Type**

bool

Default value

0x0

Set whether the processor is part of a coherent domain.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.dcache-size**Type**

int

Default value

0x8000

Set D-cache size in bytes.

cpuX.dtcn_size**Type**

int

Default value

0x8

DTCM size in KB.

cpuX.icache-size**Type**

int

Default value

0x8000

Set I-cache size in bytes.

cpuX.itcm_size**Type**

int

Default value

0x8

ITCM size in KB.

cpuX.min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.tcm-present**Type**

bool

Default value

0x1

Disables the DTCM and ITCM.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether model has VFP support.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dic-spi_count**Type**

int

Default value

0x40

Number of shared peripheral interrupts implemented.

ecc_on**Type**

bool

Default value

0x0

Enable Error Correcting Code.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

scheduler_mode**Type**

int

Default value

0x0

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!.

3.5.65 ARMCortexR52PlusCT

ARMCortexR52PlusCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-451: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- has_llpp

Iris and MTI instances for ARMCortexR52PlusCT

This model has the following Iris instances:

Table 3-452: ARMCortexR52PlusCT Iris instances

InstanceName	ComponentName
ARMCortexR52PlusCT	Cluster_ARM_Cortex-R52Plus
ARMCortexR52PlusCT.AMU	PVBusLogger
ARMCortexR52PlusCT.AMU.mapper	PVBusMapper
ARMCortexR52PlusCT.DAP	PVBusLogger
ARMCortexR52PlusCT.DAP.mapper	PVBusMapper
ARMCortexR52PlusCT.MMAP	PVBusLogger
ARMCortexR52PlusCT.MMAP.mapper	PVBusMapper
ARMCortexR52PlusCT.RAS	PVBusLogger
ARMCortexR52PlusCT.RAS.mapper	PVBusMapper
ARMCortexR52PlusCT.acp_mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexR52PlusCT.cpu0	ARM_Cortex-R52Plus
ARMCortexR52PlusCT.cpu0.UTLB	TLB
ARMCortexR52PlusCT.cpu0.dtlb	TlbCadi
ARMCortexR52PlusCT.cpu0.gicv3_cpu_if	GICv3CPUInterface
ARMCortexR52PlusCT.cpu0.l1dcache	PVCache
ARMCortexR52PlusCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexR52PlusCT.cpu0.l1licache	PVCache

ARMCortexR52PlusCT.gic_iri.rd_0_0_0_1	GICv3Redistributor
ARMCortexR52PlusCT.gic_iri.rd_tl	GICv3Distributor
ARMCortexR52PlusCT.l2_flusher	AsyncCacheFlushUnit

ARMCortexR52PlusCT contains the following CADI targets:

- ARM_Cortex-R52Plus
- Cluster_ARM_Cortex-R52Plus
- PVCache
- TlbCadi
- gic_iri

About ARMCortexR52PlusCT

The model does not implement the following:

- Redundant cores for Dual Core Lock Step operation.
- Low Power Interface to wake the target core on receiving a `wake_request` from the GIC Distributor.

Debug accesses

For debug accesses to succeed, they must have permissions that are compliant with the permission value in the `IMP_SLAVEPCTLR` register.

Note

The reset value of `IMP_SLAVEPCTLR` is `0x1` which means privileged access only.

Ports for ARMCortexR52PlusCT

Table 3-454: Ports

Name	Protocol	Type	Description
cfgdbgromaddr	Value_64	Slave	Debug ROM base address.

Name	Protocol	Type	Description
cfgdbgromaddrv	Signal	Slave	Debug ROM base address valid.
cfgendianess[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgperiphbase	Value_64	Slave	This port sets the base address of private peripheral region.
cfgthumbexceptions[4]	Signal	Slave	This signal provides default exception handling state.
cfgvectable[4]	Value_64	Slave	Reset vector base address.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	Configure Aff2 and Aff1 fields of MPIDR. Aff1 = value[7:0], Aff2 = value[15:8]
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
commr[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cpuhalt[4]	Signal	Slave	Raising this signal will put the core into halt mode.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	There is no support for PChannel in CortexR52Plus. These signals relate to core power down. Equivalent to COREACTIVEx
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
ext_slave_s	PVBus	Slave	External Slave port. Equivalent to AXIS port
extppi_in_0[9]	Signal	Slave	Core 0 external ppi signals.
extppi_in_1[9]	Signal	Slave	Core 1 external ppi signals.
extppi_in_2[9]	Signal	Slave	Core 2 external ppi signals.
extppi_in_3[9]	Signal	Slave	Core 3 external ppi signals.
flash_m[4]	PVBus	Master	Flash Port.
gdu_external_m	GICv3Comms	Master	GDU external messaging port.
hiden[4]	Signal	Slave	External debug interface.
hniden[4]	Signal	Slave	External debug interface.
llpp_m[4]	PVBus	Master	LLPP (Low-Latency Peripheral Port).
memorymapped_debug_s	PVBus	Slave	External debug interface.

Name	Protocol	Type	Description
niden[4]	Signal	Slave	External debug interface.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_core_m[4]	PVBus	Master	The core will generate bus requests on this port. Equivalent to AXIM port
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
topreset	Signal	Slave	This signal resets timer and interrupt controller.
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.
warmrstreq[4]	Signal	Master	Warm reset request from core.

Parameters for ARMCortexR52PlusCT

CLUSTER_ID

Type

int

Default value

0x0

CLUSTER_ID[15:8] equivalent to CFGMPIDRAFF2, CLUSTER_ID[7:0] equivalent to CFGMPIDRAFF1.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally

required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Equivalent to CFGDBGROMADDR.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x0

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores in cluster.

PERIPHBASE**Type**

int

Default value

0x13080000

Equivalent to CFGPERIPHBASE.

cluster_utid**Type**

int

Default value

0x0

Equivalent to CFGCLUSTERUTID.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Equivalent to CFGTHUMBEXCEPTIONS.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Equivalent to CFGVECTABLE.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether the model has been built with NEON support.

cpuX.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.flash.enable**Type**

bool

Default value

0x0

Equivalent to CFGFLASHEN.

cpuX.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

cpuX.llpp.base**Type**

int

Default value

0x0

Equivalent to CFGLLPPBASEADDR.

cpuX.llpp.size**Type**

int

Default value

0x8000000

Equivalent to CFGLLPPSIZE.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.tcm.a.enable**Type**

bool

Default value

0x0

Equivalent to CFGTCMBOOT.

cpuX.tcm.a.size**Type**

int

Default value

0x4000

Sets the size of the ATCM(in bytes).

cpuX.tcm.a.wait**Type**

int

Default value

0x0

TCM Register A accesses wait states: 0-1 states.

cpuX.tcm.b.size**Type**

int

Default value

0x4000

Sets the size of the BTCM(in bytes).

cpuX.tcm.b.wait**Type**

int

Default value

0x0

TCM Register B accesses wait states: 0-1 states.

cpuX.tcm.c.size**Type**

int

Default value

0x2000

Sets the size of the CTCM(in bytes).

cpuX.tcm.c.wait**Type**

int

Default value

0x0

TCM Register C accesses wait states: 0-1 states.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-dp-present**Type**

bool

Default value

0x1

Whether double-precision floating point feature is implemented (FEAT_F64MM).

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`enable_lock_step`

Type

bool

Default value

0x0

(equivalent to `CFGSLSPPLIT`).

`enable_simulation_performance_optimizations`

Type

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

`flash_protection_enable_at_reset`

Type

bool

Default value

0x0

Equivalent to `CFGFLASHPROTEN`.

`has_export_m_port`

Type

bool

Default value

0x1

The interrupt distributor has an optional interrupt export port for routing interrupts to an external device.

has_flash**Type**

bool

Default value

0x0

Equivalent to CFGFLASHIMP.

has_flash_protection**Type**

bool

Default value

0x1

Equivalent to CFGFLASHPROTIMP.

has_llpp**Type**

bool

Default value

0x0

Equivalent to CFGLLPPIMP.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and

intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-state_modelled`**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`memory.ext_slave_base`**Type**

int

Default value

0x0

Equivalent to `CFGAXISTCMBASEADDR`.

`memory.flash_base`**Type**

int

Default value

0x0

Equivalent to `CFGFLASHBASEADDR`.

`num_protection_regions_s1`**Type**

int

Default value

0x18

Number of v8-R protection regions.

`num_protection_regions_s2`**Type**

int

Default value

0x18

Number of v8-R hyp protection regions.

num_spi**Type**

int

Default value

0x3c0

Number of interrupts (SPI) into the internal GIC controller.

ram_protection_enable_at_reset**Type**

bool

Default value

0x0

Equivalent to CFGRAMPROTEN.

reported_fp_revision**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored. Updates the FPSID.revision value.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

3.5.66 ARM Cortex R52x1CT

ARM Cortex R52x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-455: IP revisions support

Revision	Quality level
r1p4	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- `has_llpp`

Iris and MTI instances for ARM Cortex R52x1CT

This model has the following Iris instances:

ARMCortexR52x1CT.gic_iri.rd_tl	GICv3Distributor
ARMCortexR52x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexR52x1CT contains the following CADI targets:

- ARM_CortexR52
- Cluster_ARM_Cortex-R52
- PVCache
- TlbCadi
- gic_iri

About ARMCortexR52x1CT

- The following components also exist:
 - ARMCortexR52x2CT.
 - ARMCortexR52x3CT.
 - ARMCortexR52x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.
- The Cortex-R52 processor does not implement TrustZone® technology, therefore the model does not support `S_*` or `NS_*` registers or exceptions.
- If flash memory is not enabled, to disable all routing to the flash port, set the `has_flash` parameter to false.

Differences between the model and the RTL

- The model does not implement redundant cores for Dual-Core Lock-Step operations.
- The model does not implement the Low Power Interface to wake up the target core on receiving a `wake_request` signal from the GIC distributor.
- TCMs are modeled internally and the model does not support external TCMs or the ports associated with them.
- The model does not support running Software Test Libraries (STLs).
- The `vfp-enable_at_reset` parameter is a model-specific behavior with no hardware equivalent.
- ECC and parity schemes are hardware-specific so are not supported.

Debug accesses

For debug accesses to succeed, they must have permissions that are compliant with the permission value in the `IMP_SLAVEPCTLR` register.

The reset value of IMP_SLAVEPCTLR is 0x1 which means privileged access only.

Ports for ARMCortexR52x1CT

Table 3-458: Ports

Name	Protocol	Type	Description
cfgdbgromaddr	Value_64	Slave	Debug ROM base address.
cfgdbgromaddrv	Signal	Slave	Debug ROM base address valid.
cfgendianess[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgperiphbase	Value_64	Slave	This port sets the base address of private peripheral region.
cfgthumbexceptions[1]	Signal	Slave	This signal provides default exception handling state.
cfgvectable[1]	Value_64	Slave	Reset vector base address.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	Configure Aff2 and Aff1 fields of MPIDR. Aff1 = value[7:0], Aff2 = value[15:8]
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
commr[1]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[1]	Signal	Master	Transmit portion of Data Transfer Register empty.
COREPACTIVEx1[1]	Signal	Master	These signals relate to core power down. Equivalent to COREPACTIVEx[1]
cpuhalt[1]	Signal	Slave	Raising this signal will put the core into halt mode.
cpuporeset[1]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cti[1]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
dbgack[1]	Signal	Master	External debug interface.
dbgen[1]	Signal	Slave	External debug interface.
dbgnopwrdown[1]	Signal	Master	There is no support for PChannel in CortexR52. These signals relate to core power down. Equivalent to COREPACTIVEx[0]
dbgpwrupreq[1]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.

Name	Protocol	Type	Description
edbgrq[1]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
ext_slave_s	PVBus	Slave	External Slave port. Equivalent to AXIS port
extppi_in_0[9]	Signal	Slave	Core 0 external ppi signals.
flash_m[1]	PVBus	Master	Flash Port.
gdu_external_m	GICv3Comms	Master	GDU external messaging port.
hiden[1]	Signal	Slave	External debug interface.
hniden[1]	Signal	Slave	External debug interface.
llpp_m[1]	PVBus	Master	LLPP (Low-Latency Peripheral Port).
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[1]	Signal	Slave	External debug interface.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_core_m[1]	PVBus	Master	The core will generate bus requests on this port. Equivalent to AXIM port
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
sei[1]	Signal	Slave	Per core virtual System Error physical pins.
spi_in[960]	Signal	Slave	Shared peripheral interrupts.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
topreset	Signal	Slave	This signal resets timer and interrupt controller.
vsei[1]	Signal	Slave	Per core virtual System Error physical pins.
warmrstreq[1]	Signal	Master	Warm reset request from core.

Parameters for ARMCortexR52x1CT

CLUSTER_ID

Type

int

Default value

0x0

CLUSTER_ID[15:8] equivalent to CFGMPIDRAFF2, CLUSTER_ID[7:0] equivalent to CFGMPIDRAFF1.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Equivalent to CFGDBGROMADDR.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x0

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

PERIPHBASE**Type**

int

Default value

0x13080000

Equivalent to CFGPERIPHBASE.

cluster_utid**Type**

int

Default value

0x0

Equivalent to CFGCLUSTERUTID.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Equivalent to CFGTHUMBEXCEPTIONS.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Equivalent to CFGVECTABLE.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether the model has been built with NEON support.

cpuX.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.flash.enable**Type**

bool

Default value

0x0

Equivalent to CFGFLASHEN.

cpuX.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

cpuX.llpp.base**Type**

int

Default value

0x0

Equivalent to CFGLLPPBASEADDR.

cpuX.llpp.size**Type**

int

Default value

0x1000

Equivalent to CFGLLPPSIZE.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.tcm.a.enable**Type**

bool

Default value

0x0

Equivalent to CFGTCMBOOT.

cpuX.tcm.a.size**Type**

int

Default value

0x4000

Sets the size of the ATCM(in bytes).

cpuX.tcm.a.wait**Type**

int

Default value

0x0

TCM Register A accesses wait states: 0-1 states.

cpuX.tcm.b.size**Type**

int

Default value

0x4000

Sets the size of the BTCM(in bytes).

cpuX.tcm.b.wait**Type**

int

Default value

0x0

TCM Register B accesses wait states: 0-1 states.

cpuX.tcm.c.size**Type**

int

Default value

0x2000

Sets the size of the CTCM(in bytes).

cpuX.tcm.c.wait**Type**

int

Default value

0x0

TCM Register C accesses wait states: 0-1 states.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-dp-present**Type**

bool

Default value

0x1

Whether double-precision floating point feature is implemented (FEAT_F64MM).

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

enable_lock_step**Type**

bool

Default value

0x0

(equivalent to `CFGSLSPPLIT`).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

flash_protection_enable_at_reset**Type**

bool

Default value

0x0

Equivalent to `CFGFLASHPROTEN`.

has_export_m_port**Type**

bool

Default value

0x1

The interrupt distributor has an optional interrupt export port for routing interrupts to an external device.

has_flash**Type**

bool

Default value

0x0

Equivalent to CFGFLASHIMP.

has_flash_protection**Type**

bool

Default value

0x1

Equivalent to CFGFLASHPROTIMP.

has_llpp**Type**

bool

Default value

0x0

Equivalent to CFGLLPPIMP.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and

intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-state_modelled`**Type**`bool`**Default value**`0x0`

Set whether I-cache has stateful implementation.

`memory.ext_slave_base`**Type**`int`**Default value**`0x0`

Equivalent to `CFGAXISTCMBASEADDR`.

`memory.flash_base`**Type**`int`**Default value**`0x0`

Equivalent to `CFGFLASHBASEADDR`.

`num_protection_regions_s1`**Type**`int`**Default value**`0x18`

Number of v8-R protection regions.

`num_protection_regions_s2`**Type**`int`**Default value**`0x18`

Number of v8-R hyp protection regions.

num_spi**Type**

int

Default value

0x3c0

Number of interrupts (SPI) into the internal GIC controller.

ram_protection_enable_at_reset**Type**

bool

Default value

0x0

Equivalent to CFGRAMPROTEN.

reported_fp_revision**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored. Updates the FPSID.revision value.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

3.5.67 ARM Cortex R82AECT

ARM Cortex R82AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-459: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM Cortex R82AECT

This model has the following Iris instances:

Table 3-460: ARM Cortex R82AECT Iris instances

InstanceName	ComponentName
ARM Cortex R82AECT	Cluster_ARM_Cortex-R82AE
ARM Cortex R82AECT.AMU	PVBusLogger
ARM Cortex R82AECT.AMU.mapper	PVBusMapper
ARM Cortex R82AECT.DAP	PVBusLogger
ARM Cortex R82AECT.DAP.mapper	PVBusMapper
ARM Cortex R82AECT.DSU	DSU
ARM Cortex R82AECT.DSU.PPU_cluster	PPUv1
ARM Cortex R82AECT.DSU.PPU_cluster.busslave	PVBusSlave
ARM Cortex R82AECT.DSU.PPU_core0	PPUv1
ARM Cortex R82AECT.DSU.PPU_core0.busslave	PVBusSlave
ARM Cortex R82AECT.DSU.utility_slave[0]	PVBusSlave
ARM Cortex R82AECT.MMAP	PVBusLogger
ARM Cortex R82AECT.MMAP.mapper	PVBusMapper
ARM Cortex R82AECT.RAS	PVBusLogger
ARM Cortex R82AECT.RAS.mapper	PVBusMapper
ARM Cortex R82AECT.cpu0	ARM_Cortex-R82AE
ARM Cortex R82AECT.cpu0.UTLB	TLB
ARM Cortex R82AECT.cpu0.dtlb	TlbCadi
ARM Cortex R82AECT.cpu0.gicv3_cpu_if	GICv3CPUInterface
ARM Cortex R82AECT.cpu0.l1dcache	PVCache
ARM Cortex R82AECT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARM Cortex R82AECT.cpu0.l1icache	PVCache
ARM Cortex R82AECT.cpu0.l1icache.upstream[0]	PVBusSlave
ARM Cortex R82AECT.ext_bus	PVBusLogger

InstanceName	ComponentName
ARMCortexR82AECT.ext_bus.mapper	PVBusMapper
ARMCortexR82AECT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexR82AECT.l2_cache	PVCache
ARMCortexR82AECT.l2_cache.upstream[0]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[10]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[11]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[12]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[13]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[14]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[15]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[16]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[1]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[2]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[3]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[4]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[5]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[6]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[7]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[8]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[9]	PVBusSlave
ARMCortexR82AECT.llram_atomic_filter	LLRAMAtomicOpFilter
ARMCortexR82AECT.llram_atomic_filter.atomic_bus_slave	PVBusSlave
ARMCortexR82AECT.llram_atomic_filter.filter	PVBusMapper
ARMCortexR82AECT.llram_atomic_filter.llram_exclusive_monitor	PVBusExclusiveMonitor
ARMCortexR82AECT.llram_atomic_filter.llram_exclusive_monitor.bus_mapper	PVBusMapper
ARMCortexR82AECT.llram_atomic_filter.pvbusmaster	PVBusMaster
ARMCortexR82AECT.llram_coherent_interconnect	PVCache
ARMCortexR82AECT.llram_coherent_interconnect.upstream[0]	PVBusSlave
ARMCortexR82AECT.llram_coherent_interconnect.upstream[1]	PVBusSlave
ARMCortexR82AECT.llram_coherent_interconnect.upstream[2]	PVBusSlave

This model has the following MTI trace components:

Table 3-461: ARMCortexR82AECT MTI instances

InstanceName	ComponentName
ARMCortexR82AECT	ARMv8Cluster
ARMCortexR82AECT.AMU	PVBusLogger

ARMCortexR82AECT.l2_cache.upstream[7]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[8]	PVBusSlave
ARMCortexR82AECT.l2_cache.upstream[9]	PVBusSlave
ARMCortexR82AECT.llram_atomic_filter	LLRAMAtomicOpFilter

InstanceName	ComponentName
ARMCortexR82AECT.llram_atomic_filter.atomic_bus_slave	PVBusSlave
ARMCortexR82AECT.llram_atomic_filter.filter	PVBusMapper
ARMCortexR82AECT.llram_atomic_filter.llram_exclusive_monitor	PVBusExclusiveMonitor
ARMCortexR82AECT.llram_atomic_filter.llram_exclusive_monitor.bus_mapper	PVBusMapper
ARMCortexR82AECT.llram_atomic_filter.pvbusmaster	PVBusMaster
ARMCortexR82AECT.llram_coherent_interconnect	PVCache
ARMCortexR82AECT.llram_coherent_interconnect.upstream[0]	PVBusSlave
ARMCortexR82AECT.llram_coherent_interconnect.upstream[1]	PVBusSlave
ARMCortexR82AECT.llram_coherent_interconnect.upstream[2]	PVBusSlave

ARMCortexR82AECT contains the following CADI targets:

- ARM_Cortex-R82AE
- Cluster_ARM_Cortex-R82AE
- PVCache
- TlbCadi

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexR82AECT

Table 3-462: Ports

Name	Protocol	Type	Description
acel_s	PVBus	Slave	External Slave port. Equivalent to AXIS port.
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cache_validation_control	Value	Slave	This signal provides default exception handling state.
cfgendianess[8]	Signal	Slave	This signal if for EE bit initialisation

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPSIRQ[8]	Signal	Master	Timer signals to SOC
CNTHVSIRQ[8]	Signal	Master	Timer signals to SOC
CNTPSIRQ[8]	Signal	Master	Timer signals to SOC
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module
CNTVIRQ[8]	Signal	Master	Timer signals to SOC
commirq[8]	Signal	Master	Interrupt signal from debug communication channel.
core_pcs_m_pchannel[8]	PChannel	Master	Core PCSM signals
coreerrirq[8]	Signal	Master	Core RAS error interrupt
corefaultirq[8]	Signal	Master	Core RAS fault interrupt
cp15sdisable[8]	Signal	Slave	This signal disables write access to some system control processor registers
cpuhalt[8]	Signal	Slave	Raising this signal will put the core into halt mode.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	-
cti0extin[4]	Signal	Slave	CTI trace inputs for core 0.
cti0extout[4]	Signal	Master	CTI trace outputs for core 0.
cti1extin[4]	Signal	Slave	CTI trace inputs for core 1.
cti1extout[4]	Signal	Master	CTI trace outputs for core 1.
cti2extin[4]	Signal	Slave	CTI trace inputs for core 2.
cti2extout[4]	Signal	Master	CTI trace outputs for core 2.
cti3extin[4]	Signal	Slave	CTI trace inputs for core 3.
cti3extout[4]	Signal	Master	CTI trace outputs for core 3.
cti4extin[4]	Signal	Slave	CTI trace inputs for core 4.
cti4extout[4]	Signal	Master	CTI trace outputs for core 4.
cti5extin[4]	Signal	Slave	CTI trace inputs for core 5.
cti5extout[4]	Signal	Master	CTI trace outputs for core 5.
cti6extin[4]	Signal	Slave	CTI trace inputs for core 6.
cti6extout[4]	Signal	Master	CTI trace outputs for core 6.
cti7extin[4]	Signal	Slave	CTI trace inputs for core 7.
cti7extout[4]	Signal	Master	CTI trace outputs for core 7.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.

Name	Protocol	Type	Description
dbgen	Signal	Slave	-
dbgnopwrdown[8]	Signal	Master	These signals relate to core power down.
dbgpwrdownack[8]	Signal	Master	Debug power down acknowledge.
dbgpwrdownreq[8]	Signal	Slave	Debug power down request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
external_trace_reset[8]	Signal	Slave	ETMv4 External Trace Reset signal.
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2reset	Signal	Slave	This signal resets timer and interrupt controller and I2cache
llpp_m[8]	PVBus	Master	LLPP (Low-Latency Peripheral Port).
llram_m	PVBus	Master	LLRAM Port
macp_s	PVBus	Slave	MACP slave interface
memorymapped_debug_s	PVBus	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster irq signal
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wakeup request
ppu_core_irq[8]	Signal	Master	PPU core irq signal
ppu_core_wakerequest[8]	Signal	Slave	PPU core wakeup request
presetdbg[8]	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset	Signal	Slave	-
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbar[8]	Value_64	Slave	Reset vector base address.
sei[8]	Signal	Slave	Per core System Error physical pins
spiden	Signal	Slave	Secure invasive debug enable.
spp_m	PVBus	Master	SPP (Shared Peripheral Port).

Name	Protocol	Type	Description
standbywfe[8]	Signal	Master	This signal indicates if a core is in WFE state
standbywfi[8]	Signal	Master	This signal indicates if a core is in WFI state
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[8]	Signal	Slave	ETMv4 Trace Unit Reset signal.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	Signal	Slave	This signal drives the CPUs virtual fast-interrupt handling.
virq[8]	Signal	Slave	This signal drives the CPUs virtual interrupt handling.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Parameters for ARM Cortex R82AECT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation to NC/DEV memory. The broadcastatomic signal will override this value if used.

BROADCASTATOMICL

Type

bool

Default value

0x1

Enable broadcasting of atomic operation to LLRAM memory. The broadcastatomicl signal will override this value and it will be functional for revision 2.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CCSIDR-L1D_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

CCSIDR-L1I_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

CCSIDR-L2_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

CCSIDR-L3_override**Type**

int

Default value

0x0

If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).

CFGTFPEN_pin_reset**Type**

bool

Default value

0x0

CFGTFPEN pin at reset.

CHI**Type**

bool

Default value

0x0

Selects the type of protocol the Main Manager(MM) interface implements. 0, MM port configured as AXI. 1, MM port configured as CHI.

CLUSTER_ID**Type**

int

Default value

0x0

CLUSTER_ID[15:8] equivalent to CFGMPIDRAFF3, CLUSTER_ID[7:0] equivalent to CFGMPIDRAFF2.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x0

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores in cluster.

PA_SIZE**Type**

int

Default value

0x28

Physical address range supported (FEAT_LPA).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

VMSA_supported**Type**

bool

Default value

0x1

VMSA is supported at EL1.

bus_protection_enable_at_reset**Type**

bool

Default value

0x0

Equivalent to CFGBUSPROTEN.

core_power_on_by_default**Type**

bool

Default value

0x1

Equivalent to PPU_RST_STATE. 0 = Cluster PPU and all core PPUs reset to OFF, 1 = Cluster PPU and all core PPUs reset to ON.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.RVBAR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.TEINIT**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether the model has been built with NEON support.

cpuX.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

cpuX.dtcn_base**Type**

int

Default value

0x0

Sets the 16K aligned base address of DTCM.

cpuX.dtcn_size**Type**

int

Default value

0x0

Sets the size of DTCM (in bytes).

cpuX.dtcn_stretch_clk**Type**

bool

Default value

0x0

Whether DTCM clock stretched to occupy full cycle.

cpuX.dtcm_wait**Type**

int

Default value

0x0

DTCM accesses wait states: 0-3 cycles.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

cpuX.itcm_base**Type**

int

Default value

0x0

Sets the 16K aligned base address of ITCM.

cpuX.itcm_size**Type**

int

Default value

0x0

Sets the size of ITCM (in bytes).

cpuX.itcm_stretch_clk**Type**

bool

Default value

0x0

Whether ITCM clock stretched to occupy full cycle.

cpuX.itcm_wait**Type**

int

Default value

0x0

ITCM accesses wait states: 0-3 cycles.

cpuX.llpp.base**Type**

int

Default value

0x0

Equivalent to CFGLLPPBASEADDR.

cpuX.llpp.size**Type**

int

Default value

0x8000000

Equivalent to CFGLLPPSIZE.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.tcm.a.enable**Type**

bool

Default value

0x0

Equivalent to CFGITCMENm.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-dp-present**Type**

bool

Default value

0x1

Whether double-precision floating point feature is implemented (FEAT_F64MM).

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`enable_lock_step`**Type**

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

gicv3.BPR-min**Type**

int

Default value

0x2

The minimum value for the GICC_BPR register (non-secure version will be 1 + this value).

gicv3.VBPR-min**Type**

int

Default value

0x2

The minimum value for the GICV_BPR register (non-secure version will be 1 + this value).

has_dense_mem_map**Type**

bool

Default value

0x0

If true, the cluster follows the dense memory map else it implements the sparse memory map.

has_impdef_transient_fault_protection**Type**

bool

Default value

0x1

Support the Transient Fault Protection (TFP) flop parity errors through RAS registers (FEAT_TFP).

has_llpp**Type**

bool

Default value

0x1

Equivalent to CFGLLPPIMP.

has_pmc**Type**

bool

Default value

0x0

Programmable MBIST controllers implemented.

has_spp**Type**

bool

Default value

0x1

Equivalent to CFGSPPIMP.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`

Type

int

Default value

0x400000

L2 Cache size in bytes.

`l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l2cache-write_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory.ext_slave_base**Type**

int

Default value

0x0

Equivalent to CFGACELSTCMBASEADDR.

memory.has_llram**Type**

bool

Default value

0x1

Equivalent to CFGLLRAMIMP.

memory.llram_base**Type**

int

Default value

0x20000000

Equivalent to CFGLLRAMBASEADDR.

memory.llram_enable_at_reset**Type**

bool

Default value

0x1

Equivalent to CFGLLRAMEN.

memory.llram_shared**Type**

bool

Default value

0x0

Equivalent to CFGLLRAMSHARED and it is only functional for revision 2.

memory.llram_size**Type**

int

Default value

0x10000000

Size of the LLRAM.

num_protection_regions_s1**Type**

int

Default value

0x10

Number of v8-R protection regions.

num_protection_regions_s2**Type**

int

Default value

0x10

Number of v8-R hyp protection regions.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

ram_protection_enable_at_reset**Type**

bool

Default value

0x0

Equivalent to CFGGRAMPROTEN.

spp.base**Type**

int

Default value

0x0

Equivalent to CFGSPPBASEADDR.

spp.size**Type**

int

Default value

0x8000000

Sets the size of SPP(in bytes).

stage12_tlb_size**Type**

int

Default value

0x0

If VMSA is supported at stage1, number of stage1+2 tlb entries. If instruction_tlb_size !=0, this is treated as dtlb size.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.68 ARM CortexR82CT

ARM CortexR82CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-463: IP revisions support

Revision	Quality level
r0p0	Preliminary support
r1p1	Preliminary support
r2p1	Preliminary support
r3p1	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexR82CT

This model has the following Iris instances:

Table 3-464: ARM CortexR82CT Iris instances

InstanceName	ComponentName
ARM CortexR82CT	Cluster_ARM_Cortex-R82
ARM CortexR82CT.AMU	PVBusLogger
ARM CortexR82CT.AMU.mapper	PVBusMapper
ARM CortexR82CT.DAP	PVBusLogger
ARM CortexR82CT.DAP.mapper	PVBusMapper
ARM CortexR82CT.DSU	DSU

InstanceName	ComponentName
ARMCortexR82CT.DSU.PPU_cluster	PPUv1
ARMCortexR82CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexR82CT.DSU.PPU_core0	PPUv1
ARMCortexR82CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexR82CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexR82CT.MMAP	PVBusLogger
ARMCortexR82CT.MMAP.mapper	PVBusMapper
ARMCortexR82CT.RAS	PVBusLogger
ARMCortexR82CT.RAS.mapper	PVBusMapper
ARMCortexR82CT.cpu0	ARM_Cortex-R82
ARMCortexR82CT.cpu0.UTLB	TLB
ARMCortexR82CT.cpu0.dtlb	TlbCadi
ARMCortexR82CT.cpu0.gicv3_cpu_if	GICv3CPUInterface
ARMCortexR82CT.cpu0.l1dcache	PVCache
ARMCortexR82CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexR82CT.cpu0.l1licache	PVCache
ARMCortexR82CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexR82CT.ext_bus	PVBusLogger
ARMCortexR82CT.ext_bus.mapper	PVBusMapper
ARMCortexR82CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexR82CT.l2_cache	PVCache
ARMCortexR82CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[4]	PVBusSlave

ARMCortexR82CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[4]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[6]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexR82CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexR82CT.llram_atomic_filter	LLRAMAtomicOpFilter
ARMCortexR82CT.llram_atomic_filter.atomic_bus_slave	PVBusSlave
ARMCortexR82CT.llram_atomic_filter.filter	PVBusMapper
ARMCortexR82CT.llram_atomic_filter.llram_exclusive_monitor	PVBusExclusiveMonitor
ARMCortexR82CT.llram_atomic_filter.llram_exclusive_monitor.bus_mapper	PVBusMapper
ARMCortexR82CT.llram_atomic_filter.pvbusmaster	PVBusMaster
ARMCortexR82CT.llram_coherent_interconnect	PVCache
ARMCortexR82CT.llram_coherent_interconnect.upstream[0]	PVBusSlave
ARMCortexR82CT.llram_coherent_interconnect.upstream[1]	PVBusSlave
ARMCortexR82CT.llram_coherent_interconnect.upstream[2]	PVBusSlave

ARMCortexR82CT contains the following CADI targets:

- ARM_Cortex-R82
- Cluster_ARM_Cortex-R82
- PVCache
- TlbCadi

About ARMCortexR82CT

To simulate the r1p0 model, use the following parameters:

- revision_number=1
- VMSA_supported=1

Limitations

Dense memory map support has been added for the Utility bus only.

Ports for ARMCortexR82CT

Table 3-466: Ports

Name	Protocol	Type	Description
acel_s	PVBus	Slave	External Slave port. Equivalent to AXIS port.
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastatomicl	Signal	Slave	BROADCASTATOMIC pin for LLRAM
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cache_validation_control	Value	Slave	This signal provides default exception handling state.
cfgendianess[8]	Signal	Slave	This signal if for EE bit initialisation
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPSIRQ[8]	Signal	Master	Timer signals to SOC
CNTHVSIQ[8]	Signal	Master	Timer signals to SOC
CNTPSIQ[8]	Signal	Master	Timer signals to SOC
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module
CNTVIRQ[8]	Signal	Master	Timer signals to SOC
commirq[8]	Signal	Master	Interrupt signal from debug communication channel.
core_pcs_m_pchannel[8]	PChannel	Master	Core PCSM signals
coreerrirq[8]	Signal	Master	Core RAS error interrupt
corefaultirq[8]	Signal	Master	Core RAS fault interrupt
cp15sdisable[8]	Signal	Slave	This signal disables write access to some system control processor registers
cpuhalt[8]	Signal	Slave	Raising this signal will put the core into halt mode.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	-
cti0extin[4]	Signal	Slave	CTI trace inputs for core 0.
cti0extout[4]	Signal	Master	CTI trace outputs for core 0.
cti1extin[4]	Signal	Slave	CTI trace inputs for core 1.
cti1extout[4]	Signal	Master	CTI trace outputs for core 1.

Name	Protocol	Type	Description
cti2extin[4]	Signal	Slave	CTI trace inputs for core 2.
cti2extout[4]	Signal	Master	CTI trace outputs for core 2.
cti3extin[4]	Signal	Slave	CTI trace inputs for core 3.
cti3extout[4]	Signal	Master	CTI trace outputs for core 3.
cti4extin[4]	Signal	Slave	CTI trace inputs for core 4.
cti4extout[4]	Signal	Master	CTI trace outputs for core 4.
cti5extin[4]	Signal	Slave	CTI trace inputs for core 5.
cti5extout[4]	Signal	Master	CTI trace outputs for core 5.
cti6extin[4]	Signal	Slave	CTI trace inputs for core 6.
cti6extout[4]	Signal	Master	CTI trace outputs for core 6.
cti7extin[4]	Signal	Slave	CTI trace inputs for core 7.
cti7extout[4]	Signal	Master	CTI trace outputs for core 7.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	-
dbgnopwrdown[8]	Signal	Master	These signals relate to core power down.
dbgpwrdownack[8]	Signal	Master	Debug power down acknowledge.
dbgpwrdownreq[8]	Signal	Slave	Debug power down request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
external_trace_reset[8]	Signal	Slave	ETMv4 External Trace Reset signal.
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2reset	Signal	Slave	This signal resets timer and interrupt controller and I2cache
llpp_m[8]	PVBus	Master	LLPP (Low-Latency Peripheral Port).
llram_m	PVBus	Master	LLRAM Port
macp_s	PVBus	Slave	MACP slave interface
memorymapped_debug_s	PVBus	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster irq signal
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wakeup request

Name	Protocol	Type	Description
ppu_core_irq[8]	Signal	Master	PPU core irq signal
ppu_core_wakerequest[8]	Signal	Slave	PPU core wakeup request
presetdbg[8]	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset	Signal	Slave	-
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbar[8]	Value_64	Slave	Reset vector base address.
sei[8]	Signal	Slave	Per core System Error physical pins
spiden	Signal	Slave	Secure invasive debug enable.
spp_m	PVBus	Master	SPP (Shared Peripheral Port).
standbywfe[8]	Signal	Master	This signal indicates if a core is in WFE state
standbywfi[8]	Signal	Master	This signal indicates if a core is in WFI state
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[8]	Signal	Slave	ETMv4 Trace Unit Reset signal.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	Signal	Slave	This signal drives the CPUs virtual fast-interrupt handling.
virq[8]	Signal	Slave	This signal drives the CPUs virtual interrupt handling.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Parameters for ARM Cortex R82CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation to NC/DEV memory. The broadcastatomic signal will override this value if used.

BROADCASTATOMICL**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation to LLRAM memory. The broadcastatomicl signal will override this value and it will be functional for revision 2.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CCSIDR-L1D_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

CCSIDR-L1I_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

CCSIDR-L2_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

CCSIDR-L3_override**Type**

int

Default value

0x0

If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).

CHI**Type**

bool

Default value

0x0

Selects the type of protocol the Main Manager(MM) interface implements. 0, MM port configured as AXI. 1, MM port configured as CHI.

CLUSTER_ID**Type**

int

Default value

0x0

CLUSTER_ID[15:8] equivalent to CFGMPIDRAFF3, CLUSTER_ID[7:0] equivalent to CFGMPIDRAFF2.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x0

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores in cluster.

PA_SIZE**Type**

int

Default value

0x28

Physical address range supported (FEAT_LPA).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

VMSA_supported**Type**

bool

Default value

0x0

VMSA is supported at EL1.

core_power_on_by_default**Type**

bool

Default value

0x1

Equivalent to PPU_RST_STATE. 0 = Cluster PPU and all core PPUs reset to OFF, 1 = Cluster PPU and all core PPUs reset to ON.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.RVBAR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.TEINIT**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether the model has been built with NEON support.

cpuX.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

cpuX.dtcm_base**Type**

int

Default value

0x0

Sets the 16K aligned base address of DTCM.

cpuX.dtcm_size**Type**

int

Default value

0x0

Sets the size of DTCM (in bytes).

cpuX.dtcm_stretch_clk**Type**

bool

Default value

0x0

Whether DTCM clock stretched to occupy full cycle.

cpuX.dtcn_wait**Type**

int

Default value

0x0

DTCM accesses wait states: 0-3 cycles.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

cpuX.itcm_base**Type**

int

Default value

0x0

Sets the 16K aligned base address of ITCM.

cpuX.itcm_size**Type**

int

Default value

0x0

Sets the size of ITCM (in bytes).

cpuX.itcm_stretch_clk**Type**

bool

Default value

0x0

Whether ITCM clock stretched to occupy full cycle.

cpuX.itcm_wait**Type**

int

Default value

0x0

ITCM accesses wait states: 0-3 cycles.

cpuX.llpp.base**Type**

int

Default value

0x0

Equivalent to CFGLLPPBASEADDR.

cpuX.llpp.size**Type**

int

Default value

0x8000000

Equivalent to CFGLLPPSIZE.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.tcm.a.enable**Type**

bool

Default value

0x0

Equivalent to CFGITCMENm.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-dp-present**Type**

bool

Default value

0x1

Whether double-precision floating point feature is implemented (FEAT_F64MM).

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`enable_lock_step`**Type**

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

gicv3.BPR-min**Type**

int

Default value

0x2

The minimum value for the GICC_BPR register (non-secure version will be 1 + this value).

gicv3.VBPR-min**Type**

int

Default value

0x2

The minimum value for the GICV_BPR register (non-secure version will be 1 + this value).

has_dense_mem_map**Type**

bool

Default value

0x0

If true, the cluster follows the dense memory map else it implements the sparse memory map.

has_llpp**Type**

bool

Default value

0x1

Equivalent to CFGLLPPIMP.

has_spp**Type**

bool

Default value

0x1

Equivalent to CFGSPPIMP.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l2cache-miss_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`l2cache-read_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l2cache-read_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`**Type**

int

Default value

0x400000

L2 Cache size in bytes.

l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory.ext_slave_base**Type**

int

Default value

0x0

Equivalent to CFGACELSTCMBASEADDR.

memory.has_llram**Type**

bool

Default value

0x1

Equivalent to CFGLLRAMIMP.

memory.llram_base**Type**

int

Default value

0x20000000

Equivalent to CFGLLRAMBASEADDR.

memory.llram_enable_at_reset**Type**

bool

Default value

0x1

Equivalent to CFGLLRAMEN.

memory.llram_shared**Type**

bool

Default value

0x0

Equivalent to CFGLLRAMSHARED and it is only functional for revision 2.

memory.llram_size**Type**

int

Default value

0x10000000

Size of the LLRAM.

num_protection_regions_s1**Type**

int

Default value

0x10

Number of v8-R protection regions.

num_protection_regions_s2**Type**

int

Default value

0x10

Number of v8-R hyp protection regions.

patch_level**Type**

int

Default value

0x1

Patch level of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Revision field in MIDR/MIDR_EL1. Corresponds to the patch number Y in rXpY.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

ram_protection_enable_at_reset**Type**

bool

Default value

0x0

Equivalent to CFGRAMPROTEN.

revision_number**Type**

int

Default value

0x1

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

spp.base**Type**

int

Default value

0x0

Equivalent to CFGSPPBASEADDR.

spp.size**Type**

int

Default value

0x8000000

Sets the size of SPP(in bytes).

stage12_tlb_size**Type**

int

Default value

0x0

If VMSA is supported at stage1, number of stage1+2 tlb entries. If instruction_tlb_size !=0, this is treated as dtlb size.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.69 ARM CortexX1CCT

ARM CortexX1CCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-467: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexX1CCT

This model has the following Iris instances:

Table 3-468: ARM CortexX1CCT Iris instances

InstanceName	ComponentName
ARM CortexX1CCT	Cluster_ARM_Cortex-X1C
ARM CortexX1CCT.AMU	PVBusLogger
ARM CortexX1CCT.AMU.mapper	PVBusMapper
ARM CortexX1CCT.DAP	PVBusLogger
ARM CortexX1CCT.DAP.mapper	PVBusMapper
ARM CortexX1CCT.DSU	DSU
ARM CortexX1CCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARM CortexX1CCT.DSU.mpam_busslave	PVBusSlave
ARM CortexX1CCT.DSU.shared_cache	PVCache
ARM CortexX1CCT.DSU.shared_cache.upstream[0]	PVBusSlave
ARM CortexX1CCT.DSU.shared_cache.upstream[1]	PVBusSlave
ARM CortexX1CCT.DSU.shared_cache.upstream[2]	PVBusSlave
ARM CortexX1CCT.DSU.shared_cache.upstream[3]	PVBusSlave
ARM CortexX1CCT.MMAP	PVBusLogger
ARM CortexX1CCT.MMAP.mapper	PVBusMapper
ARM CortexX1CCT.RAS	PVBusLogger
ARM CortexX1CCT.RAS.mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexX1CCT.cpu0	ARM_Cortex-X1C
ARMCortexX1CCT.cpu0.UTLB	TLB
ARMCortexX1CCT.cpu0.dtlb	TlbCadi
ARMCortexX1CCT.cpu0.l1dcache	PVCache
ARMCortexX1CCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexX1CCT.cpu0.l1icache	PVCache
ARMCortexX1CCT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexX1CCT.cpu0.l2cache	PVCache
ARMCortexX1CCT.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexX1CCT.cpu0.l2cache.upstream[1]	PVBusSlave
ARMCortexX1CCT.ext_bus	PVBusLogger
ARMCortexX1CCT.ext_bus.mapper	PVBusMapper
ARMCortexX1CCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

This model has the following MTI trace components:

Table 3-469: ARMCortexX1CCT MTI instances

InstanceName	ComponentName
ARMCortexX1CCT	ARMv8Cluster
ARMCortexX1CCT.AMU	PVBusLogger
ARMCortexX1CCT.AMU.mapper	PVBusMapper

ARMCortexX1CCT.ext_bus.mapper	PVBusMapper
ARMCortexX1CCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexX1CCT contains the following CADI targets:

- ARM_Cortex-X1C
- Cluster_ARM_Cortex-X1C
- PVCache
- TlbCadi

About ARMCortexX1CCT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Cache stashing capability.

- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

The `cfgsdisable` signal will be removed in a future release.

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexX1CCT

Table 3-470: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[8]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[8]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[8]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[8]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[8]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[8]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[8]</code>	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
commirq[8]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	Signal	Slave	Disable cryptography extensions after reset.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[8]	Signal	Master	No power-down request.
dbgpwrupreq[8]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmbirq[8]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain

Name	Protocol	Type	Description
sei[8]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	Signal	Slave	Virtualised FIQ.
vinithi[8]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexX1CCT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.70 ARMCortexX1CT

ARMCortexX1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-471: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexX1CT

This model has the following Iris instances:

Table 3-472: ARMCortexX1CT Iris instances

InstanceName	ComponentName
ARMCortexX1CT	Cluster_ARM_Cortex-X1
ARMCortexX1CT.AMU	PVBusLogger
ARMCortexX1CT.AMU.mapper	PVBusMapper
ARMCortexX1CT.DAP	PVBusLogger
ARMCortexX1CT.DAP.mapper	PVBusMapper
ARMCortexX1CT.DSU	DSU
ARMCortexX1CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexX1CT.DSU.mpam_busslave	PVBusSlave
ARMCortexX1CT.DSU.shared_cache	PVCache
ARMCortexX1CT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMCortexX1CT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMCortexX1CT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMCortexX1CT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMCortexX1CT.MMAP	PVBusLogger
ARMCortexX1CT.MMAP.mapper	PVBusMapper
ARMCortexX1CT.RAS	PVBusLogger
ARMCortexX1CT.RAS.mapper	PVBusMapper
ARMCortexX1CT.cpu0	ARM_Cortex-X1
ARMCortexX1CT.cpu0.UTLB	TLB
ARMCortexX1CT.cpu0.dtlb	TlbCadi
ARMCortexX1CT.cpu0.l1dcache	PVCache
ARMCortexX1CT.cpu0.l1dcache.upstream[0]	PVBusSlave

ARMCortexX1CT.ext_bus	PVBusLogger
ARMCortexX1CT.ext_bus.mapper	PVBusMapper
ARMCortexX1CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexX1CT contains the following CADI targets:

- ARM_Cortex-X1
- Cluster_ARM_Cortex-X1
- PVCache
- TlbCadi

About ARMCortexX1CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOFWRDWN are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where n identifies the core (0-3).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexX1CT

Table 3-474: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[4]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.

Name	Protocol	Type	Description
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.

Name	Protocol	Type	Description
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexX1CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-size`

Type

int

Default value

0x10000

L1 D-Cache size in bytes.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`default_opmode`**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

`diagnostics`**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

`enable_simulation_performance_optimizations`**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

`icache-state_modelled`**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l3cache-maintenance_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.71 ARM CortexX2CT

ARM CortexX2CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-475: IP revisions support

Revision	Quality level
r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexX2CT

This model has the following Iris instances:

Table 3-476: ARM CortexX2CT Iris instances

InstanceName	ComponentName
ARM CortexX2CT	Cluster_ARM_Cortex-X2
ARM CortexX2CT.AMU	PVBusLogger
ARM CortexX2CT.AMU.mapper	PVBusMapper
ARM CortexX2CT.DAP	PVBusLogger
ARM CortexX2CT.DAP.mapper	PVBusMapper
ARM CortexX2CT.DSU	DSU
ARM CortexX2CT.DSU.PPU_cluster	PPUv1

InstanceName	ComponentName
ARMCortexX2CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexX2CT.DSU.PPU_core0	PPUv1
ARMCortexX2CT.DSU.PPU_core0.busslave	PVBusSlave

ARMCortexX2CT.ext_bus.mapper	PVBusMapper
ARMCortexX2CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexX2CT contains the following CADI targets:

- ARM_Cortex-X2
- Cluster_ARM_Cortex-X2
- PVCache
- TlbCadi

About ARMCortexX2CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.

- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

Support for the following features is planned for a future release:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, and nPMBIRQ signals.
- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols.

The following features will not be implemented:

- 256-bit wide output transactions.
- Error correction/detection features.
- Self-test features (MBIST).
- Snoop filtering.

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexX2CT

Table 3-478: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.

Name	Protocol	Type	Description
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[12]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[12]	Signal	Master	Timer signals to SOC
CNTHVIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[12]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[12]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[12]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[12]	Signal	Master	Timer signals to SOC.
commirq[12]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[12]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[12]	PChannel	Master	Core PCSM signals
core_powerdown_out[12]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[12]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[12]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[12]	Signal	Slave	Disable cryptography extensions after reset.
cti[12]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[12]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
dbgnopwrdown[12]	Signal	Master	No power-down request.
dbgpwrupreq[12]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[12]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[12]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[12]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[12]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[12]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[12]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[12]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[12]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[12]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[12]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.

Name	Protocol	Type	Description
trbirq[12]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[12]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[12]	Signal	Slave	Virtualised FIQ.
virq[12]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[12]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexX2CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x2

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size

Type

int

Default value

0x0

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory_tagging_support_level**Type**

int

Default value

0x2

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.72 ARMCortexX3CT

ARMCortexX3CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-479: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexX3CT

This model has the following Iris instances:

Table 3-480: ARMCortexX3CT Iris instances

InstanceName	ComponentName
ARMCortexX3CT	Cluster_ARM_Cortex-X3
ARMCortexX3CT.AMU	PVBusLogger
ARMCortexX3CT.AMU.mapper	PVBusMapper
ARMCortexX3CT.DAP	PVBusLogger
ARMCortexX3CT.DAP.mapper	PVBusMapper
ARMCortexX3CT.DSU	DSU
ARMCortexX3CT.DSU.PPU_cluster	PPUv1
ARMCortexX3CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexX3CT.DSU.PPU_core0	PPUv1
ARMCortexX3CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexX3CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexX3CT.DSU.mpam_busslave	PVBusSlave
ARMCortexX3CT.DSU.shared_cache	PVCache
ARMCortexX3CT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMCortexX3CT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMCortexX3CT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMCortexX3CT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMCortexX3CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexX3CT.MMAP	PVBusLogger
ARMCortexX3CT.MMAP.mapper	PVBusMapper
ARMCortexX3CT.RAS	PVBusLogger
ARMCortexX3CT.RAS.mapper	PVBusMapper

ARMCortexX3CT.ext_bus.mapper	PVBusMapper
ARMCortexX3CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexX3CT contains the following CADI targets:

- ARM_Cortex-X3
- Cluster_ARM_Cortex-X3
- PVCache
- TlbCadi

About ARMCortexX3CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- DynamIQ r3p0.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.
- Utility bus.
- Support for Interrupt signals from SPE is added as pmbirq[8].

Support for the following features is planned for a future release:

- TRBE.
- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols.
- Core-Complex.
- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

The `cfgsdisable` signal will be removed in a future release.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Cache stashing capability.
- Embedded Logic Analyzer (ELA).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Limitations

Some of the SVE instructions do not raise undefined exceptions when SP is used as a source register.

Ports for ARMCortexX3CT

Table 3-482: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTART0MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).

Name	Protocol	Type	Description
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[12]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmp_channel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[12]	Signal	Master	Timer signals to SOC
CNTHVIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[12]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[12]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[12]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[12]	Signal	Master	Timer signals to SOC.
commirq[12]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[12]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmp_channel[12]	PChannel	Master	Core PCSM signals
core_powerdown_out[12]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[12]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[12]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error

Name	Protocol	Type	Description
cryptodisable[12]	Signal	Slave	Disable cryptography extensions after reset.
cti[12]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[12]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[12]	Signal	Master	No power-down request.
dbgpwrupreq[12]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[12]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[12]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[12]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[12]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[12]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[12]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[12]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[12]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[12]	Value_64	Slave	Reset vector base address.

Name	Protocol	Type	Description
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[12]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[12]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[12]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[12]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[12]	Signal	Slave	Virtualised FIQ.
virq[12]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[12]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexX3CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-size

Type

int

Default value

0x100000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_access_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-size`**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

`dcache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

error_record_feature_register**Type**

string

Default value

```
"[{\"ED\":0x2,\"IMPDEF_3_2\":0x0,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,
  \"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0,\"Visibility\":\"Cluster
  \"},{\"ED\":0x2,\"IMPDEF_3_2\":0x0,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,
  \"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0}]]"
```

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

ete.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CMOD value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

ext_abort_normal_noncacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of normal noncacheable-read external aborts.

ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x40000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-ways`

Type

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

`l3cache-write_access_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l3cache-write_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`memory_tagging_support_level`

Type

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of *n* means the accumulator will use (*n* * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

pseudo_fault_generation_feature_register**Type**

string

Default value

```
"[{\"OF\":true, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1,
  \"CI\":true, \"ER\":false, \"PN\":true, \"AV\":false, \"MV\":true, \"SYN\":true, \"R\":true},{\"OF
  \":false, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1, \"CI
  \":false, \"ER\":false, \"PN\":false, \"AV\":false, \"MV\":false, \"SYN\":false, \"R\":true}]"
```

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and

NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

trace_physical_registers_when_host_virtualisation_enabled**Type**

int

Default value

0x1

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers.

treat_PAC_as_NOP

Type
bool

Default value
0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.73 ARMCortexX4CT

ARMCortexX4CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-483: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexX4CT

This model has the following Iris instances:

Table 3-484: ARMCortexX4CT Iris instances

InstanceName	ComponentName
ARMCortexX4CT	Cluster_ARM_Cortex-X4
ARMCortexX4CT.AMU	PVBusLogger
ARMCortexX4CT.AMU.mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexX4CT.DAP	PVBusLogger
ARMCortexX4CT.DAP.mapper	PVBusMapper
ARMCortexX4CT.DSU	DSU

ARMCortexX4CT contains the following CADI targets:

- ARM_Cortex-X4
- Cluster_ARM_Cortex-X4
- PVCache

- TlbCadi

About ARMCortexX4CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- DynamIQ r3p0.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.
- Utility bus.
- Support for Interrupt signals from SPE is added as `pmbirq[8]`.

Support for the following features is planned for a future release:

- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols.
- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, and `nPMBIRQ` signals.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not supported but signals are implemented.

The `cfgsdisable` signal will be removed in a future release.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.

- Snoop filtering.
- Cache stashing capability.
- Embedded Logic Analyzer (ELA).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Limitations

- Some of the SVE instructions do not raise undefined exceptions when SP is used as a source register.

Ports for ARMCortexX4CT

Table 3-486: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmpchannel	PChannel	Master	Cluster PCSM signal

Name	Protocol	Type	Description
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[14]	PChannel	Master	Core PCSM signals
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgpwrupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.

Name	Protocol	Type	Description
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[14]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Name	Protocol	Type	Description
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexX4CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX . CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX . CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX . CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

ecv_support_level**Type**

int

Default value

0x2

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

has_v8_7_spe_inverted_filtering**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events.

has_v8_7_spe_previous_branch_target**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`icache-maintenance_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

log2_trace_buffer_alignment**Type**

int

Default value

0x6

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpam_has_altsp**Type**

bool

Default value

0x0

MPAM Whether MPAMIDR_EL1.HAS_ALTSP bit is set or clear.

mpamidr_has_force_ns**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_sdeflt**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_tidr**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear. Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_acp**Type**

int

Default value

0x0

Number of ACP ports.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pmu-num_counters**Type**

int

Default value

0x1f

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tcr_txsz_undersize_should_fault**Type**

bool

Default value

0x0

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP

Type
bool

Default value
0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.74 ARMCortexX925CT

ARMCortexX925CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-487: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexX925CT

This model has the following Iris instances:

Table 3-488: ARM CortexX925CT Iris instances

InstanceName	ComponentName
ARM CortexX925CT	Cluster_ARM_Cortex-X925
ARM CortexX925CT.AMU	PVBusLogger
ARM CortexX925CT.AMU.mapper	PVBusMapper
ARM CortexX925CT.DAP	PVBusLogger
ARM CortexX925CT.DAP.mapper	PVBusMapper
ARM CortexX925CT.DSU	DSU
ARM CortexX925CT.DSU.PPU_cluster	PPUv1
ARM CortexX925CT.DSU.PPU_cluster.busslave	PVBusSlave
ARM CortexX925CT.DSU.PPU_core0	PPUv1

ARMCortexX925CT.ext_bus	PVBusLogger

InstanceName	ComponentName
ARMCortexX925CT.ext_bus.mapper	PVBusMapper
ARMCortexX925CT.gic_cpuif_decoder_cluster	GLCv3CPUInterfaceDecoder

ARMCortexX925CT contains the following CADI targets:

- ARM_Cortex-X925
- Cluster_ARM_Cortex-X925
- PVCache
- TlbCadi

Ports for ARMCortexX925CT

Table 3-490: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmpchannel	PChannel	Master	Cluster PCSM signal

Name	Protocol	Type	Description
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[14]	PChannel	Master	Core PCSM signals
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgpwrupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.

Name	Protocol	Type	Description
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[14]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Name	Protocol	Type	Description
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexX925CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX . CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX . CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX . CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

ecv_support_level**Type**

int

Default value

0x2

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_mt_pmu_disable_feature**Type**

int

Default value

0x0

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, 0xF: The feature is disabled and is represented by value 0xF in ID_AA64DFR0_EL1.MTPMU.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

has_v8_7_spe_inverted_filtering**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events.

has_v8_7_spe_previous_branch_target**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

log2_trace_buffer_alignment**Type**

int

Default value

0x6

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpam_has_altsp**Type**

bool

Default value

0x0

MPAM Whether MPAMIDR_EL1.HAS_ALTSP bit is set or clear.

mpamidr_has_force_ns**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_sdeflt**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_tidr**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution

of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_acp**Type**

int

Default value

0x0

Number of ACP ports.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pmu-num_counters**Type**

int

Default value

0x1f

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tcr_txsz_undersize_should_fault**Type**

bool

Default value

0x0

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.75 ARMNeoverseE1CT

ARMNeoverseE1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-491: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMNeoverseE1CT

This model has the following Iris instances:

Table 3-492: ARMNeoverseE1CT Iris instances

InstanceName	ComponentName
ARMNeoverseE1CT	Cluster_ARM_Neoverse-E1
ARMNeoverseE1CT.AMU	PVBusLogger

ARMNeoverseE1CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMNeoverseE1CT contains the following CADI targets:

- ARM_Neoverse-E1
- Cluster_ARM_Neoverse-E1
- PVCache
- TlbCadi

About ARMNeoverseE1CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGIRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.

- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where n identifies the core (0-3).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMNeoverseE1CT

Table 3-494: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[16]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[16]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>commirq[16]</code>	Signal	Master	Interrupt signal from debug communications channel.

Name	Protocol	Type	Description
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[16]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	Signal	Slave	Disable cryptography extensions after reset.
cti[16]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[16]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[16]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[16]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	GICv3Comms	Slave	GICv3 AXI-stream port per thread.
irq[16]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmuirq[16]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	Signal	Slave	Per core virtual System Error physical pins.

Name	Protocol	Type	Description
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	Signal	Slave	Virtualised FIQ.
vinithi[16]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMNeoverseE1CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

cluster_patch_level**Type**

int

Default value

0x0

Cosmetic change to patch number in CLUSTERIDR. Corresponds to the Y in rXpY.

cluster_revision_number**Type**

int

Default value

0x0

Cosmetic change to revision number in CLUSTERIDR, Corresponds to the X in rXpY.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.enable_single_thread_at_reset**Type**

bool

Default value

0x0

Enable single thread after reset and keep other thread in reset.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x40000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.threadY.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.threadY.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.threadY.MPIDR-override**Type**

int

Default value

0x0

Override MPIDR value. A nonzero value will override the MT,cluster,cpu,thread ID bits in MPIDR.

cpuX.threadY.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.threadY.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x400000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.76 ARMNeoverseN1CT

ARMNeoverseN1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-495: IP revisions support

Revision	Quality level
r4p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMNeoverseN1CT

This model has the following Iris instances:

Table 3-496: ARMNeoverseN1CT Iris instances

InstanceName	ComponentName
ARMNeoverseN1CT	Cluster_ARM_Neoverse-N1
ARMNeoverseN1CT.AMU	PVBusLogger
ARMNeoverseN1CT.AMU.mapper	PVBusMapper
ARMNeoverseN1CT.DAP	PVBusLogger
ARMNeoverseN1CT.DAP.mapper	PVBusMapper
ARMNeoverseN1CT.DSU	DSU
ARMNeoverseN1CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMNeoverseN1CT.DSU.mpam_busslave	PVBusSlave

InstanceName	ComponentName
ARMNeoverseN1CT.DSU.shared_cache	PVCache
ARMNeoverseN1CT.DSU.shared_cache.upstream[0]	PVBusSlave

ARMNeoverseN1CT.ext_bus.mapper	PVBusMapper
ARMNeoverseN1CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMNeoverseN1CT contains the following CADI targets:

- ARM_Neoverse-N1
- Cluster_ARM_Neoverse-N1
- PVCache
- TlbCadi

About ARMNeoverseN1CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:

- Automatic CPU retention mode.
- Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGIRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMNeoverseN1CT

Table 3-498: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.

Name	Protocol	Type	Description
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMNeoverseN1CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-size`**Type**

int

Default value

0x80000

L2 Cache size in bytes.

`cpuX.l2cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`dcache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

`dcache-read_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations

Type

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l3cache-maintenance_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_issue_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-write_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l3cache-write_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`pchannel_treat_simreset_as_poreset`**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop

Type
int
Default value
0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency

Type
int
Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.77 ARMNeoverseN2CT

ARMNeoverseN2CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-499: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMNeoverseN2CT

This model has the following Iris instances:

Table 3-500: ARMNeoverseN2CT Iris instances

InstanceName	ComponentName
ARMNeoverseN2CT	Cluster_ARM_Neoverse-N2
ARMNeoverseN2CT.AMU	PVBusLogger
ARMNeoverseN2CT.AMU.mapper	PVBusMapper
ARMNeoverseN2CT.DAP	PVBusLogger
ARMNeoverseN2CT.DAP.mapper	PVBusMapper
ARMNeoverseN2CT.DSU	DSU
ARMNeoverseN2CT.DSU.PPU_cluster	PPUv1

InstanceName	ComponentName
ARMNeoverseN2CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMNeoverseN2CT.DSU.PPU_core0	PPUv1
ARMNeoverseN2CT.DSU.PPU_core0.busslave	PVBusSlave

ARMNeoverseN2CT.ext_bus.mapper	PVBusMapper
ARMNeoverseN2CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMNeoverseN2CT contains the following CADI targets:

- ARM_Neoverse-N2
- Cluster_ARM_Neoverse-N2
- PVCache
- TlbCadi

About ARMNeoverseN2CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.

- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- `BROADCASTPERSIST` pin.

Support for the following features is planned for a future release:

- DynamIQ Shared Unit-110 (DSU-110) system registers.
- `BROADCASTCACHEMAINTPOU` pin
- `COREINSTRET`, `COREINSTRUN`, and `nPMBIRQ` signals
- DSU-110 cluster. The implementation relies on DynamIQ only.
- TRBE.
- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (the Arm TLM2 extensions) bus protocols.

The following features will not be implemented:

- 256-bit wide output transactions.
- Error correction/detection features.
- Self-test features (MBIST).
- Snoop filtering.
- Armv9 trace extensions.

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMNeoverseN2CT

Table 3-502: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTART0MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).

Name	Protocol	Type	Description
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmp_channel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[1]	Signal	Master	Timer signals to SOC
CNTHVIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[1]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[1]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[1]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[1]	Signal	Master	Timer signals to SOC.
commirq[1]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[1]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmp_channel[1]	PChannel	Master	Core PCSM signals
core_powerdown_out[1]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[1]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[1]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error

Name	Protocol	Type	Description
cryptodisable[1]	Signal	Slave	Disable cryptography extensions after reset.
cti[1]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[1]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[1]	Signal	Master	No power-down request.
dbgpwrupreq[1]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[1]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[1]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[1]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[1]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[1]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[1]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[1]	Value_64	Slave	Reset vector base address.

Name	Protocol	Type	Description
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[1]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[1]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[1]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[1]	Signal	Slave	Virtualised FIQ.
virq[1]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[1]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMNeoverseN2CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_external_rndr**Type**

int

Default value

0x1

Implement external random number generator module. When enabling this with has_rndr enabled, the external random number generator will be used instead of internal random number generator.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_rndr**Type**

int

Default value

0x1

Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5 (FEAT_RNG).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l3cache-read_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_issue_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-write_access_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory_tagging_support_level**Type**

int

Default value

0x2

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

mpam_max_partid**Type**

int

Default value

0x1ff

MPAM Maximum PARTID Supported.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

rndr_rndrrs_seed**Type**

int

Default value

0x0

Initial seed for random engine used in RNDR register.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop

Type
int

Default value
0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.78 ARMNeoverseN3CT

ARMNeoverseN3CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-503: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMNeoverseN3CT

This model has the following Iris instances:

Table 3-504: ARMNeoverseN3CT Iris instances

InstanceName	ComponentName
ARMNeoverseN3CT	Cluster_ARM_Neoverse-N3
ARMNeoverseN3CT.AMU	PVBusLogger
ARMNeoverseN3CT.AMU.mapper	PVBusMapper
ARMNeoverseN3CT.DAP	PVBusLogger

ARMNeoverseN3CT.RAS	PVBusLogger
ARMNeoverseN3CT.RAS.mapper	PVBusMapper
ARMNeoverseN3CT.cpu0	ARM_Neoverse-N3
ARMNeoverseN3CT.cpu0.UTLB	TLB
ARMNeoverseN3CT.cpu0.l1dcache	PVCache
ARMNeoverseN3CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMNeoverseN3CT.cpu0.l1icache	PVCache
ARMNeoverseN3CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMNeoverseN3CT.cpu0.l2cache	PVCache
ARMNeoverseN3CT.cpu0.l2cache.upstream[0]	PVBusSlave
ARMNeoverseN3CT.cpu0.l2cache.upstream[1]	PVBusSlave
ARMNeoverseN3CT.ext_bus	PVBusLogger
ARMNeoverseN3CT.ext_bus.mapper	PVBusMapper
ARMNeoverseN3CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMNeoverseN3CT contains the following CADI targets:

- ARM_Neoverse-N3
- Cluster_ARM_Neoverse-N3

- PVCache
- TlbCadi

Ports for ARMNeoverseN3CT

Table 3-506: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AENDOMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTOMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsn_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[1]	Signal	Master	Timer signals to SOC
CNTHVIRQ[1]	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
CNTHVSIRQ[1]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[1]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[1]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[1]	Signal	Master	Timer signals to SOC.
commirq[1]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[1]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[1]	PChannel	Master	Core PCSM signals
core_powerdown_out[1]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[1]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[1]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[1]	Signal	Slave	Disable cryptography extensions after reset.
cti[1]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[1]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[1]	Signal	Master	No power-down request.
dbgpwrupreq[1]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s[1]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[1]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[1]	Signal	Master	Interrupt signal from the statistical profiling unit.

Name	Protocol	Type	Description
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[1]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[1]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[1]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[1]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[1]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[1]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[1]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[1]	Signal	Slave	Virtualised FIQ.
virq[1]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[1]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMNeoverseN3CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x4

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`cpuX.max_code_cache_mb`**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.ETE_REVISION**Type**

int

Default value

0x1

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x1

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ete.TSMARK**Type**

bool

Default value

0x1

Whether timestamp markers are supported.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_peripheral_port

Type

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_rndr_trap

Type

int

Default value

0x2

Implement trapping for RNDR and RNDRSS random number registers from ARMv8.8. (FEAT_RNG_TRAP) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_statistical_profiling

Type

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use $(n * \text{accumulator value})$ to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP

Type
bool

Default value
0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.79 ARMNeoverseV1CT

ARMNeoverseV1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-507: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMNeoverseV1CT

This model has the following Iris instances:

Table 3-508: ARMNeoverseV1CT Iris instances

InstanceName	ComponentName
ARMNeoverseV1CT	Cluster_ARM_Neoverse-V1
ARMNeoverseV1CT.AMU	PVBusLogger
ARMNeoverseV1CT.AMU.mapper	PVBusMapper
ARMNeoverseV1CT.DAP	PVBusLogger

InstanceName	ComponentName
ARMNeoverseV1CT.DAP.mapper	PVBusMapper
ARMNeoverseV1CT.DSU	DSU
ARMNeoverseV1CT.DSU.mpam_busslave	PVBusSlave

ARMNeoverseV1CT contains the following CADI targets:

- ARM_Neoverse-V1
- Cluster_ARM_Neoverse-V1
- PVCache
- TlbCadi

About ARMNeoverseV1CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

Support for the following features is planned for a future release:

- BROADCASTCACHEMAINTPOU pin.

- COREINSTRRET, COREINSTRRUN, and nPMBIRQ signals.
- A common cache that is shared by all threads of the core. Currently, each thread has its own L1 cache and L2 cache.
- Per-thread parameters, although signals are implemented.

The following features will not be implemented:

- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Snoop filtering.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- Latency configuration.
- Cache stashing capability.

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMNeoverseV1CT

Table 3-510: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.

Name	Protocol	Type	Description
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.

Name	Protocol	Type	Description
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMNeoverseV1CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the

simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE

Type

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES

Type

int

Default value

0x1

Number of cores per cluster.

cpi_div

Type

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul

Type

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND

Type

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-size`**Type**

int

Default value

0x80000

L2 Cache size in bytes.

`cpuX.l2cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics

Type

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations

Type

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

enhanced_pac2_level

Type

int

Default value

0x1

Implements Enhanced PAC2 from ARMv8.6 (FEAT_PAuth2), and PAC enhancements from ARMv9.5 (FEAT_PAuth_LR). options 0-3 of this feature are mandatory for ARMv8.6 but can be cherrypicked to a ARMv8.3(or greater) implementation. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only (FEAT_PAuth2), 2: EnhancedPAC2 with FPAC (FEAT_FPAC), 3: EnhancedPAC2 with FPACCombined (FEAT_FPACCOMBINE), 4: EnhancedPAC2 with LR signing (FEAT_PAuth_LR).

ext_abort_device_read_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_external_rndr**Type**

int

Default value

0x1

Implement external random number generator module. When enabling this with has_rndr enabled, the external random number generator will be used instead of internal random number generator.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

has_rndr**Type**

int

Default value

0x1

Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5 (FEAT_RNG).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x0

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop

Type
int

Default value
0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.80 ARMNeoverseV2CT

ARMNeoverseV2CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-511: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMNeoverseV2CT

This model has the following Iris instances:

Table 3-512: ARMNeoverseV2CT Iris instances

InstanceName	ComponentName
ARMNeoverseV2CT	Cluster_ARM_Neoverse-V2
ARMNeoverseV2CT.AMU	PVBusLogger
ARMNeoverseV2CT.AMU.mapper	PVBusMapper
ARMNeoverseV2CT.DAP	PVBusLogger
ARMNeoverseV2CT.DAP.mapper	PVBusMapper
ARMNeoverseV2CT.DSU	DSU
ARMNeoverseV2CT.DSU.PPU_cluster	PPUv1
ARMNeoverseV2CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMNeoverseV2CT.DSU.PPU_core0	PPUv1
ARMNeoverseV2CT.DSU.PPU_core0.busslave	PVBusSlave
ARMNeoverseV2CT.DSU.mpam_busslave	PVBusSlave
ARMNeoverseV2CT.DSU.shared_cache	PVCache
ARMNeoverseV2CT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMNeoverseV2CT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMNeoverseV2CT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMNeoverseV2CT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMNeoverseV2CT.DSU.utility_slave[0]	PVBusSlave
ARMNeoverseV2CT.MMAP	PVBusLogger
ARMNeoverseV2CT.MMAP.mapper	PVBusMapper
ARMNeoverseV2CT.RAS	PVBusLogger
ARMNeoverseV2CT.RAS.mapper	PVBusMapper
ARMNeoverseV2CT.cpu0	ARM_Neoverse-V2
ARMNeoverseV2CT.cpu0.UTLB	TLB

ARMNeoverseV2CT.ext_bus.mapper	PVBusMapper
ARMNeoverseV2CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMNeoverseV2CT contains the following CADI targets:

- ARM_Neoverse-V2
- Cluster_ARM_Neoverse-V2
- PVCache

- TlbCadi

About ARMNeoverseV2CT

The model supports the following features:

- DynamIQ r3p0.
- DynamIQ Shared Unit-110 (DSU-110) system registers.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- PChannel for the cluster and for each core.
- BROADCASTPERSIST pin.
- Optional peripheral port.
- L3Cache partition.
- Per-core clock.
- Utility bus.

Support for the following features is planned for a future release:

- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (the Arm TLM2 extensions) bus protocols.
- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, and nPMBIRQ signals.
- Core-Complex.
- Each thread currently has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- Error correction or detection features.
- Self-test features (MBIST).
- Snoop filtering.
- Latency configuration
- Cache stashing capability
- Embedded Logic Analyzer (ELA).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

The following models also exist, with a fixed number of cores per cluster:

- ARMNeoverseV2x1CT.

Ports for ARMNeoverseV2CT

Table 3-514: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsn_pchannel	PChannel	Master	Cluster PCSN signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq

Name	Protocol	Type	Description
CNTHPIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[1]	Signal	Master	Timer signals to SOC
CNTHVIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[1]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[1]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[1]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[1]	Signal	Master	Timer signals to SOC.
commirq[1]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[1]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[1]	PChannel	Master	Core PCSM signals
core_powerdown_out[1]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[1]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[1]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[1]	Signal	Slave	Disable cryptography extensions after reset.
cti[1]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[1]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[1]	Signal	Master	No power-down request.
dbgpwrupreq[1]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s[1]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[1]	Signal	Slave	This signal drives the CPUs interrupt handling.

Name	Protocol	Type	Description
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[1]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[1]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[1]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[1]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[1]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[1]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[1]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[1]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[1]	Signal	Slave	Virtualised FIQ.
virq[1]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[1]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMNeoverseV2CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT

Type

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`default_opmode`**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

`diagnostics`**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

`enable_simulation_performance_optimizations`**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ext_abort_normal_noncacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of normal noncacheable-read external aborts.

ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_coherent_icache

Type

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

has_enhanced_pan

Type

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete

Type

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_external_rndr

Type

int

Default value

0x1

Implement external random number generator module. When enabling this with has_rndr enabled, the external random number generator will be used instead of internal random number generator.

has_large_va

Type

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_rndr**Type**

int

Default value

0x1

Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5 (FEAT_RNG).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpam_max_partid**Type**

int

Default value

0x1ff

MPAM Maximum PARTID Supported.

mpam_max_vpmr**Type**

int

Default value

0x7

MPAM Maximum VPMR Supported.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

rndr_rndrrs_seed**Type**

int

Default value

0x0

Initial seed for random engine used in RNDR register.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

trace_physical_registers_when_host_virtualisation_enabled**Type**

int

Default value

0x1

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers).

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions

are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.81 ARMNeoverseV3AECT

ARMNeoverseV3AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-515: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- brbe_log2_num_records
- has_coherent_icache

Iris and MTI instances for ARMNeoverseV3AECT

This model has the following Iris instances:

Table 3-516: ARMNeoverseV3AECT Iris instances

InstanceName	ComponentName
ARMNeoverseV3AECT	Cluster_ARM_Neoverse-V3AE
ARMNeoverseV3AECT.AMU	PVBusLogger
ARMNeoverseV3AECT.AMU.mapper	PVBusMapper
ARMNeoverseV3AECT.DAP	PVBusLogger
ARMNeoverseV3AECT.DAP.mapper	PVBusMapper
ARMNeoverseV3AECT.DSU	DSU
ARMNeoverseV3AECT.DSU.PPU_cluster	PPUv1
ARMNeoverseV3AECT.DSU.PPU_cluster.busslave	PVBusSlave
ARMNeoverseV3AECT.DSU.PPU_core0	PPUv1

InstanceName	ComponentName
ARMNeoverseV3AECT.DSU.PPU_core0.busslave	PVBusSlave
ARMNeoverseV3AECT.DSU.mpam_busslave	PVBusSlave

ARMNeoverseV3AECT.ext_bus	PVBusLogger
ARMNeoverseV3AECT.ext_bus.mapper	PVBusMapper
ARMNeoverseV3AECT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMNeoverseV3AECT contains the following CADI targets:

- ARM_Neoverse-V3AE
- Cluster_ARM_Neoverse-V3AE
- PVCache
- TlbCadi

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.

- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, cpu0 and cpu1 identify the available cores and associated ports, not cpu0 and cpu2.

- Hybrid mode is not modeled in the DSU.

Ports for ARMNeoverseV3AECT

Table 3-518: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmp_channel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.

Name	Protocol	Type	Description
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[1]	Signal	Master	Timer signals to SOC
CNTHVIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[1]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[1]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[1]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[1]	Signal	Master	Timer signals to SOC.
commirq[1]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[1]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[1]	PChannel	Master	Core PCSM signals
core_powerdown_out[1]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[1]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[1]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[1]	Signal	Slave	Disable cryptography extensions after reset.
cti[1]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[1]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[1]	Signal	Master	No power-down request.
dbgpwrupreq[1]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[1]	GICv3Comms	Slave	GICv3 AXI-stream port.

Name	Protocol	Type	Description
irq[1]	Signal	Slave	This signal drives the CPUs interrupt handling.
l0gptsz	Value	Slave	RME LOGPTSZ port
legacy_tz_en	Signal	Slave	RME LEGACY_TZ_EN port
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[1]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[1]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[1]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[1]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rlpiden	Signal	Slave	External debug interface.
rtpiden	Signal	Slave	External debug interface.
rvbaraddr[1]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[1]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[1]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[1]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[1]	Signal	Slave	Virtualised FIQ.
virq[1]	Signal	Slave	Virtualised IRQ.

Name	Protocol	Type	Description
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[1]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMNeoverseV3AECT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMPO input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x20

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

brbe_log2_num_records**Type**

int

Default value

0x5

Log2 of number of BRB records supported. 3 -> 8 records, ... 6 -> 64 records.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.crypto_aes**Type**

int

Default value

0x2

AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 2, AES and PMULL instructions implemented (FEAT_AES, FEAT_PMULL).

cpuX.crypto_sha3**Type**

int

Default value

0x2

Implement ARMv8.4 SHA-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA3). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sha512**Type**

int

Default value

0x2

Implement ARMv8.4 SHA-512 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA512). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sm3**Type**

int

Default value

0x2

Implement ARMv8.4 SM-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SM3). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sm4**Type**

int

Default value

0x2

Implement ARMv8.4 SM-4 instructions (requires CryptoPlugin to be loaded) (FEAT_SM4). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

ecv_support_level**Type**

int

Default value

0x2

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_coherent_icache

Type

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

has_enhanced_pan

Type

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete

Type

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_peripheral_port

Type

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_rndr

Type

int

Default value

0x1

Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5 (FEAT_RNG). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

has_v8_7_spe_inverted_filtering**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events.

has_v8_7_spe_previous_branch_target**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

log2_trace_buffer_alignment**Type**

int

Default value

0x6

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpamidr_has_force_ns**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_sdeflt**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_tidr**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use $(n * \text{accumulator value})$ to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_acp**Type**

int

Default value

0x0

Number of ACP ports.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

rme_level0_gpt_size**Type**

int

Default value

0x0

The range of address space protected by each entry in the level 0 GPT (0->1GB 1->16GB, 2->64GB, 3->512GB).

rme_support_level**Type**

int

Default value

0x2

0 -> Realm management extension not implemented, 1 -> LEGACY_TZ_EN mode i.e. RME register fields are stateful but only supports secure/non-secure states, 2 -> Realm management extension fully implemented (FEAT_RME).

rndr_rndrrs_seed**Type**

int

Default value

0x0

Initial seed for random engine used in RNDR register.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tcr_txsz_undersize_should_fault**Type**

bool

Default value

0x0

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.82 ARMNeoverseV3CT

ARMNeoverseV3CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-519: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- `brbe_log2_num_records`
- `has_coherent_icache`

Iris and MTI instances for ARMNeoverseV3CT

This model has the following Iris instances:

Table 3-520: ARMNeoverseV3CT Iris instances

InstanceName	ComponentName
ARMNeoverseV3CT	Cluster_ARM_Neoverse-V3
ARMNeoverseV3CT.AMU	PVBusLogger
ARMNeoverseV3CT.AMU.mapper	PVBusMapper

- ARM_Neoverse-V3
- Cluster_ARM_Neoverse-V3
- PVCache
- TlbCadi

Ports for ARMNeoverseV3CT

Table 3-522: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.

Name	Protocol	Type	Description
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[1]	Signal	Master	Timer signals to SOC
CNTHVIRQ[1]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[1]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[1]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[1]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[1]	Signal	Master	Timer signals to SOC.
commirq[1]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[1]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[1]	PChannel	Master	Core PCSM signals
core_powerdown_out[1]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[1]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[1]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[1]	Signal	Slave	Disable cryptography extensions after reset.
cti[1]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[1]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[1]	Signal	Master	No power-down request.
dbgprupreq[1]	Signal	Master	Debug power up request.

Name	Protocol	Type	Description
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[1]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[1]	Signal	Slave	This signal drives the CPUs interrupt handling.
l0gptsz	Value	Slave	RME LOGPTSZ port
legacy_tz_en	Signal	Slave	RME LEGACY_TZ_EN port
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[1]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[1]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[1]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[1]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rlpiden	Signal	Slave	External debug interface.
rtpiden	Signal	Slave	External debug interface.
rvbaraddr[1]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[1]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[1]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[1]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[1]	Signal	Slave	Virtualised FIQ.
virq[1]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[1]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMNeoverseV3CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x20

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

brbe_log2_num_records**Type**

int

Default value

0x5

Log2 of number of BRB records supported. 3 -> 8 records, ... 6 -> 64 records.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.crypto_aes**Type**

int

Default value

0x2

AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 2, AES and PMULL instructions implemented (FEAT_AES, FEAT_PMULL).

cpuX.crypto_sha3**Type**

int

Default value

0x2

Implement ARMv8.4 SHA-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA3). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sha512**Type**

int

Default value

0x2

Implement ARMv8.4 SHA-512 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA512). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sm3**Type**

int

Default value

0x2

Implement ARMv8.4 SM-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SM3). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sm4**Type**

int

Default value

0x2

Implement ARMv8.4 SM-4 instructions (requires CryptoPlugin to be loaded) (FEAT_SM4). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x200000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-size`**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

`dcache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

ecv_support_level**Type**

int

Default value

0x2

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg

Type

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_coherent_icache

Type

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

has_enhanced_pan

Type

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_ete

Type

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_peripheral_port

Type

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

has_rndr**Type**

int

Default value

0x1

Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5 (FEAT_RNG). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

has_v8_7_spe_inverted_filtering**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events.

has_v8_7_spe_previous_branch_target**Type**

bool

Default value

0x0

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`icache-maintenance_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

log2_trace_buffer_alignment**Type**

int

Default value

0x6

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpamidr_has_force_ns**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_sdeflt**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_tidr**Type**

int

Default value

0x1

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_acp

Type

int

Default value

0x0

Number of ACP ports.

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

reported_patch_level

Type

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

rme_level0_gpt_size**Type**

int

Default value

0x0

The range of address space protected by each entry in the level 0 GPT (0->1GB 1->16GB, 2->64GB, 3->512GB).

rme_support_level**Type**

int

Default value

0x2

0 -> Realm management extension not implemented, 1 -> LEGACY_TZ_EN mode i.e. RME register fields are stateful but only supports secure/non-secure states, 2 -> Realm management extension fully implemented (FEAT_RME).

rndr_rndrrs_seed**Type**

int

Default value

0x0

Initial seed for random engine used in RNDR register.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

tcr_txsz_undersize_should_fault**Type**

bool

Default value

0x0

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.83 ARMSC000CT

ARMSC000CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-523: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMSC000CT

This model has the following Iris instances:

Table 3-524: ARMSC000CT Iris instances

InstanceName	ComponentName
ARMSC000CT	ARM_SC000
ARMSC000CT.acp_mapper	PVBusMapper
ARMSC000CT.ext_bus	PVBusLogger
ARMSC000CT.ext_bus.mapper	PVBusMapper
ARMSC000CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-525: ARMSC000CT MTI instances

InstanceName	ComponentName
ARMSC000CT	ARM_SC000
ARMSC000CT.acp_mapper	PVBusMapper
ARMSC000CT.ext_bus	PVBusLogger
ARMSC000CT.ext_bus.mapper	PVBusMapper
ARMSC000CT.l2_flusher	AsyncCacheFlushUnit

ARMSC000CT contains the following CADI targets:

- ARM_SC000

Differences between the model and the RTL

The model has the following limitations:

- It does not implement any security features.
- Only bit[0] of the Auxiliary Control Register is supported for read/write. No functionality is implemented.

- The Security Features Control Register read/write access is supported using SECKEY. No functionality is implemented.

Ports for ARMSC000CT

Table 3-526: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	Value	Master	Current execution priority.
edbgrq	Signal	Slave	External debug request.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[32]	Signal	Slave	This signal array delivers signals to the NVIC.
intnmi	Signal	Slave	Configure non maskable interrupt.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
lockup	Signal	Master	Asserted when the processor is in lockup state.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pdbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
stcalib	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARMSC000CT

BIGENDINIT

Type

bool

Default value

0x0

Initialize processor to big endian mode.

BKPT**Type**

int

Default value

0x4

Number of breakpoint unit comparators implemented.

DBG**Type**

bool

Default value

0x1

Set whether debug extensions are implemented.

IOP**Type**

bool

Default value

0x0

Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in.

IRQDIS**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n].

NUM_IRQ**Type**

int

Default value

0x20

Number of user interrupts.

NUM_MPU_REGION

Type

int

Default value

0x0

Number of MPU regions.

SYST

Type

bool

Default value

0x1

Enable support for SysTick timer functionality.

USER

Type

bool

Default value

0x1

Enable support for Unprivileged/Privileged Extension.

VTOR

Type

bool

Default value

0x1

Include Vector Table Offset Register.

WIC

Type

bool

Default value

0x1

Include support for WIC-mode deep sleep.

WPT**Type**

int

Default value

0x2

Number of watchpoint unit comparators implemented.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-stack_base**Type**

int

Default value

0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0x20700000

Virtual address of stack limit.

3.5.84 ARMSC300CT

ARMSC300CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-527: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMSC300CT

This model has the following Iris instances:

Table 3-528: ARMSC300CT Iris instances

InstanceName	ComponentName
ARMSC300CT	ARM_SC300
ARMSC300CT.acp_mapper	PVBusMapper
ARMSC300CT.ext_bus	PVBusLogger
ARMSC300CT.ext_bus.mapper	PVBusMapper
ARMSC300CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-529: ARMSC300CT MTI instances

InstanceName	ComponentName
ARMSC300CT	ARM_SC300
ARMSC300CT.acp_mapper	PVBusMapper
ARMSC300CT.ext_bus	PVBusLogger
ARMSC300CT.ext_bus.mapper	PVBusMapper
ARMSC300CT.l2_flusher	AsyncCacheFlushUnit

ARMSC300CT contains the following CADI targets:

- ARM_SC300

Differences between the model and the RTL

The model has the following limitations:

- It does not implement any security features.
- The Trash Register is implemented as RAZ/WI.
- Only bit[0] of the Auxiliary Control Register is supported for read/write. No functionality is implemented.

- The Security Features Control Register read/write access is supported using SECKEY. No functionality is implemented.

Implementation of ITM in M-class models

This model has a parameter that enables partial support for Instrumentation Trace Macrocell (ITM). In hardware or RTL, trace data from ITM is sent in packets to the trace block serially using a single pin or wire. In the model, if it is enabled, the ITM trace data is output using an MTI trace source called `itm`. The `itm` trace source has an `itm_packet_type` field. The following table shows which packet types the model supports:

Table 3-530: ITM_PACKET_TYPE field values that the model supports

Field value	Description	Supported by model
ITM_SYNC	Synchronization packet	Not supported.
ITM_P_OVERFLOW	Protocol: Overflow packet	Not supported.
ITM_P_LOCAL_TIMESTAMP	Protocol: Local timestamp packets	Not supported.
ITM_P_GLOBAL_TIMESTAMP	Protocol: Global timestamp packets	Not supported.
ITM_P_EXTEN	Protocol: Extension packet	Not supported.
ITM_S_INSTRUMENTATION	Source: Instrumentation packet	Supported.
ITM_S_DWT_EVENT_COUNTER	Hardware source: Event counter wrapping	Not supported.
ITM_S_DWT_EXCEPTION	Hardware source: Exception tracing	Supported.
ITM_S_DWT_PC_SAMPLING	Hardware source: PC sampling	Not supported.
ITM_S_DWT_DATA_PC_TRACE	Hardware source: DWT Data trace PC value	Supported.
ITM_S_DWT_DATA_ADDRESS_TRACE	Hardware source: DWT Data trace address value	Supported.
ITM_S_DWT_DATA_DATA_TRACE	Hardware source: DWT Data trace DATA value	Supported.

Ports for ARMSC300CT

Table 3-531: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
currpri	Value	Master	Current execution priority.
edbgrq	Signal	Slave	External debug request.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
intisr[240]	Signal	Slave	This signal array delivers signals to the NVIC.
intnmi	Signal	Slave	Configure non maskable interrupt.
lockup	Signal	Master	Asserted when the processor is in lockup state.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
stcalib	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARMSC300CT

BB_PRESENT

Type

bool

Default value

0x1

Enable bitbanding.

BIGENDINIT

Type

bool

Default value

0x0

Initialize processor to big endian mode.

DBGLVL

Type

int

Default value

0x3

0: No debug; 1: Minimal debug; 2: Full debug without DWT address matching; 3: Full debug support with DWT data-comparators.

LVL_WIDTH

Type

int

Default value

0x3

Number of bits of interrupt priority.

NUM_IRQ**Type**

int

Default value

0x10

Number of user interrupts.

NUM_MPU_REGION**Type**

int

Default value

0x8

Number of MPU regions.

TRACE_LVL**Type**

int

Default value

0x1

Level of instrumentation trace supported. 0: No trace, 1: Standard trace. ITM, TPIU and DWT triggers and counters present, 2: Full trace. ITM, TPIU, ETM and DWT triggers and counters present.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit

Type
int

Default value
0x20700000

Virtual address of top of heap.

semihosting-stack_base

Type
int

Default value
0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit

Type
int

Default value
0x20700000

Virtual address of stack limit.

3.6 Media components

This section describes the Media components.

3.6.1 D71

ARM D71 Display Processor. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-532: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for D71

This model has the following Iris instances:

Table 3-533: D71 Iris instances

InstanceName	ComponentName
D71	D71
D71.apb_slave_adu	PVBusSlave
D71.apb_slave_dpu	PVBusSlave

This model has the following MTI trace components:

Table 3-534: D71 MTI instances

InstanceName	ComponentName
D71	D71
D71.apb_slave_adu	PVBusSlave
D71.apb_slave_dpu	PVBusSlave

D71 contains the following CADI targets:

- D71

About D71

The model has the following limitations:

- No support for trusted layers.
- No support for image enhancements.
- No coprocessor support for HDR processing.
- No QoS support.
- The following configuration parameters are not available:
 - CONFIG_MAX_LINE_SIZE
 - CONFIG_DISPLAY_TBU_EN. TBUs are integrated separately using the given ports.
 - CONFIG_AFBC_DMA_EN. The ADU is present. If it is not used, do not program it.

Ports for D71

Table 3-535: Ports

Name	Protocol	Type	Description
apb_pvbus_s_adu	PVBus	Slave	Slave port for register access.
apb_pvbus_s_dpu	PVBus	Slave	-
axi_pvbus_adu_m	PVBus	Master	Master AXI port for the AFBC unit
axi_pvbus_lpu_m[2]	PVBus	Master	Master AXI ports for pipelines
display[2]	LCD	Master	LCD ports for display outputs
irq0_gcu_out	Signal	Master	Shared interrupt owned by the GCU
irq1_adu_out	Signal	Master	Interrupt signal for the ADU block
pixelclock_in[2]	ClockSignal	Slave	Pixel clock inputs for the display outputs
pvbus_tbu_m[2]	PVBus	Master	Master ports for connection to TBU (SMMUv3)

Name	Protocol	Type	Description
pvbustbu_s[2]	PVBus	Slave	Slave ports for loopback from TBU (SMMUv3)
reset_signal	Signal	Slave	Reset signal.

Parameters for D71

adu_nprot_nsaid

Type

int

Default value

0x0

Non-protected NSAID for ADU transactions.

adu_nprot_s2_sid

Type

int

Default value

0x2

Stage 2 non-protected StreamID for ADU transactions.

adu_prot_nsaid

Type

int

Default value

0x1

Protected NSAID for ADU transactions.

adu_prot_s2_sid

Type

int

Default value

0x5

Stage 2 protected StreamID for ADU transactions.

adu_rd_s1_sid

Type

int

Default value

0xa

Stage 1 StreamID for ADU DMA read layer.

adu_wr_s1_sid**Type**

int

Default value

0xb

Stage 1 StreamID for ADU AES write-back layer.

display_split_en**Type**

int

Default value

0x0

Display split enabled or not.

force_frame_rate_0**Type**

int

Default value

0x0

If 0 PXLCLK0 is used, if >0 the model refreshes display output 0 at the rate per simulated second.

force_frame_rate_1**Type**

int

Default value

0x0

If 0 PXLCLK1 is used, if >0 the model refreshes display output 1 at the rate per simulated second.

lpu0_l0_s1_sid**Type**

int

Default value

0x0

Stage 1 StreamID for LPU0 read layer 0.

lpu0_l1_s1_sid**Type**

int

Default value

0x1

Stage 1 StreamID for LPU0 read layer 1.

lpu0_l2_s1_sid**Type**

int

Default value

0x2

Stage 1 StreamID for LPU0 read layer 2.

lpu0_l3_s1_sid**Type**

int

Default value

0x3

Stage 1 StreamID for LPU0 read layer 3.

lpu0_nprot_nsa_id**Type**

int

Default value

0x0

Non-protected NSAID for LPU0 transactions.

lpu0_nprot_s2_sid**Type**

int

Default value

0x0

Stage 2 non-protected StreamID for LPU0 transactions.

lpu0_prot_nsaid

Type

int

Default value

0x1

Protected NSAID for LPU0 transactions.

lpu0_prot_s2_sid

Type

int

Default value

0x3

Stage 2 protected StreamID for LPU0 transactions.

lpu0_wr_s1_sid

Type

int

Default value

0x8

Stage 1 StreamID for LPU0 write-back layer.

lpu1_l0_s1_sid

Type

int

Default value

0x4

Stage 1 StreamID for LPU1 read layer 0.

lpu1_l1_s1_sid

Type

int

Default value

0x5

Stage 1 StreamID for LPU1 read layer 1.

lpu1_12_s1_sid**Type**

int

Default value

0x6

Stage 1 StreamID for LPU1 read layer 2.

lpu1_13_s1_sid**Type**

int

Default value

0x7

Stage 1 StreamID for LPU1 read layer 3.

lpu1_nprot_nsaaid**Type**

int

Default value

0x0

Non-protected NSAID for LPU1 transactions.

lpu1_nprot_s2_sid**Type**

int

Default value

0x1

Stage 2 non-protected StreamID for LPU1 transactions.

lpu1_prot_nsaaid**Type**

int

Default value

0x1

Protected NSAID for LPU1 transactions.

lpu1_prot_s2_sid

Type
int

Default value
0x4

Stage 2 protected StreamID for LPU1 transactions.

lpu1_wr_s1_sid

Type
int

Default value
0x9

Stage 1 StreamID for LPU1 write-back layer.

num_rich_layers

Type
int

Default value
0x2

Number of Rich layers in each Layer Processing Unit.

3.6.2 DP500

ARM DP500 Display Processor. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-536: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DP500

This model has the following Iris instances:

Table 3-537: DP500 Iris instances

InstanceName	ComponentName
DP500	DP500
DP500.busmaster	PVBusMaster

InstanceName	ComponentName
DP500.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-538: DP500 MTI instances

InstanceName	ComponentName
DP500	DP500
DP500.busmaster	PVBusMaster
DP500.busslave	PVBusSlave

DP500 contains the following CADI targets:

- DP500

About DP500

This model has basic support for the display and scaling engines. Connect it to a visualization component to view LCD output. This is the single display configuration of DP500. For the dual display configuration, use DP500x2.

It passes tests as part of a booting Android kernel and running under the control of the official DP500 drivers.

It provides the following functionality:

- All RGB and YUV format parsing.
- Color adjustment in Display Engine (DE).
- Nearest neighbor scaling.
- All layers.
- Alpha blending.
- Memory writeback.
- Inverse gamma adjustment.
- Basic layer (overlay) and register security semantics.

Limitations

- No support for polyphase scaling algorithm. Falls back to nearest neighbor when configured to do so.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No colorspace conversion support.
- No support for two plane YUV memory writeback.

Ports for DP500

Table 3-539: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
display	LCD	Master	Connection to visualization component.
intr	Signal	Master	Interrupt signal.
intr_se	Signal	Master	Interrupt signal from scaling engine.
pvbus_m	PVBus	Master	Bus for processor 0.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	Signal	Slave	Reset signal.

Parameters for DP500

disable_snooping_dma

Type

bool

Default value

0x0

Disable DMA snooping.

dual_mode

Type

bool

Default value

0x0

Whether 2 display mode is supported.

force_frame_rate

Type

int

Default value

0x0

If 0 - the input clock is used as PXLCLK, if >0 then the model ensures the screen display is refreshed n times per simulated second.

3.6.3 DP500x2

ARM DP500 Display Processor x2. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-540: IP revisions support

Revision	Quality level
r0p0	Full support

Iris and MTI instances for DP500x2

This model has the following Iris instances:

Table 3-541: DP500x2 Iris instances

InstanceName	ComponentName
DP500x2	DP500x2
DP500x2.display_core_0	DP500
DP500x2.display_core_0.busmaster	PVBusMaster
DP500x2.display_core_0.busslave	PVBusSlave
DP500x2.display_core_1	DP500
DP500x2.display_core_1.busmaster	PVBusMaster
DP500x2.display_core_1.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-542: DP500x2 MTI instances

InstanceName	ComponentName
DP500x2.display_core_0	DP500
DP500x2.display_core_0.busmaster	PVBusMaster
DP500x2.display_core_0.busslave	PVBusSlave
DP500x2.display_core_1	DP500
DP500x2.display_core_1.busmaster	PVBusMaster
DP500x2.display_core_1.busslave	PVBusSlave

DP500x2 contains the following CADI targets:

- DP500
- DP500x2

About DP500x2

This component is a model of the dual display configuration of the DP500 Display Processor, with basic support for the display and scaling engines. Connect it to a visualization component to view LCD output.

It provides the following functionality:

- All RGB and YUV format parsing.
- Color adjustment in Display Engine (DE).
- Nearest neighbor scaling.
- All layers.
- Alpha blending.
- Memory writeback.
- Inverse gamma adjustment.
- Basic layer (overlay) and register security semantics.

Limitations

- No support for polyphase scaling algorithm. Falls back to nearest neighbor when configured to do so.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No colorspace conversion support.
- No support for two plane YUV memory writeback.

Ports for DP500x2

Table 3-543: Ports

Name	Protocol	Type	Description
dc_de_interrupt[2]	Signal	Master	Interrupt signalling from display engines.
dc_pvbus_m[2]	PVBus	Master	Bus for processor 0 and 1.
dc_se_interrupt[2]	Signal	Master	Interrupt signalling from scaling engines.
display[2]	LCD	Master	Connection to visualization component.
dp0_clk_in	ClockSignal	Slave	Clock signal for DP0.
dp1_clk_in	ClockSignal	Slave	Clock signal for DP1.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	Signal	Slave	Reset signal.

Parameters for DP500x2

`disable_snooping_dma`

Type

bool

Default value

0x0

Disable DMA snooping.

force_frame_rate

Type

int

Default value

0x0

If 0 - the input clock is used as PXL CLOCK, if >0 then the model ensures the screen display is refreshed n times per simulated second.

3.6.4 DP550

ARM DP550 Display Processor. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-544: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DP550

This model has the following Iris instances:

Table 3-545: DP550 Iris instances

InstanceName	ComponentName
DP550	DP550
DP550.busmaster	PVBusMaster
DP550.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-546: DP550 MTI instances

InstanceName	ComponentName
DP550	DP550
DP550.busmaster	PVBusMaster
DP550.busslave	PVBusSlave

DP550 contains the following CADI targets:

- DP550

About DP550

This component is a model of the DP550 Display Processor. Connect it to a visualization component to view LCD output. This is the single display configuration of DP550. For the dual display configuration, use DP550x2.

The model provides the following functionality:

- All RGB and YUV format parsing.
- Color adjustment in Display Engine (DE).
- Nearest neighbor scaling.
- All layers.
- Alpha blending.
- Memory writeback.
- Inverse gamma adjustment.
- Basic layer (overlay) and register security semantics.

Limitations

- No support for polyphase scaling algorithm. Falls back to nearest neighbor when configured to do so.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No colorspace conversion support.
- No support for two plane YUV memory writeback.

Ports for DP550

Table 3-547: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
display	LCD	Master	Connection to visualization component.
intr	Signal	Master	Interrupt signal.
intr_se	Signal	Master	Interrupt signal from scaling engine.
pvbuss_m	PVBus	Master	Bus for processor 0.
pvbuss_s	PVBus	Slave	Slave port for register access.
reset_signal	Signal	Slave	Reset signal.

Parameters for DP550

disable_snooping_dma

Type

bool

Default value

0x0

Disable DMA snooping.

dual_mode

Type

bool

Default value

0x0

Whether 2 display mode is supported.

force_frame_rate

Type

int

Default value

0x0

If 0 - the input clock is used as PXLCLK, if >0 then the model ensures the screen display is refreshed n times per simulated second.

set_nprot_nsaaid

Type

int

Default value

0xc00ba98

Configurable NPROT_NSAAID for non-secure NSAAID values.

set_nprot_streamid

Type

int

Default value

0xc00ba98

Configurable NPROT_STREAMID for non-secure STREAMID values.

set_prot_nsaid

Type
int

Default value
0x4003210

Configurable PROT_NSAID for secure NSAID values.

set_prot_streamid

Type
int

Default value
0x4003210

Configurable PROT_STREAMID for secure STREAMID values.

3.6.5 DP550x2

ARM DP550 Display Processor x2. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-548: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DP550x2

This model has the following Iris instances:

Table 3-549: DP550x2 Iris instances

InstanceName	ComponentName
DP550x2	DP550x2
DP550x2.display_core_0	DP550
DP550x2.display_core_0.busmaster	PVBusMaster
DP550x2.display_core_0.busslave	PVBusSlave
DP550x2.display_core_1	DP550
DP550x2.display_core_1.busmaster	PVBusMaster
DP550x2.display_core_1.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-550: DP550x2 MTI instances

InstanceName	ComponentName
DP550x2.display_core_0	DP550
DP550x2.display_core_0.busmaster	PVBusMaster
DP550x2.display_core_0.busslave	PVBusSlave
DP550x2.display_core_1	DP550
DP550x2.display_core_1.busmaster	PVBusMaster
DP550x2.display_core_1.busslave	PVBusSlave

DP550x2 contains the following CADI targets:

- DP550
- DP550x2

About DP550x2

This component is a model of the dual display configuration of the DP550 Display Processor. Connect it to a visualization component to view LCD output.

The model provides the following functionality:

- All RGB and YUV format parsing.
- Color adjustment in Display Engine (DE).
- Nearest neighbor scaling.
- All layers.
- Alpha blending.
- Memory writeback.
- Inverse gamma adjustment.
- Basic layer (overlay) and register security semantics.

Limitations

- No support for polyphase scaling algorithm. Falls back to nearest neighbor when configured to do so.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No colorspace conversion support.
- No support for two plane YUV memory writeback.

Ports for DP550x2

Table 3-551: Ports

Name	Protocol	Type	Description
dc_de_interrupt[2]	Signal	Master	Interrupt signalling from display engines.

Name	Protocol	Type	Description
dc_pvbus_m[2]	PVBus	Master	Bus for processor 0 and 1.
dc_se_interrupt[2]	Signal	Master	Interrupt signalling from scaling engines.
display[2]	LCD	Master	Connection to visualization component.
dp0_clk_in	ClockSignal	Slave	Clock signal for DP0.
dp1_clk_in	ClockSignal	Slave	Clock signal for DP1.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	Signal	Slave	Reset signal.

Parameters for DP550x2

disable_snooping_dma

Type

bool

Default value

0x0

Disable DMA snooping.

force_frame_rate

Type

int

Default value

0x0

If 0 - the input clock is used as PXLCLK, if >0 then the model ensures the screen display is refreshed n times per simulated second.

set_primary_nprot_nsaidth

Type

int

Default value

0xc00ba98

Configurable NPROT_NSAID for non-secure NSAID values(primary).

set_primary_nprot_streamid

Type

int

Default value

0xc00ba98

Configurable NPROT_STREAMID for non-secure STREAMID values(primary).

set_primary_prot_nsaid**Type**

int

Default value

0x4003210

Configurable PROT_NSAID for secure NSAID values(primary).

set_primary_prot_streamid**Type**

int

Default value

0x4003210

Configurable PROT_STREAMID for secure STREAMID values(primary).

set_secondary_nprot_nsaid**Type**

int

Default value

0xc00ba98

Configurable NPROT_NSAID for non-secure NSAID values(secondary).

set_secondary_nprot_streamid**Type**

int

Default value

0xc00ba98

Configurable NPROT_STREAMID for non-secure STREAMID values(secondary).

set_secondary_prot_nsaid**Type**

int

Default value

0x4003210

Configurable PROT_NSAID for secure NSAID values(secondary).

set_secondary_prot_streamid**Type**

int

Default value

0x4003210

Configurable PROT_STREAMID for secure STREAMID values(secondary).

3.6.6 DP650

ARM DP650 Display Processor. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-552: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DP650

This model has the following Iris instances:

Table 3-553: DP650 Iris instances

InstanceName	ComponentName
DP650	DP650
DP650.busmaster	PVBusMaster
DP650.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-554: DP650 MTI instances

InstanceName	ComponentName
DP650	DP650
DP650.busmaster	PVBusMaster
DP650.busslave	PVBusSlave

DP650 contains the following CADI targets:

- DP650

About DP650

This component is a model of the DP650 Display Processor. Connect it to a visualization component to view LCD output. This is the single display configuration of DP650. For the dual display configuration, use DP650x2.

Limitations

- No support for the polyphase scaling algorithm, it always uses nearest neighbor.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No YUV 2-plane support for memory writeback.
- No color space conversion support.

Ports for DP650

Table 3-555: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Master clock input, typically 24MHz, to drive pixel clock timing.
display	LCD	Master	Connection to visualization component.
intr	Signal	Master	Interrupt signal.
intr_se	Signal	Master	Interrupt signal from scaling engine.
pvbus_m	PVBus	Master	Bus for processor 0.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	Signal	Slave	Reset signal.

Parameters for DP650

disable_snooping_dma

Type

bool

Default value

0x0

Disable DMA snooping.

dual_mode

Type

bool

Default value

0x0

Whether 2 display mode is supported.

force_frame_rate**Type**

int

Default value

0x0

If 0 - the input clock is used as PXLCLK, if >0 then the model ensures the screen display is refreshed n times per simulated second.

set_nprot_nsaid**Type**

int

Default value

0xc00ba98

Configurable NPROT_NSaid for non-secure NSaid values.

set_nprot_streamid**Type**

int

Default value

0xc00ba98

Configurable NPROT_STREAMID for non-secure STREAMID values.

set_prot_nsaid**Type**

int

Default value

0x4003210

Configurable PROT_NSaid for secure NSaid values.

set_prot_streamid**Type**

int

Default value

0x4003210

Configurable PROT_STREAMID for secure STREAMID values.

3.6.7 DP650x2

ARM DP650 Display Processor x2. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-556: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DP650x2

This model has the following Iris instances:

Table 3-557: DP650x2 Iris instances

InstanceName	ComponentName
DP650x2	DP650x2
DP650x2.display_core_0	DP650
DP650x2.display_core_0.busmaster	PVBusMaster

DP650x2.display_core_1	DP650
DP650x2.display_core_1.busmaster	PVBusMaster
DP650x2.display_core_1.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-558: DP650x2 MTI instances

InstanceName	ComponentName
DP650x2.display_core_0	DP650
DP650x2.display_core_0.busmaster	PVBusMaster
DP650x2.display_core_0.busslave	PVBusSlave
DP650x2.display_core_1	DP650
DP650x2.display_core_1.busmaster	PVBusMaster
DP650x2.display_core_1.busslave	PVBusSlave

DP650x2 contains the following CADI targets:

- DP650
- DP650x2

About DP650x2

This component is a model of the dual display configuration of the DP650 Display Processor. To view LCD output, connect it to a visualization component.

Limitations

- No support for the polyphase scaling algorithm, it always uses nearest neighbor.
- No support for 3D or interlaced video.
- No support for image enhancing functionality.
- No YUV 2-plane support for memory writeback.
- No color space conversion support.

Ports for DP650x2

Table 3-559: Ports

Name	Protocol	Type	Description
dc_de_interrupt[2]	Signal	Master	Interrupt signalling from display engines.
dc_pvbus_m[2]	PVBus	Master	Bus for processor 0 and 1.
dc_se_interrupt[2]	Signal	Master	Interrupt signalling from scaling engines.
display[2]	LCD	Master	Connection to visualization component.
dp0_clk_in	ClockSignal	Slave	Clock signal for DP0.
dp1_clk_in	ClockSignal	Slave	Clock signal for DP1.
pvbus_s	PVBus	Slave	Slave port for register access.
reset_signal	Signal	Slave	Reset signal.

Parameters for DP650x2

disable_snooping_dma

Type

bool

Default value

0x0

Disable DMA snooping.

force_frame_rate

Type

int

Default value

0x0

If 0 - the input clock is used as PXLCLK, if >0 then the model ensures the screen display is refreshed n times per simulated second.

set_primary_nprot_nsaid

Type

int

Default value

0xc00ba98

Configurable NPROT_NSAID for non-secure NSAID values(primary).

set_primary_nprot_streamid**Type**

int

Default value

0xc00ba98

Configurable NPROT_STREAMID for non-secure STREAMID values(primary).

int

Default value
0x4003210

Configurable PROT_STREAMID for secure STREAMID values(secondary).

3.6.8 Mali_C5x_streaming_sink

Arm® Mali™-C55 ISP streaming output capture example component. This component tests ISP's streaming output functionality and provides an example of how to develop components consuming frames from the Mali-C55 ISP streaming output. This implementation saves all the ISP output frames to host disk in the FRM file format which is defined as part of the ISP model specification. All the implementation code is placed in this LISA+ file. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-560: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_C5x_streaming_sink

This model has the following Iris instances:

Table 3-561: Mali_C5x_streaming_sink Iris instances

InstanceName	ComponentName
Mali_C5x_streaming_sink	Mali_C5x_streaming_sink
Mali_C5x_streaming_sink.bus_slave0	PVBUSslave
Mali_C5x_streaming_sink.bus_slave1	PVBUSslave
Mali_C5x_streaming_sink.bus_slave2	PVBUSslave

This model has the following MTI trace components:

InstanceName	ComponentName
Mali_C5x_streaming_sink.bus_slave0	PVBusSlave
Mali_C5x_streaming_sink.bus_slave1	PVBusSlave
Mali_C5x_streaming_sink.bus_slave2	PVBusSlave

Mali_C5x_streaming_sink contains the following CADI targets:

- Mali_C5x_streaming_sink

Ports for Mali_C5x_streaming_sink

Table 3-563: Ports

Name	Protocol	Type	Description
data_s[3]	PVBus	Slave	Pixels consumer ports; receive pixels as 16-bit values (and optional debug metadata).
hsync_s	Signal	Slave	Horizontal sync port; defines input image's line begin and end for all three data ports.
vsync_s	Signal	Slave	Vertical sync port; defines the input frame's begin and end for all three data ports.

Parameters for Mali_C5x_streaming_sink

do_capture

Type

bool

Default value

0x1

Saving captured frames on/off.

fn_prefix

Type

string

Default value

"isp_out_"

Saved filenames prefix.

3.6.9 Mali_C7x_streaming_sink

Arm® Mali™-C71/C78 ISP streaming output capture example component. This component tests ISP's streaming output functionality and provides an example of how to develop components consuming frames from the Mali-C7x ISP streaming output. This implementation saves all the

ISP output frames to host disk in the FRM file format which is defined as a part of the ISP model specification. All the implementation code is placed in this LISA+ file. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-564: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_C7x_streaming_sink

Name	Protocol	Type	Description
data_s[3]	PVBus	Slave	Pixels consumer ports; receive pixels as 16-bit values (and optional debug metadata).
hsync_s[3]	Signal	Slave	Horizontal sync ports; defines input image's line begin and end for the corresponding data ports.
vsync_s[3]	Signal	Slave	Vertical sync ports; define input frame's begin and end for the corresponding data port.

Parameters for Mali_C7x_streaming_sink

do_capture

Type

bool

Default value

0x1

Saving captured frames on/off.

fn_prefix

Type

string

Default value

"isp_out_"

Saved filenames prefix.

3.6.10 Mali_C55

Arm® Mali™ C55 ISP. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-568: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- CNR_FITTED
- COMPRESSION_FITTED
- DSPIPE_FITTED
- FRSCALER_FITTED
- IRIDIX_GTM_FITTED
- IRIDIX_LTM_FITTED
- PONG_CONFIG_FITTED
- SCALER_COEF_SETS
- SINTER_FITTED

- SINTER_LITE
- TEMPER_FITTED
- WDR_FITTED
- ext_mode
- verbosity

Parameters removed:

- hw_config

Iris and MTI instances for Mali_C55

This model has the following Iris instances:

Table 3-569: Mali_C55 Iris instances

InstanceName	ComponentName
Mali_C55	Mali_C55
Mali_C55.apb_slave	PVBusSlave
Mali_C55.bus_slave0	PVBusSlave
Mali_C55.bus_slave1	PVBusSlave
Mali_C55.bus_slave2	PVBusSlave

This model has the following MTI trace components:

Table 3-570: Mali_C55 MTI instances

InstanceName	ComponentName
Mali_C55.apb_slave	PVBusSlave
Mali_C55.bus_slave0	PVBusSlave
Mali_C55.bus_slave1	PVBusSlave
Mali_C55.bus_slave2	PVBusSlave

Mali_C55 contains the following CADI targets:

- Mali_C55

Limitations

- Streaming input and output interfaces are supported but the protocol differs slightly from the real hardware. See Mali_Cxx_streaming_camera.lisa and Mali_C5x_streaming_sink.lisa for details on how to use them.
- Video monitor output and DMA monitor interface are not supported.
- Error conditions (IRQ bits 2, 3, 19, 20, 22) are not supported.
- It does not expose any targets for CADI or Iris-enabled debuggers to connect to, so debug access to its registers through CADI or Iris is not supported.

Ports for Mali_C55

Table 3-571: Ports

Name	Protocol	Type	Description
ds_data_out_m[3]	PVBus	Master	-
ds_hsync_out_m	Signal	Master	-
ds_uv_valid_out_m	Signal	Master	-
ds_vsync_out_m	Signal	Master	-
fr_data_out_m[3]	PVBus	Master	Metadata + pixels, 16 bit, (RGB or YUV)
fr_hsync_out_m	Signal	Master	Horizontal sync / blanking (set at the beginning of a line; cleared at the end)
fr_uv_valid_out_m	Signal	Master	UV valid (set if both U and V pixels are valid)
fr_vsync_out_m	Signal	Master	Vertical sync / blanking (set at the beginning of a frame; cleared at the end)
irq	Signal	Master	Shared interrupt
pvbuse_m	PVBus	Master	Master AXI port for RAM access
pvbuse_s	PVBus	Slave	Slave port for register access
reset_s	Signal	Slave	Reset signal
stream_data_in_s[3]	PVBus	Slave	Metadata + pixels, 20 bit
stream_hsync_in_s	Signal	Slave	Horizontal sync / blanking (set at the beginning of a line; cleared at the end)
stream_vsync_in_s	Signal	Slave	Vertical sync / blanking (set at the beginning of a frame; cleared at the end)

Parameters for Mali_C55

CNR_FITTED

Type

int

Default value

0x1

Color Noise Reduction (CNR) and the square and square root for CNR: 0 - absent, 1 - present.

COMPRESSION_FITTED

Type

int

Default value

0x1

Temper compression logic: 0 - absent, 1 - present.

DSPIPE_FITTED

Type

int

Default value

0x1

Downscaled pipeline branch: 0 - absent, 1 - present.

FRSCALER_FITTED**Type**

int

Default value

0x1

Rull Resolution pipeline RGB scaler: 0 - absent, 1 - present.

IRIDIX_GTM_FITTED**Type**

int

Default value

0x0

Iridix(TM) global tone-mapping logic: 0 - absent, 1 - present. NOTE: Must be 1 if IRIDIX_LTM_FITTED == 0.

IRIDIX_LTM_FITTED**Type**

int

Default value

0x1

Iridix(TM) local tone-mapping logic: 0 - absent, 1 - present.

PONG_CONFIG_FITTED**Type**

int

Default value

0x1

Pong configuration space: 0 - absent, 1 - present.

SCALER_COEF_SETS**Type**

int

Default value

0x8

Number of scaler coefficient sets (8 or 16).

SINTER_FITTED**Type**

int

Default value

0x1

Sinter block: 0 - absent, 1 - present.

SINTER_LITE**Type**

int

Default value

0x0

Sinter version: 0 - full, 1 - lite.

TEMPER_FITTED**Type**

int

Default value

0x1

Temper, DMA, or merge: 0 - absent, 1 - present.

WDR_FITTED**Type**

int

Default value

0x1

Wide Dynamic Range (WDR) frame stitch, offset, and gain: 0 - absent, 1 - present.

ext_mode**Type**

int

Default value

0x0

Reserved for future use. Use it with instructions from Arm Technical Support (support-esl@arm.com).

verbosity**Type**

int

Default value

0x0

Messages verbosity level: -1 - print ERROR messages only, 0 - print ERROR and WARNING messages, 1 - print INFO messages, 2 - print DEBUG messages.

3.6.11 Mali_C71

Arm® Mali™ C71 ISP. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-572: IP revisions support

Revision	Quality level
r1p2	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- `verbosity`

Iris and MTI instances for Mali_C71

This model has the following Iris instances:

Table 3-573: Mali_C71 Iris instances

InstanceName	ComponentName
Mali_C71	Mali_C71
Mali_C71.apb_slave	PVBusSlave
Mali_C71.bus_slave0	PVBusSlave
Mali_C71.bus_slave1	PVBusSlave
Mali_C71.bus_slave2	PVBusSlave
Mali_C71.bus_slave3	PVBusSlave

This model has the following MTI trace components:

Table 3-574: Mali_C71 MTI instances

InstanceName	ComponentName
Mali_C71.apb_slave	PVBusSlave
Mali_C71.bus_slave0	PVBusSlave

InstanceName	ComponentName
Mali_C71.bus_slave1	PVBusSlave
Mali_C71.bus_slave2	PVBusSlave
Mali_C71.bus_slave3	PVBusSlave

Mali_C71 contains the following CADI targets:

- Mali_C71

Limitations

- Streaming input and output interfaces are supported but the protocol differs slightly from the real hardware.
- Fault Interface is not supported (except double interrupt).
- It does not expose any targets for CADI or Iris-enabled debuggers to connect to, so debug access to its registers through CADI or Iris is not supported.

Ports for Mali_C71

Table 3-575: Ports

Name	Protocol	Type	Description
fault	Signal	Master	Fault output interface
irq[4]	Signal	Master	Shared interrupts
pvbus_m	PVBus	Master	Master AXI port for RAM access
pvbus_s	PVBus	Slave	Slave port for register access
reset_s	Signal	Slave	Reset signal.
stream_data_in_s[4]	PVBus	Slave	Metadata + pixels
stream_data_out_m[3]	PVBus	Master	Metadata + pixels
stream_hsync_in_s[4]	Signal	Slave	Horizontal sync / blanking (set at the beginning of a line; cleared at the end)
stream_hsync_out_m[3]	Signal	Master	Horizontal sync / blanking (set at the beginning of a line; cleared at the end)
stream_tag_in_s[4]	Value	Slave	Source stream tag Can change between lines (while hsync is Clear) if several frames are multiplexed.
stream_tag_out_m[3]	Value	Master	Source stream tag (changes while vsync is Clear)
stream_vsync_in_s[4]	Signal	Slave	Vertical sync / blanking (set at the beginning of a frame; cleared at the end)
stream_vsync_out_m[3]	Signal	Master	Vertical sync / blanking (set at the beginning of a frame; cleared at the end)

Parameters for Mali_C71

verbosity

Type

int

Default value

0x0

Messages verbosity level: -1 - print ERROR messages only, 0 - print ERROR and WARNING messages, 1 - print INFO messages, 2 - print DEBUG messages.

3.6.12 Mali_C78

Arm® Mali™ C78 ISP. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-576: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Parameters added:

- `verbosity`

Iris and MTI instances for Mali_C78

This model has the following Iris instances:

Table 3-577: Mali_C78 Iris instances

InstanceName	ComponentName
Mali_C78	Mali_C78
Mali_C78.apb_slave	PVBusSlave
Mali_C78.bus_slave0	PVBusSlave
Mali_C78.bus_slave1	PVBusSlave
Mali_C78.bus_slave2	PVBusSlave
Mali_C78.bus_slave3	PVBusSlave

This model has the following MTI trace components:

Table 3-578: Mali_C78 MTI instances

InstanceName	ComponentName
Mali_C78.apb_slave	PVBusSlave
Mali_C78.bus_slave0	PVBusSlave
Mali_C78.bus_slave1	PVBusSlave
Mali_C78.bus_slave2	PVBusSlave
Mali_C78.bus_slave3	PVBusSlave

Mali_C78 contains the following CADI targets:

- Mali_C78

Limitations

- Streaming input and output interfaces are supported but the protocol differs slightly from the real hardware.
- Fault Interface is not supported (except double interrupt).
- It does not expose any targets for CADI or Iris-enabled debuggers to connect to, so debug access to its registers through CADI or Iris is not supported.

Ports for Mali_C78

Table 3-579: Ports

Name	Protocol	Type	Description
fault	Signal	Master	Fault output interface
irq[4]	Signal	Master	Shared interrupts
pvbus_m	PVBus	Master	Master AXI port for RAM access
pvbus_s	PVBus	Slave	Slave port for register access
reset_s	Signal	Slave	Reset signal.
stream_data_in_s[4]	PVBus	Slave	Metadata + pixels
stream_data_out_m[3]	PVBus	Master	Metadata + pixels
stream_hsync_in_s[4]	Signal	Slave	Horizontal sync / blanking (set at the beginning of a line; cleared at the end)
stream_hsync_out_m[3]	Signal	Master	Horizontal sync / blanking (set at the beginning of a line; cleared at the end)
stream_tag_in_s[4]	Value	Slave	Source stream tag Can change between lines (while hsync is Clear) if several frames are multiplexed.
stream_tag_out_m[3]	Value	Master	Source stream tag (changes while vsync is Clear)
stream_vsync_in_s[4]	Signal	Slave	Vertical sync / blanking (set at the beginning of a frame; cleared at the end)
stream_vsync_out_m[3]	Signal	Master	Vertical sync / blanking (set at the beginning of a frame; cleared at the end)

Parameters for Mali_C78

verbosity

Type

int

Default value

0x0

Messages verbosity level: -1 - print ERROR messages only, 0 - print ERROR and WARNING messages, 1 - print INFO messages, 2 - print DEBUG messages.

3.6.13 Mali_Cxx_streaming_camera

Simple streaming camera to connect to Mali ISP (C55, C71, or C78) streaming inputs. This component tests ISP's streaming input functionality and provides an example of how to develop

camera-like components streaming frames to a Mali-Cxx ISP. All the implementation code is placed in this LISA+ file. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-580: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_Cxx_streaming_camera

This model has the following Iris instances:

Table 3-581: Mali_Cxx_streaming_camera Iris instances

InstanceName	ComponentName
Mali_Cxx_streaming_camera	Mali_Cxx_streaming_camera
Mali_Cxx_streaming_camera.bus_master_data	PVBusMaster
Mali_Cxx_streaming_camera.bus_slave_config	PVBusSlave

This model has the following MTI trace components:

Table 3-582: Mali_Cxx_streaming_camera MTI instances

InstanceName	ComponentName
Mali_Cxx_streaming_camera.bus_master_data	PVBusMaster
Mali_Cxx_streaming_camera.bus_slave_config	PVBusSlave

Mali_Cxx_streaming_camera contains the following CADI targets:

- Mali_Cxx_streaming_camera

Ports for Mali_Cxx_streaming_camera

Table 3-583: Ports

Name	Protocol	Type	Description
config_s	PVBus	Slave	Access to the camera config register(s) (8 bit): 0x00 - output mode: 0 - no output, 1 - stream one frame and auto-reset to 0
data_m	PVBus	Master	Output frames port; sends pixels as 32-bit values (and debug metadata).
hsync_m	Signal	Master	Horizontal sync; set at the beginning of a line, cleared at the end.
vsync_m	Signal	Master	Vertical sync; set at the beginning of a frame, cleared at the end.

Parameters for Mali_Cxx_streaming_camera

image_file

Type

string

Default value

'''

A file containing one or more frames to stream in the ISP model's FRM format.

3.6.14 Mali_G51

ARM Mali-G51 GPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-584: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G51

This model has the following Iris instances:

Table 3-585: Mali_G51 Iris instances

InstanceName	ComponentName
Mali_G51	Mali_G51
Mali_G51.busmaster	PVBusMaster
Mali_G51.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-586: Mali_G51 MTI instances

InstanceName	ComponentName
Mali_G51	Mali_G51
Mali_G51.busmaster	PVBusMaster
Mali_G51.busslave	PVBusSlave

Mali_G51 contains the following CADI targets:

- Mali_G51

Limitations

- The model does not support Armv8-style page tables.
- The model does not execute GPU shader programs.
- The model does not validate all register values or job descriptors.

This model outputs values for all Mali PMU hardware counters. These values are not meaningful. Their purpose is to enable you to use the model early in the development process to check that your system is correctly configured to support performance analysis tools, for instance Streamline.

The counter is a 32-bit bitfield, with the following bit assignments:

- [31:28]**
Identifies which Mali GPU instance generated this value, typically zero for a system with a single GPU.
- [27:24]**
Identifies which hardware block is the source of the counter. It can have one of the following values:

0

Job manager.

1

Tiler.

2

L2Cache/Memory system.

3+

Shader core.
- [23:16]**
The counter number within the block.
- [15:0]**
Sawtooth counter that counts from 0 to 0xffff and then resets to 0. This value ensures that consecutive captures show different values and allows you to check that counter values are changing over time.

- These counter values might change in future.
- The model always generates counter values, even if the GPU is idle.
- Streamline does not display the precise values that the model outputs because it needs to correct them for sampling frequency and other profiling effects. However, their size relative to each other is correct. For example, counters from the job manager are always smaller than those from the memory system.

Ports for Mali_G51

Table 3-587: Ports

Name	Protocol	Type	Description
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.

Name	Protocol	Type	Description
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

Parameters for Mali_G51

revision

Type

string

Default value

"r0p0"

Revision of the RTL that the model represents. Valid values: r0p0.

3.6.15 Mali_G71

ARM Mali-G71 GPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-588: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G71

This model has the following Iris instances:

Table 3-589: Mali_G71 Iris instances

InstanceName	ComponentName
Mali_G71	Mali_G71
Mali_G71.busmaster	PVBusMaster
Mali_G71.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-590: Mali_G71 MTI instances

InstanceName	ComponentName
Mali_G71	Mali_G71

InstanceName	ComponentName
Mali_G71.busmaster	PVBusMaster
Mali_G71.busslave	PVBusSlave

Mali_G71 contains the following CADI targets:

- Mali_G71

Limitations

- The model does not support Armv8-style page tables.
- The model does not execute GPU shader programs.
- The model does not validate all register values or job descriptors.

This model outputs values for all Mali PMU hardware counters. These values are not meaningful. Their purpose is to enable you to use the model early in the development process to check that your system is correctly configured to support performance analysis tools, for instance Streamline.

The counter is a 32-bit bitfield, with the following bit assignments:

[31:28]

Identifies which Mali GPU instance generated this value, typically zero for a system with a single GPU.

[27:24]

Identifies which hardware block is the source of the counter. It can have one of the following values:

0

Job manager.

1

Tiler.

2

L2Cache/Memory system.

3+

Shader core.

[23:16]

The counter number within the block.

[15:0]

Sawtooth counter that counts from 0 to 0xffff and then resets to 0. This value ensures that consecutive captures show different values and allows you to check that counter values are changing over time.

- These counter values might change in future.
- The model always generates counter values, even if the GPU is idle.
- Streamline does not display the precise values that the model outputs because it needs to correct them for sampling frequency and other profiling effects. However, their size relative to each other is correct. For example, counters from the job manager are always smaller than those from the memory system.

Ports for Mali_G71

Table 3-591: Ports

Name	Protocol	Type	Description
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

Parameters for Mali_G71

revision

Type

string

Default value

"r0p0"

Revision of the RTL that the model represents. Valid values: r0p0.

3.6.16 Mali_G72

ARM Mali-G72 GPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-592: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G72

This model has the following Iris instances:

Table 3-593: Mali_G72 Iris instances

InstanceName	ComponentName
Mali_G72	Mali_G72
Mali_G72.busmaster	PVBusMaster
Mali_G72.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-594: Mali_G72 MTI instances

InstanceName	ComponentName
Mali_G72	Mali_G72
Mali_G72.busmaster	PVBusMaster
Mali_G72.busslave	PVBusSlave

Mali_G72 contains the following CADI targets:

- Mali_G72

Limitations

- The model does not support Armv8-style page tables.
- The model does not execute GPU shader programs.
- The model does not validate all register values or job descriptors.

This model outputs values for all Mali PMU hardware counters. These values are not meaningful. Their purpose is to enable you to use the model early in the development process to check that your system is correctly configured to support performance analysis tools, for instance Streamline.

The counter is a 32-bit bitfield, with the following bit assignments:

[31:28]

Identifies which Mali GPU instance generated this value, typically zero for a system with a single GPU.

[27:24]

Identifies which hardware block is the source of the counter. It can have one of the following values:

0

Job manager.

1

Tiler.

2

L2Cache/Memory system.

3+
Shader core.

[23:16]
The counter number within the block.

[15:0]
Sawtooth counter that counts from 0 to 0xffff and then resets to 0. This value ensures that consecutive captures show different values and allows you to check that counter values are changing over time.

- These counter values might change in future.
- The model always generates counter values, even if the GPU is idle.
- Streamline does not display the precise values that the model outputs because it needs to correct them for sampling frequency and other profiling effects. However, their size relative to each other is correct. For example, counters from the job manager are always smaller than those from the memory system.

Ports for Mali_G72

Table 3-595: Ports

Name	Protocol	Type	Description
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

Parameters for Mali_G72

revision

Type

string

Default value

"r0p0"

Revision of the RTL that the model represents. Valid values: r0p0.

3.6.17 Mali_G76

ARM Mali-G76 GPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-596: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G76

This model has the following Iris instances:

Table 3-597: Mali_G76 Iris instances

InstanceName	ComponentName
Mali_G76	Mali_G76
Mali_G76.busmaster	PVBusMaster
Mali_G76.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-598: Mali_G76 MTI instances

InstanceName	ComponentName
Mali_G76	Mali_G76
Mali_G76.busmaster	PVBusMaster
Mali_G76.busslave	PVBusSlave

Mali_G76 contains the following CADI targets:

- Mali_G76

Limitations

- The model does not support Armv8-style page tables.
- The model does not execute GPU shader programs.
- The model does not validate all register values or job descriptors.

This model outputs values for all Mali PMU hardware counters. These values are not meaningful. Their purpose is to enable you to use the model early in the development process to check that your system is correctly configured to support performance analysis tools, for instance Streamline.

The counter is a 32-bit bitfield, with the following bit assignments:

[31:28]

Identifies which Mali GPU instance generated this value, typically zero for a system with a single GPU.

[27:24]

Identifies which hardware block is the source of the counter. It can have one of the following values:

0

Job manager.

1

Tiler.

2

L2Cache/Memory system.

3+

Shader core.

[23:16]

The counter number within the block.

[15:0]

Sawtooth counter that counts from 0 to 0xffff and then resets to 0. This value ensures that consecutive captures show different values and allows you to check that counter values are changing over time.

Note

- These counter values might change in future versions.
- The model always generates counter values, even if the GPU is idle.
- Streamline does not display the precise values that the model outputs because it needs to correct them for sampling frequency and other profiling effects. However, their size relative to each other is correct. For example, counters from the job manager are always smaller than those from the memory system.

Ports for Mali_G76

Table 3-599: Ports

Name	Protocol	Type	Description
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.

Name	Protocol	Type	Description
pvbuss_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

Parameters for Mali_G76

revision

Type

string

Default value

"rOp0"

Revision of the RTL that the model represents. Valid values: rOp0.

3.6.18 Mali_G78AE

Arm® Mali™-G78AE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-600: IP revisions support

Revision	Quality level
rOp0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G78AE

This model has the following Iris instances:

Table 3-601: Mali_G78AE Iris instances

InstanceName	ComponentName
Mali_G78AE	Mali_G78AE
Mali_G78AE.AccessControl	PVBusMapper

This model has the following MTI trace components:

Table 3-602: Mali_G78AE MTI instances

InstanceName	ComponentName
Mali_G78AE	Mali_G78AE
Mali_G78AE.AccessControl	PVBusMapper

Mali_G78AE contains the following CADI targets:

- Mali_G78AE

About Mali_G78AE

The Mali_G78AE component models the Arm Mali G78AE, which implements the Valhall architecture, and is the first Mali GPU designed specifically to target automotive use cases.

The model implements the Partition Manager, enabling up to 4 independent partitions running workloads at the same time, while being accessed by up to 16 virtual machines.

The Mali_G78AE model is functional, capable of executing GPU shader programs and producing graphical or compute outputs. It requires a clock input running at around 500MHz to keep the CPU and GPU performance aligned, and to avoid software timeouts during slow-running GPU operations.

With this model, and the implemented functionality of the Partition Manager, you can:

- Simulate the entire graphics software stack, including the user space and kernel space driver components of the Arm Mali DDK, and an application that uses a graphics API.
- Verify the integration of the Mali G78AE GPU into the rest of the platform. A complex use case example of this is a system running multiple kernels in Virtual Machines under a Hypervisor, all submitting workloads to the GPU at the same time.

To configure the reference Mali driver for use with the model, we recommend you make some adjustments to the timing parameters of the Mali driver. This is because of timing differences between the real hardware and the Fast Model. Which parameters work best depend on your system, but if you are using the reference Arm implementation of the arbiter from the DDK, one possibility is:

```
insmod mali_kbase.ko gpu_req_timeout=1000
insmod mali_arbiter.ko request_timeout=200 yield_timeout=30
```

Test applications

The tests have been carried out using the r40p0 release of the Mali DDK. The following applications have been tested and confirmed to work:

- A selection of the Mali DDK integration tests in `product/build-<wsi>/install/bin/â`
 - mali_gles_integration_suite
 - mali_cl_simple_example
- A selection of lightweight Vulkan examples hosted on [GitHub](#):
 - gears
 - computeparticles, at small particle count
 - texture3d
- A selection of ComputeLibrary examples hosted on [GitHub](#):
 - graph_lenet
 - graph_mobilenet_v2

All of these applications have been successfully tested in a non-virtualised system, on Debian Buster running Linux 4.19.

A subset of these examples have been tested in the following virtualised systems:

- Xen Hypervisor 4.14.1-pre
- Privileged Debian Buster running Linux kernel 4.19, controlling the configuration of partitions, and running the Mali DDK reference arbiter implementation
- Two unprivileged virtual machines, both running Debian Buster, Linux 4.19, both running various applications listed in this section at the same time

Limitations

- The model does not support debug access to registers through CADI or Iris-enabled debuggers.
- It is not supported on Windows hosts.
- It is a functional model and does not simulate performance differences for partitions of different sizes.
- It does not implement the protection *CHK signals.
- It does not implement Parity/DCLS/CRC faults and fault fingerprints.
- It does not implement different error response modes configurable through the SYSTEM page.

Ports for Mali_G78AE

Table 3-603: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
gpu_reset	Signal	Slave	Reset signals
gpu_reset_recovery	Signal	Slave	-
irq_deferred_error	Signal	Master	-
irq_groups[4]	Signal	Master	-
irq_partitions[4]	Signal	Master	Partition Manager irq
irq_uncorrected_error	Signal	Master	-
irq_windows[16]	Signal	Master	-
pvbus_m	PVBus	Master	Output to board from GPU
pvbus_s[3]	PVBus	Slave	Slave bus ports (AXI-A through C).
sys_assign_enable	Value	Slave	System configuration access control for different ports

Parameters for Mali_G78AE

labeller_encoding_spec

Type

string

Default value

"MasterID[31:0]=StreamID[31:0]"

Specification of how the StreamID is encoded into transaction attributes.

3.6.19 Mali_G710

Arm® Mali™ G710 GPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-604: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G710

This model has the following Iris instances:

Table 3-605: Mali_G710 Iris instances

InstanceName	ComponentName
Mali_G710	Mali_G710
Mali_G710.busmaster	PVBusMaster
Mali_G710.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-606: Mali_G710 MTI instances

InstanceName	ComponentName
Mali_G710	Mali_G710
Mali_G710.busmaster	PVBusMaster
Mali_G710.busslave	PVBusSlave

Mali_G710 contains the following CADI targets:

- Mali_G710

About Mali_G710

The Mali_G710 and Mali_G715 components model the Arm Mali G710 and G715 GPUs respectively, which implement the Valhall architecture. They are among the first Mali GPUs to implement a Command Stream Frontend (CSF), which is a combination of hardware and firmware that helps to offload work from the Mali driver that is running on the CPU.

With the Mali G710 and G715 Fast Models, you can simulate:

- User space and kernel space driver components of the Arm Mali Driver Development kit (Mali DDK), when built to target Mali G710 or G715 under Android and Linux graphics stacks.

- Mali G710 or G715 firmware binaries.

These are functional models that do not attempt to execute GPU shader programs. They are sufficient to simulate a Mali driver, but rather than deliver fully rendered images to memory, they write a randomly-generated color gradient pattern to the framebuffer.

The changing frames can be used to prove that the graphics stack is correctly configured to allow the Mali GPU to write to a user-visible framebuffer.

Configuring the driver for use with the model

To account for timing differences between real hardware and the Fast Model, it is necessary to modify the following runtime settings in the Mali driver:

csf_firmware_boot_timeout_ms

Overrides the minimum timeout value for loading firmware into the model.

Type

Kernel module parameter

Recommended value

10000

reset_timeout

Overrides the minimum timeout when waiting for operations on the GPU to finish.

Type

Sysfs parameter

Recommended value

1000000

fw_timeout

Overrides the minimum timeout when waiting for operations on the GPU to finish.

Type

Sysfs parameter

Recommended value

1000000

The following commands are a snippet from an Android RC file that is an example of how a filesystem can be configured to correctly load the Mali driver when running on a Fast Models platform:

```
insmod /vendor/lib/modules/mali_kbase.ko csf_firmware_boot_timeout_ms=100000
wait /dev/mali0
chmod 0666 /dev/mali0
wait /sys/class/misc/mali0/device/reset_timeout
write /sys/class/misc/mali0/device/reset_timeout 1000000
write /sys/class/misc/mali0/device/fw_timeout 1000000
```

Limitations

- The model does not support debug access to registers through CADI or Iris-enabled debuggers.
- The timing data observed from the model does not correspond in any way to real hardware.
- The model does not expose any MTI targets.
- The model is not supported on Windows hosts.

Ports for Mali_G710

Table 3-607: Ports

Name	Protocol	Type	Description
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

Parameters for Mali_G710

altcmdline

Type

string

Default value

""

Alternate command line for the GPU model. If used, mode is ignored.

altmodel

Type

string

Default value

""

Path to an alternative GPU model library.

mode

Type

string

Default value

"fast"

GPU Mode. Inputs supported: [fast, turbo_fallback, turbo].

3.6.20 Mali_G715

Arm® Mali™ G715 GPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-608: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G715

This model has the following Iris instances:

Table 3-609: Mali_G715 Iris instances

InstanceName	ComponentName
Mali_G715	Mali_G715
Mali_G715.busmaster	PVBusMaster
Mali_G715.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-610: Mali_G715 MTI instances

InstanceName	ComponentName
Mali_G715	Mali_G715
Mali_G715.busmaster	PVBusMaster
Mali_G715.busslave	PVBusSlave

Mali_G715 contains the following CADI targets:

- Mali_G715

About Mali_G715

The Mali_G710 and Mali_G715 components model the Arm Mali G710 and G715 GPUs respectively, which implement the Valhall architecture. They are among the first Mali GPUs to implement a Command Stream Frontend (CSF), which is a combination of hardware and firmware that helps to offload work from the Mali driver that is running on the CPU.

With the Mali G710 and G715 Fast Models, you can simulate:

- User space and kernel space driver components of the Arm Mali Driver Development kit (Mali DDK), when built to target Mali G710 or G715 under Android and Linux graphics stacks. See later in this topic for details of supported window systems.
- Mali G710 or G715 firmware binaries.

These are functional models that do not attempt to execute GPU shader programs. They are sufficient to simulate a Mali driver, but rather than deliver fully rendered images to memory, they write a randomly-generated color gradient pattern to the framebuffer.

The changing frames can be used to prove that the graphics stack is correctly configured to allow the Mali GPU to write to a user-visible framebuffer.

Configuring the driver for use with the model

To account for timing differences between real hardware and the Fast Model, it is necessary to modify the following runtime settings in the Mali driver:

csf_firmware_boot_timeout_ms

Overrides the minimum timeout value for loading firmware into the model.

Type

Kernel module parameter

Recommended value

10000

reset_timeout

Overrides the minimum timeout when waiting for operations on the GPU to finish.

Type

Sysfs parameter

Recommended value

1000000

fw_timeout

Overrides the minimum timeout when waiting for operations on the GPU to finish.

Type

Sysfs parameter

Recommended value

1000000

The following commands are a snippet from an Android RC file that is an example of how a filesystem can be configured to correctly load the Mali driver when running on a Fast Models platform:

```
insmod /vendor/lib/modules/mali_kbase.ko csf_firmware_boot_timeout_ms=100000
wait /dev/mali0
chmod 0666 /dev/mali0
wait /sys/class/misc/mali0/device/reset_timeout
write /sys/class/misc/mali0/device/reset_timeout 1000000
```

```
write /sys/class/misc/mali0/device/fw_timeout 1000000
```

Limitations

- The model does not support debug access to registers through CADI or Iris-enabled debuggers.
- The timing data observed from the model does not correspond in any way to real hardware.
- The model does not expose any MTI targets.
- The model is not supported on Windows hosts.

Ports for Mali_G715

Table 3-611: Ports

Name	Protocol	Type	Description
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.

3.6.21 Mali_G720

Arm® Mali™ G720 GPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-612: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G720

This model has the following Iris instances:

Table 3-613: Mali_G720 Iris instances

InstanceName	ComponentName
Mali_G720	Mali_G720
Mali_G720.busmaster	PVBusMaster
Mali_G720.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-614: Mali_G720 MTI instances

InstanceName	ComponentName
Mali_G720	Mali_G720
Mali_G720.busmaster	PVBusMaster
Mali_G720.busslave	PVBusSlave

Mali_G720 contains the following CADI targets:

- Mali_G720

About Mali_G720

This model is the first of a new generation of fully-functional GPU models that generate correct output without the assistance of Generic Graphics Accelerator (GGA).

It supports x86_64 and AArch64 hosts running a supported version of Linux, as listed in Requirements for Fast Models in the [Fast Models User Guide](#). It does not support Windows hosts.

`$(PVLIB_HOME)/LISA/Mali_G720.lisa` requires a clock input running at around 500MHz to keep CPU and GPU performance aligned. This avoids software timeouts during slow-running GPU operations.

From a Fast Models perspective, the differences between Arm Mali-G720, Arm Immortalis-G720, and Mali-G620 are minor. The Fast Model does not model the caches and the core count is transparent to the user. Ray tracing is not currently modeled.

Limitations

- The model does not support debug access to registers through CADI or Iris-enabled debuggers.
- The timing data observed from the model does not correspond in any way to real hardware.
- The model is not supported on Windows hosts.

Ports for Mali_G720

Table 3-615: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

Parameters for Mali_G720

altcmdline

Type

string

Default value

""

Alternate command line for the GPU model. If used, mode is ignored.

altmodel

Type

string

Default value

""

Path to an alternative GPU model library.

mode

Type

string

Default value

"fast"

GPU Mode. Inputs supported: [fast, turbo_fallback, turbo].

turbo_threads

Type

int

Default value

0x0

Number of threads used.

3.6.22 Mali_G725

Arm® Mali™ G725 GPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-616: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for Mali_G725

This model has the following Iris instances:

Table 3-617: Mali_G725 Iris instances

InstanceName	ComponentName
Mali_G725	Mali_G725
Mali_G725.busmaster	PVBusMaster
Mali_G725.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-618: Mali_G725 MTI instances

InstanceName	ComponentName
Mali_G725	Mali_G725
Mali_G725.busmaster	PVBusMaster
Mali_G725.busslave	PVBusSlave

Mali_G725 contains the following CADI targets:

- Mali_G725

About Mali_G725

This component is a model of the Arm Mali-G725 GPU, fully capable of executing shaders and producing graphical or compute outputs.

It supports x86_64 and AArch64 hosts running a supported version of Linux, as listed in Requirements for Fast Models in the [Fast Models User Guide](#). It does not support Windows hosts.

\$ (PVLIB_HOME) / LISA / Mali_G725.lisa requires a clock input running at around 500MHz to keep CPU and GPU performance aligned. This avoids software timeouts during slow-running GPU operations.

From a Fast Models perspective, the differences between Mali-G725, Arm Immortalis-G925, and Mali-G625 are minor. The Fast Model does not model the caches and the core count is transparent to the user. Ray tracing is not currently modeled.

Limitations

- The model does not support debug access to registers through CADI or Iris-enabled debuggers.
- The timing data observed from the model does not correspond in any way to real hardware.
- The model is not supported on Windows hosts.

Ports for Mali_G725

Table 3-619: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

InstanceName	ComponentName
Mali_T624	Mali_T624
Mali_T624.busmaster	PVBusMaster
Mali_T624.busslave	PVBusSlave

Mali_T624 contains the following CADI targets:

- Mali_T624

Ports for Mali_T624

Table 3-623: Ports

Name	Protocol	Type	Description
gpu_reset	Signal	Slave	Resets the GPU at the input Set. The available inputs are Set and Clear.
irq_gpu	Signal	Master	The interrupt signal generated from the GPU.
irq_job	Signal	Master	The interrupt signal generated from the Job Manager on the GPU.
irq_mmu	Signal	Master	The interrupt signal generated from the MMU on the GPU.
prot_mode_m0	Signal	Master	Indicates the current state of the GPU. When it outputs: Set: The GPU is in protected mode. Clear: The GPU is in normal mode. Typically, connect this signal to the LabellerForGPUProtMode component. This enables the labeller to add a Non-Secure Access ID to the outgoing transaction on the labeller's pvbus_m port.
pvbus_m	PVBus	Master	The interface for the GPU to access external memory.
pvbus_s	PVBus	Slave	The interface for the CPU to access the GPU registers.

Parameters for Mali_T624

revision

Type

string

Default value

"r0p0"

Revision of the RTL that the model represents. Valid values: r0p0.

3.6.24 V61

Arm® Mali™-V61 Video Processor. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-624: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for V61

This model has the following Iris instances:

Table 3-625: V61 Iris instances

InstanceName	ComponentName
V61	V61
V61.BusModifier.LSID0	PVBusMapper
V61.BusModifier.LSID1	PVBusMapper
V61.BusModifier.LSID2	PVBusMapper
V61.BusModifier.LSID3	PVBusMapper
V61.apb_slave[0]	PVBusSlave

This model has the following MTI trace components:

Table 3-626: V61 MTI instances

InstanceName	ComponentName
V61	V61
V61.BusModifier.LSID0	PVBusMapper
V61.BusModifier.LSID1	PVBusMapper
V61.BusModifier.LSID2	PVBusMapper
V61.BusModifier.LSID3	PVBusMapper

InstanceName	ComponentName
V61.apb_slave[0]	PVBusSlave

V61 contains the following CADI targets:

- V61

About V61

The model requires an external OpenMAX (OMX) IL implementation for codec functionality. By default, V61 looks for `ffomaxil.dll` on Windows or `libffomaxil.so` on Linux in the model binary's directory or in the Fast Models installation. The default library path can be overridden using the `omx-library-path` parameter.

FFomaxIL is an OMX IL implementation provided by Arm in the TPIP package for convenience. Refer to the TPIP package for more details on FFomaxIL. It is available on [Product Download Hub](#)

When querying the OMX core, V61 searches for the following roles in the list of OpenMAX components:

H.264 decode

"video_decoder.avc"

JPEG decode

"video_decoder.mjpeg"

MPEG2 decode

"video_decoder.mpeg2"

MPEG4 decode

"video_decoder.mpeg4"

VC1 decode

"video_decoder.vc1"

VP8 decode

"video_decoder.vp8"

VP8 encode

"video_encoder.vp8"

To build example platforms containing V61, you must either install the TPIP package, or remove the dependency on Ffmpeg and libvpx from the platform's `sgproj` file, by removing the line containing `v5xx.sgrepo`.

Limitations

- No support for HEVC, VP9 and RealVideo decoders.
- No support for 10-bit video output.
- No support for RGB or AFBC input for encoding.

- No profiling support.
- No QoS support.
- Power/Test modes are modeled only as register state changes.

Ports for V61

Table 3-627: Ports

Name	Protocol	Type	Description
apb_s	PVBus	Slave	APB Slave port for register access.
axi_m	PVBus	Master	AXI master bus for memory accesses.
clk	ClockSignal	Slave	Master clock, typically 300MHz.
irq	Signal	Master	IRQ signal to host CPU.
reset	Signal	Slave	Reset signal.

Parameters for V61

AXI-data-width

Type

int

Default value

0x4

AXI data width, logarithmic byte notation (3->64bit, 4->128 bit).

enable-frame-rate-limiting

Type

bool

Default value

0x0

enable output rate control via the CLK port.

fuse-disable-AFBC

Type

bool

Default value

0x0

disable AFBC support by fuse.

fuse-disable-HEVC

Type

bool

Default value

0x0

disable HEVC support by fuse.

fuse-disable-Real**Type**

bool

Default value

0x0

disable RealVideo support by fuse.

fuse-disable-VPX**Type**

bool

Default value

0x0

disable VP8 support by fuse.

ncores**Type**

int

Default value

0x1

Number of cores in the component.

omx-library-path**Type**

string

Default value

""

path to a user-provided OMX library; leave blank to use FFomaxIL.

supports-10bit**Type**

bool

Default value

0x1

component supports 10-bit content decoding.

supports-64byte-ref-bursts

Type
bool
Default value
0x1

component supports 64-byte bursts for reference pixel data.

supports-encoding

Type
bool
Default value
0x1

component supports encoding.

3.6.25 V550

Arm® Mali™-V550 Video Processor. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-628: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for V550

This model has the following Iris instances:

Table 3-629: V550 Iris instances

InstanceName	ComponentName
V550	V550
V550.BusModifier.LSID0	PVBusMapper
V550.BusModifier.LSID1	PVBusMapper
V550.BusModifier.LSID2	PVBusMapper
V550.BusModifier.LSID3	PVBusMapper
V550.apb_slave[0]	PVBusSlave

This model has the following MTI trace components:

Table 3-630: V550 MTI instances

InstanceName	ComponentName
V550	V550
V550.BusModifier.LSID0	PVBusMapper
V550.BusModifier.LSID1	PVBusMapper
V550.BusModifier.LSID2	PVBusMapper
V550.BusModifier.LSID3	PVBusMapper
V550.apb_slave[0]	PVBusSlave

V550 contains the following CADI targets:

- V550

About V550

The model requires an external OpenMAX (OMX) IL implementation for codec functionality. By default, V550 looks for `ffomaxil.dll` on Windows or `libffomaxil.so` on Linux in the model binary's directory or in the Fast Models installation. The default library path can be overridden using the parameter `omx-library-path`.

FFomaxIL is an OMX IL implementation that Arm provides for convenience in the Third-Party IP (TPIP) add-on package. For more details on FFomaxIL, refer to the TPIP package, which is available from [Product Download Hub](#).

When querying the OMX core, V550 searches for the following roles in the list of OpenMAX components:

H.264 decode

"video_decoder.avc"

JPEG decode

"video_decoder.mjpeg"

MPEG2 decode

"video_decoder.mpeg2"

MPEG4 decode

"video_decoder.mpeg4"

VC1 decode

"video_decoder.vc1"

VP8 decode

"video_decoder.vp8"

VP8 encode

"video_encoder.vp8"

To build example platforms containing V550, you must either install the TPIP package, or remove the dependency on FFmpeg and libvpx from the platform’s sgproj file, by removing the line containing V5xx.sgrepo.

Limitations

- No support for HEVC and RealVideo decoders.
- No support for 10-bit video output.
- No profiling support.
- No QoS support.
- Power and Test modes are modeled only as register state changes.

Ports for V550

Table 3-631: Ports

Name	Protocol	Type	Description
apb_s	PVBus	Slave	APB Slave port for register access.
axi_m	PVBus	Master	AXI master bus for memory accesses.
clk	ClockSignal	Slave	Master clock, typically 300MHz.
irq	Signal	Master	IRQ signal to host CPU.
reset	Signal	Slave	Reset signal.

Parameters for V550

AXI-data-width

Type

int

Default value

0x4

AXI data width, logarithmic byte notation (3->64bit, 4->128 bit).

enable-frame-rate-limiting

Type

bool

Default value

0x0

enable output rate control via the CLK port.

fuse-disable-AFBC**Type**

bool

Default value

0x0

disable AFBC support by fuse.

fuse-disable-Real**Type**

bool

Default value

0x0

disable RealVideo support by fuse.

fuse-disable-VP8**Type**

bool

Default value

0x0

disable VP8 support by fuse.

ncores**Type**

int

Default value

0x1

Number of cores in the component.

omx-library-path**Type**

string

Default value

""

path to a user-provided OMX library; leave blank to use FFomaxIL.

supports-10bit

Type
bool

Default value
0x1

component supports 10-bit content decoding.

supports-VP8

Type
bool

Default value
0x1

component supports VP8.

supports-encoding

Type
bool

Default value
0x1

component supports encoding.

3.7 Peripheral components

This section describes the Peripheral components.

3.7.1 AudioOut_File

File based Audio Output for PL041_AACI. This model is written in LISA+.

Iris and MTI instances for AudioOut_File

This model has the following Iris instances:

Table 3-632: AudioOut_File Iris instances

InstanceName	ComponentName
AudioOut_File	AudioOut_File

AudioOut_File contains the following CADI targets:

- AudioOut_File

About AudioOut_File

This component implements an audio output that is suitable for use with the PL041_AACI component. It writes raw 16-bit 48KHz stereo audio data to a user-specified file.

We expect this component to have little effect on the performance of PV systems. AudioOut_File drains audio data at the rate that would be expected by software running in the simulation.

Ports for AudioOut_File

Table 3-633: Ports

Name	Protocol	Type	Description
audio	AudioControl	Slave	Audio input for a connection to a component such as the PL041_AACI.

Parameters for AudioOut_File

fname
Type
 string
Default value
 ""

Filename.

3.7.2 AudioOut_SDL

SDL based Audio Output for PL041_AACI. This model is written in LISA+.

Iris and MTI instances for AudioOut_SDL

This model has the following Iris instances:

Table 3-634: AudioOut_SDL Iris instances

InstanceName	ComponentName
AudioOut_SDL	AudioOut_SDL

AudioOut_SDL contains the following CADI targets:

- AudioOut_SDL

About AudioOut_SDL

AudioOut_SDL outputs audio using the host features of the Simple DirectMedia Layer (SDL) library.

This component results in SDL audio callbacks and might have a small impact on PV systems containing the component. It attempts to drain audio data at whatever rate is required to maintain smooth sound playback on the host PC. This might not match the data rate expected by applications running on the simulation.

Ports for AudioOut_SDL

Table 3-635: Ports

Name	Protocol	Type	Description
audio	AudioControl	Slave	Audio input for a connection to a component such as the PL041_AACI.

3.7.3 Base_PowerController

Base Platforms Power Controller. This model is written in LISA+.

Iris and MTI instances for Base_PowerController

This model has the following Iris instances:

Table 3-636: Base_PowerController Iris instances

InstanceName	ComponentName
Base_PowerController	Base_PowerController
Base_PowerController.busslave	PVBusSlave
Base_PowerController.timer_ppu_transition	ClockTimerThread
Base_PowerController.timer_ppu_transition.timer	ClockTimerThread64
Base_PowerController.timer_ppu_transition.timer.thread	SchedulerThread
Base_PowerController.timer_ppu_transition.timer.thread_event	SchedulerThreadEvent
Base_PowerController.timer_reset	ClockTimerThread
Base_PowerController.timer_reset.timer	ClockTimerThread64
Base_PowerController.timer_reset.timer.thread	SchedulerThread
Base_PowerController.timer_reset.timer.thread_event	SchedulerThreadEvent
Base_PowerController.utility_bus0	PVBusMaster
Base_PowerController.utility_bus1	PVBusMaster
Base_PowerController.utility_bus2	PVBusMaster
Base_PowerController.utility_bus3	PVBusMaster

This model has the following MTI trace components:

Table 3-637: Base_PowerController MTI instances

InstanceName	ComponentName
Base_PowerController	Base_PowerController
Base_PowerController.busslave	PVBusSlave
Base_PowerController.utility_bus0	PVBusMaster
Base_PowerController.utility_bus1	PVBusMaster
Base_PowerController.utility_bus2	PVBusMaster
Base_PowerController.utility_bus3	PVBusMaster

Base_PowerController contains the following CADI targets:

- Base_PowerController
- ClockTimerThread
- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent

Ports for Base_PowerController

Table 3-638: Ports

Name	Protocol	Type	Description
cpuporeset[36]	Signal	Master	-
dbgnopwrdown[36]	Signal	Slave	-
delayed_ppu_transition_handler	TimerCallback	Slave	-
l2reset[4]	Signal	Master	-
pchannel_m[36]	PChannel	Master	-
pvbus_s	PVBus	Slave	-
standbywfi[36]	Signal	Slave	-
standbywfi12[4]	Signal	Slave	-
system_reset	Signal	Master	-
system_reset_req	Signal	Slave	-
timer_callback_handler	TimerCallback	Slave	Handle event notifications from the timer.
utility_bus_m[4]	PVBus	Master	-
wakerequest[36]	Signal	Slave	-

Parameters for Base_PowerController

Affinity-shifted

Type

bool

Default value

0x0

Whether core number is reflected in Affinity1 instead of Affinity0.

CPU-affinities

Type

string

Default value

"0.0.0.0"

Definition of which cores are attached to the control pins, as a comma separated list of affinity dotted quads.

CPU-available-mask**Type**

int

Default value

0xffffffffffffffff

One bit per entry in CPU-affinities list, set zero if a CPU is wired up but actually not available.

enable_lock_step**Type**

bool

Default value

0x0

If lock step is enabled, the number of available cores get reduced to half.

startup**Type**

string

Default value

"0.0.0.*"

Comma-separated list of cores (wildcards allowed) to be powered up at startup or system reset.

use_in_cluster_ppu**Type**

bool

Default value

0x0

Set this to true if base power controller is connected to V9 core where in-cluster PPU is used, false, otherwise.

use_pchannel_for_threads**Type**

bool

Default value

0x0

Set this to true if the pchannel is connected to cpus with thread support.

3.7.4 CMSDK_Watchdog_cpp

ARM Watchdog Module. This model is written in C++.

Iris and MTI instances for CMSDK_Watchdog_cpp

This model has the following Iris instances:

Table 3-639: CMSDK_Watchdog_cpp Iris instances

InstanceName	ComponentName
CMSDK_Watchdog_cpp	CMSDK_Watchdog
CMSDK_Watchdog_cpp.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-640: CMSDK_Watchdog_cpp MTI instances

InstanceName	ComponentName
CMSDK_Watchdog_cpp.PVBusSlave	PVBusSlave

CMSDK_Watchdog_cpp contains the following CADI targets:

- CMSDK_Watchdog

Ports for CMSDK_Watchdog_cpp

Table 3-641: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
irq_out	Signal	Master	-
pvbus_s	PVBus	Slave	-
reset_in	Signal	Slave	-
reset_out	Signal	Master	-

Parameters for CMSDK_Watchdog_cpp

diagnostics

Type

int

Default value

0x2

Diagnostics.

simhalt

Type

bool

Default value

0x0

Halt on reset.

3.7.5 Cluster_Temperature_Sensor

Component to calculate the temperature value of all cores in a cluster. This model is written in C++.

Changes in 11.27.17

Parameters added:

- tempCoeff_A
- tempCoeff_B
- tempCoeff_K
- tempCoeff_TAMB

Parameters removed:

- A
- B
- K
- TAMB

Iris and MTI instances for Cluster_Temperature_Sensor

This model has the following Iris instances:

Table 3-642: Cluster_Temperature_Sensor Iris instances

InstanceName	ComponentName
Cluster_Temperature_Sensor	Cluster_Temperature_Sensor

Cluster_Temperature_Sensor contains the following CADI targets:

- Cluster_Temperature_Sensor

Ports for Cluster_Temperature_Sensor

Table 3-643: Ports

Name	Protocol	Type	Description
cluster_powerdown_in	Signal	Slave	-
core_powerdown_in[16]	Signal	Slave	-
core_state_in[16]	ValueState	Slave	-
core_ticks_in[16]	InstructionCount	Slave	-
freq_in	ValueState	Slave	-

Name	Protocol	Type	Description
temperature_out	ValueState	Master	-

Parameters for Cluster_Temperature_Sensor

MAX_FREQ

Type

int

Default value

0x77359400

Maximum frequency (in Hz) at which each core can run.

NUM_CORES

Type

int

Default value

0x4

Number of cores per cluster.

diagnostics

Type

int

Default value

0x0

Diagnostics.

tempCoeff_A

Type

string

Default value

"0.5"

Temperature Coefficient.

tempCoeff_B

Type

string

Default value

"0.5"

Temperature Coefficient.

tempCoeff_K

Type

int

Default value

0x32

Temperature Coefficient.

tempCoeff_TAMB

Type

int

Default value

0x14

Temperature Coefficient.

3.7.6 CombinedMessagingUnit

CMU - Combined MHU monolithic block. This model is written in LISA+.

Iris and MTI instances for CombinedMessagingUnit

This model has the following Iris instances:

Table 3-644: CombinedMessagingUnit Iris instances

InstanceName	ComponentName
CombinedMessagingUnit	CombinedMessagingUnit
CombinedMessagingUnit.host_to_local	MessageHandlingUnit
CombinedMessagingUnit.host_to_local.a_to_b_v2	MessageHandlingUnitV2
CombinedMessagingUnit.host_to_local.a_to_b_v3	MessageHandlingUnitV3
CombinedMessagingUnit.host_to_local.version_mapper_a_to_b_rec	PVBusMapper
CombinedMessagingUnit.host_to_local.version_mapper_a_to_b_snd	PVBusMapper
CombinedMessagingUnit.host_to_local_rcv_log	PVBusLogger
CombinedMessagingUnit.host_to_local_rcv_log.mapper	PVBusMapper
CombinedMessagingUnit.host_to_local_snd_log	PVBusLogger
CombinedMessagingUnit.host_to_local_snd_log.mapper	PVBusMapper
CombinedMessagingUnit.irq_rcv_combined_host_log	SignalLogger
CombinedMessagingUnit.irq_rcv_combined_local_log	SignalLogger
CombinedMessagingUnit.irq_snd_combined_host_log	SignalLogger
CombinedMessagingUnit.irq_snd_combined_local_log	SignalLogger

InstanceName	ComponentName
CombinedMessagingUnit.local_to_host	MessageHandlingUnit
CombinedMessagingUnit.local_to_host.a_to_b_v2	MessageHandlingUnitV2
CombinedMessagingUnit.local_to_host.a_to_b_v3	MessageHandlingUnitV3
CombinedMessagingUnit.local_to_host.version_mapper_a_to_b_rec	PVBusMapper
CombinedMessagingUnit.local_to_host.version_mapper_a_to_b_snd	PVBusMapper
CombinedMessagingUnit.local_to_host_rcv_log	PVBusLogger
CombinedMessagingUnit.local_to_host_rcv_log.mapper	PVBusMapper
CombinedMessagingUnit.local_to_host_snd_log	PVBusLogger
CombinedMessagingUnit.local_to_host_snd_log.mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-645: CombinedMessagingUnit MTI instances

InstanceName	ComponentName
CombinedMessagingUnit.host_to_local.a_to_b_v2	MessageHandlingUnitV2
CombinedMessagingUnit.host_to_local.a_to_b_v3	MessageHandlingUnitV3
CombinedMessagingUnit.host_to_local.version_mapper_a_to_b_rec	PVBusMapper
CombinedMessagingUnit.host_to_local.version_mapper_a_to_b_snd	PVBusMapper
CombinedMessagingUnit.host_to_local_rcv_log	PVBusLogger
CombinedMessagingUnit.host_to_local_rcv_log.mapper	PVBusMapper
CombinedMessagingUnit.host_to_local_snd_log	PVBusLogger
CombinedMessagingUnit.host_to_local_snd_log.mapper	PVBusMapper
CombinedMessagingUnit.irq_rcv_combined_host_log	SignalLogger
CombinedMessagingUnit.irq_rcv_combined_local_log	SignalLogger
CombinedMessagingUnit.irq_snd_combined_host_log	SignalLogger
CombinedMessagingUnit.irq_snd_combined_local_log	SignalLogger
CombinedMessagingUnit.local_to_host.a_to_b_v2	MessageHandlingUnitV2
CombinedMessagingUnit.local_to_host.a_to_b_v3	MessageHandlingUnitV3
CombinedMessagingUnit.local_to_host.version_mapper_a_to_b_rec	PVBusMapper
CombinedMessagingUnit.local_to_host.version_mapper_a_to_b_snd	PVBusMapper
CombinedMessagingUnit.local_to_host_rcv_log	PVBusLogger
CombinedMessagingUnit.local_to_host_rcv_log.mapper	PVBusMapper
CombinedMessagingUnit.local_to_host_snd_log	PVBusLogger
CombinedMessagingUnit.local_to_host_snd_log.mapper	PVBusMapper

CombinedMessagingUnit contains the following CADI targets:

- CombinedMessagingUnit
- MessageHandlingUnit
- MessageHandlingUnitV2

- MessageHandlingUnitV3
- PVBusLogger
- SignalLogger

Ports for CombinedMessagingUnit

Table 3-646: Ports

Name	Protocol	Type	Description
irq_rcv_combined_host	Signal	Master	-
irq_rcv_combined_local	Signal	Master	-
irq_snd_combined_host	Signal	Master	-
irq_snd_combined_local	Signal	Master	-
pvbus_s_rcv_host	PVBus	Slave	-
pvbus_s_rcv_local	PVBus	Slave	-
pvbus_s_snd_host	PVBus	Slave	-
pvbus_s_snd_local	PVBus	Slave	-
reset_in	Signal	Slave	-

Parameters for CombinedMessagingUnit

NUM_DB_CH

Type

int

Default value

0x1

Number of doorbell channels.

NUM_FAST_CH

Type

int

Default value

0x1

Number of fast channels.

diagnostics

Type

int

Default value

0x2

Diagnostics 0==FATAL_ERROR -> 4==DEBUG.

fast_ch_group_int_enable**Type**

bool

Default value

0x0

Fast Channel group interrupts enable, default=false.

fast_ch_n_per_group**Type**

int

Default value

0x1

Fast Channel num channels per group, default=1.

fast_ch_num_groups**Type**

int

Default value

0x1

Fast Channel num of groups, default=1.

fast_ch_word_size**Type**

int

Default value

0x20

Fast Channel word size 32bit or 64bit, default=32.

host_to_local.a_to_b_v3.NUM_FIFO_CH**Type**

int

Default value

0x1

Number of FIFO Channels, default=1.

host_to_local.a_to_b_v3.auto_op_full**Type**

bool

Default value

0x0

AutoOp mode - AutoOp(min) == false, AutoOp(full) == true - default: AutoOp(min).

host_to_local.a_to_b_v3.fast_ch_group_int_enable**Type**

bool

Default value

0x0

Fast Channel group interrupts enable, default=false.

host_to_local.a_to_b_v3.fifo_depth**Type**

int

Default value

0x4

Depth of the FIFO = fifo_depth + 1.

host_to_local.a_to_b_v3.m16ba_spt**Type**

bool

Default value

0x0

Mailbox 16 bit access support to FIFO registers.

host_to_local.a_to_b_v3.m32ba_spt**Type**

bool

Default value

0x1

Mailbox 32 bit access support to FIFO registers.

host_to_local.a_to_b_v3.m64ba_spt**Type**

bool

Default value

0x0

Mailbox 64 bit access support to FIFO registers.

host_to_local.a_to_b_v3.m8ba_spt**Type**

bool

Default value

0x0

Mailbox 8 bit access support to FIFO registers.

host_to_local.a_to_b_v3.monolithic**Type**

bool

Default value

0x1

Monolithic or Distributed MHU - default: monolithic(true).

host_to_local.a_to_b_v3.p16ba_spt**Type**

bool

Default value

0x0

Postbox 16 bit access support to FIFO registers.

host_to_local.a_to_b_v3.p32ba_spt**Type**

bool

Default value

0x1

Postbox 32 bit access support to FIFO registers.

host_to_local.a_to_b_v3.p64ba_spt**Type**

bool

Default value

0x0

Postbox 64 bit access support to FIFO registers.

host_to_local.a_to_b_v3.p8ba_spt**Type**

bool

Default value

0x0

Postbox 8 bit access support to FIFO registers.

host_to_local.fast_ch_group_int_enable**Type**

bool

Default value

0x0

Fast Channel group interrupts enable, default=false.

host_to_local_rcv_log.trace_snoops**Type**

bool

Default value

0x0

Enable tracing of ACE snoop requests.

host_to_local_snd_log.trace_snoops**Type**

bool

Default value

0x0

Enable tracing of ACE snoop requests.

irq_rcv_combined_host_log.forward_signal**Type**

bool

Default value

0x1

If true, trace signal and forward signal from 'in' to 'out'. If false, trace signal only without driving 'out' port.

irq_rcv_combined_local_log.forward_signal**Type**

bool

Default value

0x1

If true, trace signal and forward signal from 'in' to 'out'. If false, trace signal only without driving 'out' port.

irq_snd_combined_host_log.forward_signal**Type**

bool

Default value

0x1

If true, trace signal and forward signal from 'in' to 'out'. If false, trace signal only without driving 'out' port.

irq_snd_combined_local_log.forward_signal**Type**

bool

Default value

0x1

If true, trace signal and forward signal from 'in' to 'out'. If false, trace signal only without driving 'out' port.

local_to_host.a_to_b_v3.NUM_FIFO_CH**Type**

int

Default value

0x1

Number of FIFO Channels, default=1.

local_to_host.a_to_b_v3.auto_op_full**Type**

bool

Default value

0x0

AutoOp mode - AutoOp(min) == false, AutoOp(full) == true - default: AutoOp(min).

local_to_host.a_to_b_v3.fast_ch_group_int_enable**Type**

bool

Default value

0x0

Fast Channel group interrupts enable, default=false.

local_to_host.a_to_b_v3.fifo_depth**Type**

int

Default value

0x4

Depth of the FIFO = fifo_depth + 1.

local_to_host.a_to_b_v3.m16ba_spt**Type**

bool

Default value

0x0

Mailbox 16 bit access support to FIFO registers.

local_to_host.a_to_b_v3.m32ba_spt**Type**

bool

Default value

0x1

Mailbox 32 bit access support to FIFO registers.

local_to_host.a_to_b_v3.m64ba_spt**Type**

bool

Default value

0x0

Mailbox 64 bit access support to FIFO registers.

local_to_host.a_to_b_v3.m8ba_spt**Type**

bool

Default value

0x0

Mailbox 8 bit access support to FIFO registers.

local_to_host.a_to_b_v3.monolithic**Type**

bool

Default value

0x1

Monolithic or Distributed MHU - default: monolithic(true).

local_to_host.a_to_b_v3.p16ba_spt**Type**

bool

Default value

0x0

Postbox 16 bit access support to FIFO registers.

local_to_host.a_to_b_v3.p32ba_spt**Type**

bool

Default value

0x1

Postbox 32 bit access support to FIFO registers.

local_to_host.a_to_b_v3.p64ba_spt**Type**

bool

Default value

0x0

Postbox 64 bit access support to FIFO registers.

local_to_host.a_to_b_v3.p8ba_spt**Type**

bool

Default value

0x0

Postbox 8 bit access support to FIFO registers.

local_to_host.fast_ch_group_int_enable**Type**

bool

Default value

0x0

Fast Channel group interrupts enable, default=false.

local_to_host_rcv_log.trace_snoops**Type**

bool

Default value

0x0

Enable tracing of ACE snoop requests.

local_to_host_snd_log.trace_snoops**Type**

bool

Default value

0x0

Enable tracing of ACE snoop requests.

major_version

Type
int

Default value
0x2

MHU major version (default=2).

mhu_arch_beta01

Type
bool

Default value
0x0

true = Aligns to MHUv3.beta01; false = Aligns to MHUv3.2.

minor_version

Type
int

Default value
0x1

MHU minor version (default=1).

product_id

Type
int

Default value
0x0

MHU part number.

3.7.7 DebugAccessPort

This model is written in C++.

Ports for DebugAccessPort

Table 3-647: Ports

Name	Protocol	Type	Description
ap_pvbus_m[2]	PVBus	Master	-
clock	ClockSignal	Slave	-

Name	Protocol	Type	Description
paddrdbg31	Signal	Master	-

Parameters for DebugAccessPort

ap0_has_debug_rom

Type

bool

Default value

0x0

Whether AP0 has a Debug ROM.

ap0_rom_base_address

Type

int

Default value

0x0

ROM base address for AP 0.

ap0_set_paddrdbg31

Type

bool

Default value

0x0

Set paddrdbg31 signal during accesses on AP0.

ap1_has_debug_rom

Type

bool

Default value

0x0

Whether AP1 has a Debug ROM.

ap1_rom_base_address

Type

int

Default value

0x0

ROM base address for AP 1.

ap1_set_paddrdbg31

Type
bool

Default value
0x0

Set paddrdbg31 signal during accesses on AP1.

3.7.8 DebugROM

This model is written in C++.

Ports for DebugROM

Table 3-648: Ports

Name	Protocol	Type	Description
paddrdbg31	Signal	Master	-
pvbus_s	PVBus	Slave	-

Parameters for DebugROM

customer_modified

Parameters for DualClusterSystemConfigurationBlock

CFG_ACTIVECLUSTER

Type

int

Default value

0x1

Select which cluster will come out of reset coming out of power-on: bit[0] for primary cluster (Cortex-A15), bit[1] for secondary cluster (Cortex-A7). Value 0 is not allowed as it will hold both clusters in reset indefinitely!.

Cluster0IdOnPOReset

Type

int

Default value

0x0

ClusterId for primary cluster (Cortex-A15) on power-on reset.

Cluster1IdOnPOReset

Type

int

Default value

0x1

ClusterId for secondary cluster (Cortex-A7) on power-on reset.

DCSCB_PERIPHBASE**Type**

int

Default value

0x1e000000

PERIPHBASE.

DCS_AID**Type**

int

Default value

0x0

DCS_AID is the Auxiliary ID Register.

DCS_ID**Type**

int

Default value

0x41120000

The value returned by the DCS_ID register.

DCS_ID_BUILD_NUMBER**Type**

int

Default value

0x1

DCS_ID build number.

DCS_LEDS**Type**

int

Default value

0x0

DCS_LEDS represents eight LEDs on the board that form an 8-bit value that can be r/w from the Dual Cluster System Configuration Block.

DCS_SW**Type**

int

Default value

0x0

DCS_SW represents eight switches on the board that form an 8-bit value that can be read from the Dual Cluster System Configuration Block.

FlipVGICWiringForCluster0AndCluster1**Type**

bool

Default value

0x0

Flip the VGIC wiring round for cluster0 and cluster1. With this false, then cpu0 of cluster0 is cpu interface 0 on the VGIC. If this is true then cpu0 of cluster1 becomes cpu interface 0 on the VGIC.

INTGEN_INTS**Type**

int

Default value

0x3

Number of custom IRQs controlled by interrupt generator is $\text{INTGEN_INTS} * 32 + 32$.

NumberOfCoresInCluster0**Type**

int

Default value

0x2

The number of cores in the primary cluster.

NumberOfCoresInCluster1**Type**

int

Default value

0x2

The number of cores in the secondary cluster.

ResetValueOfDaughterUserSwitches

Type
int
Default value
0x0

Reset value of the user switches on the daughterboard.

stop_on_sequence_id

Type
int
Default value
0x0

If non-zero the sequence_id of the SW trace mechanism on which to halt the simulator.

3.7.10 DummyAPB

DummyAPB. This model is written in LISA+.

Iris and MTI instances for DummyAPB

This model has the following Iris instances:

Table 3-652: DummyAPB Iris instances

InstanceName	ComponentName
DummyAPB	DummyAPB
DummyAPB.pvbuslave	PVBusSlave

This model has the following MTI trace components:

Table 3-653: DummyAPB MTI instances

InstanceName	ComponentName
DummyAPB.pvbuslave	PVBusSlave

DummyAPB contains the following CADI targets:

- DummyAPB

About DummyAPB

Use this dummy **RAZ/WI** APB device component to ensure that software does not receive aborts for accesses to devices that should be part of the system, but are not modeled.

For validation purposes it is useful to have dummy devices that are mostly **RAZ/WI** but return the correct value when you read ID registers. You can do that with this component in the following ways:

- Specify `periphid_24` for peripherals that follow the ARM pattern of having 12 ID registers at the top of an APB frame. For example:

```
periphid_24="04000000c2b00b000df005b1"
```

You need also to set `periph_framesize` to 4 or 64, depending on whether the peripheral has its registers in a 4KB or 64KB frame.

- Give a space-separated list of offset:value pairs in the `periphid_generic` parameter to define read-only values from particular offsets. For example:

```
periphid_generic="000:02468ace 1fc:13579bdf"
```

The number of hex digits used to specify the address is used to define the width of the address mask used. For example, `BC:02468ace` returns `02468ace` at reads from any address ending `BC`.

- Give a space-separated list of offset:default-value pairs in the `ram_generic` parameter to construct RAM. That is, the register at the relevant offset returns the default-value, but if changed, it returns the value that it is changed to.

Ports for DummyAPB

Table 3-654: Ports

Name	Protocol	Type	Description
pvbuss_s	PVBus	Slave	Bus slave interface.

Parameters for DummyAPB

fail
Type
bool
Default value
0x0

Abort all accesses.

failmsg
Type
string
Default value
""

String to print when 'fail'=true and access occurred.

periph_framesize**Type**

int

Default value

0xffffffffffffffffffff

Size of frame (4/64, indicating if ID is at xFD0 or xFFD0).

periphid_24**Type**

string

Default value

""

24 hex digits for the 12 bytes of peripheral ID.

periphid_generic**Type**

string

Default value

""

Set of space-separated offset:value pairs for dwords of ID.

ram_generic**Type**

string

Default value

""

Set of space-separated offset:default pairs for writable dwords.

warn_once**Type**

bool

Default value

0x1

Warn once for the invalid read and write access.

3.7.11 ElfLoader

ELF loader component. This model is written in LISA+.

Iris and MTI instances for ElfLoader

This model has the following Iris instances:

Table 3-655: ElfLoader Iris instances

InstanceName	ComponentName
ElfLoader	ElfLoader
ElfLoader.pvbus_busmaster	PVBusMaster

This model has the following MTI trace components:

Table 3-656: ElfLoader MTI instances

InstanceName	ComponentName
ElfLoader.pvbus_busmaster	PVBusMaster

ElfLoader contains the following CADI targets:

- ElfLoader

About ElfLoader

ElfLoader provides an alternative method of loading ELF files into the system. It can load files in either of the following formats, or in gzip-compressed versions of them:

- ELF
- Motorola S-Record

Ports for ElfLoader

Table 3-657: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Master port for all memory accesses.
start_address	Value_64	Master	Provides a value reflecting the entry point of the last ELF image to be loaded.

Parameters for ElfLoader

elf

Type

string

Default value

""

ELF file.

impdef_copy**Type**

bool

Default value

0x0

DEPRECATED: Use realm_copy or root_copy parameters. load ELF file to implementation defined memory spaces, if load file is not specified.

lfile**Type**

string

Default value

""

load file for large address mapping.

ns_copy**Type**

bool

Default value

0x1

copy whole file to NS memory space.

output_attributes_parameter_of_core**Type**

string

Default value

"ExtendedID[54:39]=MPAM_PARTID, ExtendedID[38]=MPAM_SP[0],
ExtendedID[37]=MPAM_SP[1], UserFlags[31:16]=IMPDEF2"

Encoding of various attributes on the bus.

realm_copy**Type**

bool

Default value

0x0

load ELF file to REALM memory spaces, if load file is not specified.

root_copy

Type
bool

Default value
0x0

load ELF file to ROOT memory spaces, if load file is not specified.

3.7.12 FlashLoader

A device that can preload a gzipped image into flash at startup. This model is written in C++.

Iris and MTI instances for FlashLoader

This model has the following Iris instances:

Table 3-658: FlashLoader Iris instances

InstanceName	ComponentName
FlashLoader	FlashLoader

FlashLoader contains the following CADI targets:

- FlashLoader

About FlashLoader

This component complements the IntelStrataFlashJ3 component by providing a means to initialize the contents of up to four Flash components in sequence from a single host flash image file.

Ports for FlashLoader

Table 3-659: Ports

Name	Protocol	Type	Description
flash_device0	FlashLoaderPort	Master	Used to program a flash device.
flash_device1	FlashLoaderPort	Master	Used to program a flash device.
flash_device2	FlashLoaderPort	Master	Used to program a flash device.
flash_device3	FlashLoaderPort	Master	Used to program a flash device.
warm_reset	Signal	Slave	Reset signal from external master.

Parameters for FlashLoader

Diagnostics

Type
int

Default value
0x0

Diagnostics.

fname
Type
string
Default value
"(none)"

Filename (Default '(none)' means: Do not load any file. An empty string will cause a warning.).

fnameWrite
Type
string
Default value
"(none)"

FilenameWrite (Default '(none)' means: Do not save any file. An empty string will cause a warning.).

write_flash_after_reset
Type
bool
Default value
0x0

write_flash_after_reset.

3.7.13 GICv3CommsLogger

Traces GICv3Comms activity. This model is written in LISA+.

Iris and MTI instances for GICv3CommsLogger

This model has the following Iris instances:

Table 3-660: GICv3CommsLogger Iris instances

InstanceName	ComponentName
GICv3CommsLogger	GICv3CommsLogger

This model has the following MTI trace components:

Table 3-661: GICv3CommsLogger MTI instances

InstanceName	ComponentName
GICv3CommsLogger	GICv3CommsLogger

GICv3CommsLogger contains the following CADI targets:

- GICv3CommsLogger

Ports for GICv3CommsLogger

Table 3-662: Ports

Name	Protocol	Type	Description
to_cpu	GICv3Comms	Master	To connect to CPU.
to_gic	GICv3Comms	Slave	To connect to GIC.

Parameters for GICv3CommsLogger

verbose

Type

bool

Default value

0x0

Print tracing information to attached debugger in addition to via MTI.

3.7.14 GICv3CommsPVBus

GICv3 Component for conversion between GICv3Comms protocol and PVBus. This model is written in C++.

Iris and MTI instances for GICv3CommsPVBus

This model has the following Iris instances:

Table 3-663: GICv3CommsPVBus Iris instances

InstanceName	ComponentName
GICv3CommsPVBus	GICv3CommsPVBus
GICv3CommsPVBus.bus_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-664: GICv3CommsPVBus MTI instances

InstanceName	ComponentName
GICv3CommsPVBus	GICv3CommsPVBus
GICv3CommsPVBus.bus_slave	PVBusSlave

GICv3CommsPVBus contains the following CADI targets:

- GICv3CommsPVBus

Ports for GICv3CommsPVBUS

Table 3-665: Ports

Name	Protocol	Type	Description
axi_master_id_s[256]	Value	Slave	-
distributor_s[256]	GICv3Comms	Slave	-
pvbuss_m	PVBUS	Master	-
pvbuss_s	PVBUS	Slave	-

3.7.15 GICv3ProtocolChecker

GICv3 Component for command protocol checking. This model is written in C++.

Iris and MTI instances for GICv3ProtocolChecker

This model has the following Iris instances:

Table 3-666: GICv3ProtocolChecker Iris instances

InstanceName	ComponentName
GICv3ProtocolChecker	GICv3ProtocolChecker

This model has the following MTI trace components:

Table 3-667: GICv3ProtocolChecker MTI instances

InstanceName	ComponentName
GICv3ProtocolChecker	GICv3ProtocolChecker

GICv3ProtocolChecker contains the following CADI targets:

- GICv3ProtocolChecker

Ports for GICv3ProtocolChecker

Table 3-668: Ports

Name	Protocol	Type	Description
cpu_comms	GICv3Comms	Master	Master GICv3Comms port.
gicv3_comms	GICv3Comms	Slave	Slave GICv3Comms port.

Parameters for GICv3ProtocolChecker

cpu_interface_id

Type

int

Default value

0x0

Cpu interface id to which this component is connected.

enable_protocol_checking

Type
bool
Default value
0x1

Enable/disable the protocol checking.

3.7.16 GUIPoll

Component providing a real-time periodic callback for GUI refresh. This model is written in C++.

About GUIPoll

An external subcomponent that encapsulates support for generating a real-time callback signal that can be used to poll the event queue of a visualisation GUI.

The `callback` method of the callback port is invoked periodically, at approximately the rate determined by the `delay_ms` parameter.

This is a real-time callback, not simulation time. Also, callbacks will continue even while the simulation is paused.

Because of this, the client code should not implement a callback behavior that can modify the state of the simulation.

Ports for GUIPoll

Table 3-669: Ports

Name	Protocol	Type	Description
gui_callback	GUIPollCallback	Master	Sends callback requests to the visualization component.

Parameters for GUIPoll

delay_ms
Type
int
Default value
0x32

GUI update period in ms.

has_gui

Type
bool

Default value
0x1

GUI is enabled.

3.7.17 HostBridge

Host Socket Interface Component. This model is written in C++.

Iris and MTI instances for HostBridge

This model has the following Iris instances:

Table 3-670: HostBridge Iris instances

InstanceName	ComponentName
HostBridge	HostBridge

HostBridge contains the following CADI targets:

- HostBridge

About HostBridge

- This component acts as a networking proxy for target NIC device models, to forward and receive ethernet packets to and from the host. Two kinds of proxy backend are integrated into this component:
- A host TAP/TUN-like network device, which is an ordinary TAP or MacVTap. This is the default.
 - User-mode networking, which emulates a built-in IP router and DHCP server to route traffic using the host user-mode socket layer. To enable user-mode networking, set the `userNetworking` parameter to true.

HostBridge requires the following initialization sequence:

```
hostbridge.state.setValue(HostBridge::STATUS);
hostbridge.state.setValue(HostBridge::S_UP);
```

To enable tracing of user-mode networking, which can help to debug networking issues, set the `FASTSIM_USERNET_DUMP` environment variable to any or all of the following values:

```
arpin,arpout,udpin,udpout,etherin,etherout,ipv4in,ipv4out,
ipv4fragin,ipv4fragout,tcpin,tcpout,dhcpv4in,dhcpv4out
```

See also

Ports for HostBridge

Table 3-671: Ports

Name	Protocol	Type	Description
eth	VirtualEthernet	Slave	-
state	ValueState_64	Slave	-

Parameters for HostBridge

interfaceName

Type

string

Default value

""

Host Interface.

userNetOptions

Type

string

Default value

""

Control options for UserNet TCP/IP (for internal use only, please do not use).

userNetPorts

Type

string

Default value

""

Listening ports to expose in user-mode networking.

userNetSubnet

Type

string

Default value

"172.20.51.0/24"

Virtual subnet for user-mode networking.

userNetworking

Type

bool

Default value

0x0

Enable user-mode networking.

3.7.18 HostSerialInterface

Component which provides access to the host serial interface. This model is written in LISA+.

Iris and MTI instances for HostSerialInterface

This model has the following Iris instances:

Table 3-672: HostSerialInterface Iris instances

InstanceName	ComponentName
HostSerialInterface	HostSerialInterface

HostSerialInterface contains the following CADI targets:

- HostSerialInterface

Ports for HostSerialInterface

Table 3-673: Ports

Name	Protocol	Type	Description
SerialData	SerialData	Slave	Serial data connection to export to host machine.

Parameters for HostSerialInterface

baud_rate

Type

int

Default value

0x0

Baud rate override.

device**Type**

string

Default value

"/dev/ttyS0"

HW device to use.

3.7.19 Infra6_Core_Mgr_Clock_Ctrl

InfraSysDesgin6.x Core Manager and Clock Control register block. This model is written in C++.

Iris and MTI instances for Infra6_Core_Mgr_Clock_Ctrl

This model has the following Iris instances:

Table 3-674: Infra6_Core_Mgr_Clock_Ctrl Iris instances

InstanceName	ComponentName
Infra6_Core_Mgr_Clock_Ctrl	Infra6_core_manager_clock_control_registers
Infra6_Core_Mgr_Clock_Ctrl.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-675: Infra6_Core_Mgr_Clock_Ctrl MTI instances

InstanceName	ComponentName
Infra6_Core_Mgr_Clock_Ctrl.PVBusSlave	PVBusSlave

Infra6_Core_Mgr_Clock_Ctrl contains the following CADI targets:

- [Infra6_core_manager_clock_control_registers](#)

Ports for Infra6_Core_Mgr_Clock_Ctrl

Table 3-676: Ports

Name	Protocol	Type	Description
ap_aarch64_rvbar	Value_64	Master	-
ap_cfgend	Signal	Master	-
ap_l0gptsz	Value	Master	-
core_clkdiv	ClockRateControl	Master	-
core_clken	Signal	Master	-
core_clkssel	Value	Master	-
pvbus_s	PVBus	Slave	-
reset_in	Signal	Slave	-

Parameters for `Infra6_Core_Mgr_Clock_Ctrl`

`cap_clussync`

Type

bool

Default value

0x1

CAP.CLUSSYNC config.

`cap_sync`

Type

int

Default value

0x0

CAP[0].SYNC config.

`diagnostics`

Type

int

Default value

0x0

Diagnostics.

3.7.20 `Infra6_DVFS_Manager`

LCP DVFS Manager. This model is written in C++.

Iris and MTI instances for `Infra6_DVFS_Manager`

This model has the following Iris instances:

Table 3-677: `Infra6_DVFS_Manager` Iris instances

InstanceName	ComponentName
<code>Infra6_DVFS_Manager</code>	<code>Infra6_DVFS_Manager</code>
<code>Infra6_DVFS_Manager.PVBusSlave</code>	<code>PVBusSlave</code>

This model has the following MTI trace components:

Table 3-678: Infra6_DVFS_Manager MTI instances

InstanceName	ComponentName
Infra6_DVFS_Manager.PVBusSlave	PVBusSlave

Infra6_DVFS_Manager contains the following CADI targets:

- Infra6_DVFS_Manager

Ports for Infra6_DVFS_Manager

Table 3-679: Ports

Name	Protocol	Type	Description
core_clkctrl	ClockRateControl	Master	-
pdbus_s	PVBus	Slave	-

Parameters for Infra6_DVFS_Manager

diagnostics

Type

int

Default value

0x2

Diagnostics.

unmapped_range.abort_on_reads

Type

bool

Default value

0x0

Generate Abort on reads.

unmapped_range.abort_on_writes

Type

bool

Default value

0x0

Generate Abort on writes.

unmapped_range.read_data

Type

int

Default value

0x0

Data to return on reads, if not aborting.

unmapped_range.warn_on_reads

Type

bool

Default value

0x1

Generate Warn on reads.

unmapped_range.warn_on_writes

Type

bool

Default value

0x1

Generate Warn on writes.

unmapped_range.warning

Type

string

Default value

"Invalid access"

Warning string.

3.7.21 Infra6_LCP_Extended_Control

LCP Subsystem Control Register Block. This model is written in C++.

Iris and MTI instances for Infra6_LCP_Extended_Control

This model has the following Iris instances:

Table 3-680: Infra6_LCP_Extended_Control Iris instances

InstanceName	ComponentName
Infra6_LCP_Extended_Control	Infra6_LCP_Extended_Control
Infra6_LCP_Extended_Control.PVBusMapper	PVBusMapper
Infra6_LCP_Extended_Control.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-681: Infra6_LCP_Extended_Control MTI instances

InstanceName	ComponentName
Infra6_LCP_Extended_Control.PVBusMapper	PVBusMapper
Infra6_LCP_Extended_Control.PVBusSlave	PVBusSlave

Infra6_LCP_Extended_Control contains the following CADI targets:

- Infra6_LCP_Extended_Control

Ports for Infra6_LCP_Extended_Control

Table 3-682: Ports

Name	Protocol	Type	Description
ap_cluster_ppu_irq_in	Signal	Slave	-
ap_cluster_ppu_irq_out_lcp	Signal	Master	-
ap_cluster_ppu_irq_out_scp	Signal	Master	-
ap_core_ppu_irq_in	Signal	Slave	-
ap_core_ppu_irq_out_lcp	Signal	Master	-
ap_core_ppu_irq_out_scp	Signal	Master	-
pvbus_s	PVBus	Slave	-
tcm_acc_pvbus_m	PVBus	Master	-
tcm_acc_pvbus_s	PVBus	Slave	-
warm_reset_req	Signal	Slave	-

Parameters for Infra6_LCP_Extended_Control

LCP_ID

Type

int

Default value

0x0

LCP Identifier.

diagnostics

Type

int

Default value

0x2

Diagnostics.

3.7.22 Infra6_LCP_External_Control

LCP Control Registers Block. This model is written in C++.

Iris and MTI instances for Infra6_LCP_External_Control

This model has the following Iris instances:

Table 3-683: Infra6_LCP_External_Control Iris instances

InstanceName	ComponentName
Infra6_LCP_External_Control	Infra6_LCP_External_Control
Infra6_LCP_External_Control.PVBusMapper	PVBusMapper

Parameters for Infra6_MSCP_PIK

SCP_OR_MCP_CTRL

Type

int

Default value

0x1

Identify this is SCP CTRL or MCP CTRL, SCP = 1, MCP = 0.

diagnostics

Type

int

Default value

0x0

Diagnostics.

ws1_timer.clk_div.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

ws1_timer.clk_div.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

ws1_timer.counter.diagnostics

Type

int

Default value

0x2

Diagnostics.

ws1_timer.diagnostics

Type
int
Default value
0x0

Diagnostics.

ws1_timer.timer_interval

Type
int
Default value
0x0

Timer ticks to count before firing interrupt.

3.7.24 Infra6_MSCP_RAS_n_INIT_Ctrl

InfraSysDesign6.x MSCP RAS and INIT control Registers. This model is written in C++.

Iris and MTI instances for Infra6_MSCP_RAS_n_INIT_Ctrl

This model has the following Iris instances:

Table 3-689: Infra6_MSCP_RAS_n_INIT_Ctrl Iris instances

InstanceName	ComponentName
Infra6_MSCP_RAS_n_INIT_Ctrl	Infra6_MSCP_RAS_n_INIT_Ctrl
Infra6_MSCP_RAS_n_INIT_Ctrl.PVBusModifier	PVBusMapper
Infra6_MSCP_RAS_n_INIT_Ctrl.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-690: Infra6_MSCP_RAS_n_INIT_Ctrl MTI instances

InstanceName	ComponentName
Infra6_MSCP_RAS_n_INIT_Ctrl.PVBusModifier	PVBusMapper
Infra6_MSCP_RAS_n_INIT_Ctrl.PVBusSlave	PVBusSlave

Infra6_MSCP_RAS_n_INIT_Ctrl contains the following CADI targets:

- Infra6_MSCP_RAS_n_INIT_Ctrl

Ports for Infra6_MSCP_RAS_n_INIT_Ctrl

Table 3-691: Ports

Name	Protocol	Type	Description
ce_intr_out	Signal	Master	-
cpuwait	Signal	Master	-
dtdcm0_pvbust_m	PVBus	Master	-
dtdcm0_pvbust_s	PVBus	Slave	-
dtdcm1_pvbust_m	PVBus	Master	-
dtdcm1_pvbust_s	PVBus	Slave	-
itcm_pvbust_m	PVBus	Master	-
itcm_pvbust_s	PVBus	Slave	-
mcp_errclear_in	Signal	Slave	-
of_intr_out	Signal	Master	-
pvbust_s	PVBus	Slave	-
ue_intr_out	Signal	Master	-

Parameters for Infra6_MSCP_RAS_n_INIT_Ctrl

diagnostics**Type**

int

Default value

0x0

Diagnostics.

3.7.25 Infra6_SRAM_ECC_RAS

ISD6.x SRAM ECC RAS. This model is written in C++.

Iris and MTI instances for Infra6_SRAM_ECC_RAS

This model has the following Iris instances:

Table 3-692: Infra6_SRAM_ECC_RAS Iris instances

InstanceName	ComponentName
Infra6_SRAM_ECC_RAS	Infra6_SRAM_ECC_RAS
Infra6_SRAM_ECC_RAS.PVBusModifier	PVBusMapper
Infra6_SRAM_ECC_RAS.pvbust_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-693: Infra6_SRAM_ECC_RAS MTI instances

InstanceName	ComponentName
Infra6_SRAM_ECC_RAS.PVBusModifier	PVBusMapper
Infra6_SRAM_ECC_RAS.pvbus_slave	PVBusSlave

Infra6_SRAM_ECC_RAS contains the following CADI targets:

- Infra6_SRAM_ECC_RAS

Ports for Infra6_SRAM_ECC_RAS

Table 3-694: Ports

Name	Protocol	Type	Description
fhi_irq_out	Signal	Master	-
pvbus_m	PVBus	Master	-
pvbus_reg_s	PVBus	Slave	-
pvbus_s	PVBus	Slave	-

Parameters for Infra6_SRAM_ECC_RAS

diagnostics

Type

int

Default value

0x0

Diagnostics.

3.7.26 Infra6_System_PIK

InfraSysDesign6.x System Power Control Kit. This model is written in C++.

Iris and MTI instances for Infra6_System_PIK

This model has the following Iris instances:

Table 3-695: Infra6_System_PIK Iris instances

InstanceName	ComponentName
Infra6_System_PIK	Infra6_System_PIK
Infra6_System_PIK.PPUv1	PPUv1
Infra6_System_PIK.PPUv1.busslave	PVBusSlave
Infra6_System_PIK.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-696: Infra6_System_PIK MTI instances

InstanceName	ComponentName
Infra6_System_PIK.PPUv1	PPUv1
Infra6_System_PIK.PPUv1.busslave	PVBusSlave
Infra6_System_PIK.PVBusSlave	PVBusSlave

Infra6_System_PIK contains the following CADI targets:

- Infra6_System_PIK

Ports for Infra6_System_PIK

Table 3-697: Ports

Name	Protocol	Type	Description
powerdown_out	Signal	Master	-
pvbus_s	PVBus	Slave	-
reset_in	Signal	Slave	-
sys_ppu_irq_out	Signal	Master	-
tcu_10gptsz	Value	Master	-

Parameters for Infra6_System_PIK

diagnostics

Type

int

Default value

0x0

Diagnostics.

systop_pchannel_listener.diagnostics

Type

int

Default value

0x0

Diagnostics.

systop_ppu0.RevD_support

Type

bool

Default value

0x1

Whether to support Rev D locked IRQ.

systop_ppu0.bypass_handshake**Type**

bool

Default value

0x0

Bypass pcsm handshake.

systop_ppu0.dbg_recov**Type**

int

Default value

0x0

Debug Recovery Reset (0: not supported, 1: static mode only, 2: both dynamic & static mode).

systop_ppu0.default_op_dyn_en**Type**

bool

Default value

0x0

Whether to enable operating mode dynamic transition by default.

systop_ppu0.default_op_policy**Type**

int

Default value

0x0

Default operating policy.

systop_ppu0.default_power_state_on**Type**

bool

Default value

0x0

Default power state ON.

systop_ppu0.default_pwr_dyn_en**Type**

bool

Default value

0x0

Whether to enable dynamic power mode transition by default.

systop_ppu0.device_channels**Type**

int

Default value

0x0

Number of device channels (0: P-Channel, 1-8: Q-Channels).

systop_ppu0.dynamic_off**Type**

bool

Default value

0x0

Dynamic Off.

systop_ppu0.dynamic_on**Type**

bool

Default value

0x0

Dynamic On.

systop_ppu0.dynamic_warm_reset**Type**

bool

Default value

0x0

Dynamic Warm Reset.

systop_ppu0.full_ret**Type**

int

Default value

0x0

Full Retention (0: not supported, 1: static mode only, 2: both dynamic & static mode).

systop_ppu0.func_ret**Type**

int

Default value

0x0

Functional Retention (0: not supported, 1: static mode only, 2: both dynamic & static mode).

systop_ppu0.is_core_ppu**Type**

bool

Default value

0x0

PPU is core_ppu type which means wake_request would wait till PPU is OFF/OFF_EMU.

systop_ppu0.lock_support**Type**

bool

Default value

0x1

Whether to support OFF lock feature.

systop_ppu0.logic_ret**Type**

int

Default value

0x0

Logic Retention (0: not supported, 1: static, 2: dynamic).

systop_ppu0.mem_off**Type**

int

Default value

0x0

Memory Off (0: not supported, 1: static mode only, 2: both dynamic & static mode).

systop_ppu0.mem_ret**Type**

int

Default value

0x0

Memory Retention (0: not supported, 1: static mode only, 2: both dynamic & static mode).

systop_ppu0.mem_ret_emu**Type**

int

Default value

0x0

Emulated Memory Retention (0: not supported, 1: static mode only, 2: both dynamic & static mode).

systop_ppu0.num_opmode_cfg**Type**

int

Default value

0x0

Number of operating modes.

systop_ppu0.off_emu**Type**

int

Default value

0x0

Emulated Off (0: not supported, 1: static mode only, 2: both dynamic & static mode).

systop_ppu0.off_mem_ret_trans_cfg

Type
bool

Default value
0x0

OFF to MEM_RET direct transition configuration (0: not allowed, 1: allowed).

systop_ppu0.op_active_cfg

Type
int

Default value
0x0

Operating mode active configuration (0: Ladder use model, 1: Independent user model).

systop_ppu0.revision

Type
string

Default value
"r1p1"

Revision.

systop_ppu0.use_active_signal

Type
bool

Default value
0x0

Use device-active signal.

3.7.27 Infra6p6_AP_Mgmt_Regs

AP Management Registers Block. This model is written in C++.

Iris and MTI instances for Infra6p6_AP_Mgmt_Regs

This model has the following Iris instances:

Table 3-698: Infra6p6_AP_Mgmt_Regs Iris instances

InstanceName	ComponentName
Infra6p6_AP_Mgmt_Regs	Infra6p6_AP_Mgmt_Regs

InstanceName	ComponentName
Infra6p6_AP_Mgmt_Regs.apb	PVBusSlave

This model has the following MTI trace components:

Table 3-699: Infra6p6_AP_Mgmt_Regs MTI instances

InstanceName	ComponentName
Infra6p6_AP_Mgmt_Regs.apb	PVBusSlave

Infra6p6_AP_Mgmt_Regs contains the following CADI targets:

- Infra6p6_AP_Mgmt_Regs

Ports for Infra6p6_AP_Mgmt_Regs

Table 3-700: Ports

Name	Protocol	Type	Description
ap_cons_irq_in[32]	Signal	Slave	AP Consolidated interrupts
ap_cons_irq_out_lcp[32]	Signal	Master	AP Consolidated interrupts to LCP
ap_cons_irq_out_scp[32]	Signal	Master	AP Consolidated interrupts to SCP
ap_warm_reset_req	Signal	Master	AP Warm Reset Request
apb	PVBus	Slave	APB Subordinate Interface - Access to registers
mgi_irq_in0[32]	Signal	Slave	SMCF MGI interrupts indexed [0..31]
mgi_irq_in1[32]	Signal	Slave	SMCF MGI interrupts indexed [32..63]
mgi_irq_out0_lcp[32]	Signal	Master	MGI interrupt indexed [0..31] to LCP
mgi_irq_out0_scp[32]	Signal	Master	MGI interrupts indexed [0..31] to SCP
mgi_irq_out1_lcp[32]	Signal	Master	MGI interrupt indexed [32..63] to LCP
mgi_irq_out1_scp[32]	Signal	Master	MGI interrupts indexed [32..63] to SCP
reset_in	Signal	Slave	Reset in signal

Parameters for Infra6p6_AP_Mgmt_Regs

AP_GRP_ACCESS_ID

Type

int

Default value

0x0

AP Group ID in the SoC.

LCP_GRP_ACCESS_ID

Type

int

Default value

0x0

LCP Group ID associated with this AP Group.

diagnostics**Type**

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.7.28 Infra6p6_LCP_Extended_Ctrl_Regs

LCP Subsystem Control Register Block. This model is written in C++.

Iris and MTI instances for Infra6p6_LCP_Extended_Ctrl_Regs

This model has the following Iris instances:

Table 3-701: Infra6p6_LCP_Extended_Ctrl_Regs Iris instances

InstanceName	ComponentName
Infra6p6_LCP_Extended_Ctrl_Regs	Infra6p6_LCP_Extended_Ctrl_Regs
Infra6p6_LCP_Extended_Ctrl_Regs.ApbPVBUSubordinate	PVBusSlave

This model has the following MTI trace components:

Table 3-702: Infra6p6_LCP_Extended_Ctrl_Regs MTI instances

InstanceName	ComponentName
Infra6p6_LCP_Extended_Ctrl_Regs.ApbPVBUSubordinate	PVBusSlave

Infra6p6_LCP_Extended_Ctrl_Regs contains the following CADI targets:

- Infra6p6_LCP_Extended_Ctrl_Regs

Ports for Infra6p6_LCP_Extended_Ctrl_Regs

Table 3-703: Ports

Name	Protocol	Type	Description
ap2lcp_mhu_irq_ctrl	StateSignal	Slave	AP to LCP MHU Combined interrupt Control
ap_cons_irq_ctrl	StateSignal	Slave	Consolidated AP interrupts Control
ap_core_ppu_irq_ctrl	StateSignal	Slave	Consolidated AP Core PPU interrupts Control
ap_mgi_irq_ctrl	StateSignal	Slave	MGI Interrupts Control
apb	PVBus	Slave	APB Subordinate Interface - Access to registers

Name	Protocol	Type	Description
lcp_tcm_acq_en	StateSignal	Slave	LCP Core TCMs Control
reset_in	Signal	Slave	Reset in signal
smcf_trigger_in_scp	Signal	Slave	SMCF trigger driven by the SCP
smcf_trigger_out	Signal	Master	SMCF trigger out signal
warm_reset_req	Signal	Slave	AP Warm Reset Request

Parameters for Infra6p6_LCP_Extended_Ctrl_Regs

LCP_CTRL_RATIO

Type

int

Default value

0x0

Number of APs that share an LCP. The LCP is shared between LCP_CTRL_RATIO + 1 APs.

LCP_GRP_ACCESS_ID

Type

int

Default value

0x0

LCP Access region ID in the SoC.

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.7.29 Infra6p6_LCP_External_Ctrl_Regs

LCP Control Registers Block. This model is written in C++.

Iris and MTI instances for Infra6p6_LCP_External_Ctrl_Regs

This model has the following Iris instances:

Table 3-704: Infra6p6_LCP_External_Ctrl_Regs Iris instances

InstanceName	ComponentName
Infra6p6_LCP_External_Ctrl_Regs	Infra6p6_LCP_External_Ctrl_Regs
Infra6p6_LCP_External_Ctrl_Regs.ApbPVBUSubordinate	PVBusSlave
Infra6p6_LCP_External_Ctrl_Regs.PVBusMapper	PVBusMapper

This model has the following MTI trace components:

Table 3-705: Infra6p6_LCP_External_Ctrl_Regs MTI instances

InstanceName	ComponentName
Infra6p6_LCP_External_Ctrl_Regs.ApbPVBUSubordinate	PVBusSlave
Infra6p6_LCP_External_Ctrl_Regs.PVBusMapper	PVBusMapper

Infra6p6_LCP_External_Ctrl_Regs contains the following CADI targets:

- Infra6p6_LCP_External_Ctrl_Regs

Ports for Infra6p6_LCP_External_Ctrl_Regs

Table 3-706: Ports

Name	Protocol	Type	Description
access_status_irq_out	Signal	Master	LCP Access Status Interrupt
ap_cons_irq_in[32]	Signal	Slave	Consolidated interrupts from the APs [0..SHARED_AP_NUM-1]
ap_cons_irq_out_scp	Signal	Master	Consolidated AP core IRQ to SCP
ap_core_ppu_irq_in[32]	Signal	Slave	Interrupts from the AP core PPU [0..SHARED_AP_NUM-1]
ap_core_ppu_irq_out_scp	Signal	Master	Consolidated AP PPU IRQ to SCP
ap_mgi_cons_irq_in[32]	Signal	Slave	SMCF MGI Consolidated interrupts [0..SHARED_AP_NUM-1]
ap_mgi_cons_irq_out_scp	Signal	Master	Consolidated MGI IRQ to SCP
apb	PVBus	Slave	APB Subordinate Interface - Access to registers
combined_irq_in[32]	Signal	Slave	LCP Combined interrupt
combined_irq_out_scp	Signal	Master	Consolidated LCP IRQ to SCP
reset_in	Signal	Slave	Reset in signal
uart_filter_pvbus_m	PVBus	Master	-
uart_filter_pvbus_s	PVBus	Slave	Ports to check if LCP UART are accessible
uart_irq_in	Signal	Slave	LCP UART interrupt
uart_irq_out	Signal	Master	LCP UART interrupt is routed to this LCP
warm_reset_req	Signal	Master	Warm Reset Request

Parameters for Infra6p6_LCP_External_Ctrl_Regs

SHARED_AP_NUM

Type

int

Default value

0x20

Number of APs that share an LCP.

diagnostics**Type**

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.7.30 IntelStrataFlashJ3

Intel Strata Flash J3 model. This model is written in C++.

Iris and MTI instances for IntelStrataFlashJ3

This model has the following Iris instances:

Table 3-707: IntelStrataFlashJ3 Iris instances

InstanceName	ComponentName
IntelStrataFlashJ3	IntelStrataFlashJ3
IntelStrataFlashJ3.PVBusMapper	PVBusMapper
IntelStrataFlashJ3.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-708: IntelStrataFlashJ3 MTI instances

InstanceName	ComponentName
IntelStrataFlashJ3.PVBusMapper	PVBusMapper
IntelStrataFlashJ3.PVBusSlave	PVBusSlave

IntelStrataFlashJ3 contains the following CADI targets:

- IntelStrataFlashJ3

Ports for IntelStrataFlashJ3**Table 3-709: Ports**

Name	Protocol	Type	Description
flashloader	FlashLoaderPort	Slave	-
mem_port	PVDevice	Slave	-
pdbus	PVBus	Slave	-

Parameters for IntelStrataFlashJ3

diagnostics

Type

int

Default value

0x0

Diagnostic level.

enable_read_status_logic

Type

bool

Default value

0x0

Enables logic to handle the status register reads as per the '3 Volt Intel StrataFlash Memory' specification.

model_blocklock

Type

bool

Default value

0x0

Model per-block locking and set all the blocks to locked state on reset.

size

Type

int

Default value

0x40000

Memory Size.

trapwrite

Type

bool

Default value

0x0

Generate abort on write.

unphysical_writes**Type**

bool

Default value

0x1

Writes to flash are overwrite not AND.

3.7.31 Interrupt_Router

Interrupt Router Registers. This model is written in C++.

Ports for Interrupt_Router

Table 3-710: Ports

Name	Protocol	Type	Description
lockdown	Signal	Slave	-
out_interrupts0[64]	Signal	Master	-
out_interrupts1[64]	Signal	Master	-
out_interrupts10[64]	Signal	Master	-
out_interrupts11[64]	Signal	Master	-
out_interrupts12[64]	Signal	Master	-
out_interrupts13[64]	Signal	Master	-
out_interrupts14[64]	Signal	Master	-
out_interrupts15[64]	Signal	Master	-
out_interrupts2[64]	Signal	Master	-
out_interrupts3[64]	Signal	Master	-
out_interrupts4[64]	Signal	Master	-
out_interrupts5[64]	Signal	Master	-
out_interrupts6[64]	Signal	Master	-
out_interrupts7[64]	Signal	Master	-
out_interrupts8[64]	Signal	Master	-
out_interrupts9[64]	Signal	Master	-
pvbus_s	PVBus	Slave	-
reset_signal	Signal	Slave	-
shared_interrupt[428]	Signal	Slave	-
tamper_interrupt	Signal	Master	-

Number of Interrupt Controllers Interrupt interface.

num_shd_int

Type
int

Default value
0x1

Number of shared interrupts supported.

ro_access

Type
int

Default value
0x0

Stream ID of master.

rw_access

Type
int

Default value
0x0

Stream ID of master with Read Write access.

3.7.32 **IoTSS3_ManagerSecurityController**

IoT Subsystem SIE-300 Manager (Master) Security Controller. This model is written in C++.

Iris and MTI instances for IoTSS3_ManagerSecurityController

This model has the following Iris instances:

Table 3-711: IoTSS3_ManagerSecurityController Iris instances

InstanceName	ComponentName
IoTSS3_ManagerSecurityController	IoTSS3_ManagerSecurityController
IoTSS3_ManagerSecurityController.PVBusModifier	PVBusMapper

This model has the following MTI trace components:

Table 3-712: IoTSS3_ManagerSecurityController MTI instances

InstanceName	ComponentName
IoTSS3_ManagerSecurityController.PVBusModifier	PVBusMapper

IoTSS3_ManagerSecurityController contains the following CADI targets:

- IoTSS3_ManagerSecurityController

Ports for IoTSS3_ManagerSecurityController

Table 3-713: Ports

Name	Protocol	Type	Description
cfg_nonsec	ValueState	Slave	-
cfg_sec_resp	ValueState	Slave	-
idau_invalidate_region	Value_64	Slave	-
irq	StateSignal	Master	-
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

Parameters for IoTSS3_ManagerSecurityController

IRQ_ENABLE_RD

Type

bool

Default value

0x1

Interrupt enable read.

IRQ_ENABLE_WR

Type

bool

Default value

0x1

Interrupt enable write.

diagnostics

Type

int

Default value

0x0

Diagnostics.

3.7.33 IoTSS3_MemoryProtectionController

IoT Subsystem SIE-300 Memory Protection Controller. This model is written in C++.

Iris and MTI instances for IoTSS3_MemoryProtectionController

This model has the following Iris instances:

Table 3-714: IoTSS3_MemoryProtectionController Iris instances

InstanceName	ComponentName
IoTSS3_MemoryProtectionController	IoTSS3_MemoryProtectionController
IoTSS3_MemoryProtectionController.PVBusModifier	PVBusMapper
IoTSS3_MemoryProtectionController.PVBusSlave	PVBusSlave
IoTSS3_MemoryProtectionController.SchedulerThreadEvent	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-715: IoTSS3_MemoryProtectionController MTI instances

InstanceName	ComponentName
IoTSS3_MemoryProtectionController.PVBusModifier	PVBusMapper
IoTSS3_MemoryProtectionController.PVBusSlave	PVBusSlave

IoTSS3_MemoryProtectionController contains the following CADI targets:

- IoTSS3_MemoryProtectionController

Ports for IoTSS3_MemoryProtectionController

Table 3-716: Ports

Name	Protocol	Type	Description
cfg_init_value	ValueState	Slave	-
cfg_sec_resp	ValueState	Slave	-
config_pvbus_s	PVBus	Slave	-
idau_invalidate_region	Value_64	Slave	-
mpc_irq	StateSignal	Master	-
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-
reset_in	Signal	Slave	-

Parameters for IoTSS3_MemoryProtectionController

BLK_MAX

Type

int

Default value

0xffff

Maximum block index configuration.

BLK_SIZE**Type**

int

Default value

0x3

Block size configuration.

GATE_PRESENT**Type**

bool

Default value

0x1

Memory gating logic present/not.

IRQ_ENABLE_RD**Type**

bool

Default value

0x1

Interrupt enable read.

IRQ_ENABLE_WR**Type**

bool

Default value

0x1

Interrupt enable write.

diagnostics**Type**

int

Default value

0x0

Diagnostics.

3.7.34 IoTSS3_SecureAccessConfig

IoTSS3 Secure Control Register Block. This model is written in C++.

Iris and MTI instances for IoTSS3_SecureAccessConfig

This model has the following Iris instances:

Table 3-717: IoTSS3_SecureAccessConfig Iris instances

InstanceName	ComponentName
IoTSS3_SecureAccessConfig	IoTSS3_SecureAccessConfig
IoTSS3_SecureAccessConfig.PVBusMaster	PVBusMaster
IoTSS3_SecureAccessConfig.PVBusModifier	PVBusMapper
IoTSS3_SecureAccessConfig.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-718: IoTSS3_SecureAccessConfig MTI instances

InstanceName	ComponentName
IoTSS3_SecureAccessConfig.PVBusMaster	PVBusMaster
IoTSS3_SecureAccessConfig.PVBusModifier	PVBusMapper
IoTSS3_SecureAccessConfig.PVBusSlave	PVBusSlave

IoTSS3_SecureAccessConfig contains the following CADI targets:

- IoTSS3_SecureAccessConfig

Ports for IoTSS3_SecureAccessConfig

Table 3-719: Ports

Name	Protocol	Type	Description
acc_waitn	ValueState	Master	-
brg_in[32]	StateSignal	Slave	-
brg_out	Signal	Master	-
idau	PVBus	Master	-
mainnspcexp[4]	ValueState	Master	-
mainpppcexp[4]	ValueState	Master	-
mem_gating_filter_in	PVBus	Slave	-
mem_gating_filter_out	PVBus	Master	-
mpc_in[32]	StateSignal	Slave	-
mpc_out	Signal	Master	-
msc_in[32]	StateSignal	Slave	-

Name	Protocol	Type	Description
msc_out	Signal	Master	-
npuspporpl[4]	Signal	Master	-
npuspporsl[4]	Signal	Master	-
p_ahb_gating_filter_in	PVBus	Slave	-
p_ahb_gating_filter_out	PVBus	Master	-
periphnsppc0	ValueState	Master	-
periphnsppc1	ValueState	Master	-
periphnsppcexp[4]	ValueState	Master	-
periphpppc0	ValueState	Master	-
periphpppc1	ValueState	Master	-
periphpppcexp[4]	ValueState	Master	-
ppc_in[32]	StateSignal	Slave	-
ppc_out	Signal	Master	-
pvbus_nonsecure	PVBus	Slave	-
pvbus_secure	PVBus	Slave	-
reset_in	Signal	Slave	-
security_resp	ValueState	Master	-

Parameters for IoTSS3_SecureAccessConfig

CODENSC

Type

bool

Default value

0x0

Whether 0x10000000..0x1FFFFFFF is non-secure-callable.

DISABLE_GATING

Type

bool

Default value

0x0

Disable Memory gating logic.

IGNORE_MEM_MAP

Type

bool

Default value

0x0

Ignore Memory mapping logic.

MAINPPCEXP_DIS0**Type**

int

Default value

0x0

Disables support for individual bits on the MAINNSPPCEXP0 and MAINPPPCEXP0 buses.

MAINPPCEXP_DIS1**Type**

int

Default value

0x0

Disables support for individual bits on the MAINNSPPCEXP1 and MAINPPPCEXP1 buses.

MAINPPCEXP_DIS2**Type**

int

Default value

0x0

Disables support for individual bits on the MAINNSPPCEXP2 and MAINPPPCEXP2 buses.

MAINPPCEXP_DIS3**Type**

int

Default value

0x0

Disables support for individual bits on the MAINNSPPCEXP3 and MAINPPPCEXP3 buses.

PERIPHPPCEXP_DIS0**Type**

int

Default value

0x0

Disables support for individual bits on the PERIPHNSPPCEXP0 and PERIPHPPPCEXP0 buses.

PERIPHPPCEXP_DIS1

Type

int

Default value

0x0

Disables support for individual bits on the PERIPHNSPPCEXP1 and PERIPHPPPCEXP1 buses.

PERIPHPPCEXP_DIS2

Type

int

Default value

0x0

Disables support for individual bits on the PERIPHNSPPCEXP2 and PERIPHPPPCEXP2 buses.

PERIPHPPCEXP_DIS3

Type

int

Default value

0x0

Disables support for individual bits on the PERIPHNSPPCEXP3 and PERIPHPPPCEXP3 buses.

RAMNSC

Type

bool

Default value

0x0

Whether 0x30000000..0x3FFFFFFF is non-secure-callable.

diagnostics

Type

int

Default value

0x0

Diagnostics.

3.7.35 Juno_sysregs

IOFPGA system register unit. This model is written in C++.

Iris and MTI instances for Juno_sysregs

This model has the following Iris instances:

Table 3-720: Juno_sysregs Iris instances

InstanceName	ComponentName
Juno_sysregs	Juno_sysregs
Juno_sysregs.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-721: Juno_sysregs MTI instances

InstanceName	ComponentName
Juno_sysregs.PVBusSlave	PVBusSlave

Juno_sysregs contains the following CADI targets:

- Juno_sysregs

Ports for Juno_sysregs

Table 3-722: Ports

Name	Protocol	Type	Description
clock_100Hz	ClockSignal	Slave	-
clock_24Mhz	ClockSignal	Slave	-
ethernet_irq	Signal	Master	-
mmc_presence	StateSignal	Slave	-
pb_irq	Signal	Master	-

rtcc_irq	Signal	Master	-
tile1_irq	Signal	Master	-
usb_irq	Signal	Master	-

Parameters for Juno_sysregs

diagnostics

Type

int

Default value

0x0

Diagnostics.

pcie_mac
Type
int
Default value
0x2f7000001

PCIe MAC address.

rev
Type
int
Default value
0x0

Board revision.

3.7.36 LS64TestingFIFO

FIFO peripheral supporting LS64 accesses for testing purposes. This model is written in LISA+.

Iris and MTI instances for LS64TestingFIFO

This model has the following Iris instances:

Table 3-723: LS64TestingFIFO Iris instances

InstanceName	ComponentName
LS64TestingFIFO	LS64TestingFIFO
LS64TestingFIFO.pvbusslave	PVBusSlave

This model has the following MTI trace components:

Table 3-724: LS64TestingFIFO MTI instances

InstanceName	ComponentName
LS64TestingFIFO.pvbusslave	PVBusSlave

LS64TestingFIFO contains the following CADI targets:

- LS64TestingFIFO

About LD64TestingFIFO

LS64TestingFIFO is a LISA component for testing the FEAT_LS64 architectural feature. It accepts ST64B instructions and places the supplied data into a configurable buffer. LD64B instructions can then read this data out of the FIFO. The value returned can configurably be bitwise inverted.

It also supports the ST64BV variants where success and failure are reported by a return result rather than by transaction success and failure.

Ports for LS64TestingFIFO

Table 3-725: Ports

Name	Protocol	Type	Description
pvbuss_s	PVBus	Slave	Bus subordinate interface.

Parameters for LS64TestingFIFO

buffer_size

Type

int

Default value

0x2

The number of 64-byte slots in the FIFO.

op_type

Type

int

Default value

0x1

The operation performed on the 64-byte transaction data 0 - None, 1 - Bitwise Negate.

3.7.37 MemoryElement_TZC400_cpp

Memory Element with TZC-400. This model is written in C++.

Iris and MTI instances for MemoryElement_TZC400_cpp

This model has the following Iris instances:

Table 3-726: MemoryElement_TZC400_cpp Iris instances

InstanceName	ComponentName
MemoryElement_TZC400_cpp	MemoryElement_TZC400
MemoryElement_TZC400_cpp.TZC_400	TZC_400
MemoryElement_TZC400_cpp.TZC_400.apbslave[0]	PVBusSlave
MemoryElement_TZC400_cpp.TZC_400.filter0	filter0
MemoryElement_TZC400_cpp.TZC_400.filter0.BusMapper	PVBusMapper
MemoryElement_TZC400_cpp.TZC_400.filter1	filter1
MemoryElement_TZC400_cpp.TZC_400.filter1.BusMapper	PVBusMapper

InstanceName	ComponentName
MemoryElement_TZC400_cpp.TZC_400.filter2	filter2
MemoryElement_TZC400_cpp.TZC_400.filter2.BusMapper	PVBusMapper
MemoryElement_TZC400_cpp.TZC_400.filter3	filter3
MemoryElement_TZC400_cpp.TZC_400.filter3.BusMapper	PVBusMapper
MemoryElement_TZC400_cpp.TZFilterUnit	ExportTest.MemoryElement_TZC400_cppTZFilterUnit
MemoryElement_TZC400_cpp.TZFilterUnit.BusMapper	PVBusMapper

This model has the following MTI trace components:

Table 3-727: MemoryElement_TZC400_cpp MTI instances

InstanceName	ComponentName
MemoryElement_TZC400_cpp.TZC_400.apbslave[0]	PVBusSlave
MemoryElement_TZC400_cpp.TZC_400.filter0.BusMapper	PVBusMapper
MemoryElement_TZC400_cpp.TZC_400.filter1.BusMapper	PVBusMapper
MemoryElement_TZC400_cpp.TZC_400.filter2.BusMapper	PVBusMapper
MemoryElement_TZC400_cpp.TZC_400.filter3.BusMapper	PVBusMapper
MemoryElement_TZC400_cpp.TZFilterUnit.BusMapper	PVBusMapper

MemoryElement_TZC400_cpp contains the following CADI targets:

- MemoryElement_TZC400

Ports for MemoryElement_TZC400_cpp

Table 3-728: Ports

Name	Protocol	Type	Description
tzc_apb_pvbus_s	PVBus	Slave	-
tzc_filter_pvbus_m[4]	PVBus	Master	-
tzc_filter_pvbus_s[4]	PVBus	Slave	-
tzc_irq	Signal	Master	-

Parameters for MemoryElement_TZC400_cpp

addr_width

Type

int

Default value

0x40

Address width: Supported widths are 32, 36, 40, 48, 64 bits and all other values are reserved.

num_filter

Type

int

Default value

0x4

Number of filters in each TZC. Supported values are 1, 2, 4. 3 is Reserved.

num_region

Type

int

Default value

0x9

Number of regions.

3.7.38 MemoryMappedGenericTimer

ARM Generic Timer. This model is written in C++.

Iris and MTI instances for MemoryMappedGenericTimer

This model has the following Iris instances:

Table 3-729: MemoryMappedGenericTimer Iris instances

InstanceName	ComponentName
MemoryMappedGenericTimer	MemoryMappedGenericTimer
MemoryMappedGenericTimer.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-730: MemoryMappedGenericTimer MTI instances

InstanceName	ComponentName
MemoryMappedGenericTimer.PVBusSlave	PVBusSlave

MemoryMappedGenericTimer contains the following CADI targets:

- MemoryMappedGenericTimer

Ports for MemoryMappedGenericTimer

Table 3-731: Ports

Name	Protocol	Type	Description
cntpsirq[8]	Signal	Master	-
cntvalueb	CounterInterface	Slave	-

Name	Protocol	Type	Description
pvbuse_base_s[8]	PVBus	Slave	-
pvbuse_ctlbase_s	PVBus	Slave	-
pvbuse_el0base_s[8]	PVBus	Slave	-
timer_reset	Signal	Slave	-

Parameters for MemoryMappedGenericTimer

bypass_ctlbase

Type

bool

Default value

0x0

Bypass CNTBase Access Control. Enable if only timer frame feature is required without CNTBase access control.

cntel0acr_implemented

Type

int

Default value

0x0

A bit-field of 8 bits, where bit {n} enables CNTELOACR for timer frame {n}.

diagnostics

Type

int

Default value

0x0

Diagnostics.

frame_security

Type

string

Default value

""

Hard-wired/configurable security for frames (N/S/X, one character per timer frame).

num_timers**Type**

int

Default value

0x1

Number of timer frames.

3.7.39 MemoryMappedGenericWatchdog

ARM Generic Watchdog. This model is written in C++.

Iris and MTI instances for MemoryMappedGenericWatchdog

This model has the following Iris instances:

Table 3-732: MemoryMappedGenericWatchdog Iris instances

InstanceName	ComponentName
MemoryMappedGenericWatchdog	MemoryMappedGenericWatchdog
MemoryMappedGenericWatchdog.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-733: MemoryMappedGenericWatchdog MTI instances

InstanceName	ComponentName
MemoryMappedGenericWatchdog.PVBusSlave	PVBusSlave

MemoryMappedGenericWatchdog contains the following CADI targets:

- MemoryMappedGenericWatchdog

About MemoryMappedGenericWatchdog

This is a high-level watchdog that generates two interrupts rather than an interrupt followed by a reset.

Ports for MemoryMappedGenericWatchdog

Table 3-734: Ports

Name	Protocol	Type	Description
cntvalueb	CounterInterface	Slave	-
ctl_pvbus_s	PVBus	Slave	-
ref_pvbus_s	PVBus	Slave	-
reset_in	Signal	Slave	-
WS0	Signal	Master	-
WS1	Signal	Master	-

Parameters for MemoryMappedGenericWatchdog

NONSECURE

Type

bool

Default value

0x0

Non-Secure.

arch_version

Type

int

Default value

0x0

Architecture version. Available 0 and 1.

diagnostics

Type

int

Default value

0x0

Diagnostics.

product_id

Type

int

Default value

0x0

Product Identifier.

3.7.40 NonVolatileCounter

Trusted Non-Volatile Counter unit. This model is written in C++.

Iris and MTI instances for NonVolatileCounter

This model has the following Iris instances:

Table 3-735: NonVolatileCounter Iris instances

InstanceName	ComponentName
NonVolatileCounter	NonVolatileCounter
NonVolatileCounter.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-736: NonVolatileCounter MTI instances

InstanceName	ComponentName
NonVolatileCounter	NonVolatileCounter
NonVolatileCounter.PVBusSlave	PVBusSlave

NonVolatileCounter contains the following CADI targets:

- NonVolatileCounter

Ports for NonVolatileCounter

Table 3-737: Ports

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	-

Parameters for NonVolatileCounter

diagnostics

Type

int

Default value

0x0

Diagnostics.

rst_non_tz_fw_cnt

Type

int

Default value

0x0

Value of NON_TZ_FW_CNT at reset.

rst_tz_fw_cnt

Type

int

Default value

0x0

Value of TZ_FW_CNT at reset.

secure

Type

int

Default value

0x1

Instantiate model as Secure (1) or NS (0).

version

Type

string

Default value

"r0"

Version of the model functionality. Valid values are r0 and r1.

3.7.41 PCIeATC

This model is written in C++.

Iris and MTI instances for PCIeATC

This model has the following Iris instances:

Table 3-738: PCIeATC Iris instances

InstanceName	ComponentName
PCIeATC	validation_atc
PCIeATC.ExportTest.PCIeATC.mapper	PVBusMapper
PCIeATC.pvbus_id_routed_s[0]	PVBusSlave

This model has the following MTI trace components:

Table 3-739: PCIeATC MTI instances

InstanceName	ComponentName
PCIeATC	atc
PCIeATC.ExportTest.PCIeATC.mapper	PVBusMapper
PCIeATC.pvbus_id_routed_s[0]	PVBusSlave

PCIeATC contains the following CADI targets:

- validation_atc

About PCIeATC

This component is for validation only. It is not directly suitable for use as an ATC. It is used for testing the ATC implementation of `pcie_atc_if` produced by `make_PCIeATC_v0()`.

Ports for PCIeATC

Table 3-740: Ports

Name	Protocol	Type	Description
atc	PCIeATC_get_if	Slave	-
disable_PRI_and_set_RF	Signal	Master	This is pulsed (set, then clear) when a condition occurs that causes a Response Failure. The correct response of the PCIe device is to disable PRI and to set the RF bit in the PRI header.
identify	SMMUv3AEMIdentifyProtocol	Master	The user has a chance to determine how the substreamid is extracted from the transactions received on pvbus_s by using this port. If it is unimplemented then the ATC will use the default policy identified in SMMUv3_FOR_PCIE.lisa <201601041554/>
pvbus_id_routed_s	PVBus	Slave	-
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-
uprgi	Signal	Master	This is pulsed (set, then clear) when an Unrecognised PRG Index is received. In a real PCIe device this would set the UPRGI bit in the PRI header.

Parameters for PCIeATC

atc_size

Type

int

Default value

0x0

The maximum number of ATC entries. 0 is effectively a large number.

seed

Type

int

Default value

0x12345678

Seed for a random number generator.

3.7.42 PLLClockControl

Clock Rate Control. This model is written in C++.

Iris and MTI instances for PLLClockControl

This model has the following Iris instances:

Table 3-741: PLLClockControl Iris instances

InstanceName	ComponentName
PLLClockControl	PLLClockControl
PLLClockControl.ClockDivider	ClockDivider

This model has the following MTI trace components:

Table 3-742: PLLClockControl MTI instances

InstanceName	ComponentName
PLLClockControl.ClockDivider	ClockDivider

PLLClockControl contains the following CADI targets:

- PLLClockControl

Ports for PLLClockControl

Table 3-743: Ports

Name	Protocol	Type	Description
clk_en	Signal	Slave	-
clk_in	ClockSignal	Slave	-
clk_out	ClockSignal	Master	-
clk_rate	ClockRateControl	Slave	-
clk_sel	Value	Slave	-
lock	Signal	Master	-
refclk_in	ClockSignal	Slave	-
unlock	Signal	Master	-

Parameters for PLLClockControl

diagnostics

Type

int

Default value

0x0

Diagnostics.

3.7.43 PPUMultiThreadModeSwitch

PPU mode switch between single-thread mode and multi-thread mode. Support up to 8 cores and thread number per core is no more than 2. This model is written in C++.

Ports for PPUMultiThreadModeSwitch

Table 3-744: Ports

Name	Protocol	Type	Description
pchannel_from_ppu_s[8]	PChannel	Slave	-
pchannel_to_cpu_m[8]	PChannel	Master	-
wakerequest_from_gic_s[16]	Signal	Slave	-
wakerequest_to_ppu_m[8]	Signal	Master	-

Parameters for PPUMultiThreadModeSwitch

mt_mode

Type

bool

Default value

0x0

Multi-threaded mode.

3.7.44 PS2Keyboard

Interface component, which takes the keypress/release signals from the Visualisation component and translates them into clocked PS2Data signals which can be routed to a PL050_KMI component. This model is written in LISA+.

Iris and MTI instances for PS2Keyboard

This model has the following Iris instances:

Table 3-745: PS2Keyboard Iris instances

InstanceName	ComponentName
PS2Keyboard	PS2Keyboard
PS2Keyboard.ps2_clocktimer	ClockTimerThread
PS2Keyboard.ps2_clocktimer.timer	ClockTimerThread64
PS2Keyboard.ps2_clocktimer.timer.thread	SchedulerThread
PS2Keyboard.ps2_clocktimer.timer.thread_event	SchedulerThreadEvent

PS2Keyboard contains the following CADI targets:

- ClockTimerThread

- ClockTimerThread64
- PS2Keyboard
- SchedulerThread
- SchedulerThreadEvent

Ports for PS2Keyboard

Table 3-746: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock signal to rate at which PS2Data signals are generated.
keyboard	KeyboardStatus	Slave	Receives keyboard input from, for example, the Visualisation component.
ps2	PS2Data	Master	Connection to the PS/2 controller, for example, the PL050_KMI.

3.7.45 PS2Mouse

Interface component, which takes the keypress/release signals from the Visualisation component and translates them into clocked PS2Data signals which can be routed to a PL050_KMI component. This model is written in LISA+.

Iris and MTI instances for PS2Mouse

This model has the following Iris instances:

Table 3-747: PS2Mouse Iris instances

InstanceName	ComponentName
PS2Mouse	PS2Mouse
PS2Mouse.ps2_clocktimer	ClockTimerThread
PS2Mouse.ps2_clocktimer.timer	ClockTimerThread64
PS2Mouse.ps2_clocktimer.timer.thread	SchedulerThread
PS2Mouse.ps2_clocktimer.timer.thread_event	SchedulerThreadEvent

PS2Mouse contains the following CADI targets:

- ClockTimerThread
- ClockTimerThread64
- PS2Mouse
- SchedulerThread
- SchedulerThreadEvent

Ports for PS2Mouse

Table 3-748: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock signal to rate at which PS2Data signals are generated.

Name	Protocol	Type	Description
mouse	MouseStatus	Slave	Receives keyboard input from, for example, the Visualisation component.
ps2	PS2Data	Master	Connection to the PS/2 controller, for example the PL050_KMI.

3.7.46 PVBusGICv3Comms

GICv3 Component for conversion between GICv3Comms protocol and PVBus. This model is written in C++.

Iris and MTI instances for PVBusGICv3Comms

This model has the following Iris instances:

Table 3-749: PVBusGICv3Comms Iris instances

InstanceName	ComponentName
PVBusGICv3Comms	PVBusGICv3Comms
PVBusGICv3Comms.bus_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-750: PVBusGICv3Comms MTI instances

InstanceName	ComponentName
PVBusGICv3Comms	PVBusGICv3Comms
PVBusGICv3Comms.bus_slave	PVBusSlave

PVBusGICv3Comms contains the following CADI targets:

- [PVBusGICv3Comms](#)

Ports for PVBusGICv3Comms

Table 3-751: Ports

Name	Protocol	Type	Description
axi_master_id_m[256]	Value	Master	-
distributor_m[256]	GICv3Comms	Master	-
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

3.7.47 PVMetaDataController

A simulation-only (not in hardware) component that can service metadata requests for transactions on PVBUS. This model is written in C++.

About PVMetaDataController

This file defines an entity in a memory-system that responds to requests for manipulating metadata during a bus transaction and/or as part of Armv8.5-A instruction execution.

This entity is represented by `MetaDataController`. This is intended to be an `sg::Component` which can be instantiated and connected in a platform.

`MetaDataController` is a `pv::RemapTransactionIntermediary` as it needs to intercept bus transactions to apply metadata-operations and set up DMI to metadata-memory, that is, assign `MetaDataPayload_t.set_dmi()`.

By being a `pv::RemapTransactionIntermediary` and using DMIs for data and metadata, it has a very small impact on simulation speed.

Note

The Armv8.5-A specification mentions that Colour-Check, which is a certain kind of metadata operation, happens in the physical memory system and a Processing Element (PE) only cares about the result of such an operation. However doing this for *all* memory accesses will drastically slow down the simulation. While the first memory access of a `MetaDataPage_t` comes to `MetaDataController`, the rest of the accesses for addresses in this page are made through `MetaDataDMI_t`. This essentially means that Colour-Check is done in this class only *once* for every `MetaDataPage_t`. On other occasions, the intention is that the checks are done by the holder of `MetaDataDMI_t`.

Ports for PVMetaDataController

Table 3-752: Ports

Name	Protocol	Type	Description
<code>pvbuss_m</code>	PVBUS	Master	-
<code>pvbuss_s</code>	PVBUS	Slave	-

Parameters for PVMetaDataController

`init_value`

Type

int

Default value

0xd

Initialize metadata memory with this value. If one of `init_values_json` or `init_values_json_file` is specified, this value applies only to any metadata not specified in the JSON.

init_values_json**Type**

string

Default value

""

A JSON value describing initial metadata values. Mutually exclusive with `init_values_json_file`. The format is as follows: { "regions": [{ "begin": 0x0, "end": 0x10000, "mte_tag": 0xa }, { "begin": 0x20000, "end": 0x50000, "mte_tag": 0xc }] }.

init_values_json_file**Type**

string

Default value

""

Path to a JSON file with initial metadata values. Mutually exclusive with `init_values_json`. The format is as follows: { "regions": [{ "begin": 0x0, "end": 0x10000, "mte_tag": 0xa }, { "begin": 0x20000, "end": 0x50000, "mte_tag": 0xc }] }.

is_enabled**Type**

bool

Default value

0x0

If false, disables the MetaData controller functionality, and makes the component invisible to passing transactions.

mte_tag_carveout_json**Type**

string

Default value

""

JSON string that specifies the PA range of the tag carveout regions and the beginning of the PA range for which they provide tag storage. If `pa_regions_with_metadata_storage` defines which regions can have metadata, the tag carveout regions cannot overlap them, and each tagged region must be entirely covered by one of them. The block size must be ≥ 64 bytes and a power of 2, defaulting to 4KiB. The maximum block size supported is 4KiB. The carveout region size must be ≥ 4 KiB and a power of 2, and determines the size of the corresponding tagged region. { "regions": [{ "begin": 0x0, "tag_carveout_region": [0xfffff00000, 0xfffff00fff] }, { "begin": 0x20000, "tag_carveout_region": [0xfffff01000, 0xfffff01fff], "block_size": 0x100 }, { "begin": 0x100000, "tag_carveout_region": [0xfffff08000, 0xfffff0Bfff], "block_size": 0x2000 },] }.

mte_tag_carveout_json_file

Type
string

Default value
""

Path to a JSON file that specifies the PA range of the tag carveout regions with the same format as mte_tag_carveout_json. Only one of mte_tag_carveout_json and mte_tag_carveout_json_file can be used. .

mte_tag_carveout_tag_order

Type
string

Default value
"little-endian"

Order of the tags within the MTE tag carveout blocks. This can be little-endian (same order as the corresponding tagged data) or big-endian (reverse order). The parameter accepts both '-' and '_', so 'little-endian', 'big-endian', 'little_endian' and 'big_endian' are all valid. THIS PARAMETER HAS NO FUNCTIONALITY AT THE MOMENT.

pa_regions_with_metadata_storage

Type
string

Default value
""

Specify the address region where the metadata storage is available for each PAS in a JSON format. If the PAS does not have a region specified, the PAS has metadata storage for all of the space. The regions are defined by begin and end_incl addresses. Example: { "ns":[0xa0000000, 0xa0000fff], "s":[0xb0000000, 0xb0000fff], "rl":[0xc0000000, 0xc0000fff], "rt":[0xd0000000, 0xd0000fff] } ns: non-secure, s: secure, rl: realm, rt: root.

3.7.48 PchannelListener

Provides a dummy PChannel device to accept all request. This model is written in C++.

Ports for PchannelListener

Table 3-753: Ports

Name	Protocol	Type	Description
dev_pchannel_s	PChannel	Slave	-

Parameters for PchannelListener

diagnostics

Type
int

Default value
0x0

Diagnostics.

3.7.49 RAMDevice

RAM device, can be dynamic or static ram. This model is written in LISA+.

Iris and MTI instances for RAMDevice

This model has the following Iris instances:

Table 3-754: RAMDevice Iris instances

InstanceName	ComponentName
RAMDevice	RAMDevice
RAMDevice.bus_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-755: RAMDevice MTI instances

InstanceName	ComponentName
RAMDevice	RAMDevice
RAMDevice.bus_slave	PVBusSlave

RAMDevice contains the following CADI targets:

- RAMDevice

About RAMDevice

As a generic device, this component does not have a hardware revision code.

Ports for RAMDevice

Table 3-756: Ports

Name	Protocol	Type	Description
pvbus	PVBus	Slave	Bus slave interface.

Parameters for RAMDevice

enable_atomic_ops

Type

bool

Default value

0x0

Supports Atomic Operations.

fill1

Type

int

Default value

0x0

Fill pattern 1, initialise memory at start of simulation with alternating fill1, fill2 pattern.

fill2

Type

int

Default value

0x0

Fill pattern 2, initialise memory at start of simulation with alternating fill1, fill2 pattern.

read_latency

Type

int

Default value

0x0

Memory read latency (ps/byte).

size

Type

int

Default value

0x100000000

Memory Size.

write_latency

Type

int

Default value

0x0

Memory write latency (ps/byte).

3.7.50 RAMDevice_cpp

RAM device, can be dynamic or static ram. This model is written in C++.

Iris and MTI instances for RAMDevice_cpp

This model has the following Iris instances:

Table 3-757: RAMDevice_cpp Iris instances

InstanceName	ComponentName
RAMDevice_cpp	RAMDevice
RAMDevice_cpp.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-758: RAMDevice_cpp MTI instances

InstanceName	ComponentName
RAMDevice_cpp	RAMDevice
RAMDevice_cpp.PVBusSlave	PVBusSlave

RAMDevice_cpp contains the following CADI targets:

- RAMDevice

Ports for RAMDevice_cpp

Table 3-759: Ports

Name	Protocol	Type	Description
pvbus	PVBus	Slave	-

Parameters for RAMDevice_cpp

enable_atomic_ops

Type

bool

Default value

0x0

Supports Atomic Operations.

fill1**Type**

int

Default value

0xdfdfdfcf

Fill pattern 1, initialise memory at start of simulation with alternating fill1, fill2 pattern.

fill2**Type**

int

Default value

0xcfdfdfdf

Fill pattern 2, initialise memory at start of simulation with alternating fill1, fill2 pattern.

read_latency**Type**

int

Default value

0x0

Memory read latency (ps/byte).

size**Type**

int

Default value

0x100000000

Memory Size.

write_latency**Type**

int

Default value

0x0

Memory write latency (ps/byte).

3.7.51 ROM

Simple ROM device. This model is written in LISA+.

Iris and MTI instances for ROM

This model has the following Iris instances:

Table 3-760: ROM Iris instances

InstanceName	ComponentName
ROM	ROM
ROM.bus_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-761: ROM MTI instances

InstanceName	ComponentName
ROM.bus_slave	PVBusSlave

ROM contains the following CADI targets:

- ROM

Ports for ROM

Table 3-762: Ports

Name	Protocol	Type	Description
pvbuss	PVBus	Slave	-

Parameters for ROM

abort_writes

Type

bool

Default value

0x0

Abort writes instead of ignoring them.

log2_size

Type

int

Default value

0x14

Log2 size (bytes) e.g. 20 is 1 MiB.

raw_image**Type**

string

Default value

""

Raw image file to load at init time.

3.7.52 RSE_Integ_Regs

RSE Integration Layer Registers. This model is written in C++.

Iris and MTI instances for RSE_Integ_Regs

This model has the following Iris instances:

Table 3-763: RSE_Integ_Regs Iris instances

InstanceName	ComponentName
RSE_Integ_Regs	RSE_Integration_Registers
RSE_Integ_Regs.ClockDivider	ClockDivider
RSE_Integ_Regs.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-764: RSE_Integ_Regs MTI instances

InstanceName	ComponentName
RSE_Integ_Regs.ClockDivider	ClockDivider
RSE_Integ_Regs.PVBusSlave	PVBusSlave

RSE_Integ_Regs contains the following CADI targets:

- [RSE_Integration_Registers](#)

Ports for RSE_Integ_Regs

Table 3-765: Ports

Name	Protocol	Type	Description
EXTMCPRESETn	Signal	Master	-
EXTTSCPRESETn	Signal	Master	-
MCP_ATU_AP	Signal	Master	-
MCP_RAS_ERR_CLEAR	Signal	Master	-
pvbus_s	PVBus	Slave	-
REFCLK	ClockSignal	Slave	-
reset_in	Signal	Slave	-

Name	Protocol	Type	Description
RSECORECLK	ClockSignal	Master	-
SCP_ATU_AP	Signal	Master	-
SCP_RAS_ERR_CLEAR	Signal	Master	-
SYSPLLCLK	ClockSignal	Slave	-

Parameters for RSE_Integ_Regs

chip_id

Type

int

Default value

0x0

RSE Integration Register Chip ID.

diagnostics

Type

int

Default value

0x0

RSE Integration Registers Diagnostics.

multichip_mode

Type

bool

Default value

0x0

RSE Integration Register multichip mode.

3.7.53 RandomNumberGenerator

Random Number Generator unit. This model is written in C++.

Iris and MTI instances for RandomNumberGenerator

This model has the following Iris instances:

Table 3-766: RandomNumberGenerator Iris instances

InstanceName	ComponentName
RandomNumberGenerator	RandomNumberGenerator

InstanceName	ComponentName
RandomNumberGenerator.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-767: RandomNumberGenerator MTI instances

InstanceName	ComponentName
RandomNumberGenerator.PVBusSlave	PVBusSlave

RandomNumberGenerator contains the following CADI targets:

- RandomNumberGenerator

Ports for RandomNumberGenerator

Table 3-768: Ports

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	Bus slave interface.
RNG_intr	Signal	Master	Interrupt output.

Parameters for RandomNumberGenerator

diagnostics

Type

int

Default value

0x0

Diagnostics.

seed

Type

int

Default value

0x0

Random number seed.

3.7.54 RealTimeLimiter

Real Time Limiter. This model is written in LISA+.

Iris and MTI instances for RealTimeLimiter

This model has the following Iris instances:

Table 3-769: RealTimeLimiter Iris instances

InstanceName	ComponentName
RealTimeLimiter	RealTimeLimiter
RealTimeLimiter.divider	ClockDivider

This model has the following MTI trace components:

Table 3-770: RealTimeLimiter MTI instances

InstanceName	ComponentName
RealTimeLimiter.divider	ClockDivider

RealTimeLimiter contains the following CADI targets:

- ClockDivider
- RealTimeLimiter

Ports for RealTimeLimiter

Table 3-771: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock input.

Parameters for RealTimeLimiter

ENABLE

Type

bool

Default value

0x0

Rate limit simulation.

RELATIVE_SPEED

Type

int

Default value

0x64

Rate limit to at most this percentage of real time (100: limit to wall clock rate).

divider.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

3.7.55 RealtimeClockTimer

Host Time Based Timer Module for Generic Timers. This model is written in C++.

Ports for RealtimeClockTimer**Table 3-772: Ports**

Name	Protocol	Type	Description
set_frequency	Value_64	Slave	-
timer_callback	TimerCallback64	Master	-
timer_control	TimerControl64	Slave	-

3.7.56 RemapDecoder

The component that provides support for dynamically remappable regions of memory. This model is written in LISA+.

Iris and MTI instances for RemapDecoder

This model has the following Iris instances:

Table 3-773: RemapDecoder Iris instances

InstanceName	ComponentName
RemapDecoder	RemapDecoder
RemapDecoder.bus_switch	TZSwitch
RemapDecoder.bus_switch.pvbus_mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-774: RemapDecoder MTI instances

InstanceName	ComponentName
RemapDecoder.bus_switch.pvbus_mapper	PVBusMapper

RemapDecoder contains the following CADI targets:

- RemapDecoder
- TZSwitch

Ports for RemapDecoder

Table 3-775: Ports

Name	Protocol	Type	Description
control	TZSwitchControl	Broadcast	-
input	PVBus	Slave	Incoming bus transactions (connected straight to TZSwitch).
output_remap_clear	PVBus	Master	Outgoing bus transactions when remap is clear.
output_remap_set	PVBus	Master	Outgoing bus transactions when remap is set.
remap	StateSignal	Slave	Remapping control.

Parameters for RemapDecoder

`bus_switch.normal`

Type

int

Default value

0x2

Normal Port.

`bus_switch.secure`

Type

int

Default value

0x1

Secure Port.

3.7.57 RootKeyStorage

Trusted Root-Key Storage unit. This model is written in C++.

Iris and MTI instances for RootKeyStorage

This model has the following Iris instances:

Table 3-776: RootKeyStorage Iris instances

InstanceName	ComponentName
RootKeyStorage	RootKeyStorage
RootKeyStorage.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-777: RootKeyStorage MTI instances

InstanceName	ComponentName
RootKeyStorage.PVBusSlave	PVBusSlave

RootKeyStorage contains the following CADI targets:

- RootKeyStorage

Ports for RootKeyStorage

Table 3-778: Ports

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	-

Parameters for RootKeyStorage

diagnostics

Type

int

Default value

0x0

Diagnostics.

hw_unique_key

Type

string

Default value

"00000000 00000000 00000000 00000000"

Hardware Unique Key (128-bit, 4 std::hex words).

hw_unique_key_hex

Type

string

Default value

""

Hardware Unique Key (128-bit, little-endian std::hex byte stream).

private_key

Type

string

Default value

"00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000"

Private Endorsement Key (256-bit, 8 std::hex words).

private_key_hex**Type**

string

Default value

""

Private Key (256-bit, little-endian std::hex byte stream).

public_key**Type**

string

Default value

"00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000"

Public Key (256-bit, 8 std::hex words).

public_key_hex**Type**

string

Default value

""

Public Key (256-bit, little-endian std::hex byte stream).

ss_key**Type**

string

Default value

"00000000 00000000 00000000 00000000"

Secret Symmetric Key (128-bit, 4 std::hex words).

ss_key_hex**Type**

string

Default value

""

Secret Symmetric Key (128-bit, little-endian std::hex byte stream).

version

Type

string

Default value

"r1"

Version of the model functionality. Valid values are r0 and r1.

3.7.58 SI_System_Ctrl_Regs

Safety Island System Control Registers. This model is written in C++.

Iris and MTI instances for SI_System_Ctrl_Regs

This model has the following Iris instances:

Table 3-779: SI_System_Ctrl_Regs Iris instances

InstanceName	ComponentName
SI_System_Ctrl_Regs	SI_System_Control_Registers
SI_System_Ctrl_Regs.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-780: SI_System_Ctrl_Regs MTI instances

InstanceName	ComponentName
SI_System_Ctrl_Regs.PVBusSlave	PVBusSlave

SI_System_Ctrl_Regs contains the following CADI targets:

- SI_System_Control_Registers

Ports for SI_System_Ctrl_Regs

Table 3-781: Ports

Name	Protocol	Type	Description
cpuhalt_m[7]	Signal	Master	-
pvbus_s	PVBus	Slave	-
reset_in	Signal	Slave	-
rvbar_cl0[1]	Value_64	Master	-
rvbar_cl1[2]	Value_64	Master	-
rvbar_cl2[4]	Value_64	Master	-

Parameters for SI_System_Ctrl_Regs

c10_c0_cfgrvbaraddr

Type

int

Default value

0x120000000

CL0_C0_CFGRVBARADDR.

c11_c0_cfgrvbaraddr

Type

int

Default value

0x140000000

CL1_C0_CFGRVBARADDR.

c11_c1_cfgrvbaraddr

Type

int

Default value

0x140002000

CL1_C1_CFGRVBARADDR.

c12_c0_cfgrvbaraddr

Type

int

Default value

0x160000000

CL2_C0_CFGRVBARADDR.

c12_c1_cfgrvbaraddr

Type

int

Default value

0x160002000

CL2_C1_CFGRVBARADDR.

cl2_c2_cfgrvbaraddr**Type**

int

Default value

0x160004000

CL2_C2_CFGRVBARADDR.

cl2_c3_cfgrvbaraddr**Type**

int

Default value

0x160008000

CL2_C3_CFGRVBARADDR.

cpuhalt_reset**Type**

int

Default value

0x0

CPU HALT Reset value.

diagnostics**Type**

int

Default value

0x0

Diagnostics.

3.7.59 SMCF

System Monitoring Control Framework (SMCF). This model is written in C++.

Changes in 11.27.17

Ports added:

- mli_hsp_enable_ack_in
- mli_hsp_enable_out
- smcf_mli_pvbus_m

Ports removed:

- mli_amu_pvbus_m

Iris and MTI instances for SMCF

This model has the following Iris instances:

Table 3-782: SMCF Iris instances

InstanceName	ComponentName
SMCF	SMCF

SMCF contains the following CADI targets:

- SMCF

Ports for SMCF

Table 3-783: Ports

Name	Protocol	Type	Description
mgi_clk_in	ClockSignal	Slave	Clock input
mgi_irq_out	Signal	Master	Interrupt signal output
mgi_pvbus_m	PVBus	Master	For DMA or memory mapped data write
mgi_reg_pvbus_s	PVBus	Slave	To access MGI register
mgi_reset_in	Signal	Slave	Reset signal input
mgi_tag_in[4]	Value	Slave	Tag value from external hardware
mgi_trigger_in	Signal	Slave	To trigger the start of a sample by external hardware
mgi_trigger_out	Signal	Master	Signal to external hardware to indicate that an event has occurred in an MGI
mli_hsp_enable_ack_in[32]	Signal	Slave	Acknowledgement signal for enable signal in hsp.
mli_hsp_enable_out[32]	Signal	Master	Signal to enable Ring Oscillators in hsp.
mli_powerdown_in[32]	Signal	Slave	It gives info about AP is power OFF or not
mli_temperature_in[32]	ValueState	Slave	It will be connected to temperature sensor to fetch the temperature value
smcf_mli_pvbus_m[32]	PVBus	Master	manager port to read/write the AMU or HSP register value

Parameters for SMCF

ALERT_NUM_CFG

Type

int

Default value

0x0

Specifies the number of alerts present A value of 0 means that no alerts are present.

ALT_ADDR_CFG**Type**

int

Default value

0x0

Specifies where monitor data is read from, it is either: 0: The MGI_DATA<n> registers. 1: The address specified in MGI_RADDR0/1.

ALT_DELTA_CFG**Type**

int

Default value

0x0

Specifies the presence of alert rising and falling delta functions 0: The rising and falling delta functions are not present 1: The rising and falling delta functions are present.

DATA_PER_MON_CFG**Type**

int

Default value

0x0

Specifies the number of data values(DATA_PER_MON_CFG+1) generated from each monitor.

DEF_CFG_IRQ_MASK**Type**

int

Default value

0x1

Specifies the default value of the configuration interrupt event mask. Sets the reset value of MGI_IRQ_MASK.CFG_IRQ_MASK.

DEF_CFG_TRIG_MASK**Type**

int

Default value

0x1

Specifies the default value of the configuration trigger event mask. Sets the reset value of MGI_TRG_MASK.CFG_TRIG_MASK.

DEF_RADDR_CFG**Type**

int

Default value

0x0

Specifies the default alternate read address. This sets the default value for MGI_RADDR0/MGI_RADDR1.

DEF_WADDR_CFG**Type**

int

Default value

0x0

Specifies the default write address for the DMA interface. This sets the default value for MGI_WADDR0/MGI_WADDR1. Only required if DMA_IF_CFG = 1. This value must be 32-bit aligned.

DMA_IF_CFG**Type**

int

Default value

0x0

Specifies the presence of the DMA interface 0: DMA interface is not present 1: DMA interface is present.

END_COMPONENT**Type**

int

Default value

0x0

Based on this parameter value sampling value will be fetched from the respective model 0: Temperature sensor 1: Monitor unit (AMU) 2: Fake sensor/monitor.

FAKE_SENSOR_MAX_LIMIT**Type**

int

Default value

0xffff

Maximum value limit for the fake sensor/monitor.

FAKE_SENSOR_MIN_LIMIT**Type**

int

Default value

0x0

Minimum value limit for the fake sensor/monitor.

GRP_ID_CFG**Type**

int

Default value

0x0

Specifies a unique identifier for an MGI.

MGI_AIDR_RESET_VALUE**Type**

int

Default value

0x10

Reset value for MGI_AIDR register.

MGI_IIDR_RESET_VALUE**Type**

int

Default value

0x8d00043b

Reset value for MGI_IIDR register.

MLI_QUANTITY**Type**

int

Default value

0x1

Specifies the number of MLI.

MODE_LEN_CFG**Type**

int

Default value

0x1f

Specifies the bit width of each MGI_MODE_REQ/STAT. The number of bits is MODE_LEN_CFG +1.

MODE_REG_CFG**Type**

int

Default value

0x0

Specifies the number of MGI_MODE_REQ/STAT pairs. A value of 0 means that no MGI_MODE_REQ/STAT pairs are present.

MON_BASE_ADDRESS**Type**

int

Default value

0x0

AMU base address to which an offset is applied. It is used for configuration writes and data read bursts.

MON_DATA_WIDTH_CFG**Type**

int

Default value

0x1f

Specifies the bit width(MON_DATA_WIDTH_CFG+1) of each monitor data value.

MON_DISCON_CFG**Type**

int

Default value

0x0

Specifies if each monitor supports being disconnected. For example, bit 0 represents monitor 0, and bit 3 represents monitor 3. 0b0: Monitor does not support being disconnected. It is reset to connected. 0b1: Monitor supports being disconnected. It is reset to disconnected.

MON_NUM_CFG**Type**

int

Default value

0x0

Specifies the number of monitors(MON_NUM_CFG+1) in an MGI.

PACKED_CFG**Type**

int

Default value

0x0

Specifies if monitor data is packed 0: Data is not packed 1: Data is packed.

PER_TIMER_CFG**Type**

int

Default value

0x0

Specifies the presence of the periodic timer 0: The periodic timer is not present 1: The periodic timer is present.

SINGLE_MON_MODE_CFG**Type**

int

Default value

0x0

Specifies that each monitor is a single type and all monitors will have the same mode setting.

SMP_DLY_LEN_CFG**Type**

int

Default value

0x0

Specifies the bit width of MGI_SMP_DLY. The number of bits in SMP_DLY_LEN_CFG. A value of 0 means this register is not present and the feature is not supported.

TAG_IN_CFG**Type**

int

Default value

0x1

Specifies the presence of the tag input 0: The tag input is not present 1: The tag input is present.

TAG_LEN_CFG**Type**

int

Default value

0x1f

Specifies the bit width of the tag input The tag bit width is TAG_LEN_CFG+1.

TRIG_IN_CFG**Type**

int

Default value

0x1

Specifies the presence of the input trigger interface 0: The trigger in interface is not present 1: The trigger in interface is present.

TRIG_OUT_CFG**Type**

int

Default value

0x1

Specifies the presence of the output trigger interface 0: The trigger out interface is not present 1: The trigger out interface is present.

USER_DEF_CMD_CFG**Type**

int

Default value

0x0

Specifies if an MGI supports User-Defined commands. 0: User-Defined commands are not supported. 1: User-Defined commands are supported.

diagnostics

Type

int

Default value

0x2

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.7.60 SMMUv3TestEngine

Test Engine used for testing SMMUv3. This model is written in C++.

Iris and MTI instances for SMMUv3TestEngine

This model has the following Iris instances:

Table 3-784: SMMUv3TestEngine Iris instances

InstanceName	ComponentName
SMMUv3TestEngine	SMMUv3TestEngine
SMMUv3TestEngine.register_file[0]	PVBusSlave

This model has the following MTI trace components:

Table 3-785: SMMUv3TestEngine MTI instances

InstanceName	ComponentName
SMMUv3TestEngine	SMMUv3TestEngine
SMMUv3TestEngine.register_file[0]	PVBusSlave

SMMUv3TestEngine contains the following CADI targets:

- SMMUv3TestEngine

Ports for SMMUv3TestEngine

Table 3-786: Ports

Name	Protocol	Type	Description
client_s	PCIDevice2ClientProtocol	Slave	-
clk_in	ClockSignal	Slave	-
identify	SMMUv3AEMIdentifyProtocol	Slave	-
pvbus_control_s	PVBus	Slave	-
pvbus_m[64]	PVBus	Master	-
reset_in	Signal	Slave	-

Parameters for SMMUv3TestEngine

bandwidth_per_transaction_in_bytes_per_tick

Type

int

Default value

0x64

The bandwidth of the device for each in-flight transaction, in bytes/tick of clk_in. This is only a rough guess. If you are uninterested in trying to run cores and the engine simultaneously then set this to a large number.

max_number_of_inflight_transactions

Type

int

Default value

0xa

The maximum number of in-flight transactions allowed.

output_attribute_transform

Type

string

Default value

""

How to pack the stream identification information into the transaction attributes. This is: - * <empty> or "default" * "pcie" the de-facto standard for the PCIe subsystem in FastModels The <empty> or "default" is equivalent to:- ExtendedID[63]=nSEC_SID, ExtendedID[55:24]=StreamID, ExtendedID[20]=nSSV, ExtendedID[19:0]=SubstreamID The "pcie" option is equivalent to:- ExtendedID[63]=SEC_SID, ExtendedID[62]=SSV, ExtendedID[51:32]=SubstreamID, ExtendedID[31:0]=StreamID .

seed

Type

int

Default value

0x12345678

The seed to use for initialising the random number generators.

3.7.61 STLBusGasket

STLBusGasket allows a debugger or emulated T32 code to force the results of system-register reads by writing an address to the ADDR register then 32-bit values to the VALUE register, which are placed in a fifo associated with that address. A PVBUS transaction into pvbus_in goes unchanged to pvbus_out, unless its address matches that associated with a non-empty fifo, in which case: writes are ignored, non-word reads abort, and word reads take values from that fifo. This model is written in LISA+.

Iris and MTI instances for STLBusGasket

This model has the following Iris instances:

Table 3-787: STLBusGasket Iris instances

InstanceName	ComponentName
STLBusGasket	STLBusGasket
STLBusGasket.busmapper	PVBusMapper

This model has the following MTI trace components:

Table 3-788: STLBusGasket MTI instances

InstanceName	ComponentName
STLBusGasket.busmapper	PVBusMapper

STLBusGasket contains the following CADI targets:

- STLBusGasket

Ports for STLBusGasket

Table 3-789: Ports

Name	Protocol	Type	Description
pvbus_in	PVBus	Slave	-
pvbus_out	PVBus	Master	-

Parameters for STLBusGasket

function

Type

int

Default value

0x0

Function: 0-none, 1-STL value-forcing.

reg_base

Type
int

Default value
0xe001e820

Base Address of STL control regs (ADDR,VAL at offsets 0,4).

verbose

Type
int

Default value
0x0

Verbosity : 0-none, 1-some.

3.7.62 SerialCrossover

Implement an equivalent to a null-modem cable, swapping over serial transmit and receive signals. This model is written in C++.

About SerialCrossover

This component implements two SerialData slave ports and can connect two SerialData master ports, such as from PL011_Uart components. Data received on one port is buffered in a FIFO until it is read from the other port. Signals received on one port are latched and available to be read by the other port.

Ports for SerialCrossover

Table 3-790: Ports

Name	Protocol	Type	Description
port_a	SerialData	Slave	Slave port for connecting to a SerialData master.
port_b	SerialData	Slave	Slave port for connecting to a SerialData master.

3.7.63 SoC_SOR

System Override Registers unit. This model is written in C++.

Iris and MTI instances for SoC_SOR

This model has the following Iris instances:

Table 3-791: SoC_SOR Iris instances

InstanceName	ComponentName
SoC_SOR	SoC_SOR
SoC_SOR.PVBusMapper	PVBusMapper
SoC_SOR.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-792: SoC_SOR MTI instances

InstanceName	ComponentName
SoC_SOR.PVBusMapper	PVBusMapper
SoC_SOR.PVBusSlave	PVBusSlave

SoC_SOR contains the following CADI targets:

- SoC_SOR

Ports for SoC_SOR

Table 3-793: Ports

Name	Protocol	Type	Description
hdlcd0_pvbus_s	PVBus	Slave	-
hdlcd1_pvbus_s	PVBus	Slave	-
hdlcd_pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

Parameters for SoC_SOR

diagnostics

Type

int

Default value

0x0

Diagnostics.

gpr0

Type

int

Default value

0x0

General Purpose Register 0.

gpr1
Type
int
Default value
0x0

General Purpose Register 1.

3.7.64 SystemIdUnit

System ID Unit. This model is written in C++.

Iris and MTI instances for SystemIdUnit

This model has the following Iris instances:

Table 3-794: SystemIdUnit Iris instances

InstanceName	ComponentName
SystemIdUnit	SystemIdUnit
SystemIdUnit.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-795: SystemIdUnit MTI instances

InstanceName	ComponentName
SystemIdUnit.PVBusSlave	PVBusSlave

SystemIdUnit contains the following CADI targets:

- SystemIdUnit

Ports for SystemIdUnit

Table 3-796: Ports

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	-

Parameters for SystemIdUnit

chip_id
Type
int
Default value
0x0

the ID for the node/chip when there are multiple SoCs.

chiplet_type

Type

bool

Default value

0x0

Specifies Compute Chiplet (CC) or Specialization Chiplet (SC). 0 - CC, 1 - SC.

multi_chip_mode

Type

bool

Default value

0x0

Multi chip mode?.

platform_type

Type

int

Default value

0x0

the type of the subsystem: 0=mobile, 1=InfraSysDesign4.x, 2=InfraSysDesign5.x, 3=InfraSysDesign6.x, 4=SafetyIsland, 5=Client.

soc_id

Type

int

Default value

0x0

the ID for the SoC that integrates the subsystem.

system_cfg

Type

int

Default value

0x0

the ID for the subsystem configuration.

system_id**Type**

int

Default value

0x0

the version ID for the subsystem.

3.7.65 System_Time_Synchronization_Control_cpp

System Time Synchronization Control. This model is written in C++.

Iris and MTI instances for System_Time_Synchronization_Control_cpp

This model has the following Iris instances:

Table 3-797: System_Time_Synchronization_Control_cpp Iris instances

InstanceName	ComponentName
System_Time_Synchronization_Control_cpp	System_Time_Synchronization_Control
System_Time_Synchronization_Control_cpp.PVBusMapper	PVBusMapper
System_Time_Synchronization_Control_cpp.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-798: System_Time_Synchronization_Control_cpp MTI instances

InstanceName	ComponentName
System_Time_Synchronization_Control_cpp.PVBusMapper	PVBusMapper
System_Time_Synchronization_Control_cpp.PVBusSlave	PVBusSlave

System_Time_Synchronization_Control_cpp contains the following CADI targets:

- System_Time_Synchronization_Control

Ports for System_Time_Synchronization_Control_cpp

Table 3-799: Ports

Name	Protocol	Type	Description
memmap_counter_m	PVBus	Master	-
pri_signal_s	Signal	Slave	-
pdbus_s	PVBus	Slave	-
sec_signal_m	Signal	Master	-
tupdate_pdbus_m	PVBus	Master	-
tupdate_pdbus_s	PVBus	Slave	-

Parameters for System_Time_Synchronization_Control_cpp

diagnostics

Type
int
Default value
0x0

Diagnostics.

is_manager_chip

Type
bool
Default value
0x0

Set to true if the Time Synchronization module is present in the primary chip or else false.

3.7.66 TRNG

True Random Number Generator. This model is written in C++.

Iris and MTI instances for TRNG

This model has the following Iris instances:

Table 3-800: TRNG Iris instances

InstanceName	ComponentName
TRNG	TRNG
TRNG.PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-801: TRNG MTI instances

InstanceName	ComponentName
TRNG.PVBusSlave	PVBusSlave

TRNG contains the following CADI targets:

- TRNG

Ports for TRNG

Table 3-802: Ports

Name	Protocol	Type	Description
cc_host_int_req	Signal	Master	-
pvbus_s	PVBus	Slave	-
rng_clk	ClockSignal	Slave	-
rst_n	Signal	Slave	-
scanmode	Signal	Slave	-

Parameters for TRNG

diagnostics

Type

int

Default value

0x0

Diagnostics.

3.7.67 TelnetTerminal

A host interface onto a serial port: exposes the two way serial data channel over a TCP/IP interface, and automatically opens a telnet application connected to the network socket, unless a user application connects first. This model is written in C++.

Iris and MTI instances for TelnetTerminal

This model has the following Iris instances:

Table 3-803: TelnetTerminal Iris instances

InstanceName	ComponentName
TelnetTerminal	TelnetTerminal

TelnetTerminal contains the following CADI targets:

- TelnetTerminal

Using TelnetTerminal

The following figure shows a block diagram of one possible relationship between the target and host through the TelnetTerminal component. The TelnetTerminal block is what you configure when you define Terminal component parameters. The Virtual Machine is an FVP.

Figure 3-2: Terminal block diagram

On the target side, the console process that is invoked by your target OS relies on a suitable driver being present. Such drivers are normally part of the OS kernel. The driver passes serial data

through a UART, for example [3.10.65 PL011_Uart](#) on page 4486. The data is forwarded to the TelnetTerminal component. When the simulation is started and the TelnetTerminal component is enabled, the component opens a server (listening) socket on a TCP/IP port. This is port 5000 by default. This port can be connected to by, for example, a Telnet process on the host.

When data becomes available on the network socket, the TelnetTerminal component buffers the data, which can then be read from SerialData.

If there is no connection to the network socket when the first data access is made, and the `start_telnet` parameter is true, a host Telnet session is started automatically. Prior to this first access, you can connect a client of your choice to the network socket.

If the connection between the TelnetTerminal component and the client is broken at any time, for example by closing a client Telnet session, the port is re-opened on the host, permitting you to make another client connection. This could have a different port number if the original one is no longer available.

The port number of a particular TelnetTerminal instance can be defined when your model system starts. The actual value of the port used by each TelnetTerminal is declared when it starts or restarts, and might not be the value that you specified if the port is already in use. If you are using Model Shell, the port numbers are displayed in the host window in which you started the model.

Microsoft Windows 10 disables the Telnet client by default. Follow these steps to enable it:

Note

1. Select **Start > Settings**.
 2. In the search box, type **Turn Windows features on or off**. The **Windows Features** dialog opens.
 3. Select the **Telnet Client** check box and click **OK**. The installation might take several minutes to complete.
-

TelnetTerminal parameters

To set the parameters, the syntax to use in a configuration file or on the command line is:

```
motherboard.terminal_x.parameter=value
```

where *x* is the terminal identifier and can be 0, 1, 2, or 3.

You can start the TelnetTerminal component in either of the following modes, depending on the `mode` parameter:

telnet

In Telnet mode, the terminal component supports a subset of the RFC 854 protocol. This means that the terminal participates in negotiations between the host and client concerning what is and is not supported, but there is no flow control.

raw

In raw mode the byte stream passes unmodified between the host and the target. The terminal does not participate in initial capability negotiations between the host and client. Instead it acts as a TCP/IP port. You can use this feature to directly connect to your target through the TelnetTerminal component. This permits a debugger connection, for example, to connect a gdb client to a gdbserver running on the target operating system.

The `terminal_command` parameter specifies the command line used to launch a terminal application and connect to the opened TCP port. The TelnetTerminal component replaces the keywords `%port` and `%title`, if specified, with the opened port number and component name, respectively. After replacing `%port` and `%title`, the command line is executed verbatim.

An empty string, which is the default, launches `xterm` on Linux or `telnet.exe` on Windows.

If you specify a non-empty string, it must include `%port`, but `%title` is optional.

For example:

```
fvp_mps2.telnetterminal0.terminal_command="putty.exe -telnet localhost %port"
```

Ports for TelnetTerminal

Table 3-804: Ports

Name	Protocol	Type	Description
serial	SerialData	Slave	Slave port for connecting to a SerialData master.

Parameters for TelnetTerminal

mode

Type

string

Default value

"telnet"

Terminal initialisation mode.

quiet

Type

bool

Default value

0x0

Avoid output on stdout/stderr.

start_port

Type
int

Default value
0x1388

Telnet TCP Port Number.

start_telnet

Type
bool

Default value
0x1

Start telnet if nothing connected.

terminal_command

Type
string

Default value
""

Commandline to launch a terminal application and connect to the opened TCP port. Keywords %port and %title will be replaced with the opened port number and component name respectively. An empty string (default behaviour) will launch xterm (Linux) or telnet.exe (Windows).

3.7.68 Temperature

Component to synthesis the temperature value of the connected core. This model is written in C+.

Iris and MTI instances for Temperature

This model has the following Iris instances:

Table 3-805: Temperature Iris instances

InstanceName	ComponentName
Temperature	Temperature

Temperature contains the following CADI targets:

- Temperature

Ports for Temperature

Table 3-806: Ports

Name	Protocol	Type	Description
cluster_powerdown	Signal	Slave	-
core_powerdown[8]	Signal	Slave	-
freq_changed	ValueState	Slave	-
temperature	ValueState	Master	-

Parameters for Temperature

core_coefficient

Type

int

Default value

0x0

Temperature Coefficient.

diagnostics

Type

int

Default value

0x0

Diagnostics.

num_cores

Type

int

Default value

0x4

Number of cores.

3.7.69 UnusedPrimeCell

A dummy component. It can be used to represent any unimplemented PrimeCell components. This model is written in LISA+.

Iris and MTI instances for UnusedPrimeCell

This model has the following Iris instances:

Table 3-807: UnusedPrimeCell Iris instances

InstanceName	ComponentName
UnusedPrimeCell	UnusedPrimeCell
UnusedPrimeCell.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-808: UnusedPrimeCell MTI instances

InstanceName	ComponentName
UnusedPrimeCell.busslave	PVBusSlave

UnusedPrimeCell contains the following CADI targets:

- UnusedPrimeCell

Ports for UnusedPrimeCell

Table 3-809: Ports

Name	Protocol	Type	Description
pvbuss	PVBus	Slave	Bus slave interface.

3.7.70 VirtioBlockDevice

virtio block device. This model is written in C++.

Iris and MTI instances for VirtioBlockDevice

This model has the following Iris instances:

Table 3-810: VirtioBlockDevice Iris instances

InstanceName	ComponentName
VirtioBlockDevice	VirtioBlockDevice
VirtioBlockDevice.register_slave	PVBusSlave
VirtioBlockDevice.virtio_master	PVBusMaster

This model has the following MTI trace components:

Table 3-811: VirtioBlockDevice MTI instances

InstanceName	ComponentName
VirtioBlockDevice	VirtioBlockDevice
VirtioBlockDevice.register_slave	PVBusSlave
VirtioBlockDevice.virtio_master	PVBusMaster

VirtioBlockDevice contains the following CADI targets:

- VirtioBlockDevice

About VirtioBlockDevice

VirtioBlockDevice implements a block device that can be accessed from the simulated OS if it has an appropriate driver. Similarly to the VirtioP9Device, this component is targeted primarily at Linux, which has a built-in virtio block driver. VirtioBlockDevice allows you to use a file on the host that you specify using the `image_path` parameter, as a hard drive in the simulated OS.

VirtioBlockDevice supports the legacy OASIS virtio specification.

Unlike the VirtioP9Device, you should not need to carry out any special setup to use VirtioBlockDevice on VE or Base platforms, because it is usually already included in the device trees. Set the `image_path` parameter to point to your image, and then on Linux it is available as a block device, usually `/dev/vda`, which you then use like any other hard drive.

Ports for VirtioBlockDevice

Table 3-812: Ports

Name	Protocol	Type	Description
intr	Signal	Master	Virtio device sets interrupt to signal completion.
pvbus	PVBus	Slave	Virtio MMIO control/config/status registers.
virtio_m	PVBus	Master	Virtio device performs DMA accesses via master.

Parameters for VirtioBlockDevice

`image_path`

Type

string

Default value

""

image file path.

`quiet`

Type

bool

Default value

0x0

Don't print warnings on malformed commands/descriptors.

`read_only`

Type

bool

Default value

0x0

Only allow device to be read.

secure_accesses

Type
bool

Default value
0x0

Make device generate transactions with NS=0.

transaction_attributes

Type
int

Default value
0x0

Transaction attributes used by device. 0x0 - inner-shared real access. 0x1 - outer-shared real access. 0x2 - outer-shared debug access.

3.7.71 VirtioBlockDeviceMMIO

Virtio v1.0 Block device over MMIO transport. This model is written in C++.

Iris and MTI instances for VirtioBlockDeviceMMIO

This model has the following Iris instances:

Table 3-813: VirtioBlockDeviceMMIO Iris instances

InstanceName	ComponentName
VirtioBlockDeviceMMIO	VirtioBlockMMIO
VirtioBlockDeviceMMIO.dma_master	PVBusMaster

This model has the following MTI trace components:

Table 3-814: VirtioBlockDeviceMMIO MTI instances

InstanceName	ComponentName
VirtioBlockDeviceMMIO.dma_master	PVBusMaster

VirtioBlockDeviceMMIO contains the following CADI targets:

- VirtioBlockMMIO

About VirtioBlockDeviceMMIO

VirtioBlockDeviceMMIO supports both the legacy and v1.0 OASIS virtio specifications.

VirtioBlockDeviceMMIO is an evolution of VirtioBlockDevice, which is also MMIO-based and has the same ports, but only supports the legacy OASIS virtio specification.

Ports for VirtioBlockDeviceMMIO

Table 3-815: Ports

Name	Protocol	Type	Description
intr	Signal	Master	Virtio device sets interrupt to signal completion.
pvbus	PVBus	Slave	Virtio MMIO control/config/status registers.
virtio_m	PVBus	Master	Virtio device performs DMA accesses via master.

Parameters for VirtioBlockDeviceMMIO

enabled

Type

bool

Default value

0x0

Enable or disable device. If disabled, device can be accessed, but will not be activated.

image_path

Type

string

Default value

""

Image file path.

quiet

Type

bool

Default value

0x0

Don't print info or warnings (e.g. on malformed commands/descriptors).

read_only

Type

bool

Default value

0x0

Only allow device to be read. If that parameter is set to false and the image file cannot be opened in RW mode, the model will try to work around it by opening the file in RO mode.

secure_accesses

Type

bool

Default value

0x0

Make device generate transactions with NS=0.

transaction_attributes

Type

int

Default value

0x0

Transaction attributes used by device. 0x0 - inner-shared real access. 0x1 - outer-shared real access. 0x2 - outer-shared debug access.

transport

Type

string

Default value

"modern"

Choose legacy or modern virtio transport, if not specified, modern transport is used.

3.7.72 VirtioNetMMIO

Virtio net device over MMIO transport. This model is written in C++.

Iris and MTI instances for VirtioNetMMIO

This model has the following Iris instances:

Table 3-816: VirtioNetMMIO Iris instances

InstanceName	ComponentName
VirtioNetMMIO	VirtioNetMMIO
VirtioNetMMIO.dma_master	PVBusMaster
VirtioNetMMIO.hostbridge	HostBridge

This model has the following MTI trace components:

Table 3-817: VirtioNetMMIO MTI instances

InstanceName	ComponentName
VirtioNetMMIO.dma_master	PVBusMaster

VirtioNetMMIO contains the following CADI targets:

- HostBridge
- VirtioNetMMIO

About VirtioNetMMIO

This is a model of a virtual Ethernet virtio device over MMIO transport, supporting both the legacy and v1.0 OASIS virtio specifications. It provides much better network performance than the SMSC_91C111 component, because it features host-assisted network acceleration. This means that it can offload packet processing operations from the simulated OS on the target, to the host side. These operations include:

- Checksum computation
- TX packet segmentation
- RX packet combination

If the target simulated Linux or Linux-derived OS has an appropriate virtio net driver, Arm recommends you use VirtioNetMMIO instead of SMSC_91C111.

Unlike SMSC_91C111, which must work with an external HostBridge component, VirtioNetMMIO has a built-in HostBridge sub-component. The parameters to control the HostBridge are described in the VirtioNetMMIO parameters table, with the `hostbridge` parameter sub-namespace.

To enable tracing of user-mode networking, which can help to debug networking issues, set the `FASTSIM_USERNET_DUMP` environment variable to any or all of the following values:

```
arpin,arpout,udpin,udpout,etherin,etherout,ipv4in,ipv4out,
ipv4fragin,ipv4fragout,tcpin,tcpout,dhcpv4in,dhcpv4out
```

Take the following steps to set up this component in a virtual platform:

- Use a version of Linux that contains a virtio network driver.
- Add the following option to the Linux kernel configuration:

```
CONFIG_VIRTIO_NET=y
```

- Update the device tree to include the VirtioNetMMIO component, or specify it on the kernel command line, for example

```
virtio_mmio.device=0x10000@0x1c150000:76
```

- The address range for both VE and Base platforms is 0x1C150000-0x1C15FFFF. The interrupt number is 44, or IRQ 76, for both VE and Base platforms.
- Select the hostbridge that you want to use to communicate with the host in the model:

```
virtio_net.hostbridge.userNetworking=true/false (User mode or TAP/TUN networking)
```

- Configure the networking environment, as described in [Configuring the networking environment for Microsoft Windows](#) and [Configuring the networking environment for Linux](#).

Example entries for DTS files

- Add this entry next to the corresponding virtio_block or virtio_p9 entry:

```
virtio_net@0150000 {  
    compatible = "virtio,mmio";  
    reg = <0x150000 0x1000>;  
    interrupts = <0x2c>;  
};
```

- Add this entry to the interrupt map:

```
<0 0 44 &gic 0 44 4>;
```

See also

- [Configuring the networking environment for Microsoft Windows](#)
- [Configuring the networking environment for Linux](#)

Ports for VirtioNetMMIO

Table 3-818: Ports

Name	Protocol	Type	Description
intr	Signal	Master	Virtio device sets interrupt to signal completion.
pvbus	PVBus	Slave	Virtio MMIO control/config/status registers.
virtio_m	PVBus	Master	Virtio device performs DMA accesses via master.

Parameters for VirtioNetMMIO

checksum

Type

string

Default value

""

For checksum-offloaded packets, if 'tx' is specified, outgoings will be checksummed by VirtioNet device; 'rx' is specified for incomings; 'all' for both.

enabled**Type**

bool

Default value

0x1

Enable or disable device. If disabled, device can be accessed, but will not be activated.

hostbridge.interfaceName**Type**

string

Default value

""

Host Interface.

hostbridge.userNetOptions**Type**

string

Default value

""

Control options for UserNet TCP/IP (for internal use only, please do not use).

hostbridge.userNetPorts**Type**

string

Default value

""

Listening ports to expose in user-mode networking.

hostbridge.userNetSubnet**Type**

string

Default value

"172.20.51.0/24"

Virtual subnet for user-mode networking.

hostbridge.userNetworking**Type**

bool

Default value

0x1

Enable user-mode networking.

mac_address**Type**

string

Default value

""

Device MAC address, if not specified, a random MAC address is generated.

offload**Type**

string

Default value

"gso, gro"

Offload TCP/UDP segmentation/receiving operations to host.

secure_accesses**Type**

bool

Default value

0x0

Make device generate transactions with NS=0.

transport**Type**

string

Default value

"modern"

Choose legacy or modern virtio transport, if not specified, modern transport is used.

3.7.73 VirtioP9Device

virtio P9 server. This model is written in C++.

Iris and MTI instances for VirtioP9Device

This model has the following Iris instances:

Table 3-819: VirtioP9Device Iris instances

InstanceName	ComponentName
VirtioP9Device	VirtioP9Device
VirtioP9Device.mmio_slave	PVBUSSlave
VirtioP9Device.virtio_master	PVBUSMaster

This model has the following MTI trace components:

Table 3-820: VirtioP9Device MTI instances

InstanceName	ComponentName
VirtioP9Device	VirtioP9Device
VirtioP9Device.mmio_slave	PVBUSSlave
VirtioP9Device.virtio_master	PVBUSMaster

VirtioP9Device contains the following CADI targets:

- [VirtioP9Device](#)

About VirtioP9Device

This component implements a subset of the Plan 9 file protocol over a virtio transport. It enables accessing a directory on the host's filesystem within Linux, or another operating system that implements the protocol, running on a platform model.

It supports the legacy OASIS virtio specification.

It implements a subset of the Linux 9P2000.L protocol. It has the following limitations:

- You can mount only one host directory per instance of the component.
- It supports a subset of 9P2000.L message types: Tversion, Tlopen, Tlcreate, Tgetattr, Tsetattr, Treaddir, Tmkdir, Tattach, Twalk, Tread, Twrite, Tclunk, Tremove, Trename. On Linux hosts, it also supports: Treadlink, Tsymlink.
- On Windows hosts, it ignores Unix permissions when writing files.
- On Windows hosts, it performs a simple mapping from Windows to Unix permissions when reading.
- On Windows hosts, symbolic links appear as regular files.
- On Windows hosts, it does not perform writing, deleting, or renaming operations on a file that another process has open.

Setting up the VirtioP9Device component

Take the following steps to set up this component:

- Use a version of Linux that supports v9fs over virtio and virtio-mmio devices.
- Update the device tree to include the VirtioP9Device component, or specify it on the kernel command-line, as shown below. The address range for both VE and Base platforms is 0x1C140000-0x1C14FFFF. The interrupt number is 43, or IRQ 75, for both VE and Base platforms.
- Set the following parameter to the directory on the host that you want to mount in the model:

VE

```
motherboard.virtiop9device.root_path
```

Base

```
bp.virtiop9device.root_path
```

- On Linux, mount the host directory by using the following command in the model:

```
$ mount -t 9p -o trans=virtio,version=9p2000.L FM <mount point>
```

Example kernel command-line argument:

```
virtio_mmio.device=0x10000@0x1c140000:75
```

Example entry for DTS files, to add next to the corresponding virtio_block entry:

```
virtio_p9@0140000 {
    compatible = "virtio,mmio";
    reg = <0x0 0x1c140000 0x0 0x1000>;
    interrupts = <0x0 0x2b 0x4>;
};
```

Ports for VirtioP9Device

Table 3-821: Ports

Name	Protocol	Type	Description
intr	Signal	Master	Virtio device sets interrupt to signal completion.
pvbus	PVBus	Slave	Virtio MMIO control/config/status registers.
virtio_m	PVBus	Master	Virtio device performs DMA accesses via master.

Parameters for VirtioP9Device

mount_tag

Type

string

Default value

"FM"

mount tag.

quiet
Type
bool
Default value
0x0

Don't print warnings on malformed commands/descriptors.

root_path
Type
string
Default value
""

root directory path.

secure_accesses
Type
bool
Default value
0x0

Make device generate transactions with NS=0.

3.7.74 VirtioPCIBlockDevice

virtio block device with PCI transport. This model is written in C++.

Iris and MTI instances for VirtioPCIBlockDevice

This model has the following Iris instances:

Table 3-822: VirtioPCIBlockDevice Iris instances

InstanceName	ComponentName
VirtioPCIBlockDevice	VirtioPCIBlockDevice
VirtioPCIBlockDevice.register_slave	PVBusSlave
VirtioPCIBlockDevice.virtio_master	PVBusMaster

This model has the following MTI trace components:

Table 3-823: VirtioPCIBlockDevice MTI instances

InstanceName	ComponentName
VirtioPCIBlockDevice	VirtioPCIBlockDevice
VirtioPCIBlockDevice.register_slave	PVBusSlave
VirtioPCIBlockDevice.virtio_master	PVBusMaster

VirtioPCIBlockDevice contains the following CADI targets:

- VirtioPCIBlockDevice

About VirtioPCIBlockDevice

VirtioPCIBlockDevice is similar to VirtioBlockDevice, except it is PCI-based instead of MMIO-based. It supports the legacy OASIS virtio specification.

This device requires:

- The following BARs in rising order:
 - A Bar of 4K for Config accesses
 - A Bar of 4K for the MSI-X table
 - A Bar of 4K for the MSI-X PBA
- Conventional interrupts to be supported
- An `msix_table_size` of 2

Ports for VirtioPCIBlockDevice

Table 3-824: Ports

Name	Protocol	Type	Description
client_s	PCIDevice2ClientProtocol	Slave	Interrupts for MSI-X table entries.
intr	Signal	Master	Virtio device sets interrupt to signal completion.
pvbus	PVBus	Slave	Virtio pci/control/config/status registers.
virtio_m	PVBus	Master	Virtio device performs DMA accesses via master.

Parameters for VirtioPCIBlockDevice

image_path

Type

string

Default value

""

image file path.

quiet**Type**

bool

Default value

0x0

Don't print warnings on malformed commands/descriptors.

read_only**Type**

bool

Default value

0x0

Only allow device to be read.

secure_accesses**Type**

bool

Default value

0x0

Make device generate transactions with NS=0.

transaction_attributes**Type**

int

Default value

0x0

Transaction attributes used by device. 0x0 - inner-shared real access. 0x1 - outer-shared real access. 0x2 - outer-shared debug access.

3.7.75 VirtioRNG

virtio rng - Entropy device. This model is written in C++.

Iris and MTI instances for VirtioRNG

This model has the following Iris instances:

Table 3-825: VirtioRNG Iris instances

InstanceName	ComponentName
VirtioRNG	VirtioEntropyMMIO
VirtioRNG.dma_master	PVBusMaster

This model has the following MTI trace components:

Table 3-826: VirtioRNG MTI instances

InstanceName	ComponentName
VirtioRNG.dma_master	PVBusMaster

VirtioRNG contains the following CADI targets:

- [VirtioEntropyMMIO](#)

About VirtioRNG

VirtioRNG models a virtio entropy device as defined in the [Virtio 1.0 Specification](#). A virtual platform might need to integrate a VirtioRNG component to generate random numbers when:

- Linux or Android needs to generate kernel entropy. Hardware might do this using a timer, but this is not possible in the model because timers are not updated quickly enough.
- Security features are required, such as ssh.

Integrate VirtioRNG into a platform

Integrate the VirtioRNG component by instantiating it in your board's LISA file and connecting it to the SoC virtio master bus and interrupt signal as follows:

```
// Instantiate components
composition {
...
    virtio_rng : VirtioRNG();
...
}

connection {
...
    // Find a suitable address space and connect it to the SoC's virtio_m bus
    busdecoder.pybus_m_range[0x001C190000..0x001C19ffff] => virtio_rng.pybus;
    virtio_rng.virtio_m => self.virtio_m;

    // Connect the IRQ to the GIC IRQ
    virtio_rng.intr => gic400.irqs[101];
...
}
```

To configure Linux or Android for VirtioRNG, use the following build parameters:

Linux:

- `CONFIG_VIRTIO_MMIO=y`
- `CONFIG_HW_RANDOM=y`
- `CONFIG_HW_RANDOM_VIRTIO=y`

Android:

- `--enable CONFIG_VIRTIO_MMIO`
- `--enable CONFIG_HW_RANDOM`
- `--enable CONFIG_HW_RANDOM_VIRTIO`

Use the following device tree parameters:

```
virtio_rng@1c190000 {
    compatible = "virtio,mmio";
    reg = <0x0 0x1c190000 0x0 0x200>;
    interrupts = <GIC_SPI 101 IRQ_TYPE_LEVEL_HIGH>;
};
```

Configure VirtioRNG using model parameters, for example:

```
-C "board.virtio_rng.enabled=1" \
-C "board.virtio_rng.seed=0" \
-C "board.virtio_rng.generator=2" \
-C "board.virtio_rng.diagnostics=4" \ # Optional
```

Use the following guest command line to test the integration:

```
// Generate random numbers
console/> cat /dev/hwrng
```

Ports for VirtioRNG

Table 3-827: Ports

Name	Protocol	Type	Description
intr	Signal	Master	Virtio device sets interrupt to signal completion.
pvbust	PVBus	Slave	Virtio control/config/status registers.
virtio_m	PVBus	Master	Virtio device performs DMA accesses via master.

Parameters for VirtioRNG

diagnostics

Type

int

Default value

0x0

Prints debug information: 0 = disabled; 1 = generated seed and device; 4 = generated seed, device and generated numbers.

enabled**Type**

bool

Default value

0x0

Enable or disable device. If disabled, device can be accessed, but will not be activated.

generator**Type**

int

Default value

0x0

User-defined generator: 0 = xorshiftstar; 1 = rand48; 2 = mersenne.

secure_accesses**Type**

bool

Default value

0x0

Make device generate transactions with NS=0.

seed**Type**

int

Default value

0x0

User-defined seed: 0 = uses a random seed; > 0 = user-defined fixed seed value.

transport**Type**

string

Default value

"modern"

Choose legacy or modern virtio transport, if not specified, modern transport is used.

3.7.76 VirtualEthernetCrossover

Ethernet Crossover Cable. This model is written in LISA+.

Iris and MTI instances for VirtualEthernetCrossover

This model has the following Iris instances:

Table 3-828: VirtualEthernetCrossover Iris instances

InstanceName	ComponentName
VirtualEthernetCrossover	VirtualEthernetCrossover

This model has the following MTI trace components:

Table 3-829: VirtualEthernetCrossover MTI instances

InstanceName	ComponentName
VirtualEthernetCrossover	VirtualEthernetCrossover

VirtualEthernetCrossover contains the following CADI targets:

- VirtualEthernetCrossover

About VirtualEthernetCrossover

This component implements two VirtualEthernet slave ports and enables you to connect two VirtualEthernet master ports. It forwards data received on one port to the other port without delay.

Ports for VirtualEthernetCrossover

Table 3-830: Ports

Name	Protocol	Type	Description
deva	VirtualEthernet	Slave	Slave port for connecting to a VirtualEthernet master.
devb	VirtualEthernet	Slave	Slave port for connecting to a VirtualEthernet master.

3.7.77 VirtualEthernetHub3

3 Port Ethernet Hub. This model is written in LISA+.

Iris and MTI instances for VirtualEthernetHub3

This model has the following Iris instances:

Table 3-831: VirtualEthernetHub3 Iris instances

InstanceName	ComponentName
VirtualEthernetHub3	VirtualEthernetHub3

VirtualEthernetHub3 contains the following CADI targets:

- VirtualEthernetHub3

Ports for VirtualEthernetHub3

Table 3-832: Ports

Name	Protocol	Type	Description
deva	VirtualEthernet	Slave	Slave port for connecting to a VirtualEthernet master.
devb	VirtualEthernet	Slave	Slave port for connecting to a VirtualEthernet master.
devc	VirtualEthernet	Slave	Slave port for connecting to a VirtualEthernet master.

3.7.78 VisEventRecorder

Event recorder component for visualisation component. It allows you to play back and record interactive GUI sessions. This model is written in LISA+.

Iris and MTI instances for VisEventRecorder

This model has the following Iris instances:

Table 3-833: VisEventRecorder Iris instances

InstanceName	ComponentName
VisEventRecorder	VisEventRecorder
VisEventRecorder.playbackDivider	ClockDivider
VisEventRecorder.playbackTimer	ClockTimerThread
VisEventRecorder.playbackTimer.timer	ClockTimerThread64
VisEventRecorder.playbackTimer.timer.thread	SchedulerThread
VisEventRecorder.playbackTimer.timer.thread_event	SchedulerThreadEvent
VisEventRecorder.recordingDivider	ClockDivider

This model has the following MTI trace components:

Table 3-834: VisEventRecorder MTI instances

InstanceName	ComponentName
VisEventRecorder.playbackDivider	ClockDivider
VisEventRecorder.recordingDivider	ClockDivider

VisEventRecorder contains the following CADI targets:

- ClockDivider
- ClockTimerThread
- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent
- VisEventRecorder

Recording

The following command creates an ASCII file `rec.txt` and enables recording. This file can directly be used for playback.

```
./isim_system -a image.axf -C visualisation.recorder.recordingFileName=rec.txt
```

You can select the time base for the time stamps of the recorded events. The default is a 100MHz counter (10ns simulated time resolution) which usually works for all systems. To be able to correlate timestamps to the instruction counter, set the time base to the clock frequency of the CPU, but this is not necessary for an exact recording or playback. The time base should be higher than CPU frequency / 100 (typical quantum size). To set the recording time base set the `recordingTimeBase` parameter.

Playback

The following command enables the playback of all GUI input events previously recorded in file `rec.txt`. The time base of the timestamps is always taken from the file (see T record). Interactive user input is still possible and interactive events and recorded events are mixed.

```
./isim_system -a image.axf -C visualisation.recorder.playbackFileName=rec.txt
```

Note

It is possible to enable recording and playback at the same time. This makes it possible to check whether a playback session is reproducible or to extend a previously recorded session by appending events. To do this, remove the QUIT event at the end. This is also useful to check the timing accuracy of the playback/recording timestamps.

```
./isim system -a image.axf -C  
visualisation.recorder.playbackFileName=rec.txt -C  
visualisation.recorder.playbackFileName=rec.txt
```

To enable verbose messages, use the `verbose` parameter with the following values:

1

Print all events while they are recorded/played back.

2

Print also maintenance information of the internal ClockTimers. The default is disabled (0).

To disable instruction count checking (message 'instruction count differs'), set parameter `checkInstructionCount` to 0. The default is enabled.

Integration

This component is intended to be a subcomponent of a visualisation component, for example a component that instantiates a Visualisation object using `createVisualisation()`. The integration is pretty light weight:

- Wire up the `control` and `ticks` ports.

- Use `control.registerVisRegion(regionPointer, regionName)` to register all relevant `VisRegion` pointers. You only need to register the regions that are used in the `processMessages()` function to identify a region by pointer.
- Call `control.putEvent()` for all `visEvents` as they come in regardless of where they come from, usually from `processMessages()`.
- Call `control.getEvent()` to retrieve recorded events (always called directly or indirectly by the callback (master) behavior `control.processEvents()`).

Ports for VisEventRecorder

Table 3-835: Ports

Name	Protocol	Type	Description
control	VisEventRecorderProtocol	Slave	The visualisation component controls the recorder through this port.
ticks	InstructionCount	Slave	Allow VisEventRecorder to get tick count from a core.

Parameters for VisEventRecorder

checkInstructionCount

Type

bool

Default value

0x1

check instruction count in recording file against actual instruction count during playback.

playbackDivider.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

playbackFileName

Type

string

Default value

""

playback filename (empty string disables playback).

recordingDivider.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

recordingFileName

Type

string

Default value

""

recording filename (empty string disables recording).

recordingTimeBase

Type

int

Default value

0x5f5e100

timebase in 1/s (relative to the master clock (e.g. 100000000 means 10 nanoseconds resolution simulated time for a 1Hz master clock)) to be used for recording (higher values -> higher time resolution, playback time base is always taken from the playback file).

verbose

Type

int

Default value

0x0

enable verbose messages (1=normal, 2=even more).

3.7.79 Visualisation_sdl2

Display window for VE using sdl2 Visualisation library. This model is written in C++.

Iris and MTI instances for Visualisation_sdl2

This model has the following Iris instances:

Table 3-836: Visualisation_sdl2 Iris instances

InstanceName	ComponentName

Parameters for Visualisation_sdl2

cluster0_name

Type

string

Default value

""

Cluster0 name.

cluster10_name

Type

string

Default value

""

Cluster10 name.

cluster11_name

Type

string

Default value

""

Cluster11 name.

cluster12_name

Type

string

Default value

""

Cluster12 name.

cluster13_name

Type

string

Default value

""

Cluster13 name.

cluster14_name

Type

string

Default value

""

Cluster14 name.

cluster15_name

Type

string

Default value

""

Cluster15 name.

cluster1_name**Type**

string

Default value

""

Cluster1 name.

cluster2_name**Type**

string

Default value

""

Cluster2 name.

cluster3_name**Type**

string

Default value

""

Cluster3 name.

cluster4_name**Type**

string

Default value

""

Cluster4 name.

cluster5_name**Type**

string

Default value

""

Cluster5 name.

cluster6_name**Type**

string

Default value

""

Cluster6 name.

cluster7_name**Type**

string

Default value

""

Cluster7 name.

cluster8_name**Type**

string

Default value

""

Cluster8 name.

cluster9_name**Type**

string

Default value

""

Cluster9 name.

css_spec**Type**

string

Default value

"Columbus mid"

Platform specification displayed in window title.

diagnostics**Type**

int

Default value

0x0

Diagnostics.

disable_visualisation**Type**

bool

Default value

0x0

Enable/disable visualisation.

display_object**Type**

int

Default value

0x0

Display objects: LCD only (1), status only (2), or both (0).

display_poreset_button**Type**

bool

Default value

0x0

Display power-on reset button.

idler.delay_ms**Type**

int

Default value

0x32

GUI update period in ms.

idler.has_gui**Type**

bool

Default value

0x1

GUI is enabled.

is_heterogeneous_cluster**Type**

bool

Default value

0x0

Is Heterogeneous cluster.

lcd_height_param**Type**

int

Default value

0x258

LCD Height.

lcd_width_param**Type**

int

Default value

0x320

LCD Width.

mcp_name**Type**

string

Default value

"MCP: Cortex-M7"

MCP name.

num_cps**Type**

int

Default value

0x1

Number of Control Processors.

per_core_clock**Type**

bool

Default value

0x0

Per-core clock connection.

platform_name**Type**

string

Default value

"Application Processors"

Platform Name.

rate_limit-enable**Type**

bool

Default value

0x0

Rate limit simulation.

recorder.checkInstructionCount**Type**

bool

Default value

0x1

check instruction count in recording file against actual instruction count during playback.

recorder.playbackDivider.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

recorder.playbackDivider.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

recorder.playbackFileName**Type**

string

Default value

""

playback filename (empty std::string disables playback).

recorder.recordingDivider.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

recorder.recordingDivider.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

recorder.recordingFileName**Type**

string

Default value

""

recording filename (empty std::string disables recording).

recorder.recordingTimeBase**Type**

int

Default value

0x5f5e100

timebase in 1/s (relative to the master clock (e.g. 100000000 means 10 nanoseconds resolution simulated time for a 1Hz master clock)) to be used for recording (higher values -> higher time resolution, playback time base is always taken from the playback file).

recorder.verbose**Type**

int

Default value

0x0

enable verbose messages (1=normal, 2=even more).

scp_name**Type**

string

Default value

"SCP: Cortex-M7"

SCP name.

shutdown_pixel_enable**Type**

bool

Default value

0x0

Shutdown pixel enable. Use to trigger simulation shutdown when a specific pixel reaches the given target RGB value.

shutdown_pixel_rgb**Type**

int

Default value

0xffffffff

Shutdown pixel target RGB value 0xRRGGBB.

shutdown_pixel_x**Type**

int

Default value

0x0

Shutdown pixel X co-ordinate (0 is left).

shutdown_pixel_y**Type**

int

Default value

0x0

Shutdown pixel Y co-ordinate (0 is top).

trap_key**Type**

int

Default value

0x4a

Trap key that works with left Ctrl to toggle mouse display.

window_title**Type**

string

Default value

"Fast Models - %cpu%"

Window title(%cpu% will be replaced by css_spec).

3.7.80 WarningMemory

Memory that prints warnings, and RAZ/WIs or aborts. This model is written in C++.

Ports for WarningMemory

Table 3-839: Ports

Name	Protocol	Type	Description
pvbust	PVBus	Slave	Bus slave interface

Parameters for WarningMemory

`abort_on_reads`

Type

bool

Default value

0x0

Generate Abort on reads.

`abort_on_writes`

Type

bool

Default value

0x0

Generate Abort on writes.

`read_data`

Type

int

Default value

0x0

Data to return on reads, if not aborting.

`warn_on_reads`

Type

bool

Default value

0x1

Generate Warn on reads.

warn_on_writes

Type
bool

Default value
0x1

Generate Warn on writes.

warning

Type
string

Default value
"Invalid access"

Warning string.

3.7.81 v8EmbeddedCrossTrigger_Matrix

v8 Embedded Cross Trigger Matrix. This model is written in C++.

About v8EmbeddedCrossTrigger_Matrix

This is a model of a platform-level Cross Trigger Matrix (CTM) for connection to the Cross Trigger Interface (CTI) ports provided on Armv8-A processors in Fast Models. The combination of the CTI and the CTM provides an architectural model of the Coresight embedded triggering system.

A single instance of the v8EmbeddedCrossTrigger_Matrix component supports up to four clusters, each containing four cores. For example:

```
cluster0.cti[0] => v8ect.cti[0];
cluster0.cti[1] => v8ect.cti[1];
cluster0.cti[2] => v8ect.cti[2];
cluster0.cti[3] => v8ect.cti[3];
...
cluster4.cti[3] => v8ect.cti[12];
cluster4.cti[3] => v8ect.cti[13];
cluster4.cti[3] => v8ect.cti[14];
cluster4.cti[3] => v8ect.cti[15];
```

Ports for v8EmbeddedCrossTrigger_Matrix

Table 3-840: Ports

Name	Protocol	Type	Description
cti[36]	v8EmbeddedCrossTrigger_controlprotocol	Slave	-

Parameters for v8EmbeddedCrossTrigger_Matrix

has_CTIAUTHSTATUS

Type

bool

Default value

0x1

Has the optional CTIAUTHSTATUS register.

has_CTIDEVID_INOUT

Type

bool

Default value

0x1

Has the option of input gate in cross trigger matrix.

number-of-channels

Type

int

Default value

0x4

Number of channels in cross trigger matrix.

3.8 Scheduler components

This section describes the Scheduler components.

3.8.1 AsyncSignal

This model is written in C++.

About AsyncSignal

This component provides the means to cleanly schedule events from non-simulation threads onto the simulation thread.

Ports for AsyncSignal

Table 3-841: Ports

Name	Protocol	Type	Description
async_callback	AsyncSignalCallback	Master	This port emits a call to signal() on the simulation thread asynchronously after async_control.signal() has been called.
async_control	AsyncSignalControl	Slave	Non-simulation threads call signal() on this port in order to schedule an event: a call to async_callback.signal() on the simulation thread.

3.8.2 SchedulerInterface

A SchedulerInterface instance allows access to the Fast Models scheduler. This model is written in LISA+.

Iris and MTI instances for SchedulerInterface

This model has the following Iris instances:

Table 3-842: SchedulerInterface Iris instances

InstanceName	ComponentName
SchedulerInterface	SchedulerInterface

SchedulerInterface contains the following CADI targets:

- SchedulerInterface

Ports for SchedulerInterface

Table 3-843: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock frequency for waitTicks() function.
control	SchedulerInterfaceControl	Slave	Scheduler interface. Allows to: - wait for time

3.8.3 SchedulerThread

A SchedulerThread instance represents a co-routine thread in the simulation. This model is written in LISA+.

Iris and MTI instances for SchedulerThread

This model has the following Iris instances:

Table 3-844: SchedulerThread Iris instances

InstanceName	ComponentName
SchedulerThread	SchedulerThread

SchedulerThread contains the following CADI targets:

- SchedulerThread

Ports for SchedulerThread

Table 3-845: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock frequency for waitTicks() function.
control	SchedulerThreadControl	Slave	SchedulerThread control. Masters use this to: - control the thread (wait etc) - implement the actual thread function threadProc()

3.8.4 SchedulerThreadEvent

A SchedulerThreadEvent instance is an auto-reset boolean condition variable other threads can wait on. This model is written in LISA+.

Iris and MTI instances for SchedulerThreadEvent

This model has the following Iris instances:

Table 3-846: SchedulerThreadEvent Iris instances

InstanceName	ComponentName
SchedulerThreadEvent	SchedulerThreadEvent

SchedulerThreadEvent contains the following CADI targets:

- SchedulerThreadEvent

Ports for SchedulerThreadEvent

Table 3-847: Ports

Name	Protocol	Type	Description
control	SchedulerThreadEventControl	Slave	SchedulerThreadEvent control. Masters use this to: - wait for this event - notify waiters that the event happened

3.8.5 SchedulerThreadEvent_cpp

A SchedulerThreadEvent instance is an auto-reset boolean condition variable other threads can wait on. This model is written in C++.

Iris and MTI instances for SchedulerThreadEvent_cpp

This model has the following Iris instances:

Table 3-848: SchedulerThreadEvent_cpp Iris instances

InstanceName	ComponentName
SchedulerThreadEvent_cpp	SchedulerThreadEvent

SchedulerThreadEvent_cpp contains the following CADI targets:

- SchedulerThreadEvent

Ports for SchedulerThreadEvent_cpp

Table 3-849: Ports

Name	Protocol	Type	Description
control	SchedulerThreadEventControl	Slave	-

3.8.6 SchedulerThread_cpp

A SchedulerThread instance represents a co-routine thread in the simulation. This model is written in C++.

Iris and MTI instances for SchedulerThread_cpp

This model has the following Iris instances:

Table 3-850: SchedulerThread_cpp Iris instances

InstanceName	ComponentName
SchedulerThread_cpp	SchedulerThread

SchedulerThread_cpp contains the following CADI targets:

- SchedulerThread

Ports for SchedulerThread_cpp

Table 3-851: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
control	SchedulerThreadControl	Slave	-

3.9 Signals components

This section describes the Signals components.

3.9.1 AndGate

And Gate. This model is written in LISA+.

Iris and MTI instances for AndGate

This model has the following Iris instances:

Table 3-852: AndGate Iris instances

InstanceName	ComponentName
AndGate	AndGate

AndGate contains the following CADI targets:

- AndGate

About AndGate

This component implements a logical AND of two signal input ports to generate a single output signal. For example, you can use it to combine two interrupt signals.

Ports for AndGate

Table 3-853: Ports

Name	Protocol	Type	Description
input[2]	Signal	Slave	2 input signals to be AND'ed.
output	Signal	Master	AND'ed output signal.

3.9.2 FrequencyProbe

Clock Frequency observer. This model is written in C++.

Iris and MTI instances for FrequencyProbe

This model has the following Iris instances:

Table 3-854: FrequencyProbe Iris instances

InstanceName	ComponentName
FrequencyProbe	FrequencyProbe

FrequencyProbe contains the following CADI targets:

- FrequencyProbe

Ports for FrequencyProbe

Table 3-855: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
freq_changed	ValueState	Master	-

Parameters for FrequencyProbe

diagnostics

Type

int

Default value

0x0

Diagnostics.

3.9.3 LabellerMasterIdExtendedIdUserFlag

Allows the modification of MasterID, ExtendedID and UserFlags attributes of PVBus transactions.
This model is written in LISA+.

Iris and MTI instances for LabellerMasterIdExtendedIdUserFlag

This model has the following Iris instances:

Table 3-856: LabellerMasterIdExtendedIdUserFlag Iris instances

InstanceName	ComponentName
LabellerMasterIdExtendedIdUserFlag	LabellerMasterIdExtendedIdUserFlag
LabellerMasterIdExtendedIdUserFlag.pvbuslogger	PVBusLogger
LabellerMasterIdExtendedIdUserFlag.pvbuslogger.mapper	PVBusMapper
LabellerMasterIdExtendedIdUserFlag.pvbusmodifier	PVBusMapper

This model has the following MTI trace components:

Table 3-857: LabellerMasterIdExtendedIdUserFlag MTI instances

InstanceName	ComponentName
LabellerMasterIdExtendedIdUserFlag.pvbuslogger	PVBusLogger
LabellerMasterIdExtendedIdUserFlag.pvbuslogger.mapper	PVBusMapper
LabellerMasterIdExtendedIdUserFlag.pvbusmodifier	PVBusMapper

LabellerMasterIdExtendedIdUserFlag contains the following CADI targets:

- LabellerMasterIdExtendedIdUserFlag
- PVBusLogger

Ports for LabellerMasterIdExtendedIdUserFlag**Table 3-858: Ports**

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified properties.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for LabellerMasterIdExtendedIdUserFlag

extendedid

Type

int

Default value

0x0

ExtendedID value to be applied to transactions.

extendedid_mask

Type

int

Default value

0x0

Mask used to determine which bits of extendedid parameter to be set in the transactions ExtendedID attribute. 0xFFFFFFFF will overwrite all the incoming ExtendedID bits with the value of the extendedid parameter, 0x0 will overwrite none.

masterid

Type

int

Default value

0x0

MasterID value to be applied to transactions.

masterid_mask

Type

int

Default value

0x0

Mask used to determine which bits of masterid parameter to be set in the transactions MasterID attribute. 0xFFFF will overwrite all the incoming MasterID bits with the value of the masterid parameter, 0x0 will overwrite none.

pvbuslogger.trace_debug

Type

bool

Default value

0x0

Enable tracing of debug transactions.

pvbuslogger.trace_snoops

Type
bool

Default value
0x0

Enable tracing of ACE snoop requests.

userflags

Type
int

Default value
0x0

UserFlags value to be applied to transactions.

userflags_mask

Type
int

Default value
0x0

Mask used to determine which bits of userflags parameter to be set in the transactions UserFlags attribute. 0xffffffff will overwrite all the incoming UserFlags bits with the value of the userflags parameter, 0x0 will overwrite none.

3.9.4 LabellerUserSignals

This model is written in LISA+.

Iris and MTI instances for LabellerUserSignals

This model has the following Iris instances:

Table 3-859: LabellerUserSignals Iris instances

InstanceName	ComponentName
LabellerUserSignals	LabellerUserSignals
LabellerUserSignals.pvbuslogger	PVBusLogger
LabellerUserSignals.pvbuslogger.mapper	PVBusMapper
LabellerUserSignals.pvbusmodifier	PVBusMapper

This model has the following MTI trace components:

Table 3-860: LabellerUserSignals MTI instances

InstanceName	ComponentName
LabellerUserSignals.pvbuslogger	PVBusLogger
LabellerUserSignals.pvbuslogger.mapper	PVBusMapper
LabellerUserSignals.pvbusmodifier	PVBusMapper

LabellerUserSignals contains the following CADI targets:

- LabellerUserSignals
- PVBusLogger

Ports for LabellerUserSignals

Table 3-861: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified UserFlags.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for LabellerUserSignals

pvbuslogger.trace_debug

Type

bool

Default value

0x0

Enable tracing of debug transactions.

pvbuslogger.trace_snoops

Type

bool

Default value

0x0

Enable tracing of ACE snoop requests.

user

Type

int

Default value

0x0

User signal to be applied to transactions.

3.9.5 OrGate

Or Gate. This model is written in LISA+.

Iris and MTI instances for OrGate

This model has the following Iris instances:

Table 3-862: OrGate Iris instances

InstanceName	ComponentName
OrGate	OrGate

OrGate contains the following CADI targets:

- OrGate

About OrGate

This component implements a logical OR of two signal input ports to generate a single output signal. For example, you can use this component to combine two interrupt signals.

Ports for OrGate

Table 3-863: Ports

Name	Protocol	Type	Description
input[16]	Signal	Slave	16 input signals to be OR'ed.
output	Signal	Master	OR'ed output signal.

3.9.6 SGSignalBuffer

Buffer to synchronise SystemGenerator Signal setValue() calls. This model is written in LISA+.

Iris and MTI instances for SGSignalBuffer

This model has the following Iris instances:

Table 3-864: SGSignalBuffer Iris instances

InstanceName	ComponentName
SGSignalBuffer	SGSignalBuffer

SGSignalBuffer contains the following CADI targets:

- SGSignalBuffer

Variants of this component also exist with multiple input and output ports.

Ports for SGSignalBuffer

Table 3-865: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Clock rate to release buffered signals.
in	Signal	Slave	Signal in.
out	Signal	Master	Buffered signal out.

3.9.7 SignalDriver

Drives signal port based on parameter, register or bus slave port. This model is written in LISA+.

Iris and MTI instances for SignalDriver

This model has the following Iris instances:

Table 3-866: SignalDriver Iris instances

InstanceName	ComponentName
SignalDriver	SignalDriver
SignalDriver.pvbuslave	PVBusSlave

This model has the following MTI trace components:

Table 3-867: SignalDriver MTI instances

InstanceName	ComponentName
SignalDriver	SignalDriver
SignalDriver.pvbuslave	PVBusSlave

SignalDriver contains the following CADI targets:

- SignalDriver

Ports for SignalDriver

Table 3-868: Ports

Name	Protocol	Type	Description
pvbus_s	PVBus	Slave	-
signal_out	Signal	Master	-

Parameters for SignalDriver

param_input

Type

bool

Default value

0x0

Drive signal_out port with this parameter value.

3.9.8 SignalInverter

This model is written in C++.

Iris and MTI instances for SignalInverter

This model has the following Iris instances:

Table 3-869: SignalInverter Iris instances

InstanceName	ComponentName
SignalInverter	SignalInverter

SignalInverter contains the following CADI targets:

- SignalInverter

Ports for SignalInverter**Table 3-870: Ports**

Name	Protocol	Type	Description
sig_in	Signal	Slave	-
sig_out	Signal	Master	-
sig_out_invert	Signal	Master	-

3.9.9 SignalLogger

Traces signal activity. This model is written in LISA+.

Iris and MTI instances for SignalLogger

This model has the following Iris instances:

Table 3-871: SignalLogger Iris instances

InstanceName	ComponentName
SignalLogger	SignalLogger

This model has the following MTI trace components:

Table 3-872: SignalLogger MTI instances

InstanceName	ComponentName
SignalLogger	SignalLogger

SignalLogger contains the following CADI targets:

- SignalLogger

Ports for SignalLogger

Table 3-873: Ports

Name	Protocol	Type	Description
in	Signal	Slave	Input signal port.
out	Signal	Master	Output signal port.

Parameters for SignalLogger

forward_signal

Type

bool

Default value

0x1

If true, trace signal and forward signal from 'in' to 'out'. If false, trace signal only without driving 'out' port.

3.9.10 Value64Logger

Traces value activity. This model is written in LISA+.

Iris and MTI instances for Value64Logger

This model has the following Iris instances:

Table 3-874: Value64Logger Iris instances

InstanceName	ComponentName
Value64Logger	Value64Logger

This model has the following MTI trace components:

Table 3-875: Value64Logger MTI instances

InstanceName	ComponentName
Value64Logger	Value64Logger

Value64Logger contains the following CADI targets:

- Value64Logger

Ports for Value64Logger

Table 3-876: Ports

Name	Protocol	Type	Description
in	Value_64	Slave	Input signal port.
out	Value_64	Master	Output signal port.

3.9.11 ValueLogger

Traces value activity. This model is written in LISA+.

Iris and MTI instances for ValueLogger

This model has the following Iris instances:

Table 3-877: ValueLogger Iris instances

InstanceName	ComponentName
ValueLogger	ValueLogger

This model has the following MTI trace components:

Table 3-878: ValueLogger MTI instances

InstanceName	ComponentName
ValueLogger	ValueLogger

ValueLogger contains the following CADI targets:

- ValueLogger

Ports for ValueLogger

Table 3-879: Ports

Name	Protocol	Type	Description
in	Value	Slave	Input signal port.
out	Value	Master	Output signal port.

3.9.12 WideAndGate

And Gate with up to 8 inputs. This model is written in C++.

Iris and MTI instances for WideAndGate

This model has the following Iris instances:

Table 3-880: WideAndGate Iris instances

InstanceName	ComponentName
WideAndGate	WideAndGate

WideAndGate contains the following CADI targets:

- WideAndGate

Ports for WideAndGate

Table 3-881: Ports

Name	Protocol	Type	Description
input[8]	Signal	Slave	-
output	Signal	Master	-

Parameters for WideAndGate

diagnostics

Type

int

Default value

0x0

Diagnostics.

3.9.13 WideOrGate

Or Gate with up to 8 inputs. This model is written in C++.

Iris and MTI instances for WideOrGate

This model has the following Iris instances:

output	Signal	Master	-

Parameters for WideOrGate

diagnostics

Type
int
Default value
0x0

Diagnostics.

3.10 SystemIP components

This section describes the SystemIP components.

The major SystemIP components are:

- Input/output devices.
- Memory, including flash.
- Ethernet controller.
- Interrupt controllers.
- Static and dynamic memory controllers.
- Audio interface.
- Programmable clock generators.

These components are software implementations of specific hardware functionality.

3.10.1 AHCI_SATA

AHCI controller with attached SATA disks and PCIe interface. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-884: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for AHCI_SATA

This model has the following Iris instances:

Table 3-885: AHCI_SATA Iris instances

InstanceName	ComponentName
AHCI_SATA	AHCI_SATA
AHCI_SATA.ahci_master	PVBusMaster
AHCI_SATA.register_slave	PVBusSlave

This model has the following MTI trace components:

Table 3-886: AHCI_SATA MTI instances

InstanceName	ComponentName
AHCI_SATA	ExportTestAHCI_SATA
AHCI_SATA.ahci_master	PVBusMaster
AHCI_SATA.register_slave	PVBusSlave

AHCI_SATA contains the following CADI targets:

- AHCI_SATA

About AHCI_SATA

This component implements an AHCI controller including attached SATA disks. It connects as a PCIe end-point device to a PCIe framework.

Ports for AHCI_SATA

Table 3-887: Ports

Name	Protocol	Type	Description
ahci_dma_m	PVBus	Master	AHCI device performs DMA accesses via master
client_s	PCIDevice2ClientProtocol	Slave	PCIDevice client slave port, used for MSI-X
pvbus	PVBus	Slave	AHCI pci/control/config/status registers

Parameters for AHCI_SATA

force_mode

Type

string

Default value

"NCQ"

Force disk to report support for at most PIO/DMA/NCQ mode (only for testing/bring-up purposes). PIO mode is always supported. Use NCQ for maximum performance (default).

image_path

Type

string

Default value

""

Comma separated list of zero or more disk images (up to 32). Each image represents one SATA disk which is connected to one port of the AHCI controller. Empty list elements are allowed and result in a SATA port which has no disk attached. Empty string (default) means: One SATA port with no disk attached. Use 'truncate -s 4T disk.img' to create a 4 TByte sparse image. Use 'dd if=/dev/zero of=disk.img bs=1M count=42' to create a 42 MByte non-sparse image.

run_async

Type

bool

Default value

0x0

Do host I/O in a background thread asynchronously. Enabling this makes the simulation non-deterministic and may or may not improve performance. Default is 'false' (do all disk accesses synchronously).

3.10.2 AddressTranslationUnit

Address Translator Unit. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-888: IP revisions support

Revision	Quality level
0.5	Alpha support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for AddressTranslationUnit

This model has the following Iris instances:

Table 3-889: AddressTranslationUnit Iris instances

InstanceName	ComponentName
AddressTranslationUnit	AddressTranslationUnit
AddressTranslationUnit.ATU_BusMapper	PVBusMapper
AddressTranslationUnit.apb	PVBusSlave

This model has the following MTI trace components:

Table 3-890: AddressTranslationUnit MTI instances

InstanceName	ComponentName
AddressTranslationUnit.ATU_BusMapper	PVBusMapper
AddressTranslationUnit.apb	PVBusSlave

AddressTranslationUnit contains the following CADI targets:

- AddressTranslationUnit

Ports for AddressTranslationUnit

Table 3-891: Ports

Name	Protocol	Type	Description
apb	PVBus	Slave	-
irq_out	Signal	Master	-
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-
reset_in	Signal	Slave	-

Parameters for AddressTranslationUnit

ATUNTR

Type

int

Default value

0x5

Number of translation regions (1=2, 2=4, 3=8, 4=16, and 5=32).

ATUPAW

Type

int

Default value

0x5

Physical address width (0=32, 1=36, 2=40, 3=44, 4=48, 5=52, 6=56, 7=64 bits). No impact on the PVBUS transactions.

ATUPS

Type

int

Default value

0xd

Selects the page size granularity in bytes (0xC=4096, 0xD=8192, and 0xE=16384) (Default=0xD).

diagnostics

Type

int

Default value

0x0

Diagnostics 0-4 (0:FATAL 1:ERROR 2:WARNING 3:INFO 4:DEBUG - DEFAULT==2).

3.10.3 BP141_TZMA

PrimeCell Infrastructure AMBA 3 AXI TrustZone Memory Adapter. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-892: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for BP141_TZMA

This model has the following Iris instances:

Table 3-893: BP141_TZMA Iris instances

InstanceName	ComponentName
BP141_TZMA	BP141_TZMA
BP141_TZMA.pvbusrange_0	PVBusRange
BP141_TZMA.pvbusrange_0.pvbus_mapper	PVBusMapper
BP141_TZMA.tzswitch_0	TZSwitch
BP141_TZMA.tzswitch_0.pvbus_mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-894: BP141_TZMA MTI instances

InstanceName	ComponentName
BP141_TZMA.pvbusrange_0.pvbus_mapper	PVBusMapper
BP141_TZMA.tzswitch_0.pvbus_mapper	PVBusMapper

BP141_TZMA contains the following CADI targets:

- BP141_TZMA
- PVBusRange

- TZSwitch

About BP141_TZMA

BP141_TZMA permits a single physical memory cell of up to 2 MB to be shared between a secure and non-secure storage area. The partitioning between these areas is flexible.

This component routes transactions according to the following:

- The memory region that they are attempting to access.
- The security mode of the transaction.

The BP141_TZMA fixes the base address of the secure region to the base address of the decode space. It uses the R0SIZE [9:0] input to configure the size of the secure region in 4 KB increments up to a maximum of 2 MB.

TZMEMSIZE is the maximum addressing range of the memory as defined by that parameter. By default, TZMEMSIZE is set to 2 MB. In the following table, AxADDR is the offset address that the transactions want to access:

Table 3-895: BP141_TZMA security control

AxADDR	Memory Region	Non-secure Transfer	Secure Transfer
AxADDR < R0Size	Secure, R0	Illegal	Legal
R0SIZE <= AxADDR and AxADDR < TZMEMSIZE	Non-secure, R1	Legal	Legal
AxADDR => TZMEMSIZE	No access	Illegal	Illegal

Ports for BP141_TZMA

Table 3-896: Ports

Name	Protocol	Type	Description
pv_output	PVBus	Master	Routed PVBus output
pvbus	PVBus	Slave	Bus slave interface.
R0Size	Value	Slave	A software interface that is driven from the TrustZone Protection Controller (TZPC), setting the secure region size by bits[9:0].

Parameters for BP141_TZMA

TZMEMSIZE

Type

int

Default value

0x200000

Addressable range of device.

TZSECROMSIZE

Type
int

Default value
0x200

Default secure size.

TZSEGSIZE

Type
int

Default value
0x1000

Segment size.

pvbusrange_0.range

Type
int

Default value
0x0

Addressable range routed to pvbus_port_a.

3.10.4 BP147_TZPC

TrustZone Protection Controller. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-897: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for BP147_TZPC

This model has the following Iris instances:

Table 3-898: BP147_TZPC Iris instances

InstanceName	ComponentName
BP147_TZPC	BP147_TZPC
BP147_TZPC.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-899: BP147_TZPC MTI instances

InstanceName	ComponentName
BP147_TZPC.busslave	PVBusSlave

BP147_TZPC contains the following CADI targets:

- BP147_TZPC

About BP147_TZPC

BP147_TZPC provides a software interface to the protection bits in a secure system in a TrustZone design.

Ports for BP147_TZPC

Table 3-900: Ports

Name	Protocol	Type	Description
bus_in_s	PVBus	Slave	Slave port for register access.
TZPCDECPROT0	Value	Master	Output decode protection 0 status.
TZPCDECPROT1	Value	Master	Output decode protection 1 status.
TZPCDECPROT2	Value	Master	Output decode protection 2 status.
TZPCR0SIZE	Value	Master	Output secure RAM region size.

3.10.5 CCI400

Cache Coherent Interconnect for AXI4 ACE. This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-901: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CCI400

This model has the following Iris instances:

Table 3-902: CCI400 Iris instances

InstanceName	ComponentName
CCI400	CCI400
CCI400.cciinterconnect	PVCache
CCI400.cciregisters	CCIRegisters
CCI400.cciregisters.clocktimer	ClockTimerThread

InstanceName	ComponentName
CCI400.cciregisters.clocktimer.timer	ClockTimerThread64
CCI400.cciregisters.clocktimer.timer.thread	SchedulerThread
CCI400.cciregisters.clocktimer.timer.thread_event	SchedulerThreadEvent

This model has the following MTI trace components:

Table 3-903: CCI400 MTI instances

InstanceName	ComponentName
CCI400	CCI400

CCI400 contains the following CADI targets:

- CCI400

About CCI400

If you disable the `cache_state_modelled` parameter, this component has negligible performance impact. If you enable `cache_state_modelled`, it adds significant cost to throughput for coherent transactions.

This model implements the slave interface Shareable Override Register, which can be read and written, but it has no functionality.

ACE limitation

AXI Coherency Extensions (ACE) are extensions to AXI4 that support system-level cache coherency between multiple clusters. The ACE cache models in the Arm Cortex-A15 and Cortex-A7, and the ACE support in the CCI-400 have the limitation that they only process one transaction at a time. Normally, the simulation processes each transaction to completion before allowing any master to generate another transaction.

However, in the following situation the simulation might fail. If a SystemC bus slave calls `wait()` while it is processing a transaction, this call might allow another master to issue another transaction that passes through the CCI-400 or the Cortex-A15 or Cortex-A7 caches. This situation could happen if a SystemC bus master running in another thread is connected to one of the ACE-lite ports on the CCI-400.

Ports for CCI400

Table 3-904: Ports

Name	Protocol	Type	Description
acchannelen	Value	Slave	For each upstream port, determine if it is enabled or not with respect to snoop requests.
barrierterminate	Value	Slave	For each downstream port, determine if barriers are terminated at that port.
broadcastcachemain	Value	Slave	For each downstream port, determine if broadcast cache maintenance operations are forwarded down that port. A three bit signal but as the model only have a single downstream port, setting any of the bits will make it work.

Name	Protocol	Type	Description
bufferableoverride	Value	Slave	For each downstream port, determine if all transactions are forced to non-bufferable (AWCACHE[0] is forced to 0).
clk_in	ClockSignal	Slave	Clock signal for cciregisters
errorirq	Signal	Master	A signal stating that the imprecise error register is nonzero.
evntcntoverflow[5]	Signal	Master	When an event counter overflows, it sets the corresponding signal.
lint_ace_3_reset_state	Signal	Slave	This port can be connected to the reset signals of the system attached to the pvbus_s_ace_3 port.
lint_ace_4_reset_state	Signal	Slave	This port can be connected to the reset signals of the system attached to the pvbus_s_ace_4 port.
periphbase	Value_64	Slave	This port sets the base address of the private peripheral region.
pvbus_m	PVBus	Master	Master port for all downstream memory accesses.
pvbus_s_ace_3	PVBus	Slave	ACE-capable slave ports.
pvbus_s_ace_4	PVBus	Slave	ACE-capable slave ports.
pvbus_s_ace_lite_plus_dvm_0	PVBus	Slave	Memory bus interface that implements ACE lite and DVM protocol.
pvbus_s_ace_lite_plus_dvm_1	PVBus	Slave	Memory bus interface that implements ACE lite and DVM protocol.
pvbus_s_ace_lite_plus_dvm_2	PVBus	Slave	Memory bus interface that implements ACE lite and DVM protocol.
reset_in	Signal	Slave	Signal to reset the CCI.
reset_state_of_ace_lite_ports[3]	Signal	Slave	This port can be connected to the reset signals of the system attached to ACE-Lite ports 0,1,2

Parameters for CCI400

acchannelen

Type

int

Default value

0x1f

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

barrierterminate

Type

int

Default value

0x7

For each downstream port, determine if barriers will be terminated at that port.

broadcastcachemain**Type**

int

Default value

0x0

For each downstream port a bit determines if broadcast cache maintenance operations are forwarded down that port.

bufferableoverride**Type**

int

Default value

0x0

For each downstream port, determine if all transactions will be forced to non-bufferable.

cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

force_on_from_start**Type**

bool

Default value

false

Enables snooping on upstream ports from the start of simulation.

The CCI will normally start up with snooping disabled, however, using this parameter we allow the model to start with snooping enabled without SW drivers programming the CCI.

This is only setup at simulation reset and not at signal reset.

If the upstreams can ever be held in reset then you *must* connect:

- `reset_state_of_ace_lite_ports[]`
- `lint_ace_3_reset_state`
- `lint_ace_4_reset_state`

so that it knows when to disable snoops to the upstream systems.

Otherwise, the upstream system will receive snoop messages whilst in reset and complain that it 'received a snoop request whilst it was in reset'.

is_downstream_domain_boundary_for_far_atomic

Type

bool

Default value

0x0

This interconnect is at the last stage of the domain boundary.

log_enabled

Type

int

Default value

1

Enable log messages from the CCI register file.

0

do not print anything

1

print only access violations

2

also print writes

3

print reads as well.

periphbase

Type

int

Default value

0x2c000000

Value for PERIPHBASE. Only bits [39:16] are used. This value may be overridden by an input on the periphbase port.

revision

Type

string

Default value`"rOp0"`

Revision of the CCI400.

3.10.6 CCI500

Cache Coherent Interconnect. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-905: IP revisions support

Revision	Quality level
rOp0	Full support
rOp2	Full support
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.**Iris and MTI instances for CCI500**

This model has the following Iris instances:

Table 3-906: CCI500 Iris instances

InstanceName	ComponentName
CCI500	CCI500
CCI500.pvbus_register_file_s[0]	PVBusSlave
CCI500.upstream[0]	PVBusSlave
CCI500.upstream[1]	PVBusSlave
CCI500.upstream[2]	PVBusSlave
CCI500.upstream[3]	PVBusSlave
CCI500.upstream[4]	PVBusSlave
CCI500.upstream[5]	PVBusSlave
CCI500.upstream[6]	PVBusSlave

This model has the following MTI trace components:

Table 3-907: CCI500 MTI instances

InstanceName	ComponentName
CCI500	CCI500
CCI500.pvbus_register_file_s[0]	PVBusSlave
CCI500.upstream[0]	PVBusSlave
CCI500.upstream[1]	PVBusSlave
CCI500.upstream[2]	PVBusSlave

InstanceName	ComponentName
CCI500.upstream[3]	PVBusSlave
CCI500.upstream[4]	PVBusSlave
CCI500.upstream[5]	PVBusSlave
CCI500.upstream[6]	PVBusSlave

CCI500 contains the following CADI targets:

- CCI500

About CCI500

The LISA file declares seven upstream ports. You can configure these ports with `num_ace_ports` and `num_ace_lite_ports`:

- The bottom `num_ace_lite_ports` are ACE-Lite+DVM.
- The next `num_ace_ports` are ACE.
- Any remaining ports are ignored. If transactions are made on them, then warnings are produced.

For example, if `num_ace_ports = 1` and `num_ace_lite_ports = 1` then

- `pvbus_s[1]` is ACE
- `pvbus_s[0]` is ACE-Lite+DVM
- `pvbus_s[6-2]` are considered not to exist.

Differences between the model and the RTL

Address Decoder

- Only supports striping down to 4KiB.
- If the address decoder aborts the access, returns `SLVERR` rather than `DECERR`.

Interfaces

- The model does not implement the Q-Channel and P-Channel interfaces.

Performance Monitoring Unit

- PMU counters recognize only a few event sources:
 - Slave interface events:

3

ReadOnce.

4

ReadClean, ReadShared, ReadNotSharedDirty, ReadUnique.

5

MakeUnique, CleanUnique.

6

CleanInvalid, CleanShared, MakeInvalid.

7

DVM transaction received from upstream.

9

Read data that is satisfied by a snoop request.

- No events are implemented for the global events or for the master events.
- The PMU does not implement the event bus (EVNTBUS).

Register access

- The register file only supports 32-bit accesses to its registers. Later versions of the CCI500 hardware support full write strobes to the register file. This limitation means that byte and halfword accesses work on the hardware but not on this version of the component.

Snoop filter RAMs

- Snoop filter RAMs are not modeled. The Status Register fields that relate to the power state of the Snoop filter RAMs are undefined.

Ports for CCI500

Table 3-908: Ports

Name	Protocol	Type	Description
acchannelensx[7]	Value	Slave	ACCHANNELENSx represents the ports ACCHANNELENS0..ACCHANNELENS7 on the RTL (assuming there are seven upstream ports). * each upstream ACE port 'y' (pvbus_s[y]) has a two bit ACCHANNELENSx * bit 0 == 0 -- DVM messages are disabled from being sent to this interface * bit 1 == 0 -- Snoop messages are disabled from being sent to this interface * each upstream ACE-Lite port 'z' (pvbus_s[z]) has a one bit ACCHANNELENSx * bit 0 == 0 -- DVM messages are disabled from being sent to this interface In the model, as we support a variety of configurations with a single LISA file then each port will behave as though it is one bit or two bit as appropriate. If you send a value that cannot be represented, given the width of the port, then the CCI model will halt and produce a fatal error. The assumed values of these are set by parameters until they are driven, so you need not drive them if they are constant. In the RTL, these signals are sampled at reset. Due to ordering issues w.r.t. reset() on different components then we cannot do that. Instead the signals are sampled at first transaction. Thus any controller that is producing these signals has to hold them constant for long enough. AC channel enables.
address_decoder	CCI500_AddressDecoderProtocol	Master	An address decoder can be attached to the address_decoder port to choose which pvbus_s port a downstream transaction will go out of. If you do not connect an address decoder then all transactions will go out of port 0.
dbgen	Signal	Slave	Invasive debug enable.
errirq	Signal	Master	Indicates that an error response, DECERR or SLVERR, is received on the RRESP, BRESP, or CRRESP input signals, and it cannot be signaled precisely.

Name	Protocol	Type	Description
evntcntoverflow[8]	Signal	Master	Overflow flags for the PMU clock and counters.
niden	Signal	Slave	Non-invasive debug enable.
pvbus_m[6]	PVBus	Master	Bus master ports.
pvbus_register_file_s	PVBus	Slave	The slave port of the register file.
pvbus_s[7]	PVBus	Slave	Bus slave ports.
reset_in	Signal	Slave	Reset the interconnect.
reset_state_of_upstream_port[7]	Signal	Slave	Tell the interconnect the reset state of the upstream ports, this can be used by the interconnect to check some aspects of the reset sequencing. If you are using force_on_from_start then you _must_ connect these pins.
spiden	Signal	Slave	Secure invasive debug enable.
spniden	Signal	Slave	Secure privileged non-invasive debug enable.

Parameters for CCI500

acchannelens0

Type

uint64_t

Default value

0x0

For upstream port `pvbus_s[0]`, if `bit[0] == 0` then DVM messages are permanently disabled from being sent.

If this is an ACE port, then if `bit[1] == 0` then snoop messages are permanently disabled from being sent.

This parameter can be overridden by the signal `acchannelensx[0]`.

For an ACE-Lite port then `bit[1]` is ignored from the parameter, allowing the default value of `0x3` create a functional system without excessive configuration.

acchannelens1

Type

uint64_t

Default value

0x0

For upstream port `pvbus_s[1]`, if `bit[0] == 0` then DVM messages are permanently disabled from being sent.

If this is an ACE port, then if `bit[1] == 0` then snoop messages are permanently disabled from being sent.

This parameter can be overridden by the signal `acchannelensx[1]`.

For an ACE-Lite port then `bit[1]` is ignored from the parameter, allowing the default value of `0x3` create a functional system without excessive configuration.

acchannelens2

Type

`uint64_t`

Default value

`0x0`

For upstream port `pvbuss[2]`, if `bit[0] == 0` then DVM messages are permanently disabled from being sent.

If this is an ACE port, then if `bit[1] == 0` then snoop messages are permanently disabled from being sent.

This parameter can be overridden by the signal `acchannelensx[2]`.

For an ACE-Lite port then `bit[1]` is ignored from the parameter, allowing the default value of `0x3` create a functional system without excessive configuration.

acchannelens3

Type

`uint64_t`

Default value

`0x0`

For upstream port `pvbuss[3]`, if `bit[0] == 0` then DVM messages are permanently disabled from being sent.

If this is an ACE port, then if `bit[1] == 0` then snoop messages are permanently disabled from being sent.

This parameter can be overridden by the signal `acchannelensx[3]`.

For an ACE-Lite port then `bit[1]` is ignored from the parameter, allowing the default value of `0x3` create a functional system without excessive configuration.

acchannelens4

Type

`uint64_t`

Default value

`0x0`

For upstream port `pvbuss_s[4]`, if `bit[0] == 0` then DVM messages are permanently disabled from being sent.

If this is an ACE port, then if `bit[1] == 0` then snoop messages are permanently disabled from being sent.

This parameter can be overridden by the signal `acchannelensx[4]`.

For an ACE-Lite port then `bit[1]` is ignored from the parameter, allowing the default value of `0x3` create a functional system without excessive configuration.

acchannelens5

Type

`uint64_t`

Default value

`0x0`

For upstream port `pvbuss_s[5]`, if `bit[0] == 0` then DVM messages are permanently disabled from being sent.

If this is an ACE port, then if `bit[1] == 0` then snoop messages are permanently disabled from being sent.

This parameter can be overridden by the signal `acchannelensx[5]`.

For an ACE-Lite port then `bit[1]` is ignored from the parameter, allowing the default value of `0x3` create a functional system without excessive configuration.

acchannelens6

Type

`uint64_t`

Default value

`0x0`

For upstream port `pvbuss_s[6]`, if `bit[0] == 0` then DVM messages are permanently disabled from being sent.

If this is an ACE port, then if `bit[1] == 0` then snoop messages are permanently disabled from being sent.

This parameter can be overridden by the signal `acchannelensx[6]`.

For an ACE-Lite port then `bit[1]` is ignored from the parameter, allowing the default value of `0x3` create a functional system without excessive configuration.

addr_width**Type**

int

Default value

0x28

The bit-width of the address that the CCI can accept.

cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

dbgen**Type**

bool

Default value

0x1

Invasive debug enable. If true, enables the counting of PMU events.

enable_logger**Type**

bool

Default value

0x0

Enable PVBusLoggers for the downstream ports in the CCI model.

force_on_from_start**Type**

bool

Default value

false

Enables snooping on upstream ports from the start of simulation.

The interconnect will normally start up with snooping/DVM disabled. This parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if ACCHANNELENSx allows it.

No software driver for the interconnect is needed.

Any port that could go into reset must have `reset_state_of_upstream_port[]` reflect the reset state of that upstream system.

Otherwise, the upstream system may receive snoop/DVM messages whilst in reset and may complain that it 'received a snoop request whilst it was in reset'.

Do not use if software is directly controlling the interconnect.

This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

niden

Type

bool

Default value

0x1

Whether non-secure events are allowed to be counted in the performance monitor.

num_ace_lite_ports

Type

int

Default value

0x5

The bottom `num_ace_lite_ports` are ACE-Lite+DVM.

num_ace_ports

Type

int

Default value

0x2

The top `num_ace_ports` are ACE and support full coherency.

number_of_phantom_entries

Type

uint64_t

Default value

0x0000000000000020

"Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.

qos_threshold_upper

Type

int

Default value

0xc

Reset value for the QoS threshold register.

reentrancy_support

Type

string

Default value

"env"

Must be one of:

on

hazard checking per cache line (normal mode)

off

no hazard checking (use only for single master systems)

cacheglobal

hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary)

env

take value from `FM_REENTRANCY_SUPPORT` env var, if this is not set use 'on'

spiden

Type

bool

Default value

true

Secure invasive debug enable. If both `SPIDEN` and `DBGEN` are high, enables the counting of both Non-secure and Secure events.

spniden

Type

bool

Default value

true

Whether secure and non-secure events are allowed to be counted in the performance monitor

version

Type

string

Default value

""

The version of the interconnect.

Allowed versions are:

- r0p0
- r0p2
- r1p0

3.10.7 CCI550

Cache Coherent Interconnect for AXI4 ACE. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-909: IP revisions support

Revision	Quality level
r0p0	Full support
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CCI550

This model has the following Iris instances:

Table 3-910: CCI550 Iris instances

InstanceName	ComponentName
CCI550	CCI550
CCI550.pvbus_register_file_s[0]	PVBusSlave
CCI550.upstream[0]	PVBusSlave
CCI550.upstream[1]	PVBusSlave
CCI550.upstream[2]	PVBusSlave
CCI550.upstream[3]	PVBusSlave

InstanceName	ComponentName
CCI550.upstream[4]	PVBusSlave
CCI550.upstream[5]	PVBusSlave
CCI550.upstream[6]	PVBusSlave

This model has the following MTI trace components:

Table 3-911: CCI550 MTI instances

InstanceName	ComponentName
CCI550	CCI550
CCI550.pvbus_register_file_s[0]	PVBusSlave
CCI550.upstream[0]	PVBusSlave
CCI550.upstream[1]	PVBusSlave
CCI550.upstream[2]	PVBusSlave
CCI550.upstream[3]	PVBusSlave
CCI550.upstream[4]	PVBusSlave
CCI550.upstream[5]	PVBusSlave
CCI550.upstream[6]	PVBusSlave

CCI550 contains the following CADI targets:

- CCI550

Differences between the model and the RTL

Address Decoder

- Only supports striping down to 4KiB.
- If the address decoder aborts the access, returns SLVERR rather than DECERR.

Interfaces

- The model does not implement the Q-Channel and P-Channel interfaces.

Performance Monitoring Unit

- PMU counters recognize only a few event sources:
 - Slave interface events:

3

ReadOnce.

4

ReadClean, ReadShared, ReadNotSharedDirty, ReadUnique.

5

MakeUnique, CleanUnique.

6

CleanInvalid, CleanShared, MakeInvalid.

7

DVM transaction received from upstream.

9

Read data that is satisfied by a snoop request.

- No events are implemented for the global events or for the master events.
- The PMU does not implement the event bus (EVNTBUS).

Reset signal sampling

- The configuration ports `acchannelensx[]` are sampled in the hardware when coming out of reset. In the model, these ports are sampled at the first transaction to a `pvbus_s` port or to the register file.

Status Register, change-pending, and DVM messages

- The Status Register provides information on when the last transaction that could have observed an old value of a snoop or DVM enable has finished in the upstream system. Therefore a port that has been disabled can now have the system upstream of that port turned off. The model does not track DVM messages in the upstream system.

Snoop filter RAMs

- The CCI-550 hardware has a snoop filter that reduces the number of snoop requests that the interconnect has to make. The model does not have a snoop filter and could make more snoop requests than the hardware would. This difference has no programmer-visible effect.
- The Status Register fields that relate to the power state of the Snoop filter RAMs are undefined.

Registers

- The following registers provide storage but have no effect on the model.
 - QoS registers.
 - Interface monitor registers. These registers are intended for silicon debug.

Ports for CCI550

Table 3-912: Ports

Name	Protocol	Type	Description
<code>acchannelensx[7]</code>	Value	Slave	The <code>acchannelensx[N]</code> pins are used to tell the interconnect if the upstream system will accept snoops and/or DVM messages.
<code>address_decoder</code>	CCI500_ AddressDecoderProtocol	Master	An address decoder can be attached to the <code>address_decoder</code> port to choose which <code>pvbus_s</code> port a downstream transaction will go out of. If you do not connect an address decoder then all transactions will go out of port 0.
<code>dbgen</code>	Signal	Slave	Invasive debug enable.
<code>errirq</code>	Signal	Master	Some async error was detected.
<code>evntcntoverflow[8]</code>	Signal	Master	The output interrupts of the event counters.
<code>niden</code>	Signal	Slave	Non-invasive debug enable.

Name	Protocol	Type	Description
pvbus_m[7]	PVBus	Master	The downstream master ports.
pvbus_register_file_s	PVBus	Slave	The slave port of the register file.
pvbus_s[7]	PVBus	Slave	Bus slave ports.
reset_in	Signal	Slave	Reset the interconnect.
reset_state_of_upstream_port[7]	Signal	Slave	Tell the interconnect the reset state of the upstream ports, this can be used by the interconnect to check some aspects of the reset sequencing. If you are using force_on_from_start then you _must_ connect these pins.
sci_s[7]	SystemCoherencyInterface	Slave	The System Coherency Interface bus. For those upstream ports that have a corresponding bit set in the bitmap of si_system_coherency_interface then the corresponding sci_m port can be used to move the upstream system into and out of the coherency domain.
spiden	Signal	Slave	Secure privileged invasive debug enable.
spniden	Signal	Slave	Secure privileged non-invasive debug enable.

Parameters for CCI550

acchannelens0

Type

int

Default value

0x0

For upstream port 0 determine if it is enabled or not w.r.t. snoop requests.

acchannelens1

Type

int

Default value

0x0

For upstream port 1 determine if it is enabled or not w.r.t. snoop requests.

acchannelens2

Type

int

Default value

0x0

For upstream port 2 determine if it is enabled or not w.r.t. snoop requests.

acchannelens3**Type**

int

Default value

0x0

For upstream port 3 determine if it is enabled or not w.r.t. snoop requests.

acchannelens4**Type**

int

Default value

0x0

For upstream port 4 determine if it is enabled or not w.r.t. snoop requests.

acchannelens5**Type**

int

Default value

0x0

For upstream port 5 determine if it is enabled or not w.r.t. snoop requests.

acchannelens6**Type**

int

Default value

0x0

For upstream port 6 determine if it is enabled or not w.r.t. snoop requests.

addr_width**Type**

int

Default value

0x28

The bit-width of the address that the CCI can accept.

cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

dbgen**Type**

bool

Default value

0x1

Invasive debug enable. If true, enables the counting of PMU events.

enable_logger**Type**

bool

Default value

0x0

Enable PVBusLoggers for the downstream ports in the CCI model.

force_on_from_start**Type**

bool

Default value

false

The interconnect will normally start up with snooping/DVM disabled.

The parameter `si_system_coherency_interface` determines which connections are managed by the System Coherency Interface (SCI).

For connections that are managed by SCI, then this parameter has no effect.

For all other connections, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if `ACCHANNLENSx` allows it.

No software driver for the interconnect is needed.

Any non-SCI port that could go into reset must have `reset_state_of_upstream_port[]` reflect the reset state of that upstream.

Otherwise, the upstream system may receive snoop/DVM messages whilst in reset and may complain that it 'received a snoop request whilst it was in reset'.

Do not use if software is directly controlling the interconnect. This option does not disavow responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

niden

Type

bool

Default value

0x1

Whether non-secure events are allowed to be counted in the performance monitor.

num_ace_lite_ports

Type

uint64_t

Default value

0x0000000000000005

The bottom `num_ace_lite_ports` are ACE-Lite+DVM.

num_ace_ports

Type

uint64_t

Default value

0x0000000000000002

The top `num_ace_ports` are ACE and support full coherency.

number_of_phantom_entries

Type

uint64_t

Default value

0x0000000000000020

Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.

qos_threshold_upper**Type**

int

Default value

0xc

Reset value for the QoS threshold register.

reentrancy_support**Type**

string

Default value

"env"

Must be one of:

on

hazard checking per cache line (normal mode)

off

no hazard checking (use only for single master systems)

cacheglobal

hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary)

env

take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on'

si0_qos_bw_regulator**Type**

bool

Default value

0x0

For upstream port 0 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.

si1_qos_bw_regulator**Type**

bool

Default value

0x0

For upstream port 1 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.

si2_qos_bw_regulator**Type**

bool

Default value

0x0

For upstream port 2 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.

si3_qos_bw_regulator**Type**

bool

Default value

0x0

For upstream port 3 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.

si4_qos_bw_regulator**Type**

bool

Default value

0x0

For upstream port 4 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.

si5_qos_bw_regulator**Type**

bool

Default value

0x0

For upstream port 5 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.

si6_qos_bw_regulator**Type**

bool

Default value

0x0

For upstream port 6 determine if it has a BW regulator. The effect of QoS is not modelled and this parameter only alters some registers.

si_system_coherency_interface**Type**

uint64_t

Default value

0x0000000000000000

This parameter tells the interconnect which upstream ports should be controlled by the System Coherency Interface.

Each bit corresponds to an upstream port, bit 0 to upstream port 0, etc.

If the SCI port is connected but `si_system_coherency_interface` disables its use then messages from the upstream will be ignored and software must manage the upstream system's entrance and exit of the coherency domain.

spiden**Type**

bool

Default value

true

Secure invasive debug enable.

If both `SPIDEN` and `DBGEN` are high, enables the counting of both Non-secure and Secure events.

spniden**Type**

bool

Default value

true

Whether secure and non-secure events are allowed to be counted in the performance monitor

version**Type**

string

Default value

""

The version of the interconnect. Allowed versions are:

- r0p0
- r1p0

3.10.8 CCN502

CCN502 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-913: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CCN502

This model has the following Iris instances:

Table 3-914: CCN502 Iris instances

InstanceName	ComponentName
CCN502	CCN5XX

CCN502.ccn_registers	CCNRegisterSet
CCN502.ccn_registers.bus_slave	PVBusSlave
CCN502.ccn_router	PVBusMapper

CCN502 contains the following CADI targets:

- CCN5XX
- CCNCache

About CCN502

CCN502 can be used for connecting components using the ACE and ACE-Lite interfaces. It has an L3 cache that can provide coherency between up to four fully-coherent ACE clusters and nine I/O coherent masters. It can connect up to two memory elements to drive transaction requests. This interconnect can be configured to support six or eight crosspoints, both of which are implemented in the model.

CCN502 has three or five downstream ports, depending on the number of crosspoints:

- Two or four SN-F ports for the memory controller
- One Acelite port (HNI)

The CCN502 parameters are not exposed through CADI, but can be seen in `ccn502.lisa`. Some useful parameters are:

- `cache_state_modelled`
- `cache_size_in_kbytes`
- `systemaddrmap`
- `variant_name`

CCN-502 supports up to 4 SN-Fs. To enable 4 SN-Fs in the model, set the `variant_name` parameter to `CCN502_8XP`, which means the 8XP/4HNF configuration.

Limitations

The model has the following limitations:

- No support for 3 SN striping.
- If there are multiple SN-Fs, the distribution of addresses to each SN-F is not guaranteed to match the hardware.
- The parameters for the CCNCache subcomponent are not accessible in System Canvas.

Ports for CCN502

Table 3-916: Ports

Name	Protocol	Type	Description
<code>pvbus_m_hni[1]</code>	PVBus	Master	HNI downstream port.
<code>pvbus_m_snf[4]</code>	PVBus	Master	SNF downstream ports.
<code>pvbus_s_rnf[4]</code>	PVBus	Slave	RNF upstream ports.
<code>pvbus_s_rni[9]</code>	PVBus	Slave	RNI upstream ports
<code>reset_in</code>	Signal	Slave	Reset signal.

Parameters for CCN502

`acchannelen_rnf`

Type

int

Default value

0xf

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

`acchannelen_rni`

Type

int

Default value

0x1ff

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

`cache_size_in_kbytes`

Type

int

Default value

0x1000

Number of kilo bytes in cache.

cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

ccn_cache.acchannelen_rnf**Type**

int

Default value

0xf

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

ccn_cache.acchannelen_rni**Type**

int

Default value

0xffff

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

ccn_cache.cache_size_kb**Type**

int

Default value

0x2000

Number of kilo bytes in cache.

ccn_cache.cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

ccn_cache.force_on_from_start**Type**

bool

Default value

0x0

Enables snooping on upstream ports from the start of simulation. The CCI will normally start up with snooping disabled, however, using this parameter we allow the model to start with snooping enabled without having to program it. This is only setup at simulation reset and not at signal reset. If the upstreams can ever be held in reset then you **must** connect the reset_state_of_upstream_port_3 and reset_state_of_upstream_port_4 so that it knows when to disable snoops to the upstream systems. Otherwise, the upstream system will receive snoop messages whilst in reset and it will complain that it 'received a snoop request whilst it was in reset'.

ccn_cache.number_of_phantom_entries**Type**

int

Default value

0x20

Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.

ccn_cache.periphbase**Type**

int

Default value

0x2c000000

Value for PERIPHBASE. Only bits [43:24] are used.

ccn_cache.reentrancy_support**Type**

string

Default value

env

Must be one of: on/off/cacheglobal/env: 'on': hazard checking per cache line (normal mode), 'off': no hazard checking (use only for single master systems), 'cacheglobal': hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary), 'env' (or empty string): take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on', default is 'env'.

ccn_cache.sbas_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

ccn_cache.sbsx_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

enable_logger**Type**

bool

Default value

0x0

Enable PVBusLogger for downstream ports.

force_on_from_start**Type**

bool

Default value

false

Enables snooping on upstream ports from the start of simulation.

The CCN502 will normally start up with snooping disabled. However, using this parameter allows the model to start with snooping enabled without having to program it. This is only setup at simulation reset and not at signal reset

number_of_snf**Type**

int

Default value

0x2

Number of SNF nodes present.

periphbase

Type
int

Default value
0x2c000000

Value for PERIPHBASE. Only bits [43:24] are used.

sbsx_bridge_present

Type
bool

Default value
0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

systemaddrmap

Type
int

Default value
0x0

Bitmap for 20 regions in CCN Interconnect. Every two bits describes the region type for corresponding region.

variant_name

Type
string

Default value
"CCN502_6XP"

Can be either CCN502_6XP or CCN502_8XP.

3.10.9 CCN504

CCN504 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-917: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CCN504

This model has the following Iris instances:

Table 3-918: CCN504 Iris instances

InstanceName	ComponentName
CCN504	CCN5XX
CCN504.ccn502_hni_exclusive_monitor_0	PVBusExclusiveMonitor
CCN504.ccn502_hni_exclusive_monitor_0.bus_mapper	PVBusMapper
CCN504.ccn_cache	CCNCache
CCN504.ccn_cache.upstream[0]	PVBusSlave
CCN504.ccn_cache.upstream[10]	PVBusSlave
CCN504.ccn_cache.upstream[11]	PVBusSlave

InstanceName	ComponentName
CCN504.ccn_router	PVBusMapper

CCN504 contains the following CADI targets:

- CCN5XX
- CCNCache

About CCN504

CCN504 has three downstream ports:

- Two SNF ports for the memory controller
- One Acelite port (HNI)

The parameters for the ccncache subcomponent are not accessible in System Canvas.

Ports for CCN504

Table 3-920: Ports

Name	Protocol	Type	Description
pvbus_m_hni[1]	PVBus	Master	HNI downstream port.
pvbus_m_snf[2]	PVBus	Master	SNF downstream ports.
pvbus_s_rnf[4]	PVBus	Slave	RNF upstream ports.
pvbus_s_rni[18]	PVBus	Slave	RNI upstream ports.
reset_in	Signal	Slave	Reset signal.

Parameters for CCN504

acchannelen_rnf

Type

int

Default value

0xf

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

acchannelen_rni

Type

int

Default value

0x3ffff

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

cache_size_in_mbytes**Type**

int

Default value

0x8

Number of mega bytes in cache.

cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

ccn_cache.acchannelen_rnf**Type**

int

Default value

0xf

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

ccn_cache.acchannelen_rni**Type**

int

Default value

0xffff

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

ccn_cache.cache_size_kb**Type**

int

Default value

0x2000

Number of kilo bytes in cache.

ccn_cache.cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

ccn_cache.force_on_from_start**Type**

bool

Default value

0x0

Enables snooping on upstream ports from the start of simulation. The CCI will normally start up with snooping disabled, however, using this parameter we allow the model to start with snooping enabled without having to program it. This is only setup at simulation reset and not at signal reset. If the upstreams can ever be held in reset then you **must** connect the reset_state_of_upstream_port_3 and reset_state_of_upstream_port_4 so that it knows when to disable snoops to the upstream systems. Otherwise, the upstream system will receive snoop messages whilst in reset and it will complain that it 'received a snoop request whilst it was in reset'.

ccn_cache.number_of_phantom_entries**Type**

int

Default value

0x20

Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.

ccn_cache.periphbase**Type**

int

Default value

0x2c000000

Value for PERIPHBASE. Only bits [43:24] are used.

ccn_cache.reentrancy_support**Type**

string

Default value

env

Must be one of: on/off/cacheglobal/env: 'on': hazard checking per cache line (normal mode), 'off': no hazard checking (use only for single master systems), 'cacheglobal': hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary), 'env' (or empty string): take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on', default is 'env'.

ccn_cache.sbas_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

ccn_cache.sbsx_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

disable_hni_cacheable_error**Type**

bool

Default value

0x0

Disable sending error response when HNI receives cacheable access.

enable_logger**Type**

bool

Default value

0x0

Enable PVBusLoggers for the downstream ports in the CCN model.

force_on_from_start**Type**

bool

Default value

false

Enables snooping on upstream ports from the start of simulation.

The CCN504 will normally start up with snooping disabled. However, using this parameter allows the model to start with snooping enabled without having to program it. This is only setup at simulation reset and not at signal reset.

number_of_snf**Type**

int

Default value

0x2

Number of SNF nodes present.

periphbase**Type**

int

Default value

0x2c000000

Value for PERIPHBASE. Only bits [43:24] are used.

sbas_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

sbsx_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

systemaddrmap**Type**

int

Default value

0x0

Bitmap for 20 regions in CCN Interconnect. Every two bits describes the region type for corresponding region.

CCN508 contains the following CADI targets:

- CCN5XX
- CCNCache

About CCN508

CCN508 has six downstream ports:

- Four SNF ports for the memory controller.
- Two Acelite ports (HNI).

The parameters for the CCNCache subcomponent are not accessible in System Canvas.

Ports for CCN508

Table 3-924: Ports

Name	Protocol	Type	Description
pvbus_m_hni[2]	PVBus	Master	HNI downstream ports.
pvbus_m_snf[4]	PVBus	Master	SNF downstream ports.
pvbus_s_rnf[8]	PVBus	Slave	RNF upstream ports.
pvbus_s_rni[24]	PVBus	Slave	RNI upstream ports.
reset_in	Signal	Slave	Reset signal.

Parameters for CCN508

acchannelen_rnf**Type**

int

Default value

0xf

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

acchannelen_rni**Type**

int

Default value

0x3ffff

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

cache_size_in_mbytes**Type**

int

Default value

0x8

Number of mega bytes in cache.

cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

ccn_cache.acchannelen_rnf**Type**

int

Default value

0xf

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

ccn_cache.acchannelen_rni**Type**

int

Default value

0xffff

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

ccn_cache.cache_size_kb**Type**

int

Default value

0x2000

Number of kilo bytes in cache.

ccn_cache.cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

ccn_cache.force_on_from_start**Type**

bool

Default value

0x0

Enables snooping on upstream ports from the start of simulation. The CCI will normally start up with snooping disabled, however, using this parameter we allow the model to start with snooping enabled without having to program it. This is only setup at simulation reset and not at signal reset. If the upstreams can ever be held in reset then you *must* connect the reset_state_of_upstream_port_3 and reset_state_of_upstream_port_4 so that it knows when to

disable snoops to the upstream systems. Otherwise, the upstream system will receive snoop messages whilst in reset and it will complain that it 'received a snoop request whilst it was in reset'.

ccn_cache.number_of_phantom_entries

Type

int

Default value

0x20

Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.

ccn_cache.periphbase

Type

int

Default value

0x2c000000

Value for PERIPHBASE. Only bits [43:24] are used.

ccn_cache.reentrancy_support

Type

string

Default value

env

Must be one of: on/off/cacheglobal/env: 'on': hazard checking per cache line (normal mode), 'off': no hazard checking (use only for single master systems), 'cacheglobal': hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary), 'env' (or empty string): take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on', default is 'env'.

ccn_cache.sbas_bridge_present

Type

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

ccn_cache.sbsx_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

disable_hni_cacheable_error**Type**

bool

Default value

0x0

Disable sending error response when HNI receives cacheable access.

enable_logger**Type**

bool

Default value

0x0

Enable PVBusLoggers for the downstream ports in the CCN model.

force_on_from_start**Type**

bool

Default value

false

Enables snooping on upstream ports from the start of simulation.

The CCN508 will normally start up with snooping disabled. However, using this parameter allows the model to start with snooping enabled without having to program it. This is only setup at simulation reset and not at signal reset.

number_of_snf**Type**

int

Default value

0x2

Number of SNF nodes present.

periphbase

Type
int

Default value
0x2c000000

Value for PERIPHBASE. Only bits [43:24] are used.

sbas_bridge_present

Type
bool

Default value
0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

sbsx_bridge_present

Type
bool

Default value
0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

systemaddrmap

Type
int

Default value
0x0

Bitmap for 20 regions in CCN Interconnect. Every two bits describes the region type for corresponding region.

3.10.11 CCN512

CCN512 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

CCN512 contains the following CADI targets:

- CCN5XX
- CCNCache

About CCN512

CCN512 has an L3 cache that can provide coherency between up to 12 fully-coherent ACE clusters and 24 I/O coherent masters. It can connect up to four memory elements to drive transaction requests.

CCN512 has six downstream ports:

- Four SNF ports for the memory controller
- Two Acelite ports (HNI)

Some useful parameters are:

- `cache_state_modelled`
- `cache_size_in_mbytes`
- `systemaddrmap`

Limitations

The model has the following limitations:

- No support for 3 SN striping.
- If there are multiple SN-Fs, the distribution of addresses to each SN-F is not guaranteed to match the hardware.
- The parameters for the CCNCache subcomponent are not accessible in System Canvas.

Ports for CCN512

Table 3-928: Ports

Name	Protocol	Type	Description
pvbus_m_hni[2]	PVBus	Master	HNI downstream ports.
pvbus_m_snf[4]	PVBus	Master	SNF downstream ports.
pvbus_s_rnf[12]	PVBus	Slave	RNF upstream ports.
pvbus_s_rni[24]	PVBus	Slave	RNI upstream ports.

Name	Protocol	Type	Description
reset_in	Signal	Slave	Reset signal.

Parameters for CCN512

acchannelen_rnf

Type

int

Default value

0xfff

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

acchannelen_rni

Type

int

Default value

0xffffffff

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

cache_size_in_mbytes

Type

int

Default value

0x8

Number of mega bytes in cache.

cache_state_modelled

Type

bool

Default value

0x1

Model the cache state.

ccn_cache.acchannelen_rnf

Type

int

Default value

0xf

For each upstream port, determine if it is enabled or not w.r.t. snoop requests.

ccn_cache.acchannelen_rni**Type**

int

Default value

0xffff

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

ccn_cache.cache_size_kb**Type**

int

Default value

0x2000

Number of kilo bytes in cache.

ccn_cache.cache_state_modelled**Type**

bool

Default value

0x1

Model the cache state.

ccn_cache.force_on_from_start**Type**

bool

Default value

0x0

Enables snooping on upstream ports from the start of simulation. The CCI will normally start up with snooping disabled, however, using this parameter we allow the model to start with snooping enabled without having to program it. This is only setup at simulation reset and not at signal reset. If the upstreams can ever be held in reset then you *must* connect the reset_state_of_upstream_port_3 and reset_state_of_upstream_port_4 so that it knows when to disable snoops to the upstream systems. Otherwise, the upstream system will receive snoop messages whilst in reset and it will complain that it 'received a snoop request whilst it was in reset'.

ccn_cache.number_of_phantom_entries**Type**

int

Default value

0x20

Number of phantom entries in the cache. Phantom entries are used by certain cache operations to hold temporary data. Usually this should be left at the default value which is safe for all systems containing up to 32 masters.

ccn_cache.periphbase**Type**

int

Default value

0x2c000000

Value for PERIPHBASE. Only bits [43:24] are used.

ccn_cache.reentrancy_support**Type**

string

Default value

env

Must be one of: on/off/cacheglobal/env: 'on': hazard checking per cache line (normal mode), 'off': no hazard checking (use only for single master systems), 'cacheglobal': hazard checking globally for cache (not per cache line, testing feature, provokes more hazards than necessary), 'env' (or empty string): take value from FM_REENTRANCY_SUPPORT env var, if this is not set use 'on', default is 'env'.

ccn_cache.sbas_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

ccn_cache.sbsx_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

enable_logger**Type**

bool

Default value

0x0

Enbale PVBusLogger for downstream ports.

force_on_from_start**Type**

bool

Default value

false

Enables snooping on upstream ports from the start of simulation.

The CCN512 will normally start up with snooping disabled. However, using this parameter allows the model to start with snooping enabled without having to program it. This is only setup at simulation reset and not at signal reset.

number_of_snf**Type**

int

Default value

0x2

Number of SNF nodes present.

periphbase**Type**

int

Default value

0x2c000000

Value for PERIPHBASE. Only bits [43:24] are used.

sbsx_bridge_present**Type**

bool

Default value

0x1

For each upstream port, determine if it is enabled or not w.r.t. dvm requests.

systemaddrmap**Type**

int

Default value

0x0

Bitmap for 20 regions in CCN Interconnect. Every two bits describes the region type for corresponding region.

3.10.12 CI700

CI700 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-929: IP revisions support

Revision	Quality level
r2p0	Full support
r1p0	Full support
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CI700

CI700 contains the following CADI targets:

- CI700
- CMN_TAG_CACHE

About CI700

- Major IP revisions (rX) are modeled and are controlled by the `revision` parameter.
- Minor IP revisions (pY) are not modeled. There are no functional differences in the model between pY revisions, with the exception of the `periph_id2` register.
- To configure the model, you must have installed Arm Socrates. The `mesh_config_file` parameter defines the mesh placement of the CHI nodes. Set it to the name of the yml configuration file emitted by Socrates. You must use version r1p4-01rel0 or later of Socrates to generate the file. For more information about Socrates, see [Arm Socrates](#) on Arm Developer. To download it, contact Arm Technical Support.
- Interconnect models are based on the TRM description and do not typically model RTL defects.

The model supports the following features:

- `rnf`, `rni/rnd`, `hni`, and `snf/sbsx` interface ports. The mapping between the port number and `NodeId` is based on the `NodeId` index. For example, `RNF2` controls `pvbuss_s_rnf[2]`. Its index is specified in the `node_info` register as `logical_id`. Similar behavior can be expected for `HN-I`.

If both `RN-D` and `RN-I` nodes are present, then all starting `rni` ports are mapped to `RN-D` nodes and then the `RN-I` nodes. For example, for `CMN650` with two `RN-D` nodes, one `RN-I` node, and given each `RN-I` or `RN-D` node controls three interface ports, `pvbuss_s_rni[0-2]` maps to `RND0`, `pvbuss_s_rni[3-5]` maps to `RND1` and `pvbuss_s_rni[6-8]` maps to `RNI0`.

Similarly, `SN-F` and `SBSX` nodes are mapped to `pvbuss_m_snf[]` ports where starting ports are mapped to `SN-F` and then `SBSX` nodes.

- Mapping `HN*_SLC_SIZE_PARAM` values to cache sizes:

-8

OKB where `HN*_SLC_NUM_WAYS_PARAM=16`

Note

This value is not supported by the model.

-2

128KB where `HN*_SLC_NUM_WAYS_PARAM=16`

-1

256KB where `HN*_SLC_NUM_WAYS_PARAM=16`

0

512KB where `HN*_SLC_NUM_WAYS_PARAM=16`

1

1MB where `HN*_SLC_NUM_WAYS_PARAM=16`

2

2MB where `HN*_SLC_NUM_WAYS_PARAM=16`

3

3MB where `HN*_SLC_NUM_WAYS_PARAM=12`

3

4MB where `HN*_SLC_NUM_WAYS_PARAM=16`

- The Address Based Flush (ABF) feature is available. After it has started, the ABF completes instantly. The ABF implementation has the following limitations:
 - In the Fast Model, any HN-F in the interconnect can perform an ABF on any address range even if that range is not part of the System Cache Group (SCG) that the HN-F belongs to.
 - Clearing the OCM with an ABF is not supported. A trace has been added to highlight this.
 - When `HN*_ABF_PR.abf_mode` is Reserved and `HN*_ABF_PR.abf_enable` is set, an error is printed and the ABF status register is set to complete successfully, but no operation takes place.
 - Because an ABF completes instantly, the `SF_PM_TRANSITION_ABORT` state cannot be reached. Contact Arm Technical Support with questions about support for this error condition.
 - The optional interrupt `INTREQPPU` is not supported.

Model limitations

- Out of scope:
 - PMU counters are not supported. Counter registers are implemented as **RAZ**.
 - QoS is not supported and all related registers are **RAZ/WI**.
 - Error injection and error generation are not supported. All error registers are **RAZ/WI**.
 - Power, clock, and interrupt signals are not supported.

The P-channel (power) signals `PREQ_LOGIC`, `PSTATE_LOGIC`, `PACCEPT_LOGIC`, `PDENY_LOGIC`, and `PACTIVE_LOGIC`, are not implemented. The model behaves as if `PSTATE_LOGIC` is `0b00000`. So the initial power state of the HN-F nodes is `NOSFSLC/OFF`. This is reflected in the reset values of `cmn_hns_ppu_pwpr`, which was named `por_hnf_ppu_pwpr` in earlier IP revisions. Software must write the `*_ppu_pwpr` registers to change the power state. Both HAM and FAM power states enable all of the SLC ways.

- Protocol credits and flit buffers are not supported.
- Snoop filtering is not supported.
- Prefetch Target operations are not supported.
- The MTE feature has been minimally tested and the functionality cannot be guaranteed. MTE error injection and detection are not supported.
- An access to a reserved or nonexistent register does not abort. It returns `pv::Tx_Data::TX_OK` and is **RAZ/WI**.
- Topologies with three I/O masters connected through an RN-I bridge device have been tested. Configurations where multiple I/O masters share a single ACE-lite port have not been tested.
- RNSAMs external to the mesh network are not functionally supported.

Note

Model parameter `force_rnsam_internal` is true by default. If this parameter is set to false and the topology has an RNFx (non-ESAM), the external bit (bit[31]) of the RNSAM children pointer is enabled. This bit is the only functionality governed by this parameter.

- By default, HN-F hashing uses the address [MAX:12] instead of the actual address [MAX:6], due to the DMI mechanism in the model. Enable the parameter `enable_rnsam_to_hnf_wider_hash` to make hashing logic use the actual address [MAX:6], but this might reduce the simulation speed of the model.
- OKB SLC data RAM and tag RAM are not supported.
- Source-based SLC cache partitioning is not supported.
- Way-based SLC cache partitioning is not supported.
- SLC/LCC partitioning dynamic allocation is not supported.
- Remote chip addresses incorrectly allocate a line in the SLC when `cache_state_modelled=true`. This can cause unexpected cache behavior that does not match the RTL, exhausting the SLC earlier or extra evictions.
- The fields in the `mvp_device_port_connect_info` register corresponding to the number of device credit slices and the number of CAL credit slices are not supported.
- SN-F hashing in HNSAM is not supported. HNSAM SN-F hashing is a single memory range mapped to multiple SN-Fs. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0 SNF1
```

The model supports mapping HN-F to a single SN-F. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0
0x00000002000 - 0x00000003000 SNF1
```

- HN-Fs with different SLC sizes in the same configuration are not supported.
- Transactions to addresses unused by Device registers in the Configuration Register Space are always routed to the Configuration Space even when the SAM is configured to use those addresses.
- GIC communication over A4S ports is not supported.
- MPAM features are not supported in the model, and the configuration-dependent register reset values do not match the RTL. Some of the registers (`por_hnf_mpam_idr` to `por_hnf_mpam_mbwumon_idr`) shared between security modes are not present in MPAM_S.
- The following limitations apply to System Cache Groups and Hash Target Groups:
 - A mix of local and remote HN-F targets is not supported.
 - CCG/CXRH target IDs in the HN target ID table are not supported (`sys_cache_grp_hn_nodeid_reg`).
 - The `hashed_target_grp_hnp_nodeid_reg` which is used for CCG/HN-P target IDs is not supported.

- System/Hash Target Groups only support HN-Fs.
- AXID hashing across HN-P/CCGs is not supported.
- The MPAM reset values described in `por_hnf_mpam_ns_por_hnf_mpam_idr[31:24]` default to the not-supported state. The model parameter `hnf_mpam_idr_override` can be used to override this but does not implement any of the functionality.
- MPAM_S `secure_register_groups_override` is not supported.
- No specific Debug Trace (DT) node functionality is supported. See [Plug-ins for Fast Models](#) for information about using plug-ins for trace.
- For Power State Transition related flush/disable of the SLC due to HNF_PPU_PWPR register, only the Operational Mode field (bits[7:4]) is considered. The Power Policy field (bits[3:0]) is ignored.
- Setting HAM mode for the Operational Mode field (bits[7:4]) of the HNF_PPU_PWPR is equivalent to FAM mode. The SLCH2 is neither flushed nor disabled according to the Power Policy field (bits[3:0]).
- Only hashing granularities of 4096B and above are supported.
- The OCM does not keep track of the total memory used across the S/NS security world and does not perform any eviction either. It is up to the software to make sure it does not oversubscribe the OCM.
- All RNs are assumed to have the same HN mapping. Programming RNSAMs differently between RNs is not supported.
- RNSAM cannot be programmed with the same HN-F target in a hashed and non-hashed memory region.
- `RNSAM_STATUS.default_target_type` and `RNSAM_STATUS.default_nodeid` are used as the default target only when `RNSAM_STATUS.use_default_node=1`. Otherwise, when a `txn` is sent into the model that does not belong to any of the address regions programmed in the RNSAM, it is routed to the HN-D irrespective of what is programmed in the `RNSAM_STATUS.default_target_type` and `RNSAM_STATUS.default_nodeid` fields.
- Address bit masking is not supported in RNSAM or HN-F SAM.
- HN-F SAM limitations:
 - Address masking in default hash regions in HN-F SAM is not supported.
 - Hashing in default hash regions in HN-F SAM is not supported. However, trace `SNF_HASHING_Target_SNF` displays the target SNF as if 3SN/6SN hashing were enabled.

The transaction is always routed to the SN0 nodeid programmed in the `SAM_CONTROL` register.

-
- Re-programming regions in HN-F SAM is not tested.
 - Hashing across CCGs in HN-F SAM is not supported.
 - CAL2 support for HN-P and RN-D is not tested.

- The maximum number of 256 RN-Fs is not verified. 74 is the largest number tested.
- The maximum number of 40 SNs is not verified. 20 is the largest number tested.
- The maximum number of 36 RN-Is is not verified. 16 is the largest number tested.
- The maximum number of 16 HN-Is is not verified. 5 is the largest number tested.
- Early DVM completion is not supported.
- CCIX port to port forwarding is not supported.
- No support for up to 512 CXRAs with no RAID aliasing and 256 RN-Fs on a single chip.
- Each HN-F can support tracking of up to 512 logical processors for exclusive operations. However, the value of the RO field `num_excl` in the HN-F unit info register cannot exceed 255.

About the `debug_force_snoop` parameter

The CMN interconnect normally starts up with snooping disabled.

The parameters `rnf_sci_enable` and `rni_sci_enable` determine which connections are managed by the System Coherency Interface. Connections that are managed by the System Coherency Interface look after themselves for entering and leaving the coherency domain and `debug_force_snoop` has no effect on those ports.

However, for connections that are not managed by the System Coherency Interface, `debug_force_snoop` enables the system upstream of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

Therefore, software does not need to know how to turn snoops in the interconnect on and off. The reset state of the upstream rnf ports is determined by the `rnf_upstream_reset_state[]` signals and must be connected for any port that could go into reset and you want managed by `debug_force_snoop`.

If the connection is managed by SCI or can never go into reset then you need not connect this and the interconnect assumes that the upstream system is not in reset and will always enable the snoops if `ACCHANNELENSx` allows it.

If you fail to connect `rnf_upstream_reset_state[]` correctly, then the upstream system might receive snoop messages while in reset and it will complain that it received a snoop request while it was in reset.

If software overrides the enables then the next change to `rnf_upstream_reset_state[]` or the interconnect reset will overwrite the software values.

Using this operation along with software controlling the enables could confuse the software. This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

This parameter is for debug purposes only. Do not use it instead of correctly configuring CMN.

Ports for CI700

Table 3-932: Ports

Name	Protocol	Type	Description
event_clusters	Signal	Peer	CPU event communication signal from the clusters.
pvbus_m_hni[4]	PVBus	Master	HNI downstream ports.
pvbus_m_snf[8]	PVBus	Master	SNF downstream port.
pvbus_s_apb	PVBus	Slave	APB interface port.
pvbus_s_rnf[8]	PVBus	Slave	RNF upstream ports.
pvbus_s_rni[24]	PVBus	Slave	RNI upstream ports.
reset_in	Signal	Slave	Reset signal.
rnf_sci_s[8]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-F in and out of the coherency domain.
rnf_upstream_reset_in[8]	Signal	Slave	Used by the interconnect to determine the reset state of the RNF manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.
rni_sci_s[24]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-D in and out of the coherency domain.
rni_upstream_reset_in[24]	Signal	Slave	Used by the interconnect to determine the reset state of the RNI manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.

Parameters for CI700

acchannelen_rnf

Type

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rnf_sci_enable` instead.

For each rnf port, indicates if the port is populated with a snoop responding device or not.

The input value is a string, for example `0xffff` or `ffff`

acchannelen_rni

Type
string

Default value
"0"

DEPRECATED: Will be removed after FM 11.18. Use `rni_sci_enable` instead.

For each `rni` port, indicates if the port is populated with a dvm responding device or not.

The input value is a string, for example `0xffff` or `ffff`

bypass_tag_cache

Type
bool

Default value
0x0

If true, CI700 will bypass the tag cache component which provides the MTE support.

cache_state_modelled

Type
bool

Default value
0x0

Model the cache state.

ci700_tag_cache.metadata_controller.init_value

Type
int

Default value
0xd

Initialize metadata memory with this value. If one of `init_values_json` or `init_values_json_file` is specified, this value applies only to any metadata not specified in the JSON.

ci700_tag_cache.metadata_controller.init_values_json

Type
string

Default value

""

A JSON value describing initial metadata values. Mutually exclusive with `init_values_json_file`. The format is as follows: { "regions": [{ "begin": 0x0, "end": 0x10000, "mte_tag": 0xa }, { "begin": 0x20000, "end": 0x50000, "mte_tag": 0xc }] }.

ci700_tag_cache.metadata_controller.init_values_json_file**Type**

string

Default value

""

Path to a JSON file with initial metadata values. Mutually exclusive with `init_values_json`. The format is as follows: { "regions": [{ "begin": 0x0, "end": 0x10000, "mte_tag": 0xa }, { "begin": 0x20000, "end": 0x50000, "mte_tag": 0xc }] }.

ci700_tag_cache.metadata_controller.is_enabled**Type**

bool

Default value

0x0

If false, disables the MetaData controller functionality, and makes the component invisible to passing transactions.

ci700_tag_cache.metadata_controller.mte_tag_carveout_json**Type**

string

Default value

""

JSON string that specifies the PA range of the tag carveout regions and the beginning of the PA range for which they provide tag storage. If `pa_regions_with_metadata_storage` defines which regions can have metadata, the tag carveout regions cannot overlap them, and each tagged region must be entirely covered by one of them. The block size must be ≥ 64 bytes and a power of 2, defaulting to 4KiB. The maximum block size supported is 4KiB. The carveout region size must be ≥ 4 KiB and a power of 2, and determines the size of the corresponding tagged region. { "regions": [{ "begin": 0x0, "tag_carveout_region": [0xfffff00000, 0xfffff00fff] }, { "begin": 0x20000, "tag_carveout_region": [0xfffff01000, 0xfffff01fff], "block_size": 0x100 }, { "begin": 0x100000, "tag_carveout_region": [0xfffff08000, 0xfffff0Bfff], "block_size": 0x2000 },] }.

ci700_tag_cache.metadata_controller.mte_tag_carveout_json_file**Type**

string

Default value

""

Path to a JSON file that specifies the PA range of the tag carveout regions with the same format as mte_tag_carveout_json. Only one of mte_tag_carveout_json and mte_tag_carveout_json_file can be used. .

ci700_tag_cache.metadata_controller.mte_tag_carveout_tag_order**Type**

string

Default value

little-endian

Order of the tags within the MTE tag carveout blocks. This can be little-endian (same order as the corresponding tagged data) or big-endian (reverse order). The parameter accepts both '-' and '_', so 'little-endian', 'big-endian', 'little_endian' and 'big_endian' are all valid. THIS PARAMETER HAS NO FUNCTIONALITY AT THE MOMENT.

ci700_tag_cache.metadata_controller.pa_regions_with_metadata_storage**Type**

string

Default value

""

Specify the address region where the metadata storage is available for each PAS in a JSON format. If the PAS does not have a region specified, the PAS has metadata storage for all of the space. The regions are defined by begin and end_incl addresses. Example: { "ns":[0xa0000000, 0xa0000fff], "s":[0xb0000000, 0xb0000fff], "rl":[0xc0000000, 0xc0000fff], "rt":[0xd0000000, 0xd0000fff] } ns: non-secure, s: secure, rl: realm, rt: root.

debug_force_snoop**Type**

bool

Default value

false

The CI700 interconnect will normally start with snooping disabled.

The parameter rnf_sci_enable and rni_sci_enable determines which connections are managed by the System Coherency Interface.

For connections that are managed by the System Coherency Interface, then they will look after themselves for entering and leaving the coherency domain and this parameter has no effect for those ports.

However, for connections that are *not* managed by the System Coherency Interface, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

This parameter is for debug purpose only

Do not use this parameter instead of correctly configuring CMN.

`enable_logger`

Type

bool

Default value

0x0

Enable PVBUSLoggers for the downstream ports in the CMN model.

`enable_rnsam_to_hnf_wider_hash`

Type

bool

Default value

false

Enable support of wider hash for the RNSAM to HNF communication.

If this variable enabled, then `bits[47:6]` from PA used in hashing function.

By default it is `[47:12]`.

`force_rnsam_internal`

Type

bool

Default value

0x1

Force all RNSAMs to be internal independently of the mesh topology.

`hnf_mpam_idr_override`

Type

uint64_t

Default value

0

Set to override `hnf_mpam_idr[31:24]` value. Bit[28] is Reserved and is ignored.

mesh_config_file**Type**

string

Default value

""

Name of a file containing mesh placement of CI700 components.

periphbase**Type**

uint64_t

Default value

0x20000000

Value for `PERIPHBASE`. Bits [27:0] are treated 0

print_cm_n_ccix_config**Type**

bool

Default value

0x0

Print information about the CCIX configuration.

print_cm_n_config**Type**

bool

Default value

0x0

Print the mesh topology and children pointers acquired from the YML file.

revision**Type**

string

Default value

"rOp0"

Component revision.

Currently supports r2p0, r1p0, r0p0.

rnf_sci_enable

Type

string

Default value

"0x0"

For each rnf port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

rni_sci_enable

Type

string

Default value

"0x0"

For each rni port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

show_banner

Type

uint64_t

Default value

2

Show component banner:

- 0
- supress entire banner
- 1
- suppress config file
- 2+
- show full banner

skip_cmn_config_check

Type

bool

Default value

0x0

Skip any topology configuration checks. The maximum number of devices per type not verified.

use_yaml_periphbase

Type

bool

Default value

false

Use yaml param CFGM_PERIPHBASE_PARAM to specify periphbase address.

If false, model parameter periphbase will be used.

yaml_has_node_addresses

Type

bool

Default value

0x0

Does the top-level YML file describe node-addresses ?.

3.10.13 CMN600

CMN600 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-933: IP revisions support

Revision	Quality level
r1p1	Full support

Revision	Quality level
r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CMN600

This model has the following Iris instances:

Table 3-934: CMN600 Iris instances

InstanceName	ComponentName
CMN600	CMN600
CMN600.bus_slave_ocm_NS	PVBusSlave
CMN600.bus_slave_ocm_S	PVBusSlave
CMN600.cmn600_cache	CMN600Cache
CMN600.cmn600_cache.upstream[0]	PVBusSlave
CMN600.cmn600_cache.upstream[10]	PVBusSlave
CMN600.cmn600_cache.upstream[11]	PVBusSlave
CMN600.cmn600_cache.upstream[12]	PVBusSlave
CMN600.cmn600_cache.upstream[13]	PVBusSlave
CMN600.cmn600_cache.upstream[14]	PVBusSlave
CMN600.cmn600_cache.upstream[15]	PVBusSlave
CMN600.cmn600_cache.upstream[16]	PVBusSlave
CMN600.cmn600_cache.upstream[17]	PVBusSlave
CMN600.cmn600_cache.upstream[1]	PVBusSlave

CMN600.ocm_exclusive_monitor.bus_mapper	PVBusMapper
CMN600.snf_mapper	PVBusMapper

CMN600 contains the following CADI targets:

- CMN600
- CMN600Cache

About CMN600

- Major IP revisions (rX) are modeled and are controlled by the `revision` parameter.

- Minor IP revisions (pY) are not modeled. There are no functional differences in the model between pY revisions, with the exception of the `periph_id2` register.
- To configure the model, you must have installed Arm Socrates. The `mesh_config_file` parameter defines the mesh placement of the CHI nodes. Set it to the name of the yml configuration file emitted by Socrates. You must use version r1p4-01rel0 or later of Socrates to generate the file. For more information about Socrates, see [Arm Socrates](#) on Arm Developer. To download it, contact Arm Technical Support.
- Interconnect models are based on the TRM description and do not typically model RTL defects.

The model supports the following features:

- `rnf`, `rni/rnd`, `hni`, and `snf/sbsx` interface ports. The mapping between the port number and `nodeId` is based on the `nodeId` index. For example, `RNF2` controls `pvbuss_s_rnf[2]`. Its index is specified in the `node_info` register as `logical_id`. Similar behavior can be expected for `HN-I`.

If both `RN-D` and `RN-I` nodes are present, then all starting `rni` ports are mapped to `RN-D` nodes and then the `RN-I` nodes. For example, for `CMN600` with two `RN-D` nodes, one `RN-I` node, and given each `RN-I` or `RN-D` node controls three interface ports, `pvbuss_s_rni[0-2]` maps to `RND0`, `pvbuss_s_rni[3-5]` maps to `RND1` and `pvbuss_s_rni[6-8]` maps to `RNI0`.

Similarly, `SN-F` and `SBSX` nodes are mapped to `pvbuss_m_snf[]` ports where starting ports are mapped to `SN-F` and then `SBSX` nodes.

- Mapping `HN*_SLC_SIZE_PARAM` values to cache sizes:

-8

0KB where `HN*_SLC_NUM_WAYS_PARAM=16`

This value is not supported by the model.

-2

128KB where `HN*_SLC_NUM_WAYS_PARAM=16`

-1

256KB where `HN*_SLC_NUM_WAYS_PARAM=16`

0

512KB where `HN*_SLC_NUM_WAYS_PARAM=16`

1

1MB where `HN*_SLC_NUM_WAYS_PARAM=16`

2

2MB where `HN*_SLC_NUM_WAYS_PARAM=16`

3

3MB where `HN*_SLC_NUM_WAYS_PARAM=12`

3

4MB where `HN*_SLC_NUM_WAYS_PARAM=16`

- The Address Based Flush (ABF) feature is available. After it has started, the ABF completes instantly. The ABF implementation has the following limitations:
 - In the Fast Model, any HN-F in the interconnect can perform an ABF on any address range even if that range is not part of the System Cache Group (SCG) that the HN-F belongs to.
 - Clearing the OCM with an ABF is not supported. A trace has been added to highlight this.
 - When `HN*_ABF_PR.abf_mode` is Reserved and `HN*_ABF_PR.abf_enable` is set, an error is printed and the ABF status register is set to complete successfully, but no operation takes place.
 - Because an ABF completes instantly, the `SF_PM_TRANSITION_ABORT` state cannot be reached. Contact Arm Technical Support with questions about support for this error condition.
 - The optional interrupt `INTREQPPU` is not supported.

Model limitations

- Out of scope:
 - PMU counters are not supported. Counter registers are implemented as **RAZ**.
 - QoS is not supported and all related registers are **RAZ/WI**.
 - Error injection and error generation are not supported. All error registers are **RAZ/WI**.
 - Power, clock, and interrupt signals are not supported.

The P-channel (power) signals `PREQ_LOGIC`, `PSTATE_LOGIC`, `PACCEPT_LOGIC`, `PDENY_LOGIC`, and `PACTIVE_LOGIC`, are not implemented. The model behaves as if `PSTATE_LOGIC` is `0b00000`. So the initial power state of the HN-F nodes is `NOSFSLC/OFF`. This is reflected in the reset values of `cmn_hns_ppu_pwpr`, which was named `por_hnf_ppu_pwpr` in earlier IP revisions. Software must write the `*_ppu_pwpr` registers to change the power state. Both HAM and FAM power states enable all of the SLC ways.

- Protocol credits and flit buffers are not supported.
- Snoop filtering is not supported.
- Prefetch Target operations are not supported.
- The MTE feature has been minimally tested and the functionality cannot be guaranteed. MTE error injection and detection are not supported.
- An access to a reserved or nonexistent register does not abort. It returns `pv::Tx_Data::TX_OK` and is **RAZ/WI**.
- Topologies with three I/O masters connected through an RN-I bridge device have been tested. Configurations where multiple I/O masters share a single ACE-lite port have not been tested.
- RNSAMs external to the mesh network are not functionally supported.

Note

Model parameter `force_rnsam_internal` is true by default. If this parameter is set to false and the topology has an RNFx (non-ESAM), the external bit (bit[31]) of the RNSAM children pointer is enabled. This bit is the only functionality governed by this parameter.

- By default, HN-F hashing uses the address [MAX:12] instead of the actual address [MAX:6], due to the DMI mechanism in the model. Enable the parameter `enable_rnsam_to_hnf_wider_hash` to make hashing logic use the actual address [MAX:6], but this might reduce the simulation speed of the model.
- OKB SLC data RAM and tag RAM are not supported.
- Source-based SLC cache partitioning is not supported.
- Way-based SLC cache partitioning is not supported.
- SLC/LCC partitioning dynamic allocation is not supported.
- Remote chip addresses incorrectly allocate a line in the SLC when `cache_state_modelled=true`. This can cause unexpected cache behavior that does not match the RTL, exhausting the SLC earlier or extra evictions.
- The fields in the `mvp_device_port_connect_info` register corresponding to the number of device credit slices and the number of CAL credit slices are not supported.
- SN-F hashing in HNSAM is not supported. HNSAM SN-F hashing is a single memory range mapped to multiple SN-Fs. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0 SNF1
```

The model supports mapping HN-F to a single SN-F. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0
0x00000002000 - 0x00000003000 SNF1
```

- HN-Fs with different SLC sizes in the same configuration are not supported.
- Transactions to addresses unused by Device registers in the Configuration Register Space are always routed to the Configuration Space even when the SAM is configured to use those addresses.
- GIC communication over A4S ports is not supported.
- CAL (Component Aggregation Layer) r2 and r3 features are supported. These features have limited testing.
- No specific Debug Trace (DT) node functionality is supported. See [Plug-ins for Fast Models](#) for information about using plug-ins for trace.
- For Power State Transition related flush/disable of the SLC due to HNF_PPU_PWPR register, only the Operational Mode field (bits[7:4]) is considered. The Power Policy field (bits[3:0]) is ignored.

- Setting HAM mode for the Operational Mode field (bits[7:4]) of the HNF_PPU_PWPR is equivalent to FAM mode. The SLCH2 is neither flushed nor disabled according to the Power Policy field (bits[3:0]).
- Only hashing granularities of 4096B and above are supported.
- All RNs are assumed to have the same HN mapping. Programming RNSAMs differently between RNs is not supported.
- RNSAM cannot be programmed with the same HN-F target in a hashed and non-hashed memory region.
- Address bit masking is not supported in RNSAM or HN-F SAM.
- The OCM does not keep track of the total memory used across the S/NS security world and does not perform any eviction either. It is up to the software to make sure it does not oversubscribe the OCM.
- In revision r3p0, for an HTG/SCG, the model does not consider the secondary region if the primary region is not valid.
- There is no support for RAS.
- The following limitations apply to System Cache Groups and Hash Target Groups:
 - A mix of local and remote HN-F targets is not supported.
 - CCG/CXRH target IDs in the HN target ID table are not supported (`sys_cache_grp_hn_nodeid_reg`).
 - The `hashed_target_grp_hnp_nodeid_reg` which is used for CCG/HN-P target IDs is not supported.
 - System/Hash Target Groups only support HN-Fs.
 - AXID hashing across HN-P/CCGs is not supported.
- HN-F SAM:
 - Address masking in default hash regions in HN-F SAM is not supported.
 - Hashing in default hash regions in HN-F SAM is not supported. However, trace `SNF_HASHING_Target_SNF` displays the target SNF as if 3SN/6SN hashing were enabled.

The transaction is always routed to the SNO nodeid programmed in the SAM_CONTROL register.

-
- Re-programming regions in HN-F SAM is not tested.
 - Hashing across CCGs in HN-F SAM is not supported.

About the `debug_force_snoop` parameter

The CMN interconnect normally starts up with snooping disabled.

The parameters `rnf_sci_enable` and `rni_sci_enable` determine which connections are managed by the System Coherency Interface. Connections that are managed by the System

Coherency Interface look after themselves for entering and leaving the coherency domain and `debug_force_snoop` has no effect on those ports.

However, for connections that are not managed by the System Coherency Interface, `debug_force_snoop` enables the system upstream of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

Therefore, software does not need to know how to turn snoops in the interconnect on and off. The reset state of the upstream rnf ports is determined by the `rnf_upstream_reset_state[]` signals and must be connected for any port that could go into reset and you want managed by `debug_force_snoop`.

If the connection is managed by SCI or can never go into reset then you need not connect this and the interconnect assumes that the upstream system is not in reset and will always enable the snoops if `ACCHANNELENSx` allows it.

If you fail to connect `rnf_upstream_reset_state[]` correctly, then the upstream system might receive snoop messages while in reset and it will complain that it received a snoop request while it was in reset.

If software overrides the enables then the next change to `rnf_upstream_reset_state[]` or the interconnect reset will overwrite the software values.

Using this operation along with software controlling the enables could confuse the software. This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

This parameter is for debug purposes only. Do not use it instead of correctly configuring CMN.

Ports for CMN600

Table 3-936: Ports

Name	Protocol	Type	Description
<code>event_clusters</code>	Signal	Peer	CPU event communication signal from the clusters.
<code>event_downstream_link_signal[6]</code>	Signal	Master	CPU event communication signal to the CMLHub. Event from the CMN towards the Hub NOTE that these are virtual "links" on underlying PCIe hardware bus.
<code>event_upstream_link_signal[6]</code>	Signal	Slave	Event from the Hub towards the CMN
<code>pvbust_m_cml</code>	PVBus	Master	CML downstream ports
<code>pvbust_m_cml_cfg</code>	PVBus	Master	CML downstream hub configuration port
<code>pvbust_m_hni[8]</code>	PVBus	Master	HNI downstream ports.
<code>pvbust_m_snf[16]</code>	PVBus	Master	SNF downstream port.
<code>pvbust_s_cml</code>	PVBus	Slave	CML upstream ports

Name	Protocol	Type	Description
pvbus_s_rnf[64]	PVBus	Slave	RNF upstream ports.
pvbus_s_rni[96]	PVBus	Slave	RNI upstream ports.
reset_in	Signal	Slave	Reset signal.
rnf_sci_s[64]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-F in and out of the coherency domain.
rnf_upstream_reset_in[64]	Signal	Slave	Used by the interconnect to determine the reset state of the RNF manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.
rni_sci_s[96]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-D in and out of the coherency domain.
rni_upstream_reset_in[96]	Signal	Slave	Used by the interconnect to determine the reset state of the RNI manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.

Parameters for CMN600

acchannelen_rnf

Type

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rnf_sci_enable` instead.

For each rnf port, indicates if the port is populated with a snoop responding device or not.

The input value is a string, for example `0xffff` or `ffff`

acchannelen_rni

Type

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rni_sci_enable` instead.

For each rni port, indicates if the port is populated with a dvm responding device or not.

The input value is a string, for example `0xffff` or `fff`

cache_state_modelled

Type

bool

Default value

0x0

Model the cache state.

debug_force_snoop

Type

bool

Default value

false

The CMN600 interconnect will normally start with snooping disabled.

The parameter `rnf_sci_enable` and `rni_sci_enable` determines which connections are managed by the System Coherency Interface.

For connections that are managed by the System Coherency Interface, then they will look after themselves for entering and leaving the coherency domain and this parameter has no effect for those ports.

However, for connections that are *not* managed by the System Coherency Interface, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

This parameter is for debug purpose only

Do not use this parameter instead of correctly configuring CMN.

disable_CML_port

Type

bool

Default value

0x0

If true the model won't connect the CML port when there are nodes which support the CML feature (ie CXG nodes).

enable_logger**Type**

bool

Default value

0x0

Enable PVBUSLoggers for the downstream ports in the CMN model.

enable_rnsam_to_hnf_wider_hash**Type**

bool

Default value

false

Enable support of wider hash for the RNSAM to HNF communication.

If this variable enabled, then `bits[47:6]` from PA used in hashing function.

By default it is `[47:12]`.

force_rnsam_internal**Type**

bool

Default value

0x1

Force all RNSAMs to be internal independently of the mesh topology.

mesh_config_file**Type**

string

Default value

""

Name of a file containing mesh placement of CMN600 components.

periphbase**Type**

uint64_t

Default value

0x20000000

Value for `PERIPHBASE`. Bits `[25:0]` are treated 0

print_cmn_ccix_config**Type**

bool

Default value

0x0

Print information about the CCIX configuration.

print_cmn_config**Type**

bool

Default value

0x0

Print the mesh topology and children pointers acquired from the YML file.

revision**Type**

string

Default value

"r1p1"

Component revision.

Currently supports r1p1, r3p0.

rnf_sci_enable**Type**

string

Default value

"0x0"

For each rnf port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

rni_sci_enable**Type**

string

Default value

"0x0"

For each rni port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

show_banner**Type**

uint64_t

Default value

2

Show component banner:

0

supress entire banner

1

suppress config file

2+

show full banner

skip_cmn_config_check**Type**

bool

Default value

0x0

Skip any topology configuration checks. The maximum number of devices per type not verified.

use_yaml_periphbase**Type**

bool

Default value

false

Use yml param `CFGM_PERIPHBASE_PARAM` to specify periphbase address.

If false, model parameter `periphbase` will be used.

3.10.14 CMN600AE

CMN600AE Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-937: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CMN600AE

This model has the following Iris instances:

CMN600AE.snf_mapper	PVBusMapper

CMN600AE contains the following CADI targets:

- CMN600AE

About CMN600AE

- Major IP revisions (rX) are modeled and are controlled by the `revision` parameter.
- Minor IP revisions (pY) are not modeled. There are no functional differences in the model between pY revisions, with the exception of the `periph_id2` register.
- To configure the model, you must have installed Arm Socrates. The `mesh_config_file` parameter defines the mesh placement of the CHI nodes. Set it to the name of the yml configuration file emitted by Socrates. You must use version r1p4-01rel0 or later of Socrates to generate the file. For more information about Socrates, see [Arm Socrates](#) on Arm Developer. To download it, contact Arm Technical Support.
- Interconnect models are based on the TRM description and do not typically model RTL defects.

The CMN600AE model supports the following features:

- rnf, rni/rnd, hni, and snf/sbsx interface ports. The mapping between the port number and `nodeId` is based on the `nodeId` index. For example, RNF2 controls `pvbuss_s_rnf[2]`. Its index is specified in the `node_info` register as `logical_id`. Similar behavior can be expected for HN-I.

If both RN-D and RN-I nodes are present, then all starting rni ports are mapped to RN-D nodes and then the RN-I nodes. For example, for CMN600AE with two RN-D nodes, one RN-I node, and given each RN-I or RN-D node controls three interface ports, `pvbuss_s_rni[0-2]` maps to RND0, `pvbuss_s_rni[3-5]` maps to RND1 and `pvbuss_s_rni[6-8]` maps to RNI0. Similarly, SN-F and SBSX nodes are mapped to `pvbuss_m_snf[]` ports where starting ports are mapped to SN-F and then SBSX nodes.

- Mapping HN*_SLC_SIZE_PARAM values to cache sizes:

-8OKB when `HN*_SLC_NUM_WAYS_PARAM=16`

This value is not supported by the model.

-2128KB when `HN*_SLC_NUM_WAYS_PARAM=16`**-1**256KB when `HN*_SLC_NUM_WAYS_PARAM=16`**0**512KB when `HN*_SLC_NUM_WAYS_PARAM=16`**1**1MB when `HN*_SLC_NUM_WAYS_PARAM=16`**2**2MB when `HN*_SLC_NUM_WAYS_PARAM=16`**3**3MB when `HN*_SLC_NUM_WAYS_PARAM=12`**3**4MB when `HN*_SLC_NUM_WAYS_PARAM=16`

- Maximum number of nodes that have been verified are:
 - 7 RN-Fs
 - 2 RN-Ds
 - 3 RN-Is
 - 1 HN-I
 - 4 HN-Fs
 - 1 SN-F
- The Address Based Flush (ABF) feature is available. After it has started, the ABF completes instantly. The ABF implementation has the following limitations:
 - In the Fast Model, any HN-F in the interconnect can perform an ABF on any address range even if that range is not part of the System Cache Group (SCG) that the HN-F belongs to.
 - Clearing the OCM with an ABF is not supported. A trace has been added to highlight this.
 - When `HN*_ABF_PR.abf_mode` is Reserved and `HN*_ABF_PR.abf_enable` is set, an error is printed and the ABF status register is set to complete successfully, but no operation takes place.
 - Because an ABF completes instantly, the `SF_PM_TRANSITION_ABORT` state cannot be reached. Contact Arm Technical Support with questions about support for this error condition.

- The optional interrupt `INTREQPPU` is not supported.
- This model implements the following AE-specific features:
 - Memory Protection Unit (MPU), with limitations listed in the Model limitations section.
 - FuSa error logging and reporting using a Fault Management Unit (FMU) and Fault Detection and Control (FDC).
 - Dedicated APB interface into FMU for fault diagnostics and control.

Model limitations

- Out of scope:
 - PMU counters are not supported. Counter registers are implemented as **RAZ**.
 - QoS is not supported and all related registers are **RAZ/WI**.
 - Error injection and error generation are not supported. All error registers are **RAZ/WI**.
 - Power, clock, and interrupt signals are not supported.

The P-channel (power) signals `PREQ_LOGIC`, `PSTATE_LOGIC`, `PACCEPT_LOGIC`, `PDENY_LOGIC`, and `PACTIVE_LOGIC`, are not implemented. The model behaves as if `PSTATE_LOGIC` is `0b00000`. So the initial power state of the HN-F nodes is `NOSFSLC/OFF`. This is reflected in the reset values of `cmn_hns_ppu_pwpr`, which was named `por_hnf_ppu_pwpr` in earlier IP revisions. Software must write the `*_ppu_pwpr` registers to change the power state. Both HAM and FAM power states enable all of the SLC ways.

- Protocol credits and flit buffers are not supported.
- Snoop filtering is not supported.
- Prefetch Target operations are not supported.
- The MTE feature has been minimally tested and the functionality cannot be guaranteed. MTE error injection and detection are not supported.
- An access to a reserved or nonexistent register does not abort. It returns `pv::Tx_Data::TX_OK` and is **RAZ/WI**.
- Topologies with three I/O masters connected through an RN-I bridge device have been tested. Configurations where multiple I/O masters share a single ACE-Lite port have not been tested.
- RNSAMs external to the mesh network are not functionally supported.

Note

Model parameter `force_rnsam_internal` is true by default. If this parameter is set to false and the topology has an RNFx (non-ESAM), the external bit (bit[31]) of the RNSAM children pointer is enabled. This bit is the only functionality governed by this parameter.

- By default, HN-F hashing uses the address `[MAX:12]` instead of the actual address `[MAX:6]`, due to the DMI mechanism in the model. Enable the parameter `enable_rnsam_to_hnf_wider_hash` to make hashing logic use the actual address `[MAX:6]`, but this might reduce the simulation speed of the model.
- OKB SLC data RAM and tag RAM are not supported.

- Source-based SLC cache partitioning is not supported.
- Way-based SLC cache partitioning is not supported.
- SLC/LCC partitioning dynamic allocation is not supported.
- Remote chip addresses incorrectly allocate a line in the SLC when `cache_state_modelled=true`. This can cause unexpected cache behavior that does not match the RTL, exhausting the SLC earlier or extra evictions.
- The fields in the `mxp_device_port_connect_info` register corresponding to the number of device credit slices and CAL credit slices are not supported.
- SN-F hashing in HNSAM is not supported. HNSAM SN-F hashing is a single memory range mapped to multiple SN-Fs. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0 SNF1
```

The model supports mapping HN-F to a single SN-F. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0
0x00000002000 - 0x00000003000 SNF1
```

- HN-Fs with different SLC sizes in the same configuration are not supported.
- Transactions to addresses unused by Device registers in the Configuration Register Space are always routed to the Configuration Space even when the SAM is configured to use those addresses.
- GIC communication over A4S ports is not supported.
- MPU with data coherency is not supported.
- MPU located in CXRH is not supported.
- No specific Debug Trace (DT) node functionality is supported. See [Plug-ins for Fast Models](#) for information about using plug-ins for trace.
- For Power State Transition related flush/disable of the SLC due to HNF_PPU_PWPR register, only the Operational Mode field (bits[7:4]) is considered. The Power Policy field (bits[3:0]) is ignored.
- Setting HAM mode for the Operational Mode field (bits[7:4]) of the HNF_PPU_PWPR is equivalent to FAM mode. The SLCH2 is neither flushed nor disabled according to the Power Policy field (bits[3:0]).
- Only hashing granularities of 4096B and above are supported.
- All RNs are assumed to have the same HN mapping. Programming RNSAMs differently between RNs is not supported.
- RNSAM cannot be programmed with the same HN-F target in a hashed and non-hashed memory region.
- Address bit masking is not supported in RNSAM or HN-F SAM.
- The OCM does not keep track of the total memory used across the S/NS security world and does not perform any eviction either. It is up to the software to make sure it does not oversubscribe the OCM.

- There is no support for RAS.
- The following limitations apply to System Cache Groups and Hash Target Groups:
 - A mix of local and remote HN-F targets are not supported.
 - CCG/CXRH target IDs in the HN target ID table are not supported (`sys_cache_grp_hn_nodeid_reg`).
 - The `hashed_target_grp_hnp_nodeid_reg` which is used for CCG/HN-P target IDs is not supported.
 - System/Hash Target Groups only support HN-Fs.
 - AXID hashing across HN-P/CCGs is not supported.

About the `debug_force_snoop` parameter

The CMN interconnect normally starts up with snooping disabled.

The parameters `rnf_sci_enable` and `rni_sci_enable` determine which connections are managed by the System Coherency Interface. Connections that are managed by the System Coherency Interface look after themselves for entering and leaving the coherency domain and `debug_force_snoop` has no effect on those ports.

However, for connections that are not managed by the System Coherency Interface, `debug_force_snoop` enables the system upstream of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

Therefore, software does not need to know how to turn snoops in the interconnect on and off. The reset state of the upstream rnf ports is determined by the `rnf_upstream_reset_state[]` signals and must be connected for any port that could go into reset and you want managed by `debug_force_snoop`.

If the connection is managed by SCI or can never go into reset then you need not connect this and the interconnect assumes that the upstream system is not in reset and will always enable the snoops if `ACCHANNELENSx` allows it.

If you fail to connect `rnf_upstream_reset_state[]` correctly, then the upstream system might receive snoop messages while in reset and it will complain that it received a snoop request while it was in reset.

If software overrides the enables then the next change to `rnf_upstream_reset_state[]` or the interconnect reset will overwrite the software values.

Using this operation along with software controlling the enables could confuse the software. This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

This parameter is for debug purposes only. Do not use it instead of correctly configuring CMN.

Ports for CMN600AE

Table 3-940: Ports

Name	Protocol	Type	Description
event_clusters	Signal	Peer	CPU event communication signal from the clusters.
event_downstream_link_signal[2]	Signal	Master	CPU event communication signal to the CMLHub. Event from the CMN towards the Hub NOTE that these are virtual "links" on underlying PCIe hardware bus.
event_upstream_link_signal[2]	Signal	Slave	Event from the Hub towards the CMN
fmu_eri	Signal	Master	FMU signal for critical errors
fmu_fhi	Signal	Master	FMU signal for non-critical errors
pvbus_m_cml	PVBus	Master	CML downstream ports
pvbus_m_cml_cfg	PVBus	Master	CML downstream hub configuration port
pvbus_m_hni[4]	PVBus	Master	HNI downstream ports.
pvbus_m_snf[4]	PVBus	Master	SNF downstream port.
pvbus_s_apb	PVBus	Slave	APB interface port.
pvbus_s_cml	PVBus	Slave	CML upstream ports
pvbus_s_rnf[8]	PVBus	Slave	RNF upstream ports.
pvbus_s_rni[24]	PVBus	Slave	RNI upstream ports.
reset_in	Signal	Slave	Reset signal.
rnf_sci_s[8]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-F in and out of the coherency domain.
rnf_upstream_reset_in[8]	Signal	Slave	Used by the interconnect to determine the reset state of the RNF manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.
rni_sci_s[24]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-D in and out of the coherency domain.
rni_upstream_reset_in[24]	Signal	Slave	Used by the interconnect to determine the reset state of the RNI manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.

Parameters for CMN600AE

acchannelen_rnf

Type

string

Default value

"0"

Note

DEPRECATED: Will be removed after FM 11.18. Use `rnf_sci_enable` instead.

For each `rnf` port, indicates if the port is populated with a snoop responding device or not.

The input value is a string, for example `0xffff` or `ffff`

acchannelen_rni

Type

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rni_sci_enable` instead.

For each `rni` port, indicates if the port is populated with a dvm responding device or not.

The input value is a string, for example `0xffff` or `ffff`

cache_state_modelled

Type

bool

Default value

0x0

Model the cache state.

debug_force_snoop

Type

bool

Default value

false

The CMN600AE interconnect will normally start with snooping disabled.

The parameter `rnf_sci_enable` and `rni_sci_enable` determines which connections are managed by the System Coherency Interface.

For connections that are managed by the System Coherency Interface, then they will look after themselves for entering and leaving the coherency domain and this parameter has no effect for those ports.

However, for connections that are *not* managed by the System Coherency Interface, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

This parameter is for debug purpose only

Do not use this parameter instead of correctly configuring CMN.

disable_CML_port

Type

bool

Default value

0x0

If true the model won't connect the CML port when there are nodes which support the CML feature (ie CXG nodes).

enable_logger

Type

bool

Default value

0x0

Enable PVBUSLoggers for the downstream ports in the CMN model.

enable_rnsam_to_hnf_wider_hash

Type

bool

Default value

false

Enable support of wider hash for the RNSAM to HNF communication.

If this variable enabled, then `bits[47:6]` from PA used in hashing function.

By default it is `[47:12]`.

fdc_key

Type

uint8_t

Default value

0

`Por_fdc_key` register value is checked against this key.

fmw_key**Type**

uint8_t

Default value

0

Por_fm_key register value is checked against this key.

force_rnsam_internal**Type**

bool

Default value

0x1

Force all RNSAMs to be internal independently of the mesh topology.

mesh_config_file**Type**

string

Default value

""

Name of a file containing mesh placement of CMN600AE components.

number_of_mpu_programmable_regions**Type**

uint32_t

Default value

32

Number of MPU programmable regions.

Valid values are 0, 8, 16 and 32.

periphbase**Type**

uint64_t

Default value

0x20000000

Value for PERIPHBASE. Bits [25:0] are treated 0

print_cmn_ccix_config**Type**

bool

Default value

0x0

Print information about the CCIX configuration.

print_cmn_config**Type**

bool

Default value

0x0

Print the mesh topology and children pointers acquired from the YML file.

revision**Type**

string

Default value

"r1p0"

Component revision.

Currently supports r1p0.

rnf_sci_enable**Type**

string

Default value

"0x0"

For each rnf port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

rni_sci_enable**Type**

string

Default value

"0x0"

For each rni port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

show_banner**Type**

uint64_t

Default value

2

Show component banner:

0

supress entire banner

1

suppress config file

2+

show full banner

skip_cmn_config_check**Type**

bool

Default value

0x0

Skip any topology configuration checks. The maximum number of devices per type not verified.

use_yaml_periphbase**Type**

bool

Default value

false

Use yml param `CFGM_PERIPHBASE_PARAM` to specify periphbase address.

If false, model parameter `periphbase` will be used.

3.10.15 CMN600CMLHub

CMN600 CML Interconnect Hub Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-941: IP revisions support

Revision	Quality level
N/A	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CMN600CMLHub

This model has the following Iris instances:

Table 3-942: CMN600CMLHub Iris instances

InstanceName	ComponentName
CMN600CMLHub	CMN600CMLHub
CMN600CMLHub.CMN600CMLHubCache	PVCache
CMN600CMLHub.CMN600CMLHubCache.upstream[0]	PVBusSlave
CMN600CMLHub.CMN600CMLHubCache.upstream[1]	PVBusSlave
CMN600CMLHub.CMN600CMLHubCache.upstream[2]	PVBusSlave
CMN600CMLHub.CMN600CMLHubCache.upstream[3]	PVBusSlave
CMN600CMLHub.bus_s_cfg	PVBusSlave
CMN600CMLHub.cache_downstream_exclusive_monitor0	PVBusExclusiveMonitor
CMN600CMLHub.cache_downstream_exclusive_monitor0.bus_mapper	PVBusMapper
CMN600CMLHub.cache_downstream_exclusive_monitor1	PVBusExclusiveMonitor
CMN600CMLHub.cache_downstream_exclusive_monitor1.bus_mapper	PVBusMapper
CMN600CMLHub.cache_downstream_exclusive_monitor2	PVBusExclusiveMonitor
CMN600CMLHub.cache_downstream_exclusive_monitor2.bus_mapper	PVBusMapper
CMN600CMLHub.cache_downstream_exclusive_monitor3	PVBusExclusiveMonitor
CMN600CMLHub.cache_downstream_exclusive_monitor3.bus_mapper	PVBusMapper

This model has the following MTI trace components:

- CMN600CMLHub

Ports for CMN600CMLHub

Table 3-944: Ports

Name	Protocol	Type	Description
event_downstream_link_signal[4]	Signal	Slave	CPU downstream event communication signal.
event_upstream_link_signal[4]	Signal	Master	CPU upstream event communication signal.
pdbus_m[4]	PVBus	Master	Downstream CCIX port.
pdbus_s[4]	PVBus	Slave	Upstream CCIX ports.
pdbus_s_cfg[4]	PVBus	Slave	Upstream config ports.
reset_signal	Signal	Slave	Reset signal.

Parameters for CMN600CMLHub

cache_state_modelled

Type

bool

Default value

0x0

Model the cache state.

enable_logger**Type**

bool

Default value

0x0

Enable PVBusLoggers for the downstream ports in the CMN model.

3.10.16 CMN650

CMN650 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-945: IP revisions support

Revision	Quality level
r1p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CMN650

This model has the following Iris instances:

CMN650.snf_mapper	PVBusMapper

CMN650 contains the following CADI targets:

- CMN650

About CMN650

- Major IP revisions (rX) are modeled and are controlled by the `revision` parameter.
- Minor IP revisions (pY) are not modeled. There are no functional differences in the model between pY revisions, with the exception of the `periph_id2` register.
- To configure the model, you must have installed Arm Socrates. The `mesh_config_file` parameter defines the mesh placement of the CHI nodes. Set it to the name of the yml configuration file emitted by Socrates. You must use version r1p4-01rel0 or later of Socrates to generate the file. For more information about Socrates, see [Arm Socrates](#) on Arm Developer. To download it, contact Arm Technical Support.
- Interconnect models are based on the TRM description and do not typically model RTL defects.

The model supports the following features:

- `rnf`, `rni/rnd`, `hni`, and `snf/sbsx` interface ports. The mapping between the port number and `nodeId` is based on the `nodeId` index. For example, `RNF2` controls `pvbuss_rnf[2]`. Its index is specified in the `node_info` register as `logical_id`. Similar behavior can be expected for `HN-I`.

If both `RN-D` and `RN-I` nodes are present, then all starting `rni` ports are mapped to `RN-D` nodes and then the `RN-I` nodes. For example, for CMN650 with two `RN-D` nodes, one `RN-I` node, and given each `RN-I` or `RN-D` node controls three interface ports, `pvbuss_rni[0-2]` maps to `RND0`, `pvbuss_rni[3-5]` maps to `RND1` and `pvbuss_rni[6-8]` maps to `RNI0`.

Similarly, `SN-F` and `SBSX` nodes are mapped to `pvbuss_m_snf[]` ports where starting ports are mapped to `SN-F` and then `SBSX` nodes.

- Mapping `HN*_SLC_SIZE_PARAM` values to cache sizes:

-8

OKB where `HN*_SLC_NUM_WAYS_PARAM=16`

This value is not supported by the model.

-2

128KB where `HN*_SLC_NUM_WAYS_PARAM=16`

-1

256KB where `HN*_SLC_NUM_WAYS_PARAM=16`

0

512KB where `HN*_SLC_NUM_WAYS_PARAM=16`

1

1MB where `HN*_SLC_NUM_WAYS_PARAM=16`

2

2MB where `HN*_SLC_NUM_WAYS_PARAM=16`

3

3MB where `HN*_SLC_NUM_WAYS_PARAM=12`

3

4MB where `HN*_SLC_NUM_WAYS_PARAM=16`

- The Address Based Flush (ABF) feature is available. After it has started, the ABF completes instantly. The ABF implementation has the following limitations:
 - In the Fast Model, any HN-F in the interconnect can perform an ABF on any address range even if that range is not part of the System Cache Group (SCG) that the HN-F belongs to.
 - Clearing the OCM with an ABF is not supported. A trace has been added to highlight this.
 - When `HN*_ABF_PR.abf_mode` is Reserved and `HN*_ABF_PR.abf_enable` is set, an error is printed and the ABF status register is set to complete successfully, but no operation takes place.
 - Because an ABF completes instantly, the `SF_PM_TRANSITION_ABORT` state cannot be reached. Contact Arm Technical Support with questions about support for this error condition.
 - The optional interrupt `INTREQPPU` is not supported.

Model limitations

- Out of scope:
 - PMU counters are not supported. Counter registers are implemented as **RAZ**.
 - QoS is not supported and all related registers are **RAZ/WI**.
 - Error injection and error generation are not supported. All error registers are **RAZ/WI**.
 - Power, clock, and interrupt signals are not supported.

The P-channel (power) signals `PREQ_LOGIC`, `PSTATE_LOGIC`, `PACCEPT_LOGIC`, `PDENY_LOGIC`, and `PACTIVE_LOGIC`, are not implemented. The model behaves as if

PSTATE_LOGIC is 0b00000. So the initial power state of the HN-F nodes is NOSFSLC/OFF. This is reflected in the reset values of `cmn_hns_ppu_pwpr`, which was named `por_hnf_ppu_pwpr` in earlier IP revisions. Software must write the `*_ppu_pwpr` registers to change the power state. Both HAM and FAM power states enable all of the SLC ways.

- Protocol credits and flit buffers are not supported.
- Snoop filtering is not supported.
- Prefetch Target operations are not supported.
- The MTE feature has been minimally tested and the functionality cannot be guaranteed. MTE error injection and detection are not supported.
- An access to a reserved or nonexistent register does not abort. It returns `pv::Tx_Data::TX_OK` and is **RAZ/WI**.
- Topologies with three I/O masters connected through an RN-I bridge device have been tested. Configurations where multiple I/O masters share a single ACE-lite port have not been tested.
- RNSAMs external to the mesh network are not functionally supported.

Note

Model parameter `force_rnsam_internal` is true by default. If this parameter is set to false and the topology has an RNFx (non-ESAM), the external bit (bit[31]) of the RNSAM children pointer is enabled. This bit is the only functionality governed by this parameter.

- By default, HN-F hashing uses the address [MAX:12] instead of the actual address [MAX:6], due to the DMI mechanism in the model. Enable the parameter `enable_rnsam_to_hnf_wider_hash` to make hashing logic use the actual address [MAX:6], but this might reduce the simulation speed of the model.
- OKB SLC data RAM and tag RAM are not supported.
- Source-based SLC cache partitioning is not supported.
- Way-based SLC cache partitioning is not supported.
- SLC/LCC partitioning dynamic allocation is not supported.
- Remote chip addresses incorrectly allocate a line in the SLC when `cache_state_modelled=true`. This can cause unexpected cache behavior that does not match the RTL, exhausting the SLC earlier or extra evictions.
- The fields in the `mvp_device_port_connect_info` register corresponding to the number of device credit slices and the number of CAL credit slices are not supported.
- SN-F hashing in HNSAM is not supported. HNSAM SN-F hashing is a single memory range mapped to multiple SN-Fs. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0 SNF1
```

The model supports mapping HN-F to a single SN-F. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0
0x00000002000 - 0x00000003000 SNF1
```

- HN-Fs with different SLC sizes in the same configuration are not supported.
- Transactions to addresses unused by Device registers in the Configuration Register Space are always routed to the Configuration Space even when the SAM is configured to use those addresses.
- GLC communication over A4S ports is not supported.
- MPAM features are not supported in the model, and the configuration-dependent register reset values do not match the RTL. Some of the registers (`por_hnf_mpam_idr` to `por_hnf_mpam_mbwumon_idr`) shared between security modes are not present in `MPAM_S`.
- The following limitations apply to System Cache Groups and Hash Target Groups:
 - A mix of local and remote HN-F targets is not supported.
 - CCG/CXRH target IDs in the HN target ID table are not supported (`sys_cache_grp_hn_nodeid_reg`).
 - The `hashed_target_grp_hnp_nodeid_reg` which is used for CCG/HN-P target IDs is not supported.
 - System/Hash Target Groups only support HN-Fs.
 - AXID hashing across HN-P/CCGs is not supported.
- The MPAM reset values described in `por_hnf_mpam_ns_por_hnf_mpam_idr[31:24]` default to the not-supported state. The model parameter `hnf_mpam_idr_override` can be used to override this but does not implement any of the functionality.
- `MPAM_S secure_register_groups_override` is not supported.
- No specific Debug Trace (DT) node functionality is supported. See [Plug-ins for Fast Models](#) for information about using plug-ins for trace.
- For Power State Transition related flush/disable of the SLC due to `HN_F_PPU_PWPR` register, only the Operational Mode field (bits[7:4]) is considered. The Power Policy field (bits[3:0]) is ignored.
- Setting HAM mode for the Operational Mode field (bits[7:4]) of the `HN_F_PPU_PWPR` is equivalent to FAM mode. The SLCH2 is neither flushed nor disabled according to the Power Policy field (bits[3:0]).
- Only hashing granularities of 4096B and above are supported.
- The OCM does not keep track of the total memory used across the S/NS security world and does not perform any eviction either. It is up to the software to make sure it does not oversubscribe the OCM.
- All RNs are assumed to have the same HN mapping. Programming RNSAMs differently between RNs is not supported.
- RNSAM cannot be programmed with the same HN-F target in a hashed and non-hashed memory region.
- `RNSAM_STATUS.default_target_type` and `RNSAM_STATUS.default_nodeid` are used as the default target only when `RNSAM_STATUS.use_default_node=1`. Otherwise, when a `txn` is sent into the model that does not belong to any of the address regions programmed in the RNSAM, it is routed to the HN-D irrespective of what is programmed in the `RNSAM_STATUS.default_target_type` and `RNSAM_STATUS.default_nodeid` fields.

- Address bit masking is not supported in RNSAM or HN-F SAM.
- HN-F SAM limitations:
 - Address masking in default hash regions in HN-F SAM is not supported.
 - Hashing in default hash regions in HN-F SAM is not supported. However, trace `SNF_HASHING_Target_SNF` displays the target SNF as if 3SN/6SN hashing were enabled.

The transaction is always routed to the SNO nodeid programmed in the SAM_CONTROL register.

- Re-programming regions in HN-F SAM is not tested.
- Hashing across CCGs in HN-F SAM is not supported.
- For an HTG/SCG, the model does not consider the secondary region if the primary region is not valid.
- There is no support for RAS.

About the `debug_force_snoop` parameter

The CMN interconnect normally starts up with snooping disabled.

The parameters `rnf_sci_enable` and `rni_sci_enable` determine which connections are managed by the System Coherency Interface. Connections that are managed by the System Coherency Interface look after themselves for entering and leaving the coherency domain and `debug_force_snoop` has no effect on those ports.

However, for connections that are not managed by the System Coherency Interface, `debug_force_snoop` enables the system upstream of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

Therefore, software does not need to know how to turn snoops in the interconnect on and off. The reset state of the upstream rnf ports is determined by the `rnf_upstream_reset_state[]` signals and must be connected for any port that could go into reset and you want managed by `debug_force_snoop`.

If the connection is managed by SCI or can never go into reset then you need not connect this and the interconnect assumes that the upstream system is not in reset and will always enable the snoops if `ACCHANNELENSx` allows it.

If you fail to connect `rnf_upstream_reset_state[]` correctly, then the upstream system might receive snoop messages while in reset and it will complain that it received a snoop request while it was in reset.

If software overrides the enables then the next change to `rnf_upstream_reset_state[]` or the interconnect reset will overwrite the software values.

Using this operation along with software controlling the enables could confuse the software. This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

This parameter is for debug purposes only. Do not use it instead of correctly configuring CMN.

Ports for CMN650

Table 3-948: Ports

Name	Protocol	Type	Description
event_clusters	Signal	Peer	CPU event communication signal from the clusters.
event_downstream_link_signal[10]	Signal	Master	CPU event communication signal to the CMLHub. Event from the CMN towards the Hub NOTE that these are virtual "links" on underlying PCIe hardware bus.
event_upstream_link_signal[10]	Signal	Slave	Event from the Hub towards the CMN
pvbuse_m_cml	PVBus	Master	CML downstream ports
pvbuse_m_cml_cfg	PVBus	Master	CML downstream hub configuration port
pvbuse_m_hni[16]	PVBus	Master	HNI downstream ports.
pvbuse_m_snf[40]	PVBus	Master	SNF downstream port.
pvbuse_s_apb	PVBus	Slave	APB interface port.
pvbuse_s_cml	PVBus	Slave	CML upstream ports
pvbuse_s_rnf[64]	PVBus	Slave	RNF upstream ports.
pvbuse_s_rni[96]	PVBus	Slave	RNI upstream ports.
reset_in	Signal	Slave	Reset signal.
rnf_sci_s[64]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-F in and out of the coherency domain.
rnf_upstream_reset_in[64]	Signal	Slave	Used by the interconnect to determine the reset state of the RNF manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.
rni_sci_s[96]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-D in and out of the coherency domain.
rni_upstream_reset_in[96]	Signal	Slave	Used by the interconnect to determine the reset state of the RNI manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.

Parameters for CMN650

acchannelen_rnf

Type

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rnf_sci_enable` instead.

For each `rnf` port, indicates if the port is populated with a snoop responding device or not.

The input value is a string, for example `0xffff` or `ffff`

acchannelen_rni**Type**

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rni_sci_enable` instead.

For each `rni` port, indicates if the port is populated with a dvm responding device or not.

The input value is a string, for example `0xffff` or `ffff`

cache_state_modelled**Type**

bool

Default value

0x0

Model the cache state.

debug_force_snoop**Type**

bool

Default value

false

The CMN650 interconnect will normally start with snooping disabled.

The parameter `rnf_sci_enable` and `rni_sci_enable` determines which connections are managed by the System Coherency Interface.

For connections that are managed by the System Coherency Interface, then they will look after themselves for entering and leaving the coherency domain and this parameter has no effect for those ports.

However, for connections that are *not* managed by the System Coherency Interface, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

This parameter is for debug purpose only

Do not use this parameter instead of correctly configuring CMN.

`disable_CML_port`

Type

bool

Default value

0x0

If true the model won't connect the CML port when there are nodes which support the CML feature (ie CXG nodes).

`enable_logger`

Type

bool

Default value

0x0

Enable PVBUSLoggers for the downstream ports in the CMN model.

`enable_rnsam_to_hnf_wider_hash`

Type

bool

Default value

false

Enable support of wider hash for the RNSAM to HNF communication.

If this variable enabled, then `bits[47:6]` from PA used in hashing function.

By default it is `[47:12]`.

force_rnsam_internal**Type**

bool

Default value

0x1

Force all RNSAMs to be internal independently of the mesh topology.

hnf_mpam_idr_override**Type**

uint64_t

Default value

0

Set to override `hnf_mpam_idr[31:24]` value. Bit[28] is Reserved and is ignored.

mesh_config_file**Type**

string

Default value

""

Name of a file containing mesh placement of CMN650 components.

periphbase**Type**

uint64_t

Default value

0x20000000

Value for `PERIPHBASE`. Bits [27:0] are treated 0

print_cmn_ccix_config**Type**

bool

Default value

0x0

Print information about the CCIX configuration.

print_cmn_config**Type**

bool

Default value

0x0

Print the mesh topology and children pointers acquired from the YML file.

revision**Type**

string

Default value

"r1p1"

Component revision.

Currently supports r1p1.

rnf_sci_enable**Type**

string

Default value

"0x0"

For each rnf port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

rni_sci_enable**Type**

string

Default value

"0x0"

For each rni port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example `0xffff` or `ffff`

show_banner**Type**

uint64_t

Default value

2

Show component banner:

0

supress entire banner

1

suppress config file

2+

show full banner

skip_cmn_config_check**Type**

bool

Default value

0x0

Skip any topology configuration checks. The maximum number of devices per type not verified.

use_yaml_periphbase**Type**

bool

Default value

false

Use yaml param `CFGM_PERIPHBASE_PARAM` to specify periphbase address.

If false, model parameter `periphbase` will be used.

3.10.17 CMN650R2

CMN650R2 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-949: IP revisions support

Revision	Quality level
r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CMN650R2

This model has the following Iris instances:

Table 3-950: CMN650R2 Iris instances

InstanceName	ComponentName
CMN650R2	CMN650R2
CMN650R2.bus_slave_ocm_NS	PVBusSlave
CMN650R2.bus_slave_ocm_S	PVBusSlave

CMN650R2 contains the following CADI targets:

- CMN650R2

About CMN650R2

- Major IP revisions (rX) are modeled and are controlled by the `revision` parameter.
- Minor IP revisions (pY) are not modeled. There are no functional differences in the model between pY revisions, with the exception of the `periph_id2` register.
- To configure the model, you must have installed Arm Socrates. The `mesh_config_file` parameter defines the mesh placement of the CHI nodes. Set it to the name of the yml configuration file emitted by Socrates. You must use version r1p4-01rel0 or later of Socrates to generate the file. For more information about Socrates, see [Arm Socrates](#) on Arm Developer. To download it, contact Arm Technical Support.
- Interconnect models are based on the TRM description and do not typically model RTL defects.

The model supports the following features:

- `rnf`, `rni/rnd`, `hni`, and `snf/sbsx` interface ports. The mapping between the port number and `nodeId` is based on the `nodeId` index. For example, RNF2 controls `pvbush_s_rnf[2]`. Its index is specified in the `node_info` register as `logical_id`. Similar behavior can be expected for HN-I.

If both RN-D and RN-I nodes are present, then all starting `rni` ports are mapped to RN-D nodes and then the RN-I nodes. For example, for CMN650 with two RN-D nodes, one RN-I node, and given each RN-I or RN-D node controls three interface ports, `pvbush_s_rni[0-2]` maps to RND0, `pvbush_s_rni[3-5]` maps to RND1 and `pvbush_s_rni[6-8]` maps to RNI0.

Similarly, SN-F and SBSX nodes are mapped to `pvbush_m_snf[]` ports where starting ports are mapped to SN-F and then SBSX nodes.

- Mapping HN*_SLC_SIZE_PARAM values to cache sizes:

-8

0KB where HN*_SLC_NUM_WAYS_PARAM=16

Note

This value is not supported by the model.

-2

128KB where HN*_SLC_NUM_WAYS_PARAM=16

-1

256KB where HN*_SLC_NUM_WAYS_PARAM=16

0

512KB where HN*_SLC_NUM_WAYS_PARAM=16

11MB where `HN*_SLC_NUM_WAYS_PARAM=16`**2**2MB where `HN*_SLC_NUM_WAYS_PARAM=16`**3**3MB where `HN*_SLC_NUM_WAYS_PARAM=12`**3**4MB where `HN*_SLC_NUM_WAYS_PARAM=16`

- The Address Based Flush (ABF) feature is available. After it has started, the ABF completes instantly. The ABF implementation has the following limitations:
 - In the Fast Model, any HN-F in the interconnect can perform an ABF on any address range even if that range is not part of the System Cache Group (SCG) that the HN-F belongs to.
 - Clearing the OCM with an ABF is not supported. A trace has been added to highlight this.
 - When `HN*_ABF_PR.abf_mode` is Reserved and `HN*_ABF_PR.abf_enable` is set, an error is printed and the ABF status register is set to complete successfully, but no operation takes place.
 - Because an ABF completes instantly, the `SF_PM_TRANSITION_ABORT` state cannot be reached. Contact Arm Technical Support with questions about support for this error condition.
 - The optional interrupt `INTREQPPU` is not supported.

Model limitations

- Out of scope:
 - PMU counters are not supported. Counter registers are implemented as **RAZ**.
 - QoS is not supported and all related registers are **RAZ/WI**.
 - Error injection and error generation are not supported. All error registers are **RAZ/WI**.
 - Power, clock, and interrupt signals are not supported.

The P-channel (power) signals `PREQ_LOGIC`, `PSTATE_LOGIC`, `PACCEPT_LOGIC`, `PDENY_LOGIC`, and `PACTIVE_LOGIC`, are not implemented. The model behaves as if `PSTATE_LOGIC` is `0b00000`. So the initial power state of the HN-F nodes is `NOSFSLC/OFF`. This is reflected in the reset values of `cmn_hns_ppu_pwpr`, which was named `por_hnf_ppu_pwpr` in earlier IP revisions. Software must write the `*_ppu_pwpr` registers to change the power state. Both HAM and FAM power states enable all of the SLC ways.

- Protocol credits and flit buffers are not supported.
 - Snoop filtering is not supported.
 - Prefetch Target operations are not supported.
- The MTE feature has been minimally tested and the functionality cannot be guaranteed. MTE error injection and detection are not supported.
- An access to a reserved or nonexistent register does not abort. It returns `pv::Tx_Data::TX_OK` and is **RAZ/WI**.

- Topologies with three I/O masters connected through an RN-I bridge device have been tested. Configurations where multiple I/O masters share a single ACE-lite port have not been tested.
- RNSAMs external to the mesh network are not functionally supported.

Note

Model parameter `force_rnsam_internal` is true by default. If this parameter is set to false and the topology has an RNFx (non-ESAM), the external bit (bit[31]) of the RNSAM children pointer is enabled. This bit is the only functionality governed by this parameter.

- By default, HN-F hashing uses the address [MAX:12] instead of the actual address [MAX:6], due to the DMI mechanism in the model. Enable the parameter `enable_rnsam_to_hnf_wider_hash` to make hashing logic use the actual address [MAX:6], but this might reduce the simulation speed of the model.
- OKB SLC data RAM and tag RAM are not supported.
- Source-based SLC cache partitioning is not supported.
- Way-based SLC cache partitioning is not supported.
- SLC/LCC partitioning dynamic allocation is not supported.
- Remote chip addresses incorrectly allocate a line in the SLC when `cache_state_modelled=true`. This can cause unexpected cache behavior that does not match the RTL, exhausting the SLC earlier or extra evictions.
- The fields in the `mvp_device_port_connect_info` register corresponding to the number of device credit slices and the number of CAL credit slices are not supported.
- SN-F hashing in HNSAM is not supported. HNSAM SN-F hashing is a single memory range mapped to multiple SN-Fs. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0 SNF1
```

The model supports mapping HN-F to a single SN-F. Example HNFSAM_Mem_Map:

```
0x00000001000 - 0x00000002000 SNF0
0x00000002000 - 0x00000003000 SNF1
```

- HN-Fs with different SLC sizes in the same configuration are not supported.
- Transactions to addresses unused by Device registers in the Configuration Register Space are always routed to the Configuration Space even when the SAM is configured to use those addresses.
- GIC communication over A4S ports is not supported.
- MPAM features are not supported in the model, and the configuration-dependent register reset values do not match the RTL. Some of the registers (`por_hnf_mpam_idr` to `por_hnf_mpam_mbwumon_idr`) shared between security modes are not present in MPAM_S.
- The following limitations apply to System Cache Groups and Hash Target Groups:
 - A mix of local and remote HN-F targets is not supported.

- CCG/CXRH target IDs in the HN target ID table are not supported (`sys_cache_grp_hn_nodeid_reg`).
- The `hashed_target_grp_hnp_nodeid_reg` which is used for CCG/HN-P target IDs is not supported.
- System/Hash Target Groups only support HN-Fs.
- AXID hashing across HN-P/CCGs is not supported.
- The MPAM reset values described in `por_hnf_mpam_ns_por_hnf_mpam_idr[31:24]` default to the not-supported state. The model parameter `hnf_mpam_idr_override` can be used to override this but does not implement any of the functionality.
- MPAM_S `secure_register_groups_override` is not supported.
- No specific Debug Trace (DT) node functionality is supported. See [Plug-ins for Fast Models](#) for information about using plug-ins for trace.
- For Power State Transition related flush/disable of the SLC due to HNF_PPU_PWPR register, only the Operational Mode field (bits[7:4]) is considered. The Power Policy field (bits[3:0]) is ignored.
- Setting HAM mode for the Operational Mode field (bits[7:4]) of the HNF_PPU_PWPR is equivalent to FAM mode. The SLCH2 is neither flushed nor disabled according to the Power Policy field (bits[3:0]).
- Only hashing granularities of 4096B and above are supported.
- The OCM does not keep track of the total memory used across the S/NS security world and does not perform any eviction either. It is up to the software to make sure it does not oversubscribe the OCM.
- All RNs are assumed to have the same HN mapping. Programming RNSAMs differently between RNs is not supported.
- RNSAM cannot be programmed with the same HN-F target in a hashed and non-hashed memory region.
- `RNSAM_STATUS.default_target_type` and `RNSAM_STATUS.default_nodeid` are used as the default target only when `RNSAM_STATUS.use_default_node=1`. Otherwise, when a `txn` is sent into the model that does not belong to any of the address regions programmed in the RNSAM, it is routed to the HN-D irrespective of what is programmed in the `RNSAM_STATUS.default_target_type` and `RNSAM_STATUS.default_nodeid` fields.
- Address bit masking is not supported in RNSAM or HN-F SAM.
- HN-F SAM limitations:
 - Address masking in default hash regions in HN-F SAM is not supported.
 - Hashing in default hash regions in HN-F SAM is not supported. However, trace `SNF_HASHING_Target_SNF` displays the target SNF as if 3SN/6SN hashing were enabled.

The transaction is always routed to the SN0 nodeid programmed in the `SAM_CONTROL` register.

- Re-programming regions in HN-F SAM is not tested.
- Hashing across CCGs in HN-F SAM is not supported.
- CAL2 support for HN-P and RN-D is not tested.
- The maximum number of 256 RN-Fs is not verified. 74 is the largest number tested.
- The maximum number of 40 SNs is not verified. 20 is the largest number tested.
- The maximum number of 36 RN-Is is not verified. 16 is the largest number tested.
- The maximum number of 16 HN-Is is not verified. 5 is the largest number tested.
- Early DVM completion is not supported.
- CCIX port to port forwarding is not supported.
- No support for up to 512 CXRAs with no RAID aliasing and 256 RN-Fs on a single chip.
- Each HN-F can support tracking of up to 512 logical processors for exclusive operations. However, the value of the RO field `num_excl` in the HN-F unit info register cannot exceed 255.

About the `debug_force_snoop` parameter

The CMN interconnect normally starts up with snooping disabled.

The parameters `rnf_sci_enable` and `rni_sci_enable` determine which connections are managed by the System Coherency Interface. Connections that are managed by the System Coherency Interface look after themselves for entering and leaving the coherency domain and `debug_force_snoop` has no effect on those ports.

However, for connections that are not managed by the System Coherency Interface, `debug_force_snoop` enables the system upstream of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

Therefore, software does not need to know how to turn snoops in the interconnect on and off. The reset state of the upstream rnf ports is determined by the `rnf_upstream_reset_state[]` signals and must be connected for any port that could go into reset and you want managed by `debug_force_snoop`.

If the connection is managed by SCI or can never go into reset then you need not connect this and the interconnect assumes that the upstream system is not in reset and will always enable the snoops if `ACCHANNELENSx` allows it.

If you fail to connect `rnf_upstream_reset_state[]` correctly, then the upstream system might receive snoop messages while in reset and it will complain that it received a snoop request while it was in reset.

If software overrides the enables then the next change to `rnf_upstream_reset_state[]` or the interconnect reset will overwrite the software values.

Using this operation along with software controlling the enables could confuse the software. This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

This parameter is for debug purposes only. Do not use it instead of correctly configuring CMN.

Ports for CMN650R2

Table 3-952: Ports

Name	Protocol	Type	Description
event_clusters	Signal	Peer	CPU event communication signal from the clusters.
event_downstream_link_signal[10]	Signal	Master	CPU event communication signal to the CMLHub. Event from the CMN towards the Hub NOTE that these are virtual "links" on underlying PCIe hardware bus.
event_upstream_link_signal[10]	Signal	Slave	Event from the Hub towards the CMN
pvbust_m_cml	PVBus	Master	CML downstream ports
pvbust_m_cml_cfg	PVBus	Master	CML downstream hub configuration port
pvbust_m_hni[16]	PVBus	Master	HNI downstream ports.
pvbust_m_snf[40]	PVBus	Master	SNF downstream port.
pvbust_s_apb	PVBus	Slave	APB interface port.
pvbust_s_cml	PVBus	Slave	CML upstream ports
pvbust_s_rnf[256]	PVBus	Slave	RNF upstream ports.
pvbust_s_rni[108]	PVBus	Slave	RNI upstream ports.
reset_in	Signal	Slave	Reset signal.
rnf_sci_s[256]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-F in and out of the coherency domain.
rnf_upstream_reset_in[256]	Signal	Slave	Used by the interconnect to determine the reset state of the RNF manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.
rni_sci_s[108]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-D in and out of the coherency domain.
rni_upstream_reset_in[108]	Signal	Slave	Used by the interconnect to determine the reset state of the RNI manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.

Parameters for CMN650R2

acchannelen_rnf

Type

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rnf_sci_enable` instead.

For each `rnf` port, indicates if the port is populated with a snoop responding device or not.

The input value is a string, for example `0xffff` or `ffff`

acchannelen_rni

Type

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rni_sci_enable` instead.

For each `rni` port, indicates if the port is populated with a dvm responding device or not.

The input value is a string, for example `0xffff` or `ffff`

cache_state_modelled

Type

bool

Default value

0x0

Model the cache state.

debug_force_snoop

Type

bool

Default value

false

The CMN650R2 interconnect will normally start with snooping disabled.

The parameter `rnf_sci_enable` and `rni_sci_enable` determines which connections are managed by the System Coherency Interface.

For connections that are managed by the System Coherency Interface, then they will look after themselves for entering and leaving the coherency domain and this parameter has no effect for those ports.

However, for connections that are *not* managed by the System Coherency Interface, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

This parameter is for debug purpose only

Do not use this parameter instead of correctly configuring CMN.

`disable_CML_port`

Type

bool

Default value

0x0

If true the model won't connect the CML port when there are nodes which support the CML feature (ie CXG nodes).

`enable_logger`

Type

bool

Default value

0x0

Enable PVBUSLoggers for the downstream ports in the CMN model.

`enable_rnsam_to_hnf_wider_hash`

Type

bool

Default value

false

Enable support of wider hash for the RNSAM to HNF communication.

If this variable enabled, then `bits[47:6]` from PA used in hashing function.

By default it is `[47:12]`.

force_rnsam_internal**Type**

bool

Default value

0x1

Force all RNSAMs to be internal independently of the mesh topology.

hnf_mpam_idr_override**Type**

uint64_t

Default value

0

Set to override `hnf_mpam_idr[31:24]` value. Bit[28] is Reserved and is ignored.

mesh_config_file**Type**

string

Default value

""

Name of a file containing mesh placement of CMN650R2 components.

periphbase**Type**

uint64_t

Default value

0x20000000

Value for `PERIPHBASE`. Bits [27:0] are treated 0

print_cmn_ccix_config**Type**

bool

Default value

0x0

Print information about the CCIX configuration.

print_cmn_config**Type**

bool

Default value

0x0

Print the mesh topology and children pointers acquired from the YML file.

revision**Type**

string

Default value

"r2p0"

Component revision.

Currently supports r2p0.

rnf_sci_enable**Type**

string

Default value

"0x0"

For each rnf port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

rni_sci_enable**Type**

string

Default value

"0x0"

For each rni port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example `0xffff` or `ffff`

show_banner**Type**

uint64_t

Default value

2

Show component banner:

0

supress entire banner

1

suppress config file

2+

show full banner

skip_cmn_config_check**Type**

bool

Default value

0x0

Skip any topology configuration checks. The maximum number of devices per type not verified.

use_yaml_periphbase**Type**

bool

Default value

false

Use yaml param `CFGM_PERIPHBASE_PARAM` to specify periphbase address.

If false, model parameter `periphbase` will be used.

3.10.18 CMN700

CMN700 Interconnect Fast Model. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-953: IP revisions support

Revision	Quality level
r0p0	Full support
r1p0	Full support
r2p0	Full support
r3p0	Full support
r3p3	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for CMN700

This model has the following Iris instances:

Table 3-954: CMN700 Iris instances

InstanceName	ComponentName
CMN700	CMN700
CMN700.bus_slave_ocm_NS	PVBusSlave
CMN700.bus_slave_ocm_S	PVBusSlave

CMN700 contains the following CADI targets:

- CMN700
- CMN_TAG_CACHE

About CMN700

- Major IP revisions (rX) are modeled and are controlled by the `revision` parameter or the topology file.
- Minor IP revisions (pY) are not modeled. There are no functional differences in the model between pY revisions, with the exception of the `periph_id2` register.
- To configure the model, you must have installed Arm Socrates. The `mesh_config_file` parameter defines the mesh placement of the CHI nodes. Set it to the name of the yml configuration file emitted by Socrates. You must use version SYSOC-BN-00001 r1p6-02lac1 of Socrates to

generate the file. For more information about Socrates, see [Arm Socrates](#) on Arm Developer. To download it, contact Arm Technical Support.

- Interconnect models are based on the TRM description and do not typically model RTL defects.
- The maximum mesh size supported is X=12, Y=12.
- The mapping between the port number for rnf, rni/rnd, hni, and snf/sbsx interface ports and `nodeId` is based on the `nodeId` index. For example, RNF2 controls `pvbus_s_rnf[2]`. Its index is specified in the `node_info` register as `logical_id`. Similar behavior can be expected for HN-I.

If both RN-D and RN-I nodes are present, then all starting rni ports are mapped to RN-D nodes and then the RN-I nodes. For example, for CMN700 with two RN-D nodes, one RN-I node, and given each RN-I or RN-D node controls three interface ports, `pvbus_s_rni[0-2]` maps to `RND0`, `pvbus_s_rni[3-5]` maps to `RND1` and `pvbus_s_rni[6-8]` maps to `RNI0`.

Similarly, SN-F and SBSX nodes are mapped to `pvbus_m_snf[]` ports where starting ports are mapped to SN-F and then SBSX nodes.

- See the CMN700r3 TRM for the `HN*_SLC_SIZE_PARAM` values.
- There is limited support for RNSAMs external to the CMN. See the Model limitations section for more information.
- CCG device id is CCG id + 1 when CAL2 and PCIE_ENABLE are set for port 1.
- CXL Type-3 (CXL.mem) devices can be connected to the `pvbus_m_cxs[]` ports. The CXRH nodes, if any, are connected to `pvbus_m_cxs[0]` ... followed by the CCG nodes, if any.
- The Address Based Flush (ABF) feature is available. After it has started, the ABF completes instantly. The ABF implementation has the following limitations:
 - In the Fast Model, any HN-F in the interconnect can perform an ABF on any address range even if that range is not part of the System Cache Group (SCG) that the HN-F belongs to.
 - Clearing the OCM with an ABF is not supported. A trace has been added to highlight this.
 - When `HN*_ABF_PR.abf_mode` is Reserved and `HN*_ABF_PR.abf_enable` is set, an error is printed and the ABF status register is set to complete successfully, but no operation takes place.
 - Because an ABF completes instantly, the `SF_PM_TRANSITION_ABORT` state cannot be reached. Contact Arm Technical Support with questions about support for this error condition.
 - The optional interrupt `INTREQPPU` is not supported.
- There is limited support for RAS:
 - Error logging and reporting functionality for HN-I, SBSX, XP, and MTU are supported.
 - RAS-related interrupts (`INTREQERRS`, `INTREQFAULTS`, `INTREQFAULTNS`, `INTREQERRNS`) have been added.
 - Central RAS interrupt-handling functionality of HN-D is supported.

Enabling RAS can impact performance. To avoid this, RAS is disabled by default in the CMN700 model. To enable RAS, set the `enable_ras` parameter to true.

- There is support for A4S Multichip routing, with limitations:
 - When the `enable_a4s` parameter is false, top-level model ports are terminated with abort handlers.
 - Set `enable_a4s` parameter to true to opt into the feature.
 - The model routes A4S transactions from the `ic_dr_a4s` port to `tx_cxs_a4s` ports according to A4S LDIDs.
 - There is 1 A4S tx/rx port for each CCG up to a maximum of 32 CCGs.
 - When the remote transaction arrives at the receiving remote CMN on `rx_cxs_a4s` ports, it is routed to the GIC A4S port (`ic_rd_a4s`).
 - The A4S LDID for the CCGs can be found by reading the `ccg_RA.unit_info` register or through model parameter `print_cmn_config`.

A4S support limitations are listed in the Model Limitations section.

The following list describes the level of support in the CMN700 model for different revision-specific features of the IP:

- r1p0, second release

CXLv2.0 host-side support for CXL.mem and CXL.io protocols for Type-3 memory expansion devices

Model supports Type-3 connections using PVBUS

32 CCG or CXG gateway nodes

Supported

Non power-of-2 hashing of HN-Fs with $2N * \{1, 3, \text{or } 5\}$ up to 64 HN-Fs or 128 HN-Fs with CAL

Supported

- r2p0, third release

Remote PCIe streaming support

Not in scope

1.5MB SLC support

Supported, `SLC_SIZE=2`, `NUM_WAYS=12`

90 RN-I support

Only 40 supported (3 AXI port each)

128 SN-F/SBSX support

Only 80 supported

AXID based for port aggregation across chip

Not supported

RNSAM support for 4 chip flat hashing configuration

Supported

- r3p0, fourth release

AXU port on all MXPs

Not supported

512 RN-I requests support

Not in scope

16-bit REQ RSVDC support

Width reported in info_global register; RSVDC not in scope

Configurable write cancel threshold in RN-I and RN-D

Not in scope

Remote DVM sync collapsing

Not in scope

CPAG MOD-3 hashing

CPAG hashing not supported

PCIe write streaming improvements

Not in scope

- r3p3, fifth release

Performance optimization guideline improvements for RN-I and RN-D

Not in scope

HN-P and HN-I AxID Encoding improvements

Not in scope

HCAL2 Discovery supported

Feature available, but not tested for cmn700

Model limitations

- Out of scope:
 - PMU counters are not supported. Counter registers are implemented as **RAZ**.
 - QoS is not supported and all related registers are **RAZ/WI**.
 - Error injection and error generation are not supported. All error registers are **RAZ/WI**.
 - Power, clock, and interrupt signals are not supported, but RAS-related interrupts are supported.

The P-channel (power) signals PREQ_LOGIC, PSTATE_LOGIC, PACCEPT_LOGIC, PDENY_LOGIC, and PACTIVE_LOGIC, are not implemented. The model behaves as if PSTATE_LOGIC is 0b00000. So the initial power state of the HN-F nodes is NOSFSLC/OFF. This is reflected in the reset values of `cmn_hns_ppu_pwpr`, which was named `por_hnf_ppu_pwpr` in earlier IP revisions. Software must write the `*_ppu_pwpr` registers to change the power state. Both HAM and FAM power states enable all of the SLC ways.

- Protocol credits and flit buffers are not supported.
- Snoop filtering is not supported.
- Prefetch target operations are not supported.

- The MTE feature has been minimally tested and the functionality cannot be guaranteed. MTE error injection and detection are not supported.
- An access to a reserved or nonexistent register does not abort. It returns `pv::Tx_Data::TX_OK` and is **RAZ/WI**.
- Topologies with three I/O masters connected through an RN-I bridge device have been tested. Configurations where multiple I/O masters share a single ACE-lite port have not been tested.
- RNSAMs external to the mesh network are not functionally supported.

Note

Model parameter `force_rnsam_internal` is true by default. If this parameter is set to false and the topology has an RNFx (non-ESAM), the external bit (bit[31]) of the RNSAM children pointer is enabled. This bit is the only functionality governed by this parameter.

- By default, HN-F hashing uses the address [MAX:12] instead of the actual address [MAX:6], due to the DMI mechanism in the model. Enable the parameter `enable_rnsam_to_hnf_wider_hash` to make hashing logic use the actual address [MAX:6], but this might reduce the simulation speed of the model.
- OKB SLC data RAM and tag RAM are not supported.
- Source-based SLC cache partitioning is not supported.
- Way-based SLC cache partitioning is not supported.
- SLC/LCC partitioning dynamic allocation is not supported.
- Remote chip addresses incorrectly allocate a line in the SLC when `cache_state_modelled=true`. This can cause unexpected cache behavior that does not match the RTL, exhausting the SLC earlier or extra evictions.
- The fields in the `mxp_device_port_connect_info` register corresponding to the number of device credit slices and the number of CAL credit slices are not supported.
- HN-Fs with different SLC sizes in the same configuration are not supported.
- GIC communication over A4S ports is not supported.
- No support or updates for the following parameters:
 - `POR_RSVDC_STRONGNC_EN_PARAM`
 - `POR_HNSAM_CUSTOM_REGS_PARAM`
- No updates for a new bit in `CMN_HNS_CFG_CTL` to disable HNS stashing snoop (`hnf_stash_snp_dis`).
- HND-APB registers not supported.
- HN-P nodes are not supported as hashed target from the RNSAM.
- There is limited support for CXL Type-3. It only supports a single device connection (`sa_ports_cnt`).
- For CMN700R1, `por_hnf_cfg_ctl` follows the CMN700R0 write mask and reset value.
- For CMN700R1 and later, stash snooping is not supported.

- The model cannot activate both CCG APB register access traces and CMN register access traces simultaneously. Use the parameter `register_traces_for_ccg_apb_accesses` to enable CCG APB register access traces. By default, CMN register access traces are available for activation.
- MPAM features are not supported in the model, and the configuration-dependent register reset values do not match the RTL. Some of the registers (`por_hnf_mpam_idr` to `por_hnf_mpam_mbwumon_idr`) shared between security modes are not present in MPAM_S.
- The MPAM reset values described in `por_hnf_mpam_ns_por_hnf_mpam_idr[31:24]` default to the not-supported state. The model parameter `hnf_mpam_idr_override` can be used to override this but does not implement any of the functionality.
- The following limitations apply to System Cache Groups and Hash Target Groups:
 - The `hashed_target_grp_hnp_nodeid_reg` which is used for CCG/HN-P target IDs is not supported.
 - AXID hashing across HN-P/CCGs is not supported.
 - HTGs containing targets across multi-chips are not supported.
- Multiple CPA groups are not supported.
- MPAM_S `secure_register_groups_override` is not supported.
- No specific Debug Trace (DT) node functionality is supported. See [Plug-ins for Fast Models](#) for information about using plug-ins for trace.
- For Power State Transition related flush/disable of the SLC due to HNF_PPU_PWPR register, only the Operational Mode field (bits[7:4]) is considered. The Power Policy field (bits[3:0]) is ignored.
- Setting HAM mode for the Operational Mode field (bits[7:4]) of the HNF_PPU_PWPR is equivalent to FAM mode. The SLCH2 is neither flushed nor disabled according to the Power Policy field (bits[3:0]).
- Only hashing granularities of 4096B and above are supported.
- All RNs are assumed to have the same HN mapping. Programming RNSAMs differently between RNs is not supported.
- RNSAM cannot be programmed with the same HN-F target in a hashed and non-hashed memory region.
- `RNSAM_STATUS.default_target_type` and `RNSAM_STATUS.default_nodeid` are used as the default target only when `RNSAM_STATUS.use_default_node=1`. Otherwise, when a txn is sent into the model that does not belong to any of the address regions programmed in the RNSAM, it is routed to the HN-D irrespective of what is programmed in the `RNSAM_STATUS.default_target_type` and `RNSAM_STATUS.default_nodeid` fields.
- Address bit masking is not supported in RNSAM or HN-F SAM.
- The OCM does not keep track of the total memory used across the S/NS security world and does not perform any eviction either. It is up to the software to make sure it does not oversubscribe the OCM.
- RSVDC StrongNC and its associated functionality is not supported.
- User-defined hashing mechanism in an SCG is not supported.

- The CXSA mode has limited support. Currently, it only supports one aggregated device.
- The model does not display any register traces.
- GenericTrace for the CMN700 Fast Model, incorrectly mentions “CMN600” in logs.
- CCG node addresses do not match RTL node addresses if not using node addresses from yml.
- The following limitations are specific to revision r2p0:
 - The model does not support the RA_PRESENT configurable option. RAs are always present in CCG.
 - Maximum number of RN-D supported is 40.
- The following limitations apply to revisions r2p0 and r3p0:
 - No support for RWL (ReadWriteLock).
 - Maximum number of RN-I supported is 40.
 - Maximum combined number of RN-I and RN-D is 40.
 - SN-Fs on CAL4 are not supported.
 - Maximum number of SN interfaces supported is 80.
- The following limitations are specific to revision r3p0:
 - Maximum RAID of 1024 is not supported.
 - Direct Subordinate Access (DSA) CCG inbound request bypass of HN-F is not supported.
 - CXL v2.0 device support for various types is not supported or verified.
 - CXL v2.0 host support for various types is not supported or verified.
 - There is no support for CPAG MOD-3 hashing.
 - There is no support for AXU.
- RAS feature limitations:
 - Error logging and reporting functionality for CCG, HN-F, and CXHA are not supported.
 - Single-bit error injection for MTU is not supported as there is no ECC checker or register present to support it.
 - NDE response and Poison error check are not supported.
 - Flit parity and Data check errors are not supported.
 - The information that is captured as source ID, target ID, and logical ID in the ERRMISC register might not be correct or match the hardware.
 - HN-D Illegal Configuration check does not check that the access is of device type.
 - HN-D Illegal Configuration check does not check the access security mode.
 - SN-F RAS errors are treated as SBSX errors.
- A4S support limitations:
 - GIC_DESTID input strap is not supported. Incoming transactions from remote chip are always routed to IC_RD.

- The model assumes the presence of 1x A4S port for GIC without regard for the actual number of a4s interfaces in themesh_config_file topology.
- The model does not require user software at runtime to enable the CMN to route multichip A4S transactions between chips.
- Limited performance testing has been performed.
- There is no support for the use of “id_map” file specified by CMN Configuration Integration Manual (CIM) to configure the model for reset.
- Model behavior does not reflect errata notice 2732981. The model behaves as r3p1. See the errata for details.
- For an HTG/SCG, the model does not consider the secondary region if the primary region is not valid.
- HN-D is only permitted on device port P2 in a single-MXP configuration.
- Only the last RN-F in the mesh, which is the one with the highest logical id, can be controlled by mxp_p[0-5]_syscoreq_ctl registers. Also, incorrectly, it can be controlled from any XP.
- HNSAM only supports two non-hashed memory regions. Memory regions programmed using cmn_hns_sam_nonhash_cfg[1|2]_memregion2-63 registers are ignored.
- The Hierarchical hashing fields
HASHED_TARGET_GRP_HASH_CNTL_REG.htg_region#{index}_hier_enable_address_stripping
and HASHED_TARGET_GRP_HASH_CNTL_REG.htg_region#{index}_hier_cluster_mask are not supported.
- The HNSAM_DEF_HASHED_GRP_EN yml parameter is not supported and HN-F SAM legacy mode is always enabled.
- The HNSAM_NUM_HTG yml parameter is not supported.
- When both POR_CCLA_ULL_CTL.u11_to_u11_en and POR_CCLA_ULL_CTL.send_vd_init bits are set then both POR_CCLA_ULL_STATUS.tx_state and POR_CCLA_ULL_STATUS.rx_state are set. The other side of the link is not consulted to set POR_CCLA_ULL_STATUS.rx_state.
- HN-F SAM:
 - Address masking in default hash regions in HN-F SAM is not supported.
 - Hashing in default hash regions in HN-F SAM is not supported. However, trace SNF_HASHING_Target_SNF displays the target SNF as if 3SN/6SN hashing were enabled.

The transaction is always routed to the SN0 nodeid programmed in the SAM_CONTROL register.

- Re-programming regions in HN-F SAM is not tested.
- Hashing across CCGs in HN-F SAM is not supported.
- Address compare hashed regions in HN-F SAM do not support non-power of 2 hashing. When non-power of 2 hashing is enabled, the first SN in the HTG (SN0) is used as the target.

- HNSAM_DEF_HASHED_GRP_EN yml parameter is not supported.
- CMN700 r1p0 supports only 8 hashed regions in HN-F SAM. CMN700 r2p0 and r3p0 support 16 hashed regions.
- Default hash regions in HN-F SAM have limited support.
`cmn_hns_sam_cfg1_def_hashed_region` and `cmn_hns_sam_cfg2_def_hashed_region` are not supported.
- Hashing across SN-F on CAL2 in HN-F SAM is not supported.

About the `debug_force_snoop` parameter

The CMN interconnect normally starts up with snooping disabled.

The parameters `rnf_sci_enable` and `rni_sci_enable` determine which connections are managed by the System Coherency Interface. Connections that are managed by the System Coherency Interface look after themselves for entering and leaving the coherency domain and `debug_force_snoop` has no effect on those ports.

However, for connections that are not managed by the System Coherency Interface, `debug_force_snoop` enables the system upstream of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

Therefore, software does not need to know how to turn snoops in the interconnect on and off. The reset state of the upstream rnf ports is determined by the `rnf_upstream_reset_state[]` signals and must be connected for any port that could go into reset and you want managed by `debug_force_snoop`.

If the connection is managed by SCI or can never go into reset then you need not connect this and the interconnect assumes that the upstream system is not in reset and will always enable the snoops if `ACCHANNELENSX` allows it.

If you fail to connect `rnf_upstream_reset_state[]` correctly, then the upstream system might receive snoop messages while in reset and it will complain that it received a snoop request while it was in reset.

If software overrides the enables then the next change to `rnf_upstream_reset_state[]` or the interconnect reset will overwrite the software values.

Using this operation along with software controlling the enables could confuse the software. This option does not remove the responsibility of the upstream system to clean any shared dirty data from its caches before going into reset.

This parameter is for debug purposes only. Do not use it instead of correctly configuring CMN.

Ports for CMN700

Table 3-956: Ports

Name	Protocol	Type	Description
event_clusters	Signal	Peer	CPU event communication signal from the clusters.
event_downstream_link_signal[32]	Signal	Master	CPU event communication signal to the CMLHub. Event from the CMN towards the Hub NOTE that these are virtual "links" on underlying PCIe hardware bus.
event_upstream_link_signal[32]	Signal	Slave	Event from the Hub towards the CMN
ic_dr_a4s	PVBus	Slave	Interrupt Controller Distributor-to-Remote AXI4Stream port.
ic_rd_a4s	PVBus	Master	Interrupt Controller Remote-to-Distributor AXI4Stream port.
intreqerrns_irq_out	Signal	Master	Interrupt signal
intreqerrs_irq_out	Signal	Master	Interrupt signal
intreqfaultns_irq_out	Signal	Master	Interrupt signal
intreqfaults_irq_out	Signal	Master	Interrupt signal
pvbus_m_cml	PVBus	Master	CML downstream ports
pvbus_m_cml_cfg	PVBus	Master	CML downstream hub configuration port
pvbus_m_cxs[32]	PVBus	Master	CXS downstream ports
pvbus_m_hni[32]	PVBus	Master	HNI downstream ports.
pvbus_m_snf[128]	PVBus	Master	SNF downstream port.
pvbus_s_apb	PVBus	Slave	APB interface port.
pvbus_s_ccg_apb[32]	PVBus	Slave	CCG APB interface port.
pvbus_s_cml	PVBus	Slave	CML upstream ports
pvbus_s_rnf[256]	PVBus	Slave	RNF upstream ports.
pvbus_s_rni[270]	PVBus	Slave	RNI upstream ports. NOTE the upper 150 ports are only used in r2/r3.
reset_in	Signal	Slave	Reset signal.
rnf_sci_s[256]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-F in and out of the coherency domain.
rnf_upstream_reset_in[256]	Signal	Slave	Used by the interconnect to determine the reset state of the RNF manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected.
rni_sci_s[120]	SystemCoherencyInterface	Slave	System Coherency port to move the RN-D in and out of the coherency domain.
rni_upstream_reset_in[270]	Signal	Slave	Used by the interconnect to determine the reset state of the RNI manager to check an aspect of reset sequencing. If debug_force_snoop is used, this port must be connected. NOTE the upper 150 ports are only used in r2/r3.
rx_cxs_a4s[32]	PVBus	Slave	Receive channel of A4S packets from a remote CMN.
tx_cxs_a4s[32]	PVBus	Master	Transmit channel of A4S packets to a remote CMN.

Parameters for CMN700

a4s_logicalid

Type

string

Default value

""

A4S ID mapping of the GIC destination component connected through a CCG port.

Specify the `CCG_NODE_ID` and the destination A4S Logical ID of the GIC component connected by using a decimal number format like:

```
<CCG_NODEID0>=<A4S_LID0>,<CCG_NODEID1>=<A4S_LID1>
```

For example for CCG Node ID 54 with A4S ID 12 - 54=12.

All of the CCG nodes must be specified.

The parameter is only valid when the `enable_a4s` is also enabled. The default behavior without this parameter is to automatically assign an incrementing A4S ID

acchannelen_rnf

Type

string

Default value

"0"

Note

DEPRECATED: Will be removed after FM 11.18. Use `rnf_sci_enable` instead.

For each rnf port, indicates if the port is populated with a snoop responding device or not.

The input value is a string, for example `0xffff` or `ffff`

acchannelen_rni

Type

string

Default value

"0"

DEPRECATED: Will be removed after FM 11.18. Use `rni_sci_enable` instead.

For each `rni` port, indicates if the port is populated with a dvm responding device or not.

The input value is a string, for example `0xffff` or `ffff`

`cache_state_modelled`

Type

bool

Default value

0x0

Model the cache state.

`cmn700_tag_cache.metadata_controller.init_value`

Type

int

Default value

0xd

Initialize metadata memory with this value. If one of `init_values_json` or `init_values_json_file` is specified, this value applies only to any metadata not specified in the JSON.

`cmn700_tag_cache.metadata_controller.init_values_json`

Type

string

Default value

""

A JSON value describing initial metadata values. Mutually exclusive with `init_values_json_file`. The format is as follows: { "regions": [{ "begin": 0x0, "end": 0x10000, "mte_tag": 0xa }, { "begin": 0x20000, "end": 0x50000, "mte_tag": 0xc }] }.

`cmn700_tag_cache.metadata_controller.init_values_json_file`

Type

string

Default value

""

Path to a JSON file with initial metadata values. Mutually exclusive with `init_values_json`. The format is as follows: { "regions": [{ "begin": 0x0, "end": 0x10000, "mte_tag": 0xa }, { "begin": 0x20000, "end": 0x50000, "mte_tag": 0xc }] }.

`cmn700_tag_cache.metadata_controller.is_enabled`

Type

bool

Default value

0x0

If false, disables the MetaData controller functionality, and makes the component invisible to passing transactions.

`cmn700_tag_cache.metadata_controller.mte_tag_carveout_json`

Type

string

Default value

""

JSON string that specifies the PA range of the tag carveout regions and the beginning of the PA range for which they provide tag storage. If `pa_regions_with_metadata_storage` defines which regions can have metadata, the tag carveout regions cannot overlap them, and each tagged region must be entirely covered by one of them. The block size must be ≥ 64 bytes and a power of 2, defaulting to 4KiB. The maximum block size supported is 4KiB. The carveout region size must be ≥ 4 KiB and a power of 2, and determines the size of the corresponding tagged region. { "regions": [{ "begin": 0x0, "tag_carveout_region": [0xfffff00000, 0xfffff00fff] }, { "begin": 0x20000, "tag_carveout_region": [0xfffff01000, 0xfffff01fff], "block_size": 0x100 }, { "begin": 0x100000, "tag_carveout_region": [0xfffff08000, 0xfffff0Bfff], "block_size": 0x2000 },] }.

`cmn700_tag_cache.metadata_controller.mte_tag_carveout_json_file`

Type

string

Default value

""

Path to a JSON file that specifies the PA range of the tag carveout regions with the same format as `mte_tag_carveout_json`. Only one of `mte_tag_carveout_json` and `mte_tag_carveout_json_file` can be used. .

`cmn700_tag_cache.metadata_controller.mte_tag_carveout_tag_order`

Type

string

Default value

little-endian

Order of the tags within the MTE tag carveout blocks. This can be little-endian (same order as the corresponding tagged data) or big-endian (reverse order). The parameter accepts both '-' and '_', so 'little-endian', 'big-endian', 'little_endian' and 'big_endian' are all valid. THIS PARAMETER HAS NO FUNCTIONALITY AT THE MOMENT.

cmn700_tag_cache.metadata_controller.pa_regions_with_metadata_storage

Type

string

Default value

""

Specify the address region where the metadata storage is available for each PAS in a JSON format. If the PAS does not have a region specified, the PAS has metadata storage for all of the space. The regions are defined by begin and end_incl addresses. Example: { "ns":[0xa0000000, 0xa0000fff], "s":[0xb0000000, 0xb0000fff], "rl":[0xc0000000, 0xc0000fff], "rt":[0xd0000000, 0xd0000fff] } ns: non-secure, s: secure, rl: realm, rt: root.

debug_force_snoop

Type

bool

Default value

false

The CMN700 interconnect will normally start with snooping disabled.

The parameter `rnf_sci_enable` and `rni_sci_enable` determines which connections are managed by the System Coherency Interface.

For connections that are managed by the System Coherency Interface, then they will look after themselves for entering and leaving the coherency domain and this parameter has no effect for those ports.

However, for connections that are *not* managed by the System Coherency Interface, this parameter enables the upstream system of a port to be snooped if the upstream is not in reset and if `acchannelen_rnf` allows it.

This parameter is for debug purpose only

Do not use this parameter instead of correctly configuring CMN.

disable_CML_port

Type

bool

Default value

0x0

If true the model won't connect the CML port when there are nodes which support the CML feature (ie CXG nodes).

enable_a4s**Type**

bool

Default value

0x0

Enables A4S ports for GIC multi-chip routing.

enable_logger**Type**

bool

Default value

0x0

Enable PVBusLoggers for the downstream ports in the CMN model.

enable_ras**Type**

bool

Default value

0x0

Enables RAS. There is an impact on performance when RAS is enabled.

enable_rnsam_to_hnf_wider_hash**Type**

bool

Default value

false

Enable support of wider hash for the RNSAM to HNF communication.

If this variable enabled, then `bits[47:6]` from PA used in hashing function.

By default it is `[47:12]`.

force_rnsam_internal**Type**

bool

Default value

0x1

Force all RNSAMs to be internal independently of the mesh topology.

hnf_mpam_idr_override**Type**

uint64_t

Default value

0

Set to override `hnf_mpam_idr[31:24]` value. Bit[28] is Reserved and is ignored.

mesh_config_file**Type**

string

Default value

""

Name of a file containing mesh placement of CMN700 components.

periphbase**Type**

uint64_t

Default value

0x20000000

Value for `PERIPHBASE`. Bits [27:0] are treated 0

print_cmn_ccix_config**Type**

bool

Default value

0x0

Print information about the CCIX configuration.

print_cmn_config**Type**

bool

Default value

0x0

Print the mesh topology and children pointers acquired from the YML file.

register_traces_for_ccg_apb_accesses**Type**

bool

Default value

false

Will be removed when enhancement SDDKW-74284 is done.

Intended for use with trace plugins.

true

registers traces to CCG register accesses through CCG APB interface.

false

registers traces to CMN register accesses through all other interfaces (eg RN nodes).

revision**Type**

string

Default value

"r0p0"

Component revision.

Currently supports r0p0, r1p0, r2p0, r3p0, r3p3.

rnf_sci_enable**Type**

string

Default value

"0x0"

For each rnf port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

rni_sci_enable

Type

string

Default value

"0x0"

For each rni port, indicates if the port is managed by System Coherency Interface for coherency domain entry/exit

1

Managed by SCI

0

Managed by Software

The input value is a string, for example 0xffff or ffff

show_banner

Type

uint64_t

Default value

2

Show component banner:

0

supress entire banner

1

suppress config file

2+

show full banner

skip_cmn_config_check

Type

bool

Default value

0x0

Skip any topology configuration checks. The maximum number of devices per type not verified.

use_yaml_periphbase

Type

bool

Default value

false

Use yaml param CFGM_PERIPHBASE_PARAM to specify periphbase address.

If false, model parameter periphbase will be used.

yaml_has_node_addresses

Type

bool

Default value

0x0

Does the top-level YML file describe node-addresses ?.

3.10.19 DMA350

This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-957: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DMA350

This model has the following Iris instances:

Table 3-958: DMA350 Iris instances

InstanceName	ComponentName
DMA350	DMA350

DMA350 contains the following CADI targets:

- DMA350

About DMA350

This model supports the following functionality:

- 1-8 DMA channels
- 1D memory copy including increments, auto-reload, and command linking
- Interrupt capability for each channel
- 2D memory copy
- 1DWRAP and 2DWRAP support
- Template-based pack and unpack capability
- Security settings per channel
- Trigger input and output ports selectable for each channel
- General Purpose Output (GPO) per channel
- Streaming input and output interfaces per channel
- ADDR_WIDTH and DATA_WIDTH can be 32 bits or 64 bits

Ports for DMA350

Table 3-960: Ports

Name	Protocol	Type	Description
allch_pause_ack_nonsec	Signal	Master	-
allch_pause_ack_sec	Signal	Master	-
allch_pause_req_nonsec	Signal	Slave	Channel pause req/ack for all nonsecure channels
allch_pause_req_sec	Signal	Slave	Channel pause req/ack for all secure channels
allch_stop_ack_nonsec	Signal	Master	-
allch_stop_ack_sec	Signal	Master	-
allch_stop_req_nonsec	Signal	Slave	Channel stop req/ack for all nonsecure channels
allch_stop_req_sec	Signal	Slave	Channel stop req/ack for all secure channels
boot_addr	Value_64	Slave	Address when boot_en is enabled
boot_en	Signal	Slave	Enables channel 0 to load first command after reset from boot_addr
boot_memattr	Value	Slave	Memory attribute setting for the boot_addr
boot_shareattr	Value	Slave	Shareability attribute for the boot_attr
ch_enabled[16]	Signal	Master	Enable status indicator per channel
ch_err[16]	Signal	Master	Error status indicator per channel
ch_nonsec[16]	Signal	Master	Nonsecure status indicator per channel
ch_paused[16]	Signal	Master	Paused status indicator per channel
ch_priv[16]	Signal	Master	Privilege status indicator per channel
ch_stopped[16]	Signal	Master	Stopped status indicator per channel
clk_in	ClockSignal	Slave	Ada DMA clock
gpo_ch[16]	Value	Master	MISC signals General purpose output for channels 0-15 Index refers to the channel
irq_channel[16]	Signal	Master	Channel IRQ Signals

Name	Protocol	Type	Description
irq_comb_nonsec	Signal	Master	Nonsecure IRQ Signal
irq_comb_nonsec_err	Signal	Master	Nonsecure error IRQ Signal
irq_comb_sec	Signal	Master	Secure IRQ Signal
irq_comb_sec_err	Signal	Master	Secure error IRQ Signal
irq_sec_viol_err	Signal	Master	Security violation IRQ Signal
pvbust_m0	PVBus	Master	AXI5 Master 0 Interface
pvbust_m1	PVBus	Master	AXI5 Master 1 Interface
pvbust_s	PVBus	Slave	APB4 Slave Interface
pvbust_stream_in[16]	PVBus	Slave	AXI-Stream In Interface
pvbust_stream_out[16]	PVBus	Master	AXI-Stream Out Interface
reset_in	Signal	Slave	Ada DMA asynchronous reset
trig_in_ack[32]	Signal	Master	Trigger In Acknowledgement Interface
trig_in_ack_type[32]	Value	Master	-
trig_in_req[32]	Signal	Slave	Trigger In Request Interface
trig_in_req_type[32]	Value	Slave	-
trig_out_ack[32]	Signal	Slave	Trigger Out Acknowledgement Interface
trig_out_req[32]	Signal	Master	Trigger Out Request Interface

Parameters for DMA350

ADDR_WIDTH

Type

int

Default value

0x20

Address width of the bus interface.

AXI5_M1_ADDRESS_RANGES

Type

string

Default value

""

Address ranges for AXI5 M1 interface in the format e.g. [{"begin":0x40000000, "size":0x1000}, {"begin":0x80000000, "size":0x2000}]. Default when not specified uses AXI5 M0 interface.

AXI5_M1_PRESENT

Type

bool

Default value

0x0

Enables an additional master port. When set the m1 master port is present on the top level port list and additional include file can be used with a System Verilog function that defines which address ranges are mapped to the m1 interface.

CHID_WIDTH**Type**

int

Default value

0x0

Width of the configurable channel ID user signal. When set to 0, then the archid and awchid ports are not present on the module.

CH_0_FIFO_DEPTH**Type**

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_10_FIFO_DEPTH**Type**

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_11_FIFO_DEPTH**Type**

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_12_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_13_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_14_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_15_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_1_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_2_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_3_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_4_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_5_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_6_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_7_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_8_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_9_FIFO_DEPTH

Type

int

Default value

0x2

Sets the FIFO DEPTH the channels <N> can send for a transaction. N goes from 0 to NUM_CHANNELS-1. This relates to the maximum burst size a channel can support which can be calculated as $\min(16, (\text{FIFO_DEPTH}+1)/2)$. This setting needs to be aligned with the bandwidth requirements of the selected channel. This parameter highly affects the area of the design.

CH_EXT_FEAT_EN

Type

int

Default value

0x1

Enabling the extended feature set for each channel. The extension contains 2D, WRAP, TMPLT features. Default value enables it for the number of channels.

CH_GPO_EN

Type

int

Default value

0x1

.

CH_GPO_MASK

Type

int

Default value

0x0

A bitmask for enabling the GPO port for each channel. The width of the bitmask is NUM_CHANNELS-1. When bit n is set to 1 then the GPO is enabled for channel n and the gpo_ch_n[GPO_WIDTH-1:0] port appears on the module.

CH_STREAM_EN**Type**

int

Default value

0x1

.

CH_STREAM_MASK**Type**

int

Default value

0x0

A bitmask for enabling the stream interfaces for each channel. The width of the bitmask is NUM_CHANNELS-1. When bit n is set to 1 then the stream interfaces are enabled for channel n and the relevant ports appears on the module. NOTE: When streaming interface is enabled the actual FIFO size of the channel will be the double of CH_<N>_FIFO_DEPTH.

DATA_WIDTH**Type**

int

Default value

0x40

Data width of the bus interface.

DISABLE_DEVICE**Type**

bool

Default value

0x0

Disable device and ignore all interfaces.

DUMP_CONFIG**Type**

bool

Default value

0x0

Display DMA-350 DMAC parameters.

GPO_WIDTH**Type**

int

Default value

0x1

Width of GPO output for every channel. When multiple channels have GPOs then the width must be set to the maximum number of GPOs a channel can have, and unused GPO ports need to be left unconnected. When all bits of CH_GPO_MASK is 0, this parameter is not relevant.

NUM_CHANNELS**Type**

int

Default value

0x2

Number of configurable DMA channels.

NUM_TRIGGER_IN**Type**

int

Default value

0x2

Number of trigger input ports.

NUM_TRIGGER_OUT**Type**

int

Default value

0x2

Number of trigger output ports.

SECEXT_PRESENT**Type**

bool

Default value

0x1

Enables Trustzone security support.

3.10.20 DMC500

ARM Dynamic Memory Controller(DMC500). This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-961: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DMC500

This model has the following Iris instances:

Table 3-962: DMC500 Iris instances

InstanceName	ComponentName
DMC500	DMC500
DMC500.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-963: DMC500 MTI instances

InstanceName	ComponentName
DMC500	DMC-500
DMC500.busslave	PVBusSlave

DMC500 contains the following CADI targets:

- DMC500

About DMC500

A platform can have multiple instances of this component. For example:

```
//LISA instantiation
composition
{
    // Memory controllers
    dmc0    : DMC500("default_region_attributes"=dmc_default_region_attributes,
                    "default_region_id_access"=dmc_default_region_id_access,
                    "passthrough_debug_access"=true);
    dmc1    : DMC500("default_region_attributes"=dmc_default_region_attributes,
                    "default_region_id_access"=dmc_default_region_id_access,
                    "passthrough_debug_access"=true);
}
```

Differences between the model and the RTL

The model has the following limitations:

- It does not support address striping.

- It works with linear addresses and not in rank,bank,row,column form.
- It does not include any mechanism for error injection or detection.
- Scrubbing functionality is only provided from the interface point of view.
- It does not implement direct read or write commands.
- It does not implement any performance counters.
- All OR'd interrupt signals are missing from this release of the model. Users can connect the failed access interrupt as a substitute.
- The model combines separate failed access interrupts for system interfaces 1 and 2 into a single failed access interrupt.
- DMC-500 has three separate reset signals whereas this model has a single reset signal which supports the combined assertion of three resets. This model does not support separate reset signals.

Ports for DMC500

Table 3-964: Ports

Name	Protocol	Type	Description
apb_pvbus_s	PVBus	Slave	Programmers interface to program and control the DMC-500.
failed_access_interrupt_signal	Signal	Master	The DMC has detected a system request that has failed a permissions check and a previously detected assertion was not cleared.
filter_pvbus_m	PVBus	Master	DMC master port from System Interface 0 to memory.
filter_pvbus_s	PVBus	Slave	System interface 0. Generally, Non-coherent Interface.
reset_signal	Signal	Slave	DMC reset.
si1_filter_pvbus_m	PVBus	Master	DMC master port from System Interface 1 to memory.
si1_filter_pvbus_s	PVBus	Slave	System interface 1. Generally, Coherent Interface.

Parameters for DMC500

default_region_attributes

Type

int

Default value

0x1

Default Region Secure attributes. Only bits 31,30 set Secure RD/WR enable.

default_region_id_access

Type

int

Default value

0x0

Default Region NSAID permissions. Bits 31-16 set non-secure WR enable and bits 15-0 set non-secure RD enable.

passthrough_debug_access

Type

bool

Default value

0x0

Always allow debug access to memory.

3.10.21 DMC520

ARM Dynamic Memory Controller(DMC520). This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-965: IP revisions support

Revision	Quality level
r1p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DMC520

This model has the following Iris instances:

Table 3-966: DMC520 Iris instances

InstanceName	ComponentName
DMC520	DMC520
DMC520.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-967: DMC520 MTI instances

InstanceName	ComponentName
DMC520	DMC-520
DMC520.busslave	PVBusSlave

DMC520 contains the following CADI targets:

- DMC520

About DMC520

A platform can have multiple instances of this component. For example:

```
//LISA instantiation
composition
{
    // Memory controllers
    dmc520_0      : DMC520("passthrough_debug_access"=true);
    dmc520_1      : DMC520("passthrough_debug_access"=true);
}
```

Limitations

- The model does not support address striping.
- It works with linear addresses and not in rank, bank, row, column form.
- It does not include any mechanism for error injection or detection.
- Scrubbing functionality is only provided from the interface point of view.
- It does not implement direct read or write commands.
- It does not implement any performance counters.

Differences between the model and the RTL

The DMC520 and DMC620 models have different interfaces to those in the hardware due to the level of abstraction of memory in Fast Models. These are the differences:

- Like the hardware, the model has a slave port for configuring register accesses, `apb_pvbus_s`, and an AXI interface for incoming memory transactions that are attempting to access memory that is managed by the DMC.
- The hardware component translates incoming transactions on the AXI interface to a format that is conducive to accessing DRAM chips. The model performs TrustZone access control and models the DMC readiness state, but does not translate the transactions. If allowed, the model forwards incoming transactions to be handled by a memory storage handling component that works at the transaction level.

Ports for DMC520

Table 3-968: Ports

Name	Protocol	Type	Description
<code>all_or_interrupt_signal</code>	Signal	Master	A combined interrupt that is the logical OR of the other interrupts.
<code>apb_pvbus_s</code>	PVBus	Slave	Programmers interface to program and control the DMC-520.
<code>arch_fsm_interrupt_signal</code>	Signal	Master	The DMC has detected a change in the architectural state.
<code>failed_access_interrupt_signal</code>	Signal	Master	The DMC has detected a system request that has failed a permissions check and a previously detected assertion was not cleared.
<code>filter_pvbus_m</code>	PVBus	Master	DMC master port to memory.
<code>filter_pvbus_s</code>	PVBus	Slave	System interface.
<code>reset_signal</code>	Signal	Slave	DMC reset.

Name	Protocol	Type	Description
scrub_event_in[8]	Signal	Slave	Scrub event n trigger.
scrub_event_out[8]	Signal	Master	Scrub event n triggered.

Parameters for DMC520

override_default_config

Type

bool

Default value

0x0

Override default block-all behavior of DMC. Allow access to memory.

passthrough_debug_access

Type

bool

Default value

0x0

Always allow debug access to memory.

3.10.22 DMC620

ARM Dynamic Memory Controller(DMC620). This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-969: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DMC620

This model has the following Iris instances:

Table 3-970: DMC620 Iris instances

InstanceName	ComponentName
DMC620	DMC620
DMC620.busslave	PVBusSlave

This model has the following MTI trace components:

Table 3-971: DMC620 MTI instances

InstanceName	ComponentName
DMC620	DMC-620
DMC620.busslave	PVBusSlave

DMC620 contains the following CADI targets:

- DMC620

Limitations

- It does not support address striping.
- It works with linear addresses and not in rank,bank,row,column form.
- It includes error injection and detection mechanisms and syndrome registers support only for RAS error types 4 (ECC single-bit SRAM error) and 5 (ECC double-bit SRAM error).
- Scrubbing functionality is not provided.
- It does not implement direct read or write commands.
- It does not implement any performance counters.

Differences between the model and the RTL

The DMC520 and DMC620 models have different interfaces to those in the hardware due to the level of abstraction of memory in Fast Models. These are the differences:

- Like the hardware, the model has a slave port for configuring register accesses, apb_pvbus_s, and an AXI interface for incoming memory transactions that are attempting to access memory that is managed by the DMC.
- The hardware component translates incoming transactions on the AXI interface to a format that is conducive to accessing DRAM chips. The model performs TrustZone® access control and models the DMC readiness state, but does not translate the transactions. If allowed, the model forwards incoming transactions to be handled by a memory storage handling component that works at the transaction level.

Ports for DMC620

Table 3-972: Ports

Name	Protocol	Type	Description
all_or_interrupt_signal	Signal	Master	A combined interrupt that is the logical OR of the other interrupts.
apb_pvbus_s	PVBus	Slave	Programmers interface to program and control the DMC-620.
arch_fsm_interrupt_signal	Signal	Master	The DMC has detected a change in the architectural state.
failed_access_interrupt_signal	Signal	Master	The DMC has detected a system request that has failed a permissions check and a previously detected assertion was not cleared.
filter_pvbus_m	PVBus	Master	DMC master port to memory.
filter_pvbus_s	PVBus	Slave	System interface.
interrupt_cfh_master	Signal	Master	The DMC has detected and corrected a single bit error on the RAM access.

Name	Protocol	Type	Description
interrupt_combined_oflow_master	Signal	Master	The DMC has detected a counter overflow.
interrupt_fh_master	Signal	Master	The DMC has detected a double bit error on the RAM access.
reset_signal	Signal	Slave	DMC reset.

Parameters for DMC620

override_default_config

Type

bool

Default value

0x0

Override default block-all behavior of DMC. Allow access to memory.

passthrough_debug_access

Type

bool

Default value

0x0

Always allow debug access to memory.

3.10.23 DMC_400

ARM PrimeCell Dynamic Memory Controller(DMC400). This model is written in LISA+.

This model supports the following revisions of the IP at the given quality levels:

Table 3-973: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for DMC_400

This model has the following Iris instances:

Table 3-974: DMC_400 Iris instances

InstanceName	ComponentName
DMC_400	DMC_400
DMC_400.apb_slave	PVBusSlave

InstanceName	ComponentName
DMC_400.ex_mon0	PVBusMapper
DMC_400.ex_mon1	PVBusMapper
DMC_400.ex_mon2	PVBusMapper
DMC_400.ex_mon3	PVBusMapper

This model has the following MTI trace components:

Table 3-975: DMC_400 MTI instances

InstanceName	ComponentName
DMC_400.apb_slave	PVBusSlave
DMC_400.ex_mon0	PVBusMapper
DMC_400.ex_mon1	PVBusMapper
DMC_400.ex_mon2	PVBusMapper
DMC_400.ex_mon3	PVBusMapper

DMC_400 contains the following CADI targets:

- DMC_400

About DMC_400

The configuration of this model by setting the registers does not generally affect accesses to main memory.

This component has no timing information, so changing the values of the timing registers has no effect on behavior. The memory models do not attach to the component, and error checking does not update registers because the model does not include the possibility of errors.

Ports for DMC_400

Table 3-976: Ports

Name	Protocol	Type	Description
apb_interface	PVBus	Slave	Slave bus interface for register access.
axi_if_in[4]	PVBus	Slave	Slave bus for connecting to bus decoder.
axi_if_out[4]	PVBus	Master	Master to connect to DRAM.
clr_ex_mon	Signal	Master	Indicates when global monitors state is cleared.
user_status_ext	Value	Slave	Allow user status to be set from outside.

Parameters for DMC_400

ECC_SUPPORT

Type

bool

Default value

0x1

Does the controller support ECC?.

IF_CHIP0**Type**

int

Default value

0xffffffffffffffff

Set this parameter to 0 if memory is connected.

IF_CHIP1**Type**

int

Default value

0xffffffffffffffff

Set this parameter to 0 if memory is connected.

IF_CHIP2**Type**

int

Default value

0xffffffffffffffff

Set this parameter to 0 if memory is connected.

IF_CHIP3**Type**

int

Default value

0xffffffffffffffff

Set this parameter to 0 if memory is connected.

MEMORY_WIDTH**Type**

int

Default value

0x20

Valid widths are 16, 32 or 64 bits.

diagnostics

Type
int
Default value
0x0

Diagnostics.

revision_string

Type
string
Default value
"r0p1"

Revision.

3.10.24 EthosU55

Arm Ethos-U55 microNPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-977: IP revisions support

Revision	Quality level
r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for EthosU55

This model has the following Iris instances:

Table 3-978: EthosU55 Iris instances

InstanceName	ComponentName
EthosU55	EthosU55
EthosU55.pvbusmaster0	PVBusMaster
EthosU55.pvbusmaster1	PVBusMaster
EthosU55.pvbusslave	PVBusSlave

This model has the following MTI trace components:

Table 3-979: EthosU55 MTI instances

InstanceName	ComponentName
EthosU55.pvbusmaster0	PVBusMaster
EthosU55.pvbusmaster1	PVBusMaster
EthosU55.pvbuslave	PVBusSlave

EthosU55 contains the following CADI targets:

- EthosU55

About EthosU55

The EthosU55 model has the following parameters:

diagnostics

Enables additional information messages from the EthosU55 component about the NPU configuration and the PORPL/PORSL port values. Use any nonzero integer to enable all messages. The default value of 0 disables them.

extra_args

Reserved for future use. We recommend using this parameter only with customized instructions from Arm Technical Support.

num_macs

Controls the number of 8x8 MACs performed per cycle. The valid values are 32, 64, 128, or 256. The default value is 128.

- The EthosU55 model does not expose its registers through CADI or Iris.
- The resetn_in signal is active-LOW.

Ports for EthosU55

Table 3-980: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	NPU clock signal
irq_out	Signal	Master	Sends interrupt requests to the external host application processor
popl_in	Signal	Slave	The Power-On-Reset Privilege Level (PORPL). LOW means User level. HIGH means Privileged level
posl_in	Signal	Slave	The Power-On-Reset Security Level (PORSL). LOW means Secure. HIGH means Non-secure.
pvbus_m0	PVBus	Master	Port 0 for NPU to access external memory
pvbus_m1	PVBus	Master	Port 1 for NPU to access external memory
pvbus_s	PVBus	Slave	Port to access NPU control registers
resetn_in	Signal	Slave	NPU reset signal

Parameters for EthosU55

diagnostics

Type
int
Default value
0x0

Enable diagnostic messages.

extra_args

Type
string
Default value
""

Reserved for future use. We recommend using this parameter only with customized instructions from Arm Technical Support (support-esl@arm.com).

num_macs

Type
int
Default value
0x80

Number of 8x8 MACs performed per cycle.

3.10.25 EthosU65

Arm Ethos-U65 microNPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-981: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for EthosU65

This model has the following Iris instances:

Table 3-982: EthosU65 Iris instances

InstanceName	ComponentName
EthosU65	EthosU65
EthosU65.pvbusmaster0	PVBusMaster
EthosU65.pvbusmaster1	PVBusMaster
EthosU65.pvbusslave	PVBusSlave

This model has the following MTI trace components:

Table 3-983: EthosU65 MTI instances

InstanceName	ComponentName
EthosU65.pvbusmaster0	PVBusMaster
EthosU65.pvbusmaster1	PVBusMaster
EthosU65.pvbusslave	PVBusSlave

EthosU65 contains the following CADI targets:

- EthosU65

About EthosU65

The EthosU65 model has the following parameters:

diagnostics

Enables additional information messages from the EthosU65 component about the NPU configuration and the PORPL/PORSL port values. Use any nonzero integer to enable all messages. The default value of 0 disables them.

extra_args

Reserved for future use. We recommend using this parameter only with customized instructions from Arm Technical Support.

num_macs

Controls the number of 8x8 MACs performed per cycle. The valid values are 256 and 512. The default value is 256.

Note

- The EthosU65 model does not expose its registers through CADI or Iris.
- The resetn_in signal is active-LOW.

Ports for EthosU65

Table 3-984: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	NPU clock signal
irq_out	Signal	Master	Sends interrupt requests to the external host application processor
popl_in	Signal	Slave	The Power-On-Reset Privilege Level (PORPL). LOW means User level. HIGH means Privileged level

Name	Protocol	Type	Description
posl_in	Signal	Slave	The Power-On-Reset Security Level (PORSL). LOW means Secure. HIGH means Non-secure.
pvbush_m0	PVBus	Master	Port 0 for NPU to access external memory
pvbush_m1	PVBus	Master	Port 1 for NPU to access external memory
pvbush_s	PVBus	Slave	Port to access NPU control registers
reseth_in	Signal	Slave	NPU reset signal

Parameters for EthosU65

diagnostics

Type

int

Default value

0x0

Enable diagnostic messages.

extra_args

Type

string

Default value

""

Reserved for future use. We recommend using this parameter only with customized instructions from Arm Technical Support.

num_macs

Type

int

Default value

0x100

Number of 8x8 MACs performed per cycle.

3.10.26 EthosU85

Arm EthosU85 microNPU. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-985: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

InstanceName	ComponentName
EthosU85.pvbusmaster0	PVBusMaster
EthosU85.pvbusmaster1	PVBusMaster
EthosU85.pvbusslave	PVBusSlave

EthosU85 contains the following CADI targets:

- EthosU85

Ports for EthosU85

Table 3-989: Ports

Name	Protocol	Type	Description
cfgextcap_in	Value	Slave	The configuration of capabilities for DRAM AXI ports (32 bits). Sampled with soft and hard reset.
cfgexthash0_in	Value_64	Slave	The configuration of hash function for selecting among EXT ports (40 bits). Used to set the hash for AXI DRAM ports 0 and 1 if they are present. Sampled with soft and hard reset.
cfgsramcap_in	Value	Slave	The configuration of capabilities for SRAM AXI ports (32 bits). Sampled with soft and hard reset.

Name	Protocol	Type	Description
cfgsramhash0_in	Value_64	Slave	The configuration of hash function for selecting among SRAM ports (40 bits). Used to set the hash for AXI SRAM ports 0 and 1. Sampled with soft and hard reset.
cfgsramhash1_in	Value_64	Slave	The configuration of hash function for selecting among SRAM ports (40 bits). Used to set the hash for AXI SRAM ports 2 and 3 if they are present. Sampled with soft and hard reset.
clk_in	ClockSignal	Slave	NPU clock signal
irq_out	Signal	Master	Sends interrupt requests to the external host application processor, level triggered when HIGH.
popl_in	Signal	Slave	The Power-On-Reset Privilege Level (PORPL). LOW means User level. HIGH means Privileged level
posl_in	Signal	Slave	The Power-On-Reset Security Level (PORSL). LOW means Secure. HIGH means Non-secure.
pvbus_m0	PVBus	Master	Port 0 for NPU to access external memory
pvbus_m1	PVBus	Master	Port 1 for NPU to access external memory
pvbus_s	PVBus	Slave	Port to access NPU control registers
resetsn_in	Signal	Slave	NPU reset signal (active-LOW)

Parameters for EthosU85

diagnostics

Type

int

Default value

0x0

Enable diagnostic messages.

extra_args

Type

string

Default value

""

Reserved for future use. We recommend using this parameter only with customized instructions from Arm Technical Support.

num_macs

Type

int

Default value

0x80

Number of 8x8 MACs performed per cycle.

3.10.27 Firewall

Firewall IP. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

pvbus_component_s[31]	PVBus	Slave	-
pvbus_program_iface	PVBus	Slave	-
reset_signal	Signal	Slave	-

Parameters for Firewall

ADDR WIDTH

Type

string

Default value

[illegible]

Maximum address field width of the Bus interfaces of the Firewall Component. 0x00 - 0x04 - Reserved 0x05 - 5 bits of address 0x06 - 6 bits of address ... 0x40 - 64 bits of address All other values are Reserved. When a Firewall Component supports more than one Bus Slave or Master interface this field is set to the largest width used. .

BYPASS IF ST

Type

int

Default value

0x1

Status of the bypass interface implemented by the Firewall. 0x0 - Bypass interface disabled. 0x1 - Bypass interface enabled. All other values are Reserved.

BYPASS VLD

Type

int

Default value

0x1

Validity for the bypass mode implemented by the Firewall. 0x0 - Bypass mode invalid implemented. 0x1 - Bypass mode valid implemented. All other values are Reserved.

CONFIG FILE

Type

string

Default value

■■■■

Firewall Configuration file.

INST SPT

Type

string

Minimum Region Size. This field is Reserved and treated as RAZ/WI when PE.0 is implemented.
0x0 - 32B, 0x1 - 64B, 0x2 - 128B, 0x3 - 256B, 0x4 - 512B, 0x5 - 1KB, 0x6 - 2KB, 0x7 - 4KB.
Another value will get the default one (0) .

MST_ID WIDTH

Type

string

Default value

[illegible]

Maximum MasterID field width of the Bus interfaces of the Firewall Component. 0x00 - 1 bit of MasterID 0x01 - 2 bits of MasterID ... 0x1F - 32 bits of MasterID When a Firewall Component supports more than one Bus Slave or Master interface this field is set to the largest width used .

MXRS

Type

string

Default value

[illegible]

The Maximum Region Size the Firewall Component Supports 0x05 - 32B. 0x06 - 64B. ... 0x0C - 4KB. 0x0D - 8KB. ... 0x40 - 16EB. All other values are Reserved. This field is Reserved and treated as RAZ/WI invalid for a Firewall Component which implements PE.0 .

NUM_FC

Type

int

Default value

0x1f

Number of Firewall Components implemented. The number of Firewall Components which are implemented in the Firewall is NUM_FC+1. For Firewall Components, other than 0, this field is Reserved and treated as RAZ/WI. .

NUM MPE

Type

string

Default value

[illegible]

Number of MPEs implemented, per region, in the Firewall Component. 0b00 - 1 MPE per region, 0b01 - 2 MPE per region, 0b10 - 3 MPE per region, 0b11 - 4 MPE per region, This field is Reserved and treated as RAZ/WI when PE.0 is implemented. .

NUM_RGN

Type

string

Default value

[illegible]

Number of regions implemented in the Firewall Component. The number of regions implemented is NUM_RGN+1. This field is Reserved and treated as RAZ/WI when PE.0 is implemented.

PE LVL

Type

string

Default value

[illegible]

Level of the Protection Extension implemented by the Firewall Component. 0x0 - PE.0 is implemented. 0x1 - PE.1 is implemented. 0x2 - PE.2 is implemented. All other values are Reserved. .

PRIV SPT

Type

string

Default value

[illegible]

Firewall Component support for checking the privileged level of the incoming transaction and setting the privileged level of the outgoing transaction. Ob0 - Not supported, Ob1 - Supported .

PROT SIZE

Type

string

Default value

[illegible]

Protection size, as defined by the Protection Size interface. The value of this field indicates the range of addresses which the Firewall Component protects 0x00 - 0B. 0x05 - 32B. 0x06 - 64B. ... 0x07 - 4KB. 0x08 - 8KB. ... 0x40 - 16EB. All other values are Reserved and treated as if 0x00. This field is Reserved and treated as RAZ/WI invalid for a Firewall Component which implements PE.0. When this field reads as 0x00 all transactions are considered to fail the protection logic checks. .

RSE LVL

Type

string

TE_LVL

Type

string

Default value

[illegible]

Level of the Translation Extension implemented by Firewall Component 0. 0x0 - TE.0 is implemented. 0x1 - TE.1 is implemented. 0x2 - TE.2 is implemented. All other values are Reserved. (This field is always 0x0 when the FC_CAPO.PE_LVL is 0x0.) .

3.10.28 GIC500

GLC500 Component for distribution of interrupts. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-994: IP revisions support

Revision	Quality level
r1p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for GIC500

This model has the following Iris instances:

Table 3-995: GIC500 Iris instances

InstanceName	ComponentName
GIC500	GIC_IRI
GIC500.ITS0	GICv3InterruptTranslationService
GIC500.rd_0	GICv3RedistributorInternal
GIC500.rd_0_0	GICv3RedistributorInternal
GIC500.rd_0_0_0	GICv3RedistributorInternal
GIC500.rd_0_0_0_0	GICv3Redistributor
GIC500.rd_tl	GICv3Distributor

This model has the following MTI trace components:

Table 3-996: GIC500 MTI instances

InstanceName	ComponentName
GIC500	GICv3IRI
GIC500.ITS0	GICv3InterruptTranslationService
GIC500.rd_0	GICv3RedistributorInternal
GIC500.rd_0_0	GICv3RedistributorInternal

InstanceName	ComponentName
GIC500.rd_0_0_0	GICv3RedistributorInternal
GIC500.rd_0_0_0_0	GICv3Redistributor
GIC500.rd_t1	GICv3Distributor

GIC500 contains the following CADI targets:

- GIC500

About GIC500

This is a single-component implementation of the GICv3 architecture with support for 256 cores. You can configure the model to support a maximum of 32 clusters with 8 cores per cluster. Use it with an Armv8-A core to deliver interrupts. It supports a single Interrupt Translation Service for message-based interrupts. It supports the architectural features, but does not support the implementation defined features.

To use the GIC500 component, you must configure some parameters. For example:

```
gic500: GIC500(
    "num_clusters" = 2,
    "cpus_per_cluster_0" = 4,
    "cpus_per_cluster_1" = 4,
    "reg-base" = 0x2c200000,
    "SPI-count" = 256
);
```

Note

- To print to stderr the memory map of any GICv3 or later models that are included in the platform, set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1.
- For writes to `GITS_TRANSLATE64R`, the MSIRewriter component can be used to create the correct data transactions based on the device ID. For more details about `GITS_TRANSLATE64R`, see the [MSIRewriter](#) component.

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

PVBus attribute	Bits used	Property encoded	Notes
MasterID	31:0	Master ID that invoked the register access	–
ExtendedID	–	–	Not used
UserFlags	–	–	Not used

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Ports for GIC500

Table 3-998: Ports

Name	Protocol	Type	Description
cfgsdisable	Signal	Slave	Disable some SPIs signal.
cpu_active_0[8]	Signal	Slave	cpu_active pins of cluster 0.
cpu_active_1[8]	Signal	Slave	cpu_active pins of cluster 1.
cpu_active_10[8]	Signal	Slave	cpu_active pins of cluster 10.
cpu_active_11[8]	Signal	Slave	cpu_active pins of cluster 11.
cpu_active_12[8]	Signal	Slave	cpu_active pins of cluster 12.

ppi16_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 29.
ppi16_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 3.
ppi16_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 30.
ppi16_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 31.
ppi16_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 4.
ppi16_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 5.
ppi16_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 6.
ppi16_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 7.
ppi16_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 8.
ppi16_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 9.
ppi17_in_0[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 0.
ppi17_in_1[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 1.
ppi17_in_10[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 10.
ppi17_in_11[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 11.
ppi17_in_12[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 12.
ppi17_in_13[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 13.
ppi17_in_14[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 14.
ppi17_in_15[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 15.
ppi17_in_16[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 16.
ppi17_in_17[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 17.

Name	Protocol	Type	Description
ppi17_in_18[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 18.
ppi17_in_19[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 19.
ppi17_in_2[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 2.
ppi17_in_20[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 20.
ppi17_in_21[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 21.
ppi17_in_22[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 22.
ppi17_in_23[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 23.
ppi17_in_24[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 24.
ppi17_in_25[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 25.
ppi17_in_26[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 26.
ppi17_in_27[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 27.
ppi17_in_28[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 28.
ppi17_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 29.
ppi17_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 3.
ppi17_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 30.
ppi17_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 31.
ppi17_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 4.
ppi17_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 5.
ppi17_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 6.
ppi17_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 7.
ppi17_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 8.
ppi17_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 9.
ppi18_in_0[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 0.
ppi18_in_1[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 1.
ppi18_in_10[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 10.
ppi18_in_11[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 11.
ppi18_in_12[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 12.
ppi18_in_13[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 13.
ppi18_in_14[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 14.
ppi18_in_15[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 15.
ppi18_in_16[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 16.
ppi18_in_17[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 17.
ppi18_in_18[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 18.
ppi18_in_19[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 19.
ppi18_in_2[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 2.
ppi18_in_20[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 20.
ppi18_in_21[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 21.
ppi18_in_22[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 22.
ppi18_in_23[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 23.

Name	Protocol	Type	Description
ppi18_in_24[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 24.
ppi18_in_25[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 25.
ppi18_in_26[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 26.
ppi18_in_27[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 27.
ppi18_in_28[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 28.
ppi18_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 29.
ppi18_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 3.
ppi18_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 30.
ppi18_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 31.
ppi18_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 4.
ppi18_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 5.
ppi18_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 6.
ppi18_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 7.
ppi18_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 8.
ppi18_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 9.
ppi19_in_0[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 0.
ppi19_in_1[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 1.
ppi19_in_10[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 10.
ppi19_in_11[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 11.
ppi19_in_12[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 12.
ppi19_in_13[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 13.
ppi19_in_14[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 14.
ppi19_in_15[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 15.
ppi19_in_16[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 16.
ppi19_in_17[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 17.
ppi19_in_18[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 18.
ppi19_in_19[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 19.
ppi19_in_2[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 2.
ppi19_in_20[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 20.
ppi19_in_21[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 21.
ppi19_in_22[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 22.
ppi19_in_23[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 23.
ppi19_in_24[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 24.
ppi19_in_25[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 25.
ppi19_in_26[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 26.
ppi19_in_27[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 27.
ppi19_in_28[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 28.
ppi19_in_29[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 29.
ppi19_in_3[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 3.

Name	Protocol	Type	Description
ppi19_in_30[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 30.
ppi19_in_31[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 31.
ppi19_in_4[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 4.
ppi19_in_5[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 5.
ppi19_in_6[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 6.
ppi19_in_7[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 7.
ppi19_in_8[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 8.
ppi19_in_9[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 9.
ppi20_in_0[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 0.
ppi20_in_1[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 1.
ppi20_in_10[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 10.
ppi20_in_11[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 11.
ppi20_in_12[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 12.
ppi20_in_13[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 13.
ppi20_in_14[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 14.
ppi20_in_15[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 15.
ppi20_in_16[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 16.
ppi20_in_17[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 17.
ppi20_in_18[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 18.
ppi20_in_19[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 19.
ppi20_in_2[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 2.
ppi20_in_20[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 20.
ppi20_in_21[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 21.
ppi20_in_22[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 22.
ppi20_in_23[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 23.
ppi20_in_24[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 24.
ppi20_in_25[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 25.
ppi20_in_26[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 26.
ppi20_in_27[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 27.
ppi20_in_28[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 28.
ppi20_in_29[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 29.
ppi20_in_3[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 3.
ppi20_in_30[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 30.
ppi20_in_31[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 31.
ppi20_in_4[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 4.
ppi20_in_5[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 5.
ppi20_in_6[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 6.
ppi20_in_7[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 7.
ppi20_in_8[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 8.

Name	Protocol	Type	Description
ppi20_in_9[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 9.
ppi21_in_0[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 0.
ppi21_in_1[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 1.
ppi21_in_10[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 10.
ppi21_in_11[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 11.
ppi21_in_12[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 12.
ppi21_in_13[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 13.
ppi21_in_14[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 14.
ppi21_in_15[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 15.
ppi21_in_16[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 16.
ppi21_in_17[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 17.
ppi21_in_18[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 18.
ppi21_in_19[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 19.
ppi21_in_2[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 2.
ppi21_in_20[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 20.
ppi21_in_21[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 21.
ppi21_in_22[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 22.
ppi21_in_23[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 23.
ppi21_in_24[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 24.
ppi21_in_25[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 25.
ppi21_in_26[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 26.
ppi21_in_27[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 27.
ppi21_in_28[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 28.
ppi21_in_29[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 29.
ppi21_in_3[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 3.
ppi21_in_30[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 30.
ppi21_in_31[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 31.
ppi21_in_4[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 4.
ppi21_in_5[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 5.
ppi21_in_6[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 6.
ppi21_in_7[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 7.
ppi21_in_8[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 8.
ppi21_in_9[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 9.
ppi22_in_0[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 0.
ppi22_in_1[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 1.
ppi22_in_10[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 10.

Name	Protocol	Type	Description
ppi22_in_11[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 11.
ppi22_in_12[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 12.
ppi22_in_13[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 13.
ppi22_in_14[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 14.
ppi22_in_15[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 15.
ppi22_in_16[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 16.
ppi22_in_17[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 17.
ppi22_in_18[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 18.
ppi22_in_19[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 19.
ppi22_in_2[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 2.
ppi22_in_20[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 20.
ppi22_in_21[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 21.
ppi22_in_22[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 22.
ppi22_in_23[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 23.
ppi22_in_24[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 24.
ppi22_in_25[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 25.
ppi22_in_26[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 26.
ppi22_in_27[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 27.
ppi22_in_28[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 28.
ppi22_in_29[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 29.
ppi22_in_3[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 3.
ppi22_in_30[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 30.
ppi22_in_31[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 31.

Name	Protocol	Type	Description
ppi22_in_4[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 4.
ppi22_in_5[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 5.
ppi22_in_6[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 6.
ppi22_in_7[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 7.
ppi22_in_8[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 8.
ppi22_in_9[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 9.
ppi23_in_0[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 0.
ppi23_in_1[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 1.
ppi23_in_10[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 10.
ppi23_in_11[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 11.
ppi23_in_12[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 12.
ppi23_in_13[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 13.
ppi23_in_14[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 14.
ppi23_in_15[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 15.
ppi23_in_16[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 16.
ppi23_in_17[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 17.
ppi23_in_18[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 18.
ppi23_in_19[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 19.
ppi23_in_2[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 2.
ppi23_in_20[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 20.
ppi23_in_21[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 21.
ppi23_in_22[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 22.
ppi23_in_23[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 23.

Name	Protocol	Type	Description
ppi23_in_24[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 24.
ppi23_in_25[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 25.
ppi23_in_26[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 26.
ppi23_in_27[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 27.
ppi23_in_28[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 28.
ppi23_in_29[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 29.
ppi23_in_3[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 3.
ppi23_in_30[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 30.
ppi23_in_31[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 31.
ppi23_in_4[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 4.
ppi23_in_5[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 5.
ppi23_in_6[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 6.
ppi23_in_7[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 7.
ppi23_in_8[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 8.
ppi23_in_9[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 9.
ppi24_in_0[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 0.
ppi24_in_1[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 1.
ppi24_in_10[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 10.
ppi24_in_11[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 11.
ppi24_in_12[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 12.
ppi24_in_13[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 13.
ppi24_in_14[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 14.
ppi24_in_15[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 15.

Name	Protocol	Type	Description
ppi24_in_16[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 16.
ppi24_in_17[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 17.
ppi24_in_18[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 18.
ppi24_in_19[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 19.
ppi24_in_2[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 2.
ppi24_in_20[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 20.
ppi24_in_21[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 21.
ppi24_in_22[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 22.
ppi24_in_23[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 23.
ppi24_in_24[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 24.
ppi24_in_25[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 25.
ppi24_in_26[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 26.
ppi24_in_27[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 27.
ppi24_in_28[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 28.
ppi24_in_29[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 29.
ppi24_in_3[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 3.
ppi24_in_30[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 30.
ppi24_in_31[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 31.
ppi24_in_4[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 4.
ppi24_in_5[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 5.
ppi24_in_6[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 6.
ppi24_in_7[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 7.
ppi24_in_8[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 8.

Name	Protocol	Type	Description
ppi24_in_9[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 9.
ppi25_in_0[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 0.
ppi25_in_1[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 1.
ppi25_in_10[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 10.
ppi25_in_11[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 11.
ppi25_in_12[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 12.
ppi25_in_13[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 13.
ppi25_in_14[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 14.
ppi25_in_15[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 15.
ppi25_in_16[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 16.
ppi25_in_17[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 17.
ppi25_in_18[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 18.
ppi25_in_19[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 19.
ppi25_in_2[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 2.
ppi25_in_20[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 20.
ppi25_in_21[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 21.
ppi25_in_22[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 22.
ppi25_in_23[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 23.
ppi25_in_24[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 24.
ppi25_in_25[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 25.
ppi25_in_26[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 26.
ppi25_in_27[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 27.
ppi25_in_28[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 28.

Name	Protocol	Type	Description
ppi25_in_29[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 29.
ppi25_in_3[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 3.
ppi25_in_30[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 30.
ppi25_in_31[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 31.
ppi25_in_4[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 4.
ppi25_in_5[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 5.
ppi25_in_6[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 6.
ppi25_in_7[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 7.
ppi25_in_8[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 8.
ppi25_in_9[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 9.
ppi26_in_0[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 0.
ppi26_in_1[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 1.
ppi26_in_10[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 10.
ppi26_in_11[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 11.
ppi26_in_12[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 12.
ppi26_in_13[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 13.
ppi26_in_14[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 14.
ppi26_in_15[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 15.
ppi26_in_16[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 16.
ppi26_in_17[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 17.
ppi26_in_18[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 18.
ppi26_in_19[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 19.
ppi26_in_2[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 2.
ppi26_in_20[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 20.
ppi26_in_21[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 21.
ppi26_in_22[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 22.
ppi26_in_23[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 23.
ppi26_in_24[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 24.
ppi26_in_25[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 25.
ppi26_in_26[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 26.
ppi26_in_27[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 27.
ppi26_in_28[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 28.

Name	Protocol	Type	Description
ppi26_in_29[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 29.
ppi26_in_3[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 3.
ppi26_in_30[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 30.
ppi26_in_31[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 31.
ppi26_in_4[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 4.
ppi26_in_5[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 5.
ppi26_in_6[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 6.
ppi26_in_7[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 7.
ppi26_in_8[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 8.
ppi26_in_9[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 9.
ppi27_in_0[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 0.
ppi27_in_1[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 1.
ppi27_in_10[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 10.
ppi27_in_11[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 11.
ppi27_in_12[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 12.
ppi27_in_13[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 13.
ppi27_in_14[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 14.
ppi27_in_15[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 15.
ppi27_in_16[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 16.
ppi27_in_17[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 17.
ppi27_in_18[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 18.
ppi27_in_19[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 19.
ppi27_in_2[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 2.
ppi27_in_20[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 20.
ppi27_in_21[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 21.
ppi27_in_22[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 22.
ppi27_in_23[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 23.
ppi27_in_24[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 24.
ppi27_in_25[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 25.
ppi27_in_26[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 26.
ppi27_in_27[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 27.
ppi27_in_28[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 28.
ppi27_in_29[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 29.
ppi27_in_3[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 3.
ppi27_in_30[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 30.
ppi27_in_31[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 31.
ppi27_in_4[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 4.
ppi27_in_5[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 5.
ppi27_in_6[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 6.

Name	Protocol	Type	Description
ppi27_in_7[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 7.
ppi27_in_8[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 8.
ppi27_in_9[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 9.
ppi28_in_0[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 0.
ppi28_in_1[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 1.
ppi28_in_10[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 10.
ppi28_in_11[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 11.
ppi28_in_12[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 12.
ppi28_in_13[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 13.
ppi28_in_14[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 14.
ppi28_in_15[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 15.
ppi28_in_16[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 16.
ppi28_in_17[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 17.
ppi28_in_18[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 18.
ppi28_in_19[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 19.
ppi28_in_2[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 2.
ppi28_in_20[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 20.
ppi28_in_21[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 21.
ppi28_in_22[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 22.
ppi28_in_23[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 23.
ppi28_in_24[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 24.
ppi28_in_25[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 25.
ppi28_in_26[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 26.
ppi28_in_27[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 27.
ppi28_in_28[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 28.
ppi28_in_29[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 29.
ppi28_in_3[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 3.
ppi28_in_30[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 30.
ppi28_in_31[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 31.
ppi28_in_4[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 4.
ppi28_in_5[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 5.
ppi28_in_6[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 6.
ppi28_in_7[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 7.
ppi28_in_8[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 8.
ppi28_in_9[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 9.
ppi29_in_0[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 0.
ppi29_in_1[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 1.
ppi29_in_10[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 10.
ppi29_in_11[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 11.

Name	Protocol	Type	Description
ppi29_in_12[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 12.
ppi29_in_13[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 13.
ppi29_in_14[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 14.
ppi29_in_15[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 15.
ppi29_in_16[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 16.
ppi29_in_17[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 17.
ppi29_in_18[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 18.
ppi29_in_19[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 19.
ppi29_in_2[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 2.
ppi29_in_20[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 20.
ppi29_in_21[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 21.
ppi29_in_22[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 22.
ppi29_in_23[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 23.
ppi29_in_24[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 24.
ppi29_in_25[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 25.
ppi29_in_26[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 26.
ppi29_in_27[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 27.
ppi29_in_28[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 28.
ppi29_in_29[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 29.
ppi29_in_3[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 3.
ppi29_in_30[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 30.
ppi29_in_31[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 31.
ppi29_in_4[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 4.
ppi29_in_5[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 5.
ppi29_in_6[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 6.
ppi29_in_7[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 7.
ppi29_in_8[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 8.
ppi29_in_9[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 9.
ppi30_in_0[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 0.
ppi30_in_1[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 1.
ppi30_in_10[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 10.
ppi30_in_11[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 11.
ppi30_in_12[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 12.
ppi30_in_13[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 13.

Name	Protocol	Type	Description
ppi30_in_14[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 14.
ppi30_in_15[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 15.
ppi30_in_16[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 16.
ppi30_in_17[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 17.
ppi30_in_18[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 18.
ppi30_in_19[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 19.
ppi30_in_2[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 2.
ppi30_in_20[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 20.
ppi30_in_21[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 21.
ppi30_in_22[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 22.
ppi30_in_23[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 23.
ppi30_in_24[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 24.
ppi30_in_25[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 25.
ppi30_in_26[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 26.
ppi30_in_27[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 27.
ppi30_in_28[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 28.
ppi30_in_29[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 29.
ppi30_in_3[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 3.
ppi30_in_30[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 30.
ppi30_in_31[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 31.
ppi30_in_4[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 4.
ppi30_in_5[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 5.
ppi30_in_6[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 6.

Name	Protocol	Type	Description
ppi30_in_7[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 7.
ppi30_in_8[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 8.
ppi30_in_9[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 9.
ppi31_in_0[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 0.
ppi31_in_1[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 1.
ppi31_in_10[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 10.
ppi31_in_11[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 11.
ppi31_in_12[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 12.
ppi31_in_13[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 13.
ppi31_in_14[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 14.
ppi31_in_15[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 15.
ppi31_in_16[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 16.
ppi31_in_17[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 17.
ppi31_in_18[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 18.
ppi31_in_19[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 19.
ppi31_in_2[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 2.
ppi31_in_20[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 20.
ppi31_in_21[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 21.
ppi31_in_22[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 22.
ppi31_in_23[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 23.
ppi31_in_24[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 24.
ppi31_in_25[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 25.
ppi31_in_26[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 26.
ppi31_in_27[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 27.
ppi31_in_28[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 28.
ppi31_in_29[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 29.
ppi31_in_3[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 3.
ppi31_in_30[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 30.
ppi31_in_31[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 31.
ppi31_in_4[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 4.
ppi31_in_5[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 5.
ppi31_in_6[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 6.
ppi31_in_7[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 7.
ppi31_in_8[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 8.
ppi31_in_9[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 9.
pvbuss_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbuss_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.

Name	Protocol	Type	Description
redistributor_m[256]	GICv3Comms	Master	Input from and output to CPU interface.
reset	Signal	Slave	Reset.
spi_in[988]	Signal	Slave	Shared peripheral interrupts.
wake_request_0[8]	Signal	Master	Power management outputs of cluster 0.
wake_request_1[8]	Signal	Master	Power management outputs of cluster 1.
wake_request_10[8]	Signal	Master	Power management outputs of cluster 10.
wake_request_11[8]	Signal	Master	Power management outputs of cluster 11.
wake_request_12[8]	Signal	Master	Power management outputs of cluster 12.
wake_request_13[8]	Signal	Master	Power management outputs of cluster 13.
wake_request_14[8]	Signal	Master	Power management outputs of cluster 14.
wake_request_15[8]	Signal	Master	Power management outputs of cluster 15.
wake_request_16[8]	Signal	Master	Power management outputs of cluster 16.
wake_request_17[8]	Signal	Master	Power management outputs of cluster 17.
wake_request_18[8]	Signal	Master	Power management outputs of cluster 18.
wake_request_19[8]	Signal	Master	Power management outputs of cluster 19.
wake_request_2[8]	Signal	Master	Power management outputs of cluster 2.
wake_request_20[8]	Signal	Master	Power management outputs of cluster 20.
wake_request_21[8]	Signal	Master	Power management outputs of cluster 21.
wake_request_22[8]	Signal	Master	Power management outputs of cluster 22.
wake_request_23[8]	Signal	Master	Power management outputs of cluster 23.
wake_request_24[8]	Signal	Master	Power management outputs of cluster 24.
wake_request_25[8]	Signal	Master	Power management outputs of cluster 25.
wake_request_26[8]	Signal	Master	Power management outputs of cluster 26.
wake_request_27[8]	Signal	Master	Power management outputs of cluster 27.
wake_request_28[8]	Signal	Master	Power management outputs of cluster 28.
wake_request_29[8]	Signal	Master	Power management outputs of cluster 29.
wake_request_3[8]	Signal	Master	Power management outputs of cluster 3.
wake_request_30[8]	Signal	Master	Power management outputs of cluster 30.
wake_request_31[8]	Signal	Master	Power management outputs of cluster 31.
wake_request_4[8]	Signal	Master	Power management outputs of cluster 4.
wake_request_5[8]	Signal	Master	Power management outputs of cluster 5.
wake_request_6[8]	Signal	Master	Power management outputs of cluster 6.
wake_request_7[8]	Signal	Master	Power management outputs of cluster 7.
wake_request_8[8]	Signal	Master	Power management outputs of cluster 8.
wake_request_9[8]	Signal	Master	Power management outputs of cluster 9.

Parameters for GIC500

GICD_ITARGETSR-RAZWI

Type

bool

Default value

0x0

If true, the GICD_ITARGETS registers are RAZ/WI.

ITS-count

Type

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits

Type

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-threaded-command-queue

Type

bool

Default value

0x1

Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation.

SPI-count

Type

int

Default value

0xe0

Number of SPIs that are implemented.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

cpus_per_cluster_0**Type**

int

Default value

0x1

Number of cores within cluster 0.

cpus_per_cluster_1**Type**

int

Default value

0x1

Number of cores within cluster 1.

cpus_per_cluster_10**Type**

int

Default value

0x1

Number of cores within cluster 10.

cpus_per_cluster_11**Type**

int

Default value

0x1

Number of cores within cluster 11.

cpus_per_cluster_12**Type**

int

Default value

0x1

Number of cores within cluster 12.

cpus_per_cluster_13**Type**

int

Default value

0x1

Number of cores within cluster 13.

cpus_per_cluster_14**Type**

int

Default value

0x1

Number of cores within cluster 14.

cpus_per_cluster_15**Type**

int

Default value

0x1

Number of cores within cluster 15.

cpus_per_cluster_16**Type**

int

Default value

0x1

Number of cores within cluster 16.

cpus_per_cluster_17**Type**

int

Default value

0x1

Number of cores within cluster 17.

cpus_per_cluster_18**Type**

int

Default value

0x1

Number of cores within cluster 18.

cpus_per_cluster_19**Type**

int

Default value

0x1

Number of cores within cluster 19.

cpus_per_cluster_2**Type**

int

Default value

0x1

Number of cores within cluster 2.

cpus_per_cluster_20**Type**

int

Default value

0x1

Number of cores within cluster 20.

cpus_per_cluster_21**Type**

int

Default value

0x1

Number of cores within cluster 21.

cpus_per_cluster_22**Type**

int

Default value

0x1

Number of cores within cluster 22.

cpus_per_cluster_23**Type**

int

Default value

0x1

Number of cores within cluster 23.

cpus_per_cluster_24**Type**

int

Default value

0x1

Number of cores within cluster 24.

cpus_per_cluster_25**Type**

int

Default value

0x1

Number of cores within cluster 25.

cpus_per_cluster_26**Type**

int

Default value

0x1

Number of cores within cluster 26.

cpus_per_cluster_27**Type**

int

Default value

0x1

Number of cores within cluster 27.

cpus_per_cluster_28**Type**

int

Default value

0x1

Number of cores within cluster 28.

cpus_per_cluster_29**Type**

int

Default value

0x1

Number of cores within cluster 29.

cpus_per_cluster_3**Type**

int

Default value

0x1

Number of cores within cluster 3.

cpus_per_cluster_30**Type**

int

Default value

0x1

Number of cores within cluster 30.

cpus_per_cluster_31**Type**

int

Default value

0x1

Number of cores within cluster 31.

cpus_per_cluster_4**Type**

int

Default value

0x1

Number of cores within cluster 4.

cpus_per_cluster_5**Type**

int

Default value

0x1

Number of cores within cluster 5.

cpus_per_cluster_6**Type**

int

Default value

0x1

Number of cores within cluster 6.

cpus_per_cluster_7**Type**

int

Default value

0x1

Number of cores within cluster 7.

cpus_per_cluster_8**Type**

int

Default value

0x1

Number of cores within cluster 8.

cpus_per_cluster_9**Type**

int

Default value

0x1

Number of cores within cluster 9.

delay-ITS-accesses**Type**

bool

Default value

0x1

Delay accesses from the ITS until GICR_SYNCRR is read.

delay-redistributor-accesses**Type**

bool

Default value

0x1

Delay memory accesses from the redistributor until GICR_SYNCRR is read.

enable_protocol_checking**Type**

bool

Default value

0x0

Enable/disable protocol checking at cpu interface.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

num_clusters**Type**

int

Default value

0x1

Number of implemented affinity level1 clusters.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-threaded-sync**Type**

bool

Default value

0x1

Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation.

reg-base**Type**

int

Default value

0x10000000

GIC500 base address.

using-generated-memorymap**Type**

bool

Default value

0x1

Use the generated memorymap for the GIC500 and warn if superfluous parameters are passed.

wakeup-on-reset**Type**

bool

Default value

0x0

Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.10.29 GIC500_ClusterPorts

GIC500 Component for distribution of interrupts. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-999: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for GIC500_ClusterPorts

This model has the following Iris instances:

Table 3-1000: GIC500_ClusterPorts Iris instances

InstanceName	ComponentName
GIC500_ClusterPorts	GIC_IRI
GIC500_ClusterPorts.ITS0	GICv3InterruptTranslationService
GIC500_ClusterPorts.rd_0	GICv3RedistributorInternal
GIC500_ClusterPorts.rd_0_0	GICv3RedistributorInternal
GIC500_ClusterPorts.rd_0_0_0	GICv3RedistributorInternal
GIC500_ClusterPorts.rd_0_0_0_0	GICv3Redistributor
GIC500_ClusterPorts.rd_tl	GICv3Distributor

This model has the following MTI trace components:

Table 3-1001: GIC500_ClusterPorts MTI instances

InstanceName	ComponentName
GIC500_ClusterPorts	GICv3IRI
GIC500_ClusterPorts.ITS0	GICv3InterruptTranslationService
GIC500_ClusterPorts.rd_0	GICv3RedistributorInternal
GIC500_ClusterPorts.rd_0_0	GICv3RedistributorInternal
GIC500_ClusterPorts.rd_0_0_0	GICv3RedistributorInternal
GIC500_ClusterPorts.rd_0_0_0_0	GICv3Redistributor
GIC500_ClusterPorts.rd_tl	GICv3Distributor

GIC500_ClusterPorts contains the following CADI targets:

- GIC500

About GIC500_ClusterPorts

An alternate version of GIC500, identical to the above except for the CPUIF ports being exposed as an array per cluster

Ports for GIC500_ClusterPorts

Table 3-1002: Ports

Name	Protocol	Type	Description
cfgsdisable	Signal	Slave	Disable some SPIs signal.

Name	Protocol	Type	Description
cpu_active_0[8]	Signal	Slave	cpu_active pins of cluster 0.
cpu_active_1[8]	Signal	Slave	cpu_active pins of cluster 1.
cpu_active_10[8]	Signal	Slave	cpu_active pins of cluster 10.
cpu_active_11[8]	Signal	Slave	cpu_active pins of cluster 11.
cpu_active_12[8]	Signal	Slave	cpu_active pins of cluster 12.
cpu_active_13[8]	Signal	Slave	cpu_active pins of cluster 13.
cpu_active_14[8]	Signal	Slave	cpu_active pins of cluster 14.
cpu_active_15[8]	Signal	Slave	cpu_active pins of cluster 15.
cpu_active_16[8]	Signal	Slave	cpu_active pins of cluster 16.
cpu_active_17[8]	Signal	Slave	cpu_active pins of cluster 17.
cpu_active_18[8]	Signal	Slave	cpu_active pins of cluster 18.
cpu_active_19[8]	Signal	Slave	cpu_active pins of cluster 19.
cpu_active_2[8]	Signal	Slave	cpu_active pins of cluster 2.
cpu_active_20[8]	Signal	Slave	cpu_active pins of cluster 20.
cpu_active_21[8]	Signal	Slave	cpu_active pins of cluster 21.
cpu_active_22[8]	Signal	Slave	cpu_active pins of cluster 22.
cpu_active_23[8]	Signal	Slave	cpu_active pins of cluster 23.
cpu_active_24[8]	Signal	Slave	cpu_active pins of cluster 24.
cpu_active_25[8]	Signal	Slave	cpu_active pins of cluster 25.
cpu_active_26[8]	Signal	Slave	cpu_active pins of cluster 26.
cpu_active_27[8]	Signal	Slave	cpu_active pins of cluster 27.
cpu_active_28[8]	Signal	Slave	cpu_active pins of cluster 28.
cpu_active_29[8]	Signal	Slave	cpu_active pins of cluster 29.
cpu_active_3[8]	Signal	Slave	cpu_active pins of cluster 3.
cpu_active_30[8]	Signal	Slave	cpu_active pins of cluster 30.
cpu_active_31[8]	Signal	Slave	cpu_active pins of cluster 31.
cpu_active_4[8]	Signal	Slave	cpu_active pins of cluster 4.
cpu_active_5[8]	Signal	Slave	cpu_active pins of cluster 5.
cpu_active_6[8]	Signal	Slave	cpu_active pins of cluster 6.
cpu_active_7[8]	Signal	Slave	cpu_active pins of cluster 7.
cpu_active_8[8]	Signal	Slave	cpu_active pins of cluster 8.
cpu_active_9[8]	Signal	Slave	cpu_active pins of cluster 9.
po_reset	Signal	Slave	Power on reset.
ppi16_in_0[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 0.
ppi16_in_1[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 1.
ppi16_in_10[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 10.
ppi16_in_11[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 11.
ppi16_in_12[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 12.
ppi16_in_13[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 13.

Name	Protocol	Type	Description
ppi16_in_14[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 14.
ppi16_in_15[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 15.
ppi16_in_16[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 16.
ppi16_in_17[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 17.
ppi16_in_18[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 18.
ppi16_in_19[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 19.
ppi16_in_2[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 2.
ppi16_in_20[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 20.
ppi16_in_21[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 21.
ppi16_in_22[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 22.
ppi16_in_23[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 23.
ppi16_in_24[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 24.
ppi16_in_25[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 25.
ppi16_in_26[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 26.
ppi16_in_27[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 27.
ppi16_in_28[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 28.
ppi16_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 29.
ppi16_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 3.
ppi16_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 30.
ppi16_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 31.
ppi16_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 4.
ppi16_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 5.
ppi16_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 6.
ppi16_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 7.
ppi16_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 8.
ppi16_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 9.
ppi17_in_0[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 0.
ppi17_in_1[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 1.
ppi17_in_10[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 10.
ppi17_in_11[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 11.
ppi17_in_12[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 12.
ppi17_in_13[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 13.
ppi17_in_14[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 14.
ppi17_in_15[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 15.
ppi17_in_16[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 16.
ppi17_in_17[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 17.
ppi17_in_18[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 18.
ppi17_in_19[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 19.
ppi17_in_2[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 2.

Name	Protocol	Type	Description
ppi17_in_20[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 20.
ppi17_in_21[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 21.
ppi17_in_22[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 22.
ppi17_in_23[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 23.
ppi17_in_24[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 24.
ppi17_in_25[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 25.
ppi17_in_26[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 26.
ppi17_in_27[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 27.
ppi17_in_28[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 28.
ppi17_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 29.
ppi17_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 3.
ppi17_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 30.
ppi17_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 31.
ppi17_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 4.
ppi17_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 5.
ppi17_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 6.
ppi17_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 7.
ppi17_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 8.
ppi17_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 9.
ppi18_in_0[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 0.
ppi18_in_1[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 1.
ppi18_in_10[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 10.
ppi18_in_11[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 11.
ppi18_in_12[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 12.
ppi18_in_13[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 13.
ppi18_in_14[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 14.
ppi18_in_15[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 15.
ppi18_in_16[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 16.
ppi18_in_17[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 17.
ppi18_in_18[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 18.
ppi18_in_19[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 19.
ppi18_in_2[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 2.
ppi18_in_20[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 20.
ppi18_in_21[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 21.
ppi18_in_22[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 22.
ppi18_in_23[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 23.
ppi18_in_24[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 24.
ppi18_in_25[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 25.
ppi18_in_26[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 26.

Name	Protocol	Type	Description
ppi18_in_27[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 27.
ppi18_in_28[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 28.
ppi18_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 29.
ppi18_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 3.
ppi18_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 30.
ppi18_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 31.
ppi18_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 4.
ppi18_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 5.
ppi18_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 6.
ppi18_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 7.
ppi18_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 8.
ppi18_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 9.
ppi19_in_0[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 0.
ppi19_in_1[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 1.
ppi19_in_10[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 10.
ppi19_in_11[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 11.
ppi19_in_12[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 12.
ppi19_in_13[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 13.
ppi19_in_14[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 14.
ppi19_in_15[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 15.
ppi19_in_16[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 16.
ppi19_in_17[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 17.
ppi19_in_18[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 18.
ppi19_in_19[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 19.
ppi19_in_2[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 2.
ppi19_in_20[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 20.
ppi19_in_21[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 21.
ppi19_in_22[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 22.
ppi19_in_23[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 23.
ppi19_in_24[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 24.
ppi19_in_25[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 25.
ppi19_in_26[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 26.
ppi19_in_27[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 27.
ppi19_in_28[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 28.
ppi19_in_29[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 29.
ppi19_in_3[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 3.
ppi19_in_30[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 30.
ppi19_in_31[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 31.
ppi19_in_4[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 4.

Name	Protocol	Type	Description
ppi19_in_5[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 5.
ppi19_in_6[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 6.
ppi19_in_7[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 7.
ppi19_in_8[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 8.
ppi19_in_9[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 9.
ppi20_in_0[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 0.
ppi20_in_1[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 1.
ppi20_in_10[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 10.
ppi20_in_11[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 11.
ppi20_in_12[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 12.
ppi20_in_13[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 13.
ppi20_in_14[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 14.
ppi20_in_15[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 15.
ppi20_in_16[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 16.
ppi20_in_17[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 17.
ppi20_in_18[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 18.
ppi20_in_19[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 19.
ppi20_in_2[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 2.
ppi20_in_20[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 20.
ppi20_in_21[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 21.
ppi20_in_22[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 22.
ppi20_in_23[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 23.
ppi20_in_24[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 24.
ppi20_in_25[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 25.
ppi20_in_26[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 26.
ppi20_in_27[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 27.
ppi20_in_28[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 28.
ppi20_in_29[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 29.
ppi20_in_3[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 3.
ppi20_in_30[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 30.
ppi20_in_31[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 31.
ppi20_in_4[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 4.
ppi20_in_5[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 5.
ppi20_in_6[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 6.
ppi20_in_7[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 7.
ppi20_in_8[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 8.
ppi20_in_9[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 9.
ppi21_in_0[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 0.
ppi21_in_1[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 1.

Name	Protocol	Type	Description
ppi21_in_10[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 10.
ppi21_in_11[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 11.
ppi21_in_12[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 12.
ppi21_in_13[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 13.
ppi21_in_14[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 14.
ppi21_in_15[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 15.
ppi21_in_16[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 16.
ppi21_in_17[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 17.
ppi21_in_18[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 18.
ppi21_in_19[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 19.
ppi21_in_2[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 2.
ppi21_in_20[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 20.
ppi21_in_21[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 21.
ppi21_in_22[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 22.
ppi21_in_23[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 23.
ppi21_in_24[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 24.
ppi21_in_25[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 25.
ppi21_in_26[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 26.
ppi21_in_27[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 27.
ppi21_in_28[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 28.
ppi21_in_29[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 29.
ppi21_in_3[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 3.
ppi21_in_30[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 30.
ppi21_in_31[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 31.
ppi21_in_4[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 4.
ppi21_in_5[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 5.
ppi21_in_6[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 6.
ppi21_in_7[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 7.
ppi21_in_8[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 8.
ppi21_in_9[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 9.
ppi22_in_0[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 0.
ppi22_in_1[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 1.
ppi22_in_10[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 10.
ppi22_in_11[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 11.
ppi22_in_12[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 12.

Name	Protocol	Type	Description
ppi22_in_13[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 13.
ppi22_in_14[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 14.
ppi22_in_15[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 15.
ppi22_in_16[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 16.
ppi22_in_17[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 17.
ppi22_in_18[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 18.
ppi22_in_19[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 19.
ppi22_in_2[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 2.
ppi22_in_20[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 20.
ppi22_in_21[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 21.
ppi22_in_22[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 22.
ppi22_in_23[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 23.
ppi22_in_24[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 24.
ppi22_in_25[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 25.
ppi22_in_26[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 26.
ppi22_in_27[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 27.
ppi22_in_28[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 28.
ppi22_in_29[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 29.
ppi22_in_3[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 3.
ppi22_in_30[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 30.
ppi22_in_31[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 31.
ppi22_in_4[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 4.
ppi22_in_5[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 5.

Name	Protocol	Type	Description
ppi22_in_6[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 6.
ppi22_in_7[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 7.
ppi22_in_8[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 8.
ppi22_in_9[8]	Signal	Slave	Private peripheral interrupts (ID22, typically the Debug Communications Channel (DCC) interrupt) of cluster 9.
ppi23_in_0[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 0.
ppi23_in_1[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 1.
ppi23_in_10[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 10.
ppi23_in_11[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 11.
ppi23_in_12[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 12.
ppi23_in_13[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 13.
ppi23_in_14[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 14.
ppi23_in_15[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 15.
ppi23_in_16[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 16.
ppi23_in_17[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 17.
ppi23_in_18[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 18.
ppi23_in_19[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 19.
ppi23_in_2[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 2.
ppi23_in_20[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 20.
ppi23_in_21[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 21.
ppi23_in_22[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 22.
ppi23_in_23[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 23.
ppi23_in_24[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 24.
ppi23_in_25[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 25.

Name	Protocol	Type	Description
ppi23_in_26[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 26.
ppi23_in_27[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 27.
ppi23_in_28[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 28.
ppi23_in_29[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 29.
ppi23_in_3[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 3.
ppi23_in_30[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 30.
ppi23_in_31[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 31.
ppi23_in_4[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 4.
ppi23_in_5[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 5.
ppi23_in_6[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 6.
ppi23_in_7[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 7.
ppi23_in_8[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 8.
ppi23_in_9[8]	Signal	Slave	Private peripheral interrupts (ID23, typically the Performance Counter (PMU) overflow interrupt) of cluster 9.
ppi24_in_0[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 0.
ppi24_in_1[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 1.
ppi24_in_10[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 10.
ppi24_in_11[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 11.
ppi24_in_12[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 12.
ppi24_in_13[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 13.
ppi24_in_14[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 14.
ppi24_in_15[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 15.
ppi24_in_16[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 16.
ppi24_in_17[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 17.

Name	Protocol	Type	Description
ppi24_in_18[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 18.
ppi24_in_19[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 19.
ppi24_in_2[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 2.
ppi24_in_20[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 20.
ppi24_in_21[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 21.
ppi24_in_22[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 22.
ppi24_in_23[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 23.
ppi24_in_24[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 24.
ppi24_in_25[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 25.
ppi24_in_26[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 26.
ppi24_in_27[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 27.
ppi24_in_28[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 28.
ppi24_in_29[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 29.
ppi24_in_3[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 3.
ppi24_in_30[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 30.
ppi24_in_31[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 31.
ppi24_in_4[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 4.
ppi24_in_5[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 5.
ppi24_in_6[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 6.
ppi24_in_7[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 7.
ppi24_in_8[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 8.
ppi24_in_9[8]	Signal	Slave	Private peripheral interrupts (ID24, typically the Cross Trigger Interface (CTI) interrupt) of cluster 9.
ppi25_in_0[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 0.

Name	Protocol	Type	Description
ppi25_in_1[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 1.
ppi25_in_10[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 10.
ppi25_in_11[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 11.
ppi25_in_12[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 12.
ppi25_in_13[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 13.
ppi25_in_14[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 14.
ppi25_in_15[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 15.
ppi25_in_16[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 16.
ppi25_in_17[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 17.
ppi25_in_18[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 18.
ppi25_in_19[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 19.
ppi25_in_2[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 2.
ppi25_in_20[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 20.
ppi25_in_21[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 21.
ppi25_in_22[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 22.
ppi25_in_23[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 23.
ppi25_in_24[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 24.
ppi25_in_25[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 25.
ppi25_in_26[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 26.
ppi25_in_27[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 27.
ppi25_in_28[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 28.
ppi25_in_29[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 29.
ppi25_in_3[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 3.

Name	Protocol	Type	Description
ppi25_in_30[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 30.
ppi25_in_31[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 31.
ppi25_in_4[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 4.
ppi25_in_5[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 5.
ppi25_in_6[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 6.
ppi25_in_7[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 7.
ppi25_in_8[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 8.
ppi25_in_9[8]	Signal	Slave	Private peripheral interrupts (ID25, typically the virtual CPU interface maintenance interrupt) of cluster 9.
ppi26_in_0[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 0.
ppi26_in_1[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 1.
ppi26_in_10[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 10.
ppi26_in_11[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 11.
ppi26_in_12[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 12.
ppi26_in_13[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 13.
ppi26_in_14[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 14.
ppi26_in_15[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 15.
ppi26_in_16[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 16.
ppi26_in_17[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 17.
ppi26_in_18[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 18.
ppi26_in_19[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 19.
ppi26_in_2[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 2.
ppi26_in_20[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 20.
ppi26_in_21[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 21.
ppi26_in_22[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 22.
ppi26_in_23[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 23.
ppi26_in_24[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 24.
ppi26_in_25[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 25.
ppi26_in_26[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 26.
ppi26_in_27[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 27.
ppi26_in_28[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 28.
ppi26_in_29[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 29.
ppi26_in_3[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 3.
ppi26_in_30[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 30.
ppi26_in_31[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 31.

Name	Protocol	Type	Description
ppi26_in_4[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 4.
ppi26_in_5[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 5.
ppi26_in_6[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 6.
ppi26_in_7[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 7.
ppi26_in_8[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 8.
ppi26_in_9[8]	Signal	Slave	Private peripheral interrupts (ID26, typically the hypervisor timer) of cluster 9.
ppi27_in_0[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 0.
ppi27_in_1[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 1.
ppi27_in_10[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 10.
ppi27_in_11[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 11.
ppi27_in_12[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 12.
ppi27_in_13[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 13.
ppi27_in_14[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 14.
ppi27_in_15[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 15.
ppi27_in_16[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 16.
ppi27_in_17[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 17.
ppi27_in_18[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 18.
ppi27_in_19[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 19.
ppi27_in_2[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 2.
ppi27_in_20[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 20.
ppi27_in_21[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 21.
ppi27_in_22[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 22.
ppi27_in_23[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 23.
ppi27_in_24[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 24.
ppi27_in_25[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 25.
ppi27_in_26[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 26.
ppi27_in_27[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 27.
ppi27_in_28[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 28.
ppi27_in_29[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 29.
ppi27_in_3[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 3.
ppi27_in_30[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 30.
ppi27_in_31[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 31.
ppi27_in_4[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 4.
ppi27_in_5[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 5.
ppi27_in_6[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 6.
ppi27_in_7[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 7.
ppi27_in_8[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 8.
ppi27_in_9[8]	Signal	Slave	Private peripheral interrupts (ID27, typically the virtual timer) of cluster 9.
ppi28_in_0[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 0.

Name	Protocol	Type	Description
ppi28_in_1[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 1.
ppi28_in_10[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 10.
ppi28_in_11[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 11.
ppi28_in_12[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 12.
ppi28_in_13[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 13.
ppi28_in_14[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 14.
ppi28_in_15[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 15.
ppi28_in_16[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 16.
ppi28_in_17[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 17.
ppi28_in_18[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 18.
ppi28_in_19[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 19.
ppi28_in_2[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 2.
ppi28_in_20[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 20.
ppi28_in_21[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 21.
ppi28_in_22[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 22.
ppi28_in_23[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 23.
ppi28_in_24[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 24.
ppi28_in_25[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 25.
ppi28_in_26[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 26.
ppi28_in_27[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 27.
ppi28_in_28[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 28.
ppi28_in_29[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 29.
ppi28_in_3[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 3.
ppi28_in_30[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 30.
ppi28_in_31[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 31.
ppi28_in_4[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 4.
ppi28_in_5[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 5.
ppi28_in_6[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 6.
ppi28_in_7[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 7.
ppi28_in_8[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 8.
ppi28_in_9[8]	Signal	Slave	Private peripheral interrupts (ID28) of cluster 9.
ppi29_in_0[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 0.
ppi29_in_1[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 1.
ppi29_in_10[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 10.
ppi29_in_11[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 11.
ppi29_in_12[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 12.
ppi29_in_13[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 13.
ppi29_in_14[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 14.
ppi29_in_15[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 15.

Name	Protocol	Type	Description
ppi29_in_16[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 16.
ppi29_in_17[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 17.
ppi29_in_18[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 18.
ppi29_in_19[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 19.
ppi29_in_2[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 2.
ppi29_in_20[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 20.
ppi29_in_21[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 21.
ppi29_in_22[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 22.
ppi29_in_23[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 23.
ppi29_in_24[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 24.
ppi29_in_25[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 25.
ppi29_in_26[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 26.
ppi29_in_27[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 27.
ppi29_in_28[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 28.
ppi29_in_29[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 29.
ppi29_in_3[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 3.
ppi29_in_30[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 30.
ppi29_in_31[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 31.
ppi29_in_4[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 4.
ppi29_in_5[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 5.
ppi29_in_6[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 6.
ppi29_in_7[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 7.
ppi29_in_8[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 8.
ppi29_in_9[8]	Signal	Slave	Private peripheral interrupts (ID29, typically the Secure physical timer) of cluster 9.
ppi30_in_0[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 0.
ppi30_in_1[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 1.
ppi30_in_10[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 10.
ppi30_in_11[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 11.
ppi30_in_12[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 12.
ppi30_in_13[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 13.
ppi30_in_14[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 14.
ppi30_in_15[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 15.
ppi30_in_16[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 16.

Name	Protocol	Type	Description
ppi30_in_17[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 17.
ppi30_in_18[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 18.
ppi30_in_19[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 19.
ppi30_in_2[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 2.
ppi30_in_20[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 20.
ppi30_in_21[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 21.
ppi30_in_22[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 22.
ppi30_in_23[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 23.
ppi30_in_24[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 24.
ppi30_in_25[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 25.
ppi30_in_26[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 26.
ppi30_in_27[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 27.
ppi30_in_28[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 28.
ppi30_in_29[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 29.
ppi30_in_3[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 3.
ppi30_in_30[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 30.
ppi30_in_31[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 31.
ppi30_in_4[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 4.
ppi30_in_5[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 5.
ppi30_in_6[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 6.
ppi30_in_7[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 7.
ppi30_in_8[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 8.
ppi30_in_9[8]	Signal	Slave	Private peripheral interrupts (ID30, typically the Non-secure physical timer) of cluster 9.

Name	Protocol	Type	Description
ppi31_in_0[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 0.
ppi31_in_1[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 1.
ppi31_in_10[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 10.
ppi31_in_11[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 11.
ppi31_in_12[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 12.
ppi31_in_13[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 13.
ppi31_in_14[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 14.
ppi31_in_15[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 15.
ppi31_in_16[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 16.
ppi31_in_17[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 17.
ppi31_in_18[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 18.
ppi31_in_19[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 19.
ppi31_in_2[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 2.
ppi31_in_20[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 20.
ppi31_in_21[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 21.
ppi31_in_22[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 22.
ppi31_in_23[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 23.
ppi31_in_24[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 24.
ppi31_in_25[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 25.
ppi31_in_26[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 26.
ppi31_in_27[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 27.
ppi31_in_28[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 28.
ppi31_in_29[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 29.
ppi31_in_3[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 3.
ppi31_in_30[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 30.
ppi31_in_31[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 31.
ppi31_in_4[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 4.
ppi31_in_5[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 5.
ppi31_in_6[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 6.
ppi31_in_7[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 7.
ppi31_in_8[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 8.
ppi31_in_9[8]	Signal	Slave	Private peripheral interrupts (ID31) of cluster 9.
pvbuss_m	PVBus	Master	Memory bus out: transactions generated by the IRI.
pvbuss_s	PVBus	Slave	Memory bus in: memory-mapped register accesses are accepted on this interface.
redistributor_0[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 0
redistributor_1[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 1.
redistributor_10[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 10.
redistributor_11[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 11.
redistributor_12[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 12.

Name	Protocol	Type	Description
redistributor_13[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 13.
redistributor_14[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 14.
redistributor_15[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 15.
redistributor_16[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 16.
redistributor_17[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 17.
redistributor_18[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 18.
redistributor_19[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 19.
redistributor_2[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 2.
redistributor_20[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 20.
redistributor_21[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 21.
redistributor_22[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 22.
redistributor_23[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 23.
redistributor_24[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 24.
redistributor_25[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 25.
redistributor_26[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 26.
redistributor_27[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 27.
redistributor_28[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 28.
redistributor_29[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 29.

redistributor_30[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 30.
redistributor_31[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 31.
redistributor_4[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 4.
redistributor_5[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 5.
redistributor_6[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 6.
redistributor_7[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 7.
redistributor_8[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 8.
redistributor_9[8]	GICv3Comms	Master	Input from and output to CPU interface for cluster 9.
reset	Signal	Slave	Reset.
spi_in[988]	Signal	Slave	Shared peripheral interrupts.
wake_request_0[8]	Signal	Master	Power management outputs of cluster 0.
wake_request_1[8]	Signal	Master	Power management outputs of cluster 1.
wake_request_10[8]	Signal	Master	Power management outputs of cluster 10.
wake_request_11[8]	Signal	Master	Power management outputs of cluster 11.
wake_request_12[8]	Signal	Master	Power management outputs of cluster 12.
wake_request_13[8]	Signal	Master	Power management outputs of cluster 13.
wake_request_14[8]	Signal	Master	Power management outputs of cluster 14.
wake_request_15[8]	Signal	Master	Power management outputs of cluster 15.
wake_request_16[8]	Signal	Master	Power management outputs of cluster 16.
wake_request_17[8]	Signal	Master	Power management outputs of cluster 17.

Name	Protocol	Type	Description
wake_request_18[8]	Signal	Master	Power management outputs of cluster 18.
wake_request_19[8]	Signal	Master	Power management outputs of cluster 19.
wake_request_2[8]	Signal	Master	Power management outputs of cluster 2.
wake_request_20[8]	Signal	Master	Power management outputs of cluster 20.
wake_request_21[8]	Signal	Master	Power management outputs of cluster 21.
wake_request_22[8]	Signal	Master	Power management outputs of cluster 22.
wake_request_23[8]	Signal	Master	Power management outputs of cluster 23.
wake_request_24[8]	Signal	Master	Power management outputs of cluster 24.
wake_request_25[8]	Signal	Master	Power management outputs of cluster 25.
wake_request_26[8]	Signal	Master	Power management outputs of cluster 26.
wake_request_27[8]	Signal	Master	Power management outputs of cluster 27.
wake_request_28[8]	Signal	Master	Power management outputs of cluster 28.
wake_request_29[8]	Signal	Master	Power management outputs of cluster 29.
wake_request_3[8]	Signal	Master	Power management outputs of cluster 3.
wake_request_30[8]	Signal	Master	Power management outputs of cluster 30.
wake_request_31[8]	Signal	Master	Power management outputs of cluster 31.
wake_request_4[8]	Signal	Master	Power management outputs of cluster 4.
wake_request_5[8]	Signal	Master	Power management outputs of cluster 5.
wake_request_6[8]	Signal	Master	Power management outputs of cluster 6.
wake_request_7[8]	Signal	Master	Power management outputs of cluster 7.
wake_request_8[8]	Signal	Master	Power management outputs of cluster 8.
wake_request_9[8]	Signal	Master	Power management outputs of cluster 9.

Parameters for GIC500_ClusterPorts

GICD_ITARGETSR-RAZWI

Type

bool

Default value

0x0

If true, the GICD_ITARGETS registers are RAZ/WI.

ITS-count

Type

int

Default value

0x1

Number of Interrupt Translation Services to be instantiated (0=none).

ITS-device-bits**Type**

int

Default value

0x10

Number of bits supported for ITS device IDs.

ITS-threaded-command-queue**Type**

bool

Default value

0x1

Enable execution of ITS commands in a separate thread which is sometimes required for cosimulation.

SPI-count**Type**

int

Default value

0xe0

Number of SPIs that are implemented.

clear-ISPENDR-bit-for-level-sensitive-interrupt-when-acknowledged**Type**

bool

Default value

0x0

If true, acknowledgement of a level sensitive interrupt clears the corresponding bit in the ISPENDR register.

cpus_per_cluster_0**Type**

int

Default value

0x1

Number of cores within cluster 0.

cpus_per_cluster_1**Type**

int

Default value

0x1

Number of cores within cluster 1.

cpus_per_cluster_10**Type**

int

Default value

0x1

Number of cores within cluster 10.

cpus_per_cluster_11**Type**

int

Default value

0x1

Number of cores within cluster 11.

cpus_per_cluster_12**Type**

int

Default value

0x1

Number of cores within cluster 12.

cpus_per_cluster_13**Type**

int

Default value

0x1

Number of cores within cluster 13.

cpus_per_cluster_14**Type**

int

Default value

0x1

Number of cores within cluster 14.

cpus_per_cluster_15**Type**

int

Default value

0x1

Number of cores within cluster 15.

cpus_per_cluster_16**Type**

int

Default value

0x1

Number of cores within cluster 16.

cpus_per_cluster_17**Type**

int

Default value

0x1

Number of cores within cluster 17.

cpus_per_cluster_18**Type**

int

Default value

0x1

Number of cores within cluster 18.

cpus_per_cluster_19**Type**

int

Default value

0x1

Number of cores within cluster 19.

cpus_per_cluster_2**Type**

int

Default value

0x1

Number of cores within cluster 2.

cpus_per_cluster_20**Type**

int

Default value

0x1

Number of cores within cluster 20.

cpus_per_cluster_21**Type**

int

Default value

0x1

Number of cores within cluster 21.

cpus_per_cluster_22**Type**

int

Default value

0x1

Number of cores within cluster 22.

cpus_per_cluster_23**Type**

int

Default value

0x1

Number of cores within cluster 23.

cpus_per_cluster_24**Type**

int

Default value

0x1

Number of cores within cluster 24.

cpus_per_cluster_25**Type**

int

Default value

0x1

Number of cores within cluster 25.

cpus_per_cluster_26**Type**

int

Default value

0x1

Number of cores within cluster 26.

cpus_per_cluster_27**Type**

int

Default value

0x1

Number of cores within cluster 27.

cpus_per_cluster_28**Type**

int

Default value

0x1

Number of cores within cluster 28.

cpus_per_cluster_29**Type**

int

Default value

0x1

Number of cores within cluster 29.

cpus_per_cluster_3**Type**

int

Default value

0x1

Number of cores within cluster 3.

cpus_per_cluster_30**Type**

int

Default value

0x1

Number of cores within cluster 30.

cpus_per_cluster_31**Type**

int

Default value

0x1

Number of cores within cluster 31.

cpus_per_cluster_4**Type**

int

Default value

0x1

Number of cores within cluster 4.

cpus_per_cluster_5**Type**

int

Default value

0x1

Number of cores within cluster 5.

cpus_per_cluster_6**Type**

int

Default value

0x1

Number of cores within cluster 6.

cpus_per_cluster_7**Type**

int

Default value

0x1

Number of cores within cluster 7.

cpus_per_cluster_8**Type**

int

Default value

0x1

Number of cores within cluster 8.

cpus_per_cluster_9**Type**

int

Default value

0x1

Number of cores within cluster 9.

delay-ITS-accesses**Type**

bool

Default value

0x1

Delay accesses from the ITS until GICR_SYNCRR is read.

delay-redistributor-accesses**Type**

bool

Default value

0x1

Delay memory accesses from the redistributor until GICR_SYNCRR is read.

enable_protocol_checking**Type**

bool

Default value

0x0

Enable/disable protocol checking at cpu interface.

enabled**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

has-two-security-states**Type**

bool

Default value

0x1

If true, has two security states.

num_clusters**Type**

int

Default value

0x1

Number of implemented affinity level1 clusters.

print-memory-map**Type**

bool

Default value

0x0

Print memory map to stdout.

redistributor-threaded-sync**Type**

bool

Default value

0x1

Enable execution of redistributor delayed transactions in a separate thread which is sometimes required for cosimulation.

reg-base**Type**

int

Default value

0x10000000

GIC500 base address.

using-generated-memorymap**Type**

bool

Default value

0x1

Use the generated memorymap for the GIC500 and warn if superfluous parameters are passed.

wakeup-on-reset**Type**

bool

Default value

0x0

Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

3.10.30 GIC500_Filter

GIC500 Component for distribution of interrupts, filtering version for validation. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-1003: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for GIC500_Filter

This model has the following Iris instances:

Table 3-1004: GIC500_Filter Iris instances

InstanceName	ComponentName
GIC500_Filter	GIC_IRI
GIC500_Filter.ITS0	GICv3InterruptTranslationService
GIC500_Filter.rd_0	GICv3RedistributorInternal
GIC500_Filter.rd_0_0	GICv3RedistributorInternal
GIC500_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC500_Filter.rd_0_0_0_0	GICv3Redistributor
GIC500_Filter.rd_tl	GICv3Distributor

This model has the following MTI trace components:

Table 3-1005: GIC500_Filter MTI instances

InstanceName	ComponentName
GIC500_Filter	GICv3IRI
GIC500_Filter.ITS0	GICv3InterruptTranslationService
GIC500_Filter.rd_0	GICv3RedistributorInternal
GIC500_Filter.rd_0_0	GICv3RedistributorInternal
GIC500_Filter.rd_0_0_0	GICv3RedistributorInternal
GIC500_Filter.rd_0_0_0_0	GICv3Redistributor
GIC500_Filter.rd_tl	GICv3Distributor

GIC500_Filter contains the following CADI targets:

- GIC500

About GIC500_Filter

This is a single-component implementation of the GICv3 architecture with support for 256 cores. You can configure the model to support a maximum of 32 clusters with 8 cores per cluster. Use it with an Armv8-A core to deliver interrupts. It supports a single Interrupt Translation Service for message-based interrupts. It supports the architectural features, but does not support the implementation defined features.

Note

- Set the `FASTSIM_GIC_MEMORY_MAP` environment variable to 1 to print to stderr the memory map of any GICv3 or later models that are included in the platform being run.
- For writes to `GITS_TRANSLATE64R`, the `MSIRewriter` component can be used to create the correct data transactions based on the device ID. For more details about `GITS_TRANSLATE64R`, see [MSIRewriter](#).

MasterID, ExtendedID, and UserFlags

This table shows how this model encodes information in the `MasterID`, `ExtendedID`, and `UserFlags` bus attributes:

PVBus attribute	Bits used	Property encoded	Notes
MasterID	31:0	Master ID that invoked the register access	–
ExtendedID	–	–	Not used
UserFlags	–	–	Not used

Note

The `pvbus_m` port does not use `MasterID`, `ExtendedID`, or `UserFlags`.

Ports for GIC500_Filter

Table 3-1007: Ports

Name	Protocol	Type	Description
cfgsdisable	Signal	Slave	Disable some SPIs signal.
cpu_active_0[8]	Signal	Slave	cpu_active pins of cluster 0.
cpu_active_1[8]	Signal	Slave	cpu_active pins of cluster 1.
cpu_active_10[8]	Signal	Slave	cpu_active pins of cluster 10.
cpu_active_11[8]	Signal	Slave	cpu_active pins of cluster 11.
cpu_active_12[8]	Signal	Slave	cpu_active pins of cluster 12.
cpu_active_13[8]	Signal	Slave	cpu_active pins of cluster 13.
cpu_active_14[8]	Signal	Slave	cpu_active pins of cluster 14.
cpu_active_15[8]	Signal	Slave	cpu_active pins of cluster 15.
cpu_active_16[8]	Signal	Slave	cpu_active pins of cluster 16.
cpu_active_17[8]	Signal	Slave	cpu_active pins of cluster 17.
cpu_active_18[8]	Signal	Slave	cpu_active pins of cluster 18.
cpu_active_19[8]	Signal	Slave	cpu_active pins of cluster 19.
cpu_active_2[8]	Signal	Slave	cpu_active pins of cluster 2.
cpu_active_20[8]	Signal	Slave	cpu_active pins of cluster 20.
cpu_active_21[8]	Signal	Slave	cpu_active pins of cluster 21.
cpu_active_22[8]	Signal	Slave	cpu_active pins of cluster 22.
cpu_active_23[8]	Signal	Slave	cpu_active pins of cluster 23.
cpu_active_24[8]	Signal	Slave	cpu_active pins of cluster 24.
cpu_active_25[8]	Signal	Slave	cpu_active pins of cluster 25.
cpu_active_26[8]	Signal	Slave	cpu_active pins of cluster 26.
cpu_active_27[8]	Signal	Slave	cpu_active pins of cluster 27.
cpu_active_28[8]	Signal	Slave	cpu_active pins of cluster 28.
cpu_active_29[8]	Signal	Slave	cpu_active pins of cluster 29.
cpu_active_3[8]	Signal	Slave	cpu_active pins of cluster 3.
cpu_active_30[8]	Signal	Slave	cpu_active pins of cluster 30.
cpu_active_31[8]	Signal	Slave	cpu_active pins of cluster 31.
cpu_active_4[8]	Signal	Slave	cpu_active pins of cluster 4.
cpu_active_5[8]	Signal	Slave	cpu_active pins of cluster 5.
cpu_active_6[8]	Signal	Slave	cpu_active pins of cluster 6.
cpu_active_7[8]	Signal	Slave	cpu_active pins of cluster 7.
cpu_active_8[8]	Signal	Slave	cpu_active pins of cluster 8.
cpu_active_9[8]	Signal	Slave	cpu_active pins of cluster 9.
po_reset	Signal	Slave	Power on reset.
ppi16_in_0[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 0.
ppi16_in_1[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 1.
ppi16_in_10[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 10.

Name	Protocol	Type	Description
ppi16_in_11[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 11.
ppi16_in_12[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 12.
ppi16_in_13[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 13.
ppi16_in_14[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 14.
ppi16_in_15[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 15.
ppi16_in_16[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 16.
ppi16_in_17[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 17.
ppi16_in_18[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 18.
ppi16_in_19[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 19.
ppi16_in_2[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 2.
ppi16_in_20[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 20.
ppi16_in_21[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 21.
ppi16_in_22[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 22.
ppi16_in_23[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 23.
ppi16_in_24[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 24.
ppi16_in_25[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 25.
ppi16_in_26[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 26.
ppi16_in_27[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 27.
ppi16_in_28[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 28.
ppi16_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 29.
ppi16_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 3.
ppi16_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 30.
ppi16_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 31.
ppi16_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 4.
ppi16_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 5.
ppi16_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 6.
ppi16_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 7.
ppi16_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 8.
ppi16_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID16) of cluster 9.
ppi17_in_0[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 0.
ppi17_in_1[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 1.
ppi17_in_10[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 10.
ppi17_in_11[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 11.
ppi17_in_12[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 12.
ppi17_in_13[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 13.
ppi17_in_14[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 14.
ppi17_in_15[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 15.
ppi17_in_16[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 16.
ppi17_in_17[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 17.

Name	Protocol	Type	Description
ppi17_in_18[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 18.
ppi17_in_19[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 19.
ppi17_in_2[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 2.
ppi17_in_20[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 20.
ppi17_in_21[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 21.
ppi17_in_22[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 22.
ppi17_in_23[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 23.
ppi17_in_24[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 24.
ppi17_in_25[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 25.
ppi17_in_26[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 26.
ppi17_in_27[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 27.
ppi17_in_28[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 28.
ppi17_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 29.
ppi17_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 3.
ppi17_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 30.
ppi17_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 31.
ppi17_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 4.
ppi17_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 5.
ppi17_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 6.
ppi17_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 7.
ppi17_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 8.
ppi17_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID17) of cluster 9.
ppi18_in_0[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 0.
ppi18_in_1[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 1.
ppi18_in_10[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 10.
ppi18_in_11[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 11.
ppi18_in_12[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 12.
ppi18_in_13[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 13.
ppi18_in_14[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 14.
ppi18_in_15[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 15.
ppi18_in_16[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 16.
ppi18_in_17[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 17.
ppi18_in_18[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 18.
ppi18_in_19[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 19.
ppi18_in_2[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 2.
ppi18_in_20[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 20.
ppi18_in_21[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 21.
ppi18_in_22[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 22.
ppi18_in_23[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 23.

Name	Protocol	Type	Description
ppi18_in_24[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 24.
ppi18_in_25[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 25.
ppi18_in_26[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 26.
ppi18_in_27[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 27.
ppi18_in_28[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 28.
ppi18_in_29[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 29.
ppi18_in_3[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 3.
ppi18_in_30[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 30.
ppi18_in_31[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 31.
ppi18_in_4[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 4.
ppi18_in_5[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 5.
ppi18_in_6[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 6.
ppi18_in_7[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 7.
ppi18_in_8[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 8.
ppi18_in_9[8]	Signal	Slave	Private peripheral interrupts interrupts (ID18) of cluster 9.
ppi19_in_0[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 0.
ppi19_in_1[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 1.
ppi19_in_10[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 10.
ppi19_in_11[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 11.
ppi19_in_12[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 12.
ppi19_in_13[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 13.
ppi19_in_14[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 14.
ppi19_in_15[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 15.
ppi19_in_16[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 16.
ppi19_in_17[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 17.
ppi19_in_18[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 18.
ppi19_in_19[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 19.
ppi19_in_2[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 2.
ppi19_in_20[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 20.
ppi19_in_21[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 21.
ppi19_in_22[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 22.
ppi19_in_23[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 23.
ppi19_in_24[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 24.
ppi19_in_25[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 25.
ppi19_in_26[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 26.
ppi19_in_27[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 27.
ppi19_in_28[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 28.
ppi19_in_29[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 29.
ppi19_in_3[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 3.

Name	Protocol	Type	Description
ppi19_in_30[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 30.
ppi19_in_31[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 31.
ppi19_in_4[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 4.
ppi19_in_5[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 5.
ppi19_in_6[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 6.
ppi19_in_7[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 7.
ppi19_in_8[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 8.
ppi19_in_9[8]	Signal	Slave	Private peripheral interrupts (ID19) of cluster 9.
ppi20_in_0[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 0.
ppi20_in_1[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 1.
ppi20_in_10[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 10.
ppi20_in_11[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 11.
ppi20_in_12[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 12.
ppi20_in_13[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 13.
ppi20_in_14[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 14.
ppi20_in_15[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 15.
ppi20_in_16[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 16.
ppi20_in_17[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 17.
ppi20_in_18[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 18.
ppi20_in_19[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 19.
ppi20_in_2[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 2.
ppi20_in_20[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 20.
ppi20_in_21[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 21.
ppi20_in_22[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 22.
ppi20_in_23[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 23.
ppi20_in_24[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 24.
ppi20_in_25[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 25.
ppi20_in_26[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 26.
ppi20_in_27[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 27.
ppi20_in_28[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 28.
ppi20_in_29[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 29.
ppi20_in_3[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 3.
ppi20_in_30[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 30.
ppi20_in_31[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 31.
ppi20_in_4[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 4.
ppi20_in_5[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 5.
ppi20_in_6[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 6.
ppi20_in_7[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 7.
ppi20_in_8[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 8.

Name	Protocol	Type	Description
ppi20_in_9[8]	Signal	Slave	Private peripheral interrupts (ID20) of cluster 9.
ppi21_in_0[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 0.
ppi21_in_1[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 1.
ppi21_in_10[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 10.
ppi21_in_11[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 11.
ppi21_in_12[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 12.
ppi21_in_13[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 13.
ppi21_in_14[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 14.
ppi21_in_15[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 15.
ppi21_in_16[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 16.
ppi21_in_17[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 17.
ppi21_in_18[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 18.
ppi21_in_19[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 19.
ppi21_in_2[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 2.
ppi21_in_20[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 20.
ppi21_in_21[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 21.
ppi21_in_22[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 22.
ppi21_in_23[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 23.
ppi21_in_24[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 24.
ppi21_in_25[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 25.
ppi21_in_26[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 26.
ppi21_in_27[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 27.
ppi21_in_28[8]	Signal	Slave	Private peripheral interrupts (ID21) of cluster 28.
