If you prefer, you can skip to [the start of the content](#).

Intended audience

This document is written for software developers who are using the components and tools in the Fast Models portfolio to build custom platform models and integrate them with third-party tools and models.

Inclusive language commitment

Arm values inclusive communities. Arm recognizes that we and our industry have used language that can be offensive. Arm strives to lead the industry and create change.

This document includes language that can be offensive. We will replace this language in a future issue of this document.

To report offensive language in this document, email terms@arm.com.

Feedback

Arm welcomes feedback on this product and its documentation. To provide feedback on the product, create a ticket on <https://support.developer.arm.com>.

To provide feedback on the document, fill the following survey: <https://developer.arm.com/documentation-feedback-survey>.

Contents

1. About the models.....	22
1.1 Model capabilities.....	22
1.2 Running Arm Software Test Libraries (STL) on Fast Models.....	22
1.3 Quality level definitions.....	23
1.4 Fast Models accuracy.....	23
1.4.1 Timing accuracy of Fast Models.....	24
1.4.2 Bus traffic in Fast Models.....	24
1.4.3 Instruction prefetch in Fast Models.....	26
1.4.4 Out-of-order execution and write-buffers in Fast Models.....	26
1.4.5 Caches in Fast Models.....	27
1.4.6 Global exclusive monitor in Fast Models.....	28
1.5 Processor implementation.....	28
1.5.1 Mapping PMU events to MTI trace sources.....	28
1.5.2 Caches in PV models.....	30
1.5.3 GICv3 in PV models.....	32
1.5.4 GICv4 in PV models.....	32
1.5.5 CP14 Debug coprocessor.....	33
1.5.6 TLBs in PV models.....	33
1.5.7 Memory access in PV models.....	33
1.5.8 Timing in PV models.....	34
1.5.9 CADI interactions with processor behavior.....	35
1.6 Fast Models CADI implementation.....	36
1.7 CADI sync watchpoints.....	38
1.8 Non-CADI sync watchpoints.....	38
1.8.1 syncLevel definitions.....	39
1.8.2 Controlling and observing the syncLevel.....	40
1.9 SCADI.....	42
1.9.1 Intended uses of CADI and SCADI.....	42
1.9.2 Responsibilities of the SCADI caller.....	43
1.9.3 SCADI interface access.....	43
1.9.4 SCADI semantics.....	45
1.10 User mode networking.....	46

1.11 TAP/TUN networking.....	48
1.11.1 TAP/TUN networking limitations.....	48
1.11.2 Setting up a network connection for Microsoft Windows.....	48
1.11.3 Configuring the networking environment for Microsoft Windows.....	49
1.11.4 Commands for tap_setup_32.exe or tap_setup_64.exe for Microsoft Windows.....	49
1.11.5 Uninstalling networking for Microsoft Windows.....	50
1.11.6 Setting up a network connection for Red Hat Enterprise Linux.....	50
1.11.7 Setting up a network connection for Ubuntu Linux.....	52
1.11.8 Configuring the networking environment for Linux.....	54
1.11.9 Solutions to networking issues on Linux.....	55
1.11.10 Disabling and re-enabling networking for Linux.....	55
1.11.11 Uninstalling networking for Linux.....	56
1.12 Using parameters to set port values.....	56
1.13 PVBUS C++ transaction and Tx_Result classes.....	57
1.13.1 Class pv::TransactionGenerator.....	57
1.13.2 TransactionGenerator efficiency considerations.....	58
1.13.3 Enum pv::AccessWidth.....	58
1.13.4 Class pv::Transaction.....	58
1.13.5 Class pv::ReadTransaction.....	59
1.13.6 Class pv::WriteTransaction.....	59
1.14 Visualisation library.....	60
1.14.1 LISA visualisation models.....	61
1.14.2 Visualisation library C++ classes.....	61
2. Protocols.....	66
2.1 AMBA-PV protocols.....	66
2.1.1 AMBAPV protocol.....	66
2.1.2 AMBAPVACE protocol.....	69
2.1.3 AMBAPVSignal protocol.....	72
2.1.4 AMBAPVSignalState protocol.....	72
2.1.5 AMBAPVValue protocol.....	72
2.1.6 AMBAPVValue64 protocol.....	72
2.1.7 AMBAPVValueState protocol.....	73
2.1.8 AMBAPVValueState64 protocol.....	73
2.2 Clocking protocols.....	73
2.2.1 ClockRateControl protocol.....	73

2.2.2 TimerCallback protocol.....	74
2.2.3 TimerCallback64 protocol.....	74
2.2.4 TimerControl protocol.....	74
2.2.5 TimerControl64 protocol.....	75
2.3 Debug interface protocols.....	75
2.3.1 CADIDisassemblerProtocol protocol.....	76
2.3.2 CADIProtocol protocol.....	77
2.4 Peripheral protocols.....	79
2.4.1 AudioControl protocol.....	79
2.4.2 CharacterLCD protocol.....	80
2.4.3 FlashLoaderPort protocol.....	80
2.4.4 GUIPollCallback protocol.....	80
2.4.5 ICS307Configuration protocol.....	80
2.4.6 KeyboardStatus protocol.....	81
2.4.7 LCD protocol.....	81
2.4.8 LCDLayoutInfo protocol.....	82
2.4.9 MMC_Protocol protocol.....	82
2.4.10 MouseStatus protocol.....	83
2.4.11 PL080_DMACE_DmaPortProtocol protocol.....	83
2.4.12 PS2Data protocol.....	84
2.4.13 PVBUSSlaveControl protocol.....	84
2.4.14 PVDevice protocol.....	87
2.4.15 PVTransactionMaster protocol.....	87
2.4.16 SerialData protocol.....	88
2.4.17 SMMUv3AEMIdentifyProtocol protocol.....	89
2.4.18 TZFilterControl protocol.....	89
2.4.19 VirtualEthernet protocol.....	90
2.5 Power management protocols.....	90
2.5.1 PChannel protocol.....	90
2.6 Processor protocols.....	91
2.6.1 CoprocBusProtocol protocol.....	91
2.6.2 CounterInterface protocol.....	97
2.6.3 GICv3Comms protocol.....	97
2.6.4 InstructionCount protocol.....	98
2.6.5 v8EmbeddedCrossTrigger_controlprotocol protocol.....	99
2.7 Signaling protocols.....	99

2.7.1 Signal protocol.....	99
2.7.2 StateSignal protocol.....	99
2.7.3 Value protocol.....	100
2.7.4 Value_64 protocol.....	100
2.7.5 ValueState protocol.....	100
3. Fast Models components.....	101
3.1 Component differences.....	101
3.2 Bridge components.....	103
3.2.1 AMBAPV2PVBus.....	104
3.2.2 AMBAPVACE2PVBus.....	105

1. About the models

Programmers View (PV) models of processors and devices work at a level where functional behavior is equivalent to what a programmer would see using the hardware.

They sacrifice timing accuracy to achieve fast simulation execution speeds. You can use the PV models for confirming software functionality, but you must not rely on the accuracy of cycle counts, low-level component interactions, or other hardware-specific behavior.

1.1 Model capabilities

Fast Models attempt to accurately model the hardware, but compromises exist between speed of execution, accuracy, and other criteria. A processor model might not match the hardware under certain conditions.

Fast Models can:

- Accurately model instructions.
- Correctly execute architecturally-correct code.
- Model some unpredictable behavior.

Fast Models cannot:

- Validate the hardware.
- Model all unpredictable behavior.
- Model cycle counting.
- Model timing-sensitive behavior.
- Model SMP instruction scheduling.
- Measure software performance.
- Model bus traffic.

Related information

- [Caches in Fast Models](#)

1.2 Running Arm Software Test Libraries (STL) on Fast Models

Fast Models does not support running the entire STL.

The reasons are:

- Some micro-architectural features implemented in the RTL are not implemented in the Fast Model and therefore the model's behavior might deviate from the RTL.
- Some peripheral support must be included to enable parts of the STL. For example SBIST controller support is available in the RTL but not in the Fast Model.

Fast Models can be used for integration of the STL into your software stack, but running the STL might not perform accurate measurement and validation.

1.3 Quality level definitions

The documentation for each model of Arm® IP includes one or more quality level statements to indicate how complete the model's implementation is for each supported revision of the IP.

Table 1-1: Quality level definitions

Quality level	Definition
Alpha support	The model implementation is at an early stage and is likely to change in future releases. There might be significant defects or limitations in the model.
Preliminary support	The model implementation is complete or almost complete. Testing is nearly to the level of a fully-supported model. However, changes might still occur and there are likely to be known defects present.
Full support	Also called Release quality. Support is complete and the model has been tested as fully as possible. The modeled IP has reached its LAC milestone.

1.4 Fast Models accuracy

Fast Models aim to be accurate from the point of view of the program running on the processors. This section describes areas where Fast Models differ from hardware.

Software is able to detect differences between hardware and the model, but these differences generally depend on behavior that is not precisely specified. For example, it is possible to detect differences in the exact timings of instructions and bus transactions, effects of speculative prefetch and cache victim selection.

Certain classes of behavior are specified as unpredictable and these cases are detectable by software. A program that relies on such behavior, even unintentionally, is not guaranteed to work reliably on any device, or on a Fast Model. Programs that exploit this behavior might execute differently between the hardware and the model.

Fast Models do not attempt to accurately model bus transactions. PVBus provides the infrastructure to ensure that the program gets the correct results.

1.4.1 Timing accuracy of Fast Models

Fast Models do not model instruction timing accurately. The simulation as a whole has a very accurate concept of timing, but the Code Translation (CT) processors do not claim to dispatch instructions with device-like timing.

In general, a processor issues a set of instructions, called a quantum, at the same point in simulation time, and then waits for some amount of time before executing the next quantum. The timing is arranged so that on average the processor executes one instruction per clock cycle.

Timing annotation can cause the cycle count and instruction count to differ. For more details, see [Timing Annotation](#) in the Fast Models User Guide.

The consequences of this are:

- The perceived performance of software running on the model differs from real-world software. In particular, memory accesses and arithmetic operations all take a significant amount of time.
- A program might be able to detect the quantized execution behavior of a processor, for example by polling a high-resolution timer.
- All instructions in a quantum are effectively atomic.

This might mask some race-condition bugs in software.

1.4.2 Bus traffic in Fast Models

PVBus can simulate the behavior of individual bus transactions passing through a hierarchy of bus fabric, but it uses the following techniques to optimize this process:

- PVBus generally decodes the path between a bus master and bus slave the first time a transaction is issued. All subsequent transactions to the same address are automatically sent to the same slave, without passing through the intervening fabric.
- For accesses to normal memory, the master can cache a pointer to the host storage that holds the data contents of the memory. The master can read and write directly to this memory without generating bus transactions.
- For instruction-fetch, and for operations such as repeated DMA from framebuffer memory, PVBus provides an optimization called snooping, which informs the master if anyone else could have modified the contents of memory. If no changes have occurred, the master can avoid the need to re-read memory contents.

If a piece of bus fabric wants to intercept and log all bus transactions, it can defeat these optimizations by claiming to be a slave device. It can then log all transactions and can reissue identical transactions on its own master port. However, doing this slows all bus transactions and significantly impacts simulation performance.

If direct accesses to memory by the CT engine are intercepted by the fabric, the processor is forced to single step. Execution is much slower than normal operation with translated code.

The bus traffic generated by a processor is not representative of real traffic:

Timing differences

Reordering and buffering of memory accesses, out-of-order execution, speculative prefetch, and drain-buffers can cause timing differences. They are not modeled, since they are not visible to the programmer except in situations where a cluster program contains race conditions that violate serial-consistency expectations.

Bus contention

Fast Models do not model the time taken for a bus transaction, so they cannot model the effects of multiple transactions contending for bus availability.

Size of access

Fast Models do not attempt to generate the same types of burst transaction from the processor for accesses to multiple consecutive locations. PVBUS only supports burst transactions of type INCR.

Instruction fetch

The behavior of the instruction prefetch unit of a processor is not modeled to match the hardware implementation.

Behavioral differences

In some software, the trace of instruction execution depends on timing effects. For example, if a loop polls a device waiting for a 10ms time-out, the number of iterations of the polling loop depends on the rate of instruction execution.

Other differences

- PVBUS does not support any type of write strobes.
- PVBUS does not support Quality of Service (QoS) or region values.
- Transactions cannot cross a 4KB boundary.
- Barriers and DVM messages are not transmitted on the PVBUS.

[Instruction prefetch in Fast Models](#) on page 25

1.4.3 Instruction prefetch in Fast Models

The CT engine in the processor models relies on Fast Models PVBUS optimizations. It only performs code-translation if it has been able to prefetch and snoop the underlying memory. It then need not issue bus transactions until the snoop handling detects an external modification to memory.

If the CT engine cannot get prefetch access to memory, it drops to single-stepping. This single-stepping is very slow (~1000x slower than translated code execution).

Real processors attempt to prefetch instructions ahead of execution and predict branch destinations to keep the prefetch queue full. The instruction prefetch behavior of a processor can be observed by a program that writes into its own prefetch queue (without using explicit barriers). The architecture does not define the results.

The CT engine processes code in blocks. The effect is as if the processor filled its prefetch queue with a block of instructions, then executed the block to completion. As a result, this virtual prefetch queue is sometimes larger and sometimes smaller than the corresponding hardware. In the current implementation, the virtual prefetch queue can follow small forward branches.

With an L1 instruction cache turned on, the instruction blocksize is limited to a single cache-line. The processor ensures that a line is present in the cache at the point where it starts executing instructions from that line.

In real hardware, the effects of the instruction prefetch queue are to cause additional fetch transactions. Some of these are redundant because of incorrect branch prediction. This causes extra cache and bus pressure.

1.4.4 Out-of-order execution and write-buffers in Fast Models

Hardware memory is Weakly Ordered, but Fast Models memory is Strongly Ordered.

The CT implementation executes instructions sequentially. One instruction is retired before the next starts to execute. In a real processor, multiple memory accesses can be outstanding, and can complete in a different order from their program order. Writes can also be delayed in a write-buffer.

The programmer-visible effects of these behaviors are defined in the architecture as the Weakly Ordered memory model, which the programmer must be aware of when writing lock-free cluster code.

Within Fast Models, memory accesses happen in program order, effectively as if all memory is Strongly Ordered.

1.4.5 Caches in Fast Models

Fast Models with cache-state modeling enabled can replicate some types of failure-case, but not all types.

The effects of caches are programmer-visible because they can cause a single memory location to exist as multiple inconsistent copies. If caches are not correctly maintained, reads can observe stale copies of locations, and flushes/cleans can cause writes to be lost.

There are three ways in which incorrect cache maintenance can be programmer-visible:

From the D-side interface of a single processor

The only way of detecting the presence of caches is to create aliases in the memory map, so that the same range of physical addresses can be observed as both cached and non-cached memory.

From the D-side of a single processor to its I-side

Stale instruction data can be fetched when new instructions have been written by the D-side. This can either be because of deliberate self-modifying code, or as a consequence of incorrect OS demand paging.

Between one processor and another device

For example, another processor in a non-coherent MP system, or an external DMA device.

Fast Models with cache-state modeling enabled can replicate all of these failure cases. However, they do not attempt to reproduce the following effects of caches:

- Changes to timing behavior of a program because of cache hits/misses (because the timing of memory accesses is not modeled).
- Ordering of line-fill and eviction operations.
- Cache usage statistics (because the models do not generate accurate bus traffic).
- Device-accurate allocation of cache victim lines (which is not possible without accurate bus traffic modeling).
- Write-streaming behavior where a cache spots patterns of writes to consecutive addresses and automatically turns off the write-allocation policy.

The Cortex-A9 and Cortex-A5 models do not model device-accurate MESI behavior. The Cortex-A15 and Cortex-A7 models do simulate hardware MOESI state handling, and can handle cache-to-cache snoops. In addition, they model the AMBA 4 ACE cache-coherency protocols over their PVBUS ports, so can be connected to a model of an ACE Coherent Interconnect (such as the CCI-400 model) to simulate coherent sharing of cache contents between processors.

It is not possible to insert devices between the processor and its L1 caches. In particular, you cannot model L1 traffic, although you can tell the model not to model the state of L1 caches.

1.4.6 Global exclusive monitor in Fast Models

A monitor for cacheable nonshared and shared memory is always implemented, but the implementation differs depending on whether `cache-state-modelled` is `true` or `false`.

- When `cache-state-modelled` is `true`, caches are modeled, so exclusiveness is handled by the cache coherency protocol. Each line in a coherent cache records whether it is exclusive. When another core writes to an exclusive line, it is invalidated in other caches.
- When `cache-state-modelled` is `false`, the cache state is not modeled, so there are no cache lines or coherency. To provide the same functionality from a software perspective, an exclusive monitor is instantiated internally to maintain coherency.

The RAMDevice component and PVBUS to AMBAPV bridges do not contain global monitors. As a result, exclusive stores that reach a RAMDevice fail unless they go through an exclusive monitor. Some platforms might need a global monitor outside of the cache coherency domains. These platforms must include a system-level monitor in the same place in the bus hierarchy as in the hardware. See the FVP_VE and FVP_Base example platforms for examples of how to use the PVBUSExclusiveMonitor component.

1.5 Processor implementation

This section outlines the differences between the code translation models and the hardware.

1.5.1 Mapping PMU events to MTI trace sources

In Fast Models, many PMU events are modeled and are exposed through the standard PMU interface, although in many cases they are implemented using MTI trace sources.

Note

- Counters that are modeled can generate PMU overflow interrupts, which work the same as in hardware.
- Counters that are not modeled have the value zero and do not increment.

The following tables show which PMUv1 and PMUv2 events are modeled, and which MTI trace sources are used to model them. The associated event numbers are as listed in the Arm® Architecture Reference Manual Arm®v7-A and Arm®v7-R edition, section C12.8.2 Common event numbers.

Table 1-2: PMUv1 event mappings

PMUv1 event	MTI trace sources	Notes
Software increment (0x00)	-	Modeled, but not using MTI.
Level 1 instruction cache refill (0x01)	ALLOC_LINEFILL	-
Level 1 instruction TLB refill (0x02)	MMU_TLB_FILL	-
Level 1 data cache refill (0x03)	ALLOC_LINEFILL	-

PMUv1 event	MTI trace sources	Notes
Level 1 data cache access (0x04)	CACHE_READ_HIT, CACHE_READ_MISS, CACHE_WRITE_HIT, CACHE_WRITE_MISS	-
Level 1 data TLB refill (0x05)	MMU_TLB_FILL	-
Load (0x06)	CORE_LOADS, NV2_CORE_LOADS, MEMTAG_LOAD_INST, SVE_LD_RETIRED	-
Store (0x07)	CORE_STORES, NV2_CORE_STORES, MEMTAG_STORE_INST, SVE_ST_RETIRED	-
Instruction architecturally executed (0x08)	-	Modeled, but not using MTI.
Exception taken (0x09)	EXCEPTION	-
Exception return (0x0A)	EXCEPTION_RETURN_PREBRANCH	-
Write to CONTEXTIDR (0x0B)	CONTEXTIDR	-
Software change of the PC (0x0C)	BRA_DIR, BRA_INDIR.	-
Immediate branch (0x0D)	BRA_DIR, BRA_DIR_FAIL.	-
Procedure return (0x0E)	BRA_RET	-
Unaligned load or store (0x0F)	UNALIGNED_LDST_RETIRED, SVE_UNALIGNED_LDST_RETIRED	-
Mispredicted or not predicted branch speculatively executed (0x10)	BRANCH_MISPREDICT	Only if the BranchPrediction plug-in is loaded.
Cycle count (0x11)	-	Modeled, but not using MTI. Note: This value is an approximation.
Predictable branch speculatively executed (0x12)	-	Not modeled.

Table 1-3: PMUv2 event mappings

PMUv2 event	MTI source	Notes
Data memory access (0x13)	-	Not modeled.
Level 1 instruction cache access (0x14)	CACHE_READ_HIT, CACHE_READ_MISS	-
Level 1 data cache write-back (0x15)	-	Not modeled.
Level 2 data cache access (0x16)	CACHE_READ_HIT, CACHE_READ_MISS, CACHE_WRITE_HIT, CACHE_WRITE_MISS	-
Level 2 data cache refill (0x17)	ALLOC_LINEFILL	-
Level 2 data cache write-back (0x18)	-	Not modeled.
Bus access (0x19)	CORE_LOADS, CORE_STORES, MEMTAG_LOADS, MEMTAG_STORES	-
Memory error (0x1A)	-	Not modeled.
Instruction speculatively executed (0x1B)	-	Not modeled.
Write to TTBR (0x1C)	TTBR_WRITE	-

PMUv2 event	MTI source	Notes
Bus cycle (0x1D)	INST	This value is an approximation.

1.5.2 Caches in PV models

Some processor models have PV-accurate caches, but others do not model Level 1 or Level 2 caches.

Cores that have PV-accurate cache implementation provide a functionally-accurate model. For more information, see the processor component descriptions.

Other PV models do not model Level 1 or Level 2 caches. The system coprocessor registers related to cache operations permit cache-aware software to work, but in most cases they only check register access permissions.

The registers affected on all code translation processor models are:

- Invalidate and/or Clean Entire ICache/DCache.
- Invalidate and/or Clean ICache/DCache by MVA.
- Invalidate and/or Clean ICache/DCache by Index.
- Invalidate and/or Clean Both Caches.
- Cache Dirty Status.
- Data Write Barrier.
- Data Memory Barrier.
- Prefetch ICache Line.
- ICache/DCache lockdown.
- ICache/DCache master valid.

1.5.2.1 Functional caches in Fast Models

Fast Models implement two types of cache model: register model and functional model.

A register model provides all the cache control registers so that cache operations succeed, but does not model the state of the cache. All accesses go to memory.

A functional model tracks cache state and its contents at each level of the memory hierarchy. Incorrect cache management might return incorrect data, as it would on real hardware.

Fast Models provide:

- System IPs that support caches.
- Register models of caches on all processors that support caches and also the PL310 cache controller (PL310_L2CC).
- Functional models of caches integrated into Cortex cores.

For a core with no L2 cache, the configuration parameters are:

icache-state-modelled

Set whether the I-cache has stateful implementation.

dcache-state-modelled

Set whether the D-cache has stateful implementation.

For Arm®v7-A cores with an L2 cache, the configuration parameters are:

l1_icache-state-modelled

Set whether L1 I-cache has stateful implementation.

l1_dcache-state-modelled

Set whether L1 D-cache has stateful implementation.

l2_cache-state-modelled

Enable unified Level 2 cache state model.

For Arm®v8-A cores with an L2 cache, the configuration parameters are:

icache-state_modelled

Set whether L1 I-cache has stateful implementation. Instructions at L2 or L3 are not cached in Fast Models.

dcache-state_modelled

Set whether D-cache has stateful implementation at L1, L2, and L3.

1.5.2.2 Performance impact of functional caches in Fast Models

Enabling functional cache modeling is likely to reduce performance.

Enable the L1 and L2 functional caches together. For consistent system operation, Arm recommends that you either disable functional behavior completely or enable it for both I and D L1 caches and the L2 cache.

Cache enablement must be system wide. If you enable cache state modeling in any component then you must enable it in all components in the system, including all cores (L1 and L2) and any external cache controller (such as the PL310_L2CC) and any interconnect that has caches.

If platform memory is being modeled outside of the Fast Models environment, for example in a SystemC environment, use of functional cache modeling might improve performance if there is no other fast route to memory.

1.5.3 GICv3 in PV models

The PV models implement the Generic Interrupt Controller architecture version 3 (GICv3).

The GICv3 architecture defines two parts:

- The core interface (integrated into the core)
- The Interrupt Redistribution Infrastructure (IRI)

You can configure all Arm®v8-A cores to include a GICv3 interface. You can integrate a separate GIC_IRI component into your platforms. Communication between the core and the IRI is over an architected packet interface. An internal communication protocol represents the packets that pass over this interface.

You can configure the GICv3 models in some platforms to act as though they were GICv2 or GICv2-M models. Even in this mode, you need a GIC_IRI component and a supported core. Configure them to comply with the same standard.

Models have the following limitations:

- Support for the GITS_CTLR.Quiescent bit is not complete.
- Support for ITS save/restore is not complete. Configuration stays within the model and it does not use allocated memory.
- GICD_CTLR.RWP does not perform adequately. This difference is only an issue if you use the distributor in systems with delaying interface between the distributor and the cores. Do not use this version of the model for simulation of the GIC in a setup where interfaces are not instantly reactive.

Set the environment variable `FASTSIM_GIC_MEMORY_MAP` to 1 to print to `stderr` the memory map of certain models that are included in the platform being run. This functionality is available for all GICv3 and later models.

1.5.4 GICv4 in PV models

GICv4 is an extension of the GICv3 architecture. It allows the direct injection of LPIs into a virtualized system through the `virtual-lpi-support` parameter of the `GIC_IRI` or `GIC_IRI_Filter` component.

In addition to requiring the presence of an ITS that is configured as shown in [GIC_IRI](#), GICv4 requires you to enable the virtual LPIs feature and to configure a virtual PE table using the parameters shown in this example:

```
"virtual-lpi-support"=true,  
"GITS_BASER4-type"=2 //Type 2 is Virtual PEs.  
                      //Such a table is needed for GICv4 functionality.
```

1.5.5 CP14 Debug coprocessor

Some models fully implement the CP14 Debug coprocessor registers. Other models only implement the DSCR register. This register reads as 0 and ignores writes.

External debugging must be used to debug systems containing PV models.

1.5.6 TLBs in PV models

The PV models implement Translation Lookaside Buffers (TLBs) and model most aspects of TLB behavior.

If the `device-accurate-tlb` parameter is set to `false`, the simulation uses a different number of TLBs if this improves simulation performance. The simulation is architecturally accurate, but not device accurate. Architectural accuracy is almost always sufficient. Set `device-accurate-tlb` to `true` if you require device accuracy.

These TLB registers do not have working implementations:

- Primary memory remap register.
- Normal memory remap register.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

The models do not implement device-accurate MicroTLBs, or system coprocessor registers related to MicroTLB state.

1.5.7 Memory access in PV models

PV models use a PVBUSMaster subcomponent to communicate with slaves in a System Canvas-generated system. This provides efficient access to memory-like slaves and relatively efficient access to device-like slaves.

Memory access in PV models differs from real hardware to enable fast modeling of the processor:

- All memory accesses are performed in programmer view order.
- Unaligned accesses, where permitted, are always performed as byte transfers.

In addition, some PV models do not use all the transaction states available in a PVBUS transaction. The Privileged and Instruction flags are set correctly for Arm®v7 processors but might not be set correctly in earlier architectures. However all memory accesses are atomic so `swp` instructions behave as expected.

1.5.7.1 I-side access in PV models

PV models cache translations of instructions fetched from memory-like slaves. The models might not perform further access to those slaves for significant periods. A slave can force the model to reread the memory by declaring that the memory has changed.

PV models do not model a prefetch queue but the code translation mechanism effectively acts as a prefetch queue of variable depth. Arm recommends that you follow the standards in the [Arm® architecture specifications](#) for dealing with prefetch issues, such as self modifying code, and use appropriate cache flushing and synchronization barriers.

Translation of instructions only occurs for memory-like slaves, which are those declared by devices as having type `PV::MEMORY`. Instructions fetched from device-like slaves are repeatedly fetched, decoded, and executed, significantly slowing down model performance.

1.5.7.2 D-side access in PV models

PV models cache references to the underlying memory of memory-like slaves, and might not perform further accesses to those slaves over the bus for significant periods.

Slaves declared as type `PV::MEMORY` provide the fastest possible memory access for PV processors.

Slaves declared as type `PV::DEVICE` are normally used for peripheral access.

1.5.8 Timing in PV models

Programmers View (PV) models are loosely timed.

- Caches and write buffers are not modeled, so all memory access timing is effectively zero wait state.
- All instructions execute, in aggregate, in one cycle of the component master clock input.
- Interrupts are not taken at every instruction boundary.
- Some sequences of instructions are executed atomically, ahead of the master clock of a component, so that system time does not advance during execution. This difference in behavior can affect sequential access of device registers, where devices are expecting time to move on between accesses.
- DMA to and from Tightly Coupled Memory (TCM) is atomic.

1.5.9 CADI interactions with processor behavior

Architecturally, M series processors have different reset behavior to that of A and R series processors.

For both hardware and model processors, a reset consists of asserting, and then deasserting the reset pin. However:

M series

The architecture documentation specifies that on asserting the reset pin, the processor stops executing instructions. On deasserting the reset pin, the VTOR is given its reset value, SP_main is read from address VTOR+0, and the PC is read from address VTOR+4. See the Reset behavior section and the Vector Table Offset Register, VTOR section in the [ARMv7-M Architecture Reference Manual](#). Also, the processor begins fetching and executing instructions.

A and R series

Asserting the reset pin causes the processor to stop executing instructions and the PC to be given its reset value, which depends on VINITHI, and the SP is UNKNOWN. See the Reset section in the [ARM Architecture Reference Manual ARMv7-A and ARMv7-R edition](#). On deasserting the reset pin, the processor begins fetching and executing instructions.

The behavior of reset on M series processors interacts differently with CADI debugging functionality than it does for A and R series processors.

On A and R series processors, after the reset pin of the processor is asserted, a new application can be loaded using the `CADIExecLoadApplication()` call in CADI. This loads an application into memory, and sets the PC if a start address is specified in the application. When reset is deasserted, the processor begins fetching and executing from the start address as expected. Similarly, if a debugger asserts reset on the processor, it can modify memory with a sequence of `CADIMemWrite()` calls, update the PC with a `CADIRegWrite()` call, and when reset is deasserted the processor begins to fetch and execute from the PC.

On M series processors, these techniques do not work because after reset is deasserted the processor updates SP_main and the PC, overwriting the settings made by the CADI calls.

For these techniques to be possible, the M series processor models differ slightly from the architectural reset behavior. When reset is asserted, the M series makes note of whether the PC or SP is modified before reset is next deasserted. If there are any CADI writes to the PC or SP registers, either directly through `CADIRegWrite` or indirectly through `CADIExecLoadApplication()`, this is tracked. When reset is deasserted, if the PC has been modified using CADI, the PC retains the value written to it, otherwise it reads it from address VTOR+4. Similarly, if the SP has been modified using CADI, SP_main retains the value written to it, otherwise it reads it from address VTOR+0.

1.6 Fast Models CADI implementation

Fast Models implement a subset of CADI functionality.

The following CADI methods are not supported by Fast Models:

CADI class:

Register API

`CADIGetCommittedPCs()`

Memory API

`CADIMemGetOverlays()`

Virtual Memory API

`PhysicalToVirtual()`

Cache API

- `CADIGetCacheInfo()`
- `CADICacheRead()`
- `CADICacheWrite()`

Execution API

- `CADIExecLoadApplication()`. Implemented by CPU components only
- `CADIExecUnloadApplication()`
- `CADIExecGetLoadedApplications()`. Implemented by CPU components only. It only returns the most recently loaded application if more than one have been loaded.
- `CADIExecAssertException()`
- `CADIExecGetPipeStages()`
- `CADIExecGetPipeStageFields()`
- `CADIGetCycleCount()`

CADICallbackObj class:

- `appliOpen()`
- `appliClose()`
- `cycleTick()`
- `killInterface()`

CADIDisassembler class:

- `GetSourceReferenceForAddress()`
- `GetAddressForSourceReference()`
- `GetInstructionType()`

CADIDisassemblerCB class:

- `ReceiveSourceReference()`

The following tables describe the implementation of other CADI functionality by processor models:

Table 1-4: CADI broker implementation

Feature	Implemented	Remarks
Factories	Yes	Model DLL provides a single factory.
Instances	Yes	Factory can only instantiate one model at a time.

Table 1-5: CADI target implementation

Feature	Implemented	Remarks
# breakpoints	Yes	No intrinsic limit.
Breakpoint disabling	Yes	You can disable global breakpoints, but not user breakpoints set through <code>CADIBptSet()</code> . Debuggers usually disable breakpoints with <code>CADIBptClear()</code> and re-enable them with <code>CADIBptSet()</code> , so this does not affect debugger GUIs, but it does affect the CADI C++ interface. Global breakpoints are built-in and permanent, so <code>CADIBptSet()/Clear()</code> cannot set or delete them. With <code>CADIBptConfigure()</code> , you can only enable/disable these global breakpoints to stop on certain processor events.
Breakpoint ignore count	No	-
Breakpoint formal conditions	No	-
Breakpoint free-form conditions	No	-
Breakpoint setting	Yes, but not permitted while target is running.	-
Breakpoint types	Yes: <code>CADI_BPT_MEMORY</code> , <code>CADI_BPT_PROGRAM</code> , <code>CADI_BPT_PROGRAM_RANGE</code>	All registers in the Vector register group have disabled register breakpoints. You cannot create new register breakpoints.
Breakpoint triggers	Yes: <code>CADI_BPT_TRIGGER_ON_MODIFY</code> , <code>CADI_BPT_TRIGGER_ON_READ</code> , <code>CADI_BPT_TRIGGER_ON_WRITE</code>	<code>CADI_BPT_TRIGGER_ON_WRITE</code> approximates <code>CADI_BPT_TRIGGER_ON_MODIFY</code> . If either is set, the simulation stops when a value is written, even when it does not change.
<code>CADIExecSingleStep()</code>	Yes	Fast Models ignores the <code>stepCycle</code> and <code>stepOver</code> arguments.
Intrusive debug	Yes	Stop/start can affect processor scheduling: single stepping and multiple stepping both change scheduling, and so are intrusive.
Memory read/write	Yes, but not permitted while target is running.	-
Reset	Yes	One reset level is supported. When calling <code>CADIExecReset()</code> , Arm recommends the simulation should use a <code>syncLevel</code> of 1 or higher for best results.
Runnable	Yes	-
Stop simulation	Yes	-

1.7 CADI sync watchpoints

The CADI/Synchronous CADI (SCADI) interfaces of processor components support watchpoints. Memory components like RAMDevice do not.

When the simulator hits a watchpoint, the CADI/SCADI interface emits a sequence, typically only one, of `modeChange (CADI_EXECMODE_Bpt, bptNumber)` callbacks, where `bptNumber` is the breakpoint ID of the watchpoint. After this sequence it sends a `modeChange (CADI_EXECMODE_stop)` callback. Only after the debugger receives this `stop` callback might it inspect the state of the model.

You can read additional information about the last of the hit watchpoints from these CADI registers declared by the processor in register group `simulation`:

memoryBptPC

The PC of the instruction that caused the watchpoint to hit.

memoryBptAccessVA

Virtual address of the access or sub-access that caused the watchpoint to hit.

memoryBptAccessSize

Size in bytes of the access or sub-access that caused the watchpoint to hit.

memoryBptAccessRW

Type of access or sub-access that caused the watchpoint to hit: 1 = read, 2 = write, 3 = both, 0 = no access.

These registers are not memory (or CPnn-) mapped anywhere and are not accessible to target programs. These registers are read-only. `memoryBptPC` and `memoryBptAccessVA` are 32 or 64 bit depending on the architecture. `memoryBptAccessSize` and `memoryBptAccessRW` are 32 bit.

When multiple accesses have hit watchpoints at the same time, for example during the same instruction, the information contained in these registers is valid and consistent only for one of these accesses.

Whenever at least one CADI watchpoint is set on a processor, the `syncLevel` on that processor is at least 2.

1.8 Non-CADI sync watchpoints

This section describes `syncLevel` enum values, semantics, and behaviors, with `syncLevel` values listed from fast to slow simulation, from fewer to more requirements.

1.8.1 syncLevel definitions

Definitions for the possible syncLevel values.

syncLevel 0: OFF

- The simulator runs as fast as possible. It does not permit inspection of the processor registers while the simulation is running, and does not stop synchronously when requested to do so.
- After enabling or disabling a trace source, it is undefined how many instructions will be executed before the change takes effect.
- Quantum end detection guarantees that a quantum is not overshoot indefinitely. Quantum end detection applies to (but is not limited to) backward branches, indirect jumps, exceptions, and atomic operation retries. In addition to temporal quantum end detection, some events may end a quantum, like executing a barrier, entering a low power state, or accessing a peripheral. Target software and simulation controllers must not rely on a specific scheduling pattern based on these quantum end check points.
- Use cases: normal fast simulation and normal CADI debugging while no CADI watchpoint is set.

When using CADI reset on a model, for best results, Arm recommends using a syncLevel of 1 or higher.

syncLevel 1: SYNC_STATE

- The simulation runs slightly slower than syncLevel 0. SCADI can read the up-to-date values of the processor registers, including PC and instruction count. You cannot stop the simulation synchronously.
- After enabling or disabling a trace source, it is undefined how many instructions will be executed before the change takes effect.
- Quantum end detection is as for syncLevel 0.
- Use cases: external breakpoints that block the simulation, inspect state of processor/memory from within a peripheral or memory access.

syncLevel 2: POST_INSN_IO

- As for syncLevel 1, except that you can stop the simulation synchronously from within all LD/ST and similar instructions. The simulation stops immediately after the current LD/ST instruction has been completely executed (post instruction).
- After enabling or disabling a trace source, it is likely, but not guaranteed, that the change will be visible sooner than with syncLevel 0 or 1.
- Quantum end detection is as for syncLevel 1, plus it includes the end of LD/ST instructions.
- Use cases: CADI watchpoints, external breakpoints, stopping from within LD/ST-related MTI callbacks.

syncLevel 3: POST_INSN_ALL

- As for syncLevel 2, except that you can stop the simulation synchronously from within any instruction. The simulation stops immediately after the current instruction has been completely executed (post instruction).
- After enabling or disabling a trace source, the change will be visible at the next instruction that is executed.
- Quantum end detection is as for syncLevel 2. This allows switching between syncLevels 2 and 3 without changing the simulation scheduling.
- Use cases: a `stop` from within arbitrary MTI callbacks such as the `INST` callback. This syncLevel is a fallback for all use cases that do not fall into syncLevels 0-2.

1.8.2 Controlling and observing the syncLevel

CADI watchpoints automatically register and unregister for their required syncLevel (`POST_INSN_IO`). All other use cases must explicitly register and unregister for the syncLevel they require.

Users of syncLevel write to a set of non-architectural processor registers in the CADI and SCADI interface to register and unregister for specific syncLevels. Processor registers are more suitable than CADI parameters for exposing an interface that has side effects on writes and where values might change spontaneously.

This is the exposed interface to control and observe the value of syncLevel. All these registers are in the CADI/SCADI register group `simulation` for each CT processor that contains non-architectural, simulator-specific registers. All are 32-bit integer registers. Users of syncLevel write to these registers to register and unregister for the syncLevel they require:

syncLevelSyncStateRegister

Users write to this register for `SYNC_STATE`. Write-only.

syncLevelSyncStateUnregister

Users write this to unregister for `SYNC_STATE`. Write-only.

syncLevelPostInsnIORegister

Users write to this register for `POST_INSN_LDST`. Write-only.

syncLevelPostInsnIOUnregister

Users write this to unregister for `POST_INSN_LDST`. Write-only.

syncLevelPostInsnAllRegister

Users write this to register for `POST_INSN_ALL`. Write-only.

syncLevelPostInsnAllUnregister

Users write this to unregister for `POST_INSN_ALL`. Write-only.

These registers are only for debugging and visibility in the debugger, and syncLevel users do not usually access them at all:

syncLevel

Current syncLevel. Read-only.

syncLevelSyncStateCount

User counter. Read/write (use as read-only).

syncLevelPostInsnIOCount

User counter. Read/write (use as read-only).

syncLevelPostInsnAllCount

User counter. Read/write (use as read-only).

minSyncLevel

Same as the `min_sync_level` parameter, described below. Read/write.

The `syncLevelxxxRegister` and `syncLevelxxxUnregister` registers are for syncLevel users to register and unregister themselves, by writing the value 0 to them. Changes to the syncLevel become effective at the next stop event checkpoint. In addition, syncLevel users can write to these registers any time before the simulation is running, for example from the `init()` simulation phase. The change takes effect immediately when the simulation is run.

The other registers are only present to make the debugging of these mechanisms and their users easier. The `syncLevel` register enables you to see what kind of performance you can expect from the model. You must treat access to these other registers as read-only. You can write to them, however, to permit debugging the syncLevel mechanisms.

These registers are not memory (or CPnn-) mapped anywhere, and are not accessible to target programs.

In addition to this debug register interface, there is a CADI parameter that can influence the syncLevel:

```
min_sync_level (default=0, type=int, runtime=true)
```

This parameter enables you to control the minimum syncLevel by the CADI parameter interface. This is not intended to be the primary interface to control the syncLevel because it does not enable multiple independent syncLevel users to indicate their requirements to the simulator. It is primarily for debugging purposes and for situations where a single global syncLevel setting is sufficient.

You can change this parameter at runtime, and changes become effective at the next stop event checkpoint. Reading this parameter value returns the `min_sync_level`, not the current syncLevel. This parameter is only an additional way of controlling the syncLevel and controls the same mechanisms as the register interface.

1.9 SCADI

A Synchronous CADI (SCADI) interface enables you to request a synchronous stop of the simulation. It offers direct synchronous, but unsynchronized, register and memory read access.

The intention is that this interface is used by code that is inherently synchronized with the simulation, in particular from code that is part of the simulation itself (simulation thread). Examples of code that could use this interface are SystemC and LISA peripheral device or bus access functions, and MTI callback functions that are always called synchronously by the simulation itself.

The SCADI interface is not a replacement for CADI. It is an additional interface with clear semantics that differ slightly from CADI.

1.9.1 Intended uses of CADI and SCADI

Component Architecture Debug Interface (CADI) and Synchronous CADI (SCADI) have separate design principles.

CADI

Used by debuggers and simulation controllers to control the simulation. Execution control functions are always asynchronous and are usually called from a non-simulation thread, usually the debugger GUI thread. You can also use CADI to read/write registers, memory and so on, but only from non-simulation threads, for example only from the debugger thread.

SCADI

Implements a specific subset of CADI functions, that is, mainly read/write registers and memory, set and clear breakpoints, and get disassembly. You can only use SCADI from the simulation thread itself and from threads that can make sure on their own that the simulation is currently blocked, for example a debugger thread while it is sure that the simulation is in a stable state. SCADI is intended to be used from within peripheral read/write accesses while the simulation is running, or from within MTI callbacks that the simulation is running.

SCADI does not implement and execute control functions except `CADIExecStop()`, because only stop makes sense from within the simulation thread. Asynchronous functions such as `CADIExecContinue()` and `CADIExecSingleStep()` are not supported by SCADI, so for these you must use CADI instead.

The `SCADI::CADIExecStop()` function is the exception, because for CADI this means “stop when it is convenient for the simulation”, which is asynchronous, but `CADIExecStop()` is synchronous and means “stop now”, which you enable with the appropriate `syncLevel >= 2`.

The guidelines are:

- Use CADI for execution control.
- Use CADI or SCADI for read/write registers and memory, depending on the situation:

- Use SCADI if the caller can make sure that the accesses are (potentially inherently) synchronized with the simulation.
- Use CADI if called from a debugger thread that does not know exactly whether the simulation is running or is in a stable state.

1.9.2 Responsibilities of the SCADI caller

Synchronous interface means that the caller of SCADI functions is always responsible for ensuring that the simulation is in a stable state.

Being in a stable state means that the simulation does not advance while the call is being made. The caller is also responsible for meeting all host thread and synchronization requirements of any external bus slaves that are directly or indirectly connected to the memory bus.

1.9.3 SCADI interface access

You can obtain the SCADI interface from the same `CAInterface` pointers that provide the CADI and MTI interfaces.

This is done using the `CAInterface::ObtainInterface()` method. The interface names for the normal CADI and MTI interfaces are `CADI::IFNAME()` and `ComponentTraceInterface::IFNAME()`, respectively.

The interface name for the SCADI interface to pass into `ObtainInterface()` is `"eslapi.SCADI2"` and the interface revision is 0. There are no `IFNAME()` and `IFREVISION()` static functions defined for SCADI, and a plain string constant and integer constant (0) are used instead.

The pointer returned by `CAInterface::ObtainInterface("eslapi.SCADI2")` must be cast into an `eslapi::CADI` class pointer, that is, the same class as for `eslapi.CADI2`, the normal CADI interface class.

1.9.3.1 Access to SCADI from within LISA components

To access the SCADI interface of the LISA component itself, use the `getSCADI()` function. This returns the SCADI interface of the LISA component itself.

To access the SCADI interfaces of other components in the system, use the `getGlobalInterface()` function. This returns a `CAInterface` pointer to a simulation-wide Component Registry.

You then have to use this registry pointer with the `obtainComponentInterfacePointer()` function to obtain the `SystemTraceInterface`. This interface provides a list of all components in the system that provide trace data. You can use this list to access the SCADI interfaces of all the components.

1.9.3.2 Access to SCADI from within SystemC

To access the SCADI interfaces from within SystemC, use the `scx_get_global_interface()` function. This returns a `CAInterface` pointer to a simulation-wide Component Registry.

You then have to use this registry pointer with the `obtainComponentInterfacePointer()` function to obtain the `SystemTraceInterface`. This interface provides a list of all components in the system that provide trace data. You can use this list to access the SCADI interfaces of all the components.

1.9.3.3 Access to SCADI from MTI plug-ins

MTI plug-ins can gain access to SCADI interfaces by using the `CAInterface` pointer, which is passed as a parameter to the `RegisterSimulation()` function.

This pointer has the same semantics as the `CAInterface` pointer returned by the `getGlobalInterface()` functions in the SystemC or LISA use cases.

1.9.3.4 Example code for retrieving a SCADI interface pointer of a component

This code demonstrates how to use `getGlobalInterface()` to retrieve a SCADI interface pointer of a specific component.

From within LISA, use `getGlobalInterface()`. From within SystemC, it is assumed that you have a pointer to the Fast Models platform called `platform`. From within an MTI plug-in, you do not have to call `getGlobalInterface()`, and you can use the `CAInterface` pointer passed to `RegisterSimulation()`.

```
#include "sg/SGComponentRegistry.h"
eslapi::CADI *Peripheral::get_SCADI_interface(const char *instanceName)
{
    // get access to MTI interface (SystemTraceInterface)
    // - this code is for a SystemC peripheral
    // - for LISA this would be just 'getGlobalInterface()'
    // - for MTI plugins this would be just using the CAInterface *caif pointer passed
    // into RegisterSimulation()
    eslapi::CAInterface *globalInterface = scx::scx_get_global_interface();
    const char *errorMessage = "(no error)";
    MTI::SystemTraceInterface *mti = 0;
    if (globalInterface)
        mti = sg::obtainComponentInterfacePointer<MTI::SystemTraceInterface>
            (globalInterface,
             "mtiRegistry",
             &errorMessage);

    if (mti == 0)
    {
        printf("ERROR:MTI interface not found! (%s)\n", errorMessage);
        return 0;
    }
    // find component with instanceName
    eslapi::CAInterface *compif = 0;
    for (MTI::SystemTraceInterface::TraceComponentIndex i = 0;
         i < mti->GetNumOfTraceComponents();
         i++)
    {
        const char *name = mti->GetComponentTracePath(i);
        if (verbose)
```

```

        printf("TEST MTI component '%s'\n", name);
        if (strcmp(name, instanceName) == 0)
            compif = mti->GetComponentTrace(i);
    }
    if (!compif)
    {
        printf("ERROR:instance '%s' not found while trying to get SCADI! \n",
               instanceName);
        return 0;
    }
    // get and return SCADI interface
    return static_cast<eslapi::CADI *>(compif->ObtainInterface("eslapi.SCADI2", 0,
0));
}

```

1.9.4 SCADI semantics

This section lists the available subset of functionality and the differences in semantics from the CADI interface.

The SCADI interface provides a subset of functionality of the CADI interface. All functions in SCADI differ from the CADI functions, that is, the caller is responsible for satisfying the constraints and requirements in terms of synchronization with the simulation.

These functions have the same semantics as in CADI:

- CADIRegGetGroups()
- CADIRegGetMap()
- CADIRegGetCompount()
- CADIMemGetSpaces()
- CADIMemGetBlocks()
- CADIMemGetOverlays()
- CADIGetParameters()
- CADIGetParameterInfo()
- CADIXfaceGetFeatures()

The following debug read access functions have the same semantics as in CADI, but the values that these read access functions return might differ from the values returned by the corresponding CADI functions because some of the accessed resource values might change during the execution of an instruction.

The values of resources that are modified by the current instruction are **UNKNOWN**, except the PC, which always reflects the address of the last instruction that was issued. Reading and writing registers and memory while the simulation is running is generally only useful for `syncLevel >= SL_SYNC_STATE`. For `SL_OFF`, all registers and all memory locations are always **UNKNOWN** while the simulation is running.

- CADIRegRead()
- CADIMemRead()

- `CADIGetParameterValues()`
- `CADIGetInstructionCount()`
- `CADIGetPC()`
- `CADIGetDisassembler()`

The following write access functions always provide write access to the register in the `simulation` register group. They also might provide limited write access semantics to certain resources. A SCADI implementation might choose not to support any write access to core registers and memory:

- `CADIRegWrite()`
- `CADIMemWrite()`
- `CADISetParameters()`

The breakpoint functions have nearly all the same semantics as in the CADI interface, except that changes to breakpoints only become effective at the next stop event checkpoint defined by the current `syncLevel`. Changes might also only become visible in `CADIBptRead()` and `CADIBptGetList()` at this next synchronization point.

- `CADIBptGetList()`
- `CADIBptRead()`
- `CADIBptSet()`
- `CADIBptClear()`
- `CADIBptConfigure()`

Execution control is limited to stopping the simulation. The simulation stops at the next synchronization point as defined by the current `syncLevel`:

- `CADIExecStop()`.

All other functions are unsupported, and return `CADI_STATUS_CmdNotSupported`.

1.10 User mode networking

User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts.

This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running. Fast Models supports the following kinds of Ethernet device models:

SMSC_91C111

This is paired with an external `HostBridge` component. The user mode networking specification is set on the external `HostBridge`.

VirtioNetMMIO

This has a built-in HostBridge sub-component. The user mode networking specification is set on the internal HostBridge.

- You can use TCP and UDP over IP, but not ICMP (ping).
- User mode networking does not support forwarding UDP ports on the host to the model.
- You can only use DHCP within the private network.
- You can only make inward connections by mapping TCP ports on the host to the model. This is common to all implementations that provide host connectivity using NAT.
- Operations that require privileged source ports, for example NFS in its default configuration, do not work.
- If setup fails, or the parameter syntax is incorrect, there is no error reporting.

To enable user mode networking, run the model with the following CADI parameters to activate the components:

SMSC_91C111:

```
-C motherboard.hostbridge.userNetworking=true  
-C motherboard.smc_91c111.enabled=true
```

VirtioNetMMIO:

```
-C motherboard.virtio_net.hostbridge.userNetworking=true  
-C motherboard.virtio_net.enabled=true
```

To map a host TCP port to a model port, run the model with the `userNetPorts` parameter. This parameter allows services to appear to be listening on privileged ports in the model but be mapped to unprivileged ports on the host. The syntax is a comma-separated list of items in the form:

```
[host-ip:]hostport=[model-ip:]modelport
```

For example, to map port 8022 on the host to port 22 on the model, use this parameter:

SMSC_91C111:

```
-C motherboard.hostbridge.userNetPorts=8022=22
```

VirtioNetMMIO:

```
-C motherboard.virtio_net.hostbridge.userNetPorts=8022=22
```

Either or both of a host IP address and model IP address can optionally be specified on either side of the assignment to select a specific interface on which the mapping will occur. For example:

```
127.0.0.1:8022=127.0.0.1:22
```

The default is to accept connections on any interface.

Related information

- [HostBridge](#)

1.11 TAP/TUN networking

This section describes TAP/TUN networking.

1.11.1 TAP/TUN networking limitations

This section describes general limitations of TAP/TUN networking for models.

DHCP

If the host uses Dynamic DNS, it inserts records into DNS. If you manage this host with DHCP, then installing TAP networking can cause failure to register in the DNS. After the physical device attaches to the bridge device, the DHCP client reruns, but the DHCP request does not have the correct hostname.

WiFi

Most WiFi adaptors do not implement the required support for TAP networking to work.

1.11.2 Setting up a network connection for Microsoft Windows

This section describes how to set up a network connection.

Before you begin

The Fast Models networking environment needs the Third Party IP add-on for the Fast Model Portfolio.

Procedure

1. Close all non-essential applications.
2. Install the TAP driver and configure it:
 - a) Locate the Fast Models Portfolio, by default `C:\Program Files\ARM\FastModelsPortfolio_X.Y\`.
 - b) Execute the `ModelNetworking\add_adapter_64.bat` file.
3. Select **Start > Control Panel > Network Connections** and locate the newly installed TAP device.
4. Select at least one real Ethernet adapter connection. Press the **Ctrl** key to multi-select.
5. Right-click and select **Bridge Connections**.

1.11.3 Configuring the networking environment for Microsoft Windows

This section describes how to set the parameters to make a network connection.

About this task

- This procedure has not been tested with wireless network adapters.
- Firewall software might block network traffic in the network bridge, and might result in a networking failure in the model. If the model does not work after configuration, check the firewall settings.

Procedure

1. Set the appropriate parameters on the `HostBridge` and `SMSC_91C111` components, or on the `VirtioNetMMIO` component and its `HostBridge` subcomponent. For example:

SMSC_91C111:

```
hostbridge.interfaceName="ARM<x>"
smc_91c111.enabled=1
```

VirtioNetMMIO:

```
virtio_net.hostbridge.interfaceName="ARM<x>"
virtio_net.enabled=1
```

`ARM<x>` is an adapter that is built into the network bridge, and is 0 by default. Use `x+1` if `ARM<x>` exists.

2. Set another parameter on the device, if you have to enable promiscuous mode for the TAP device.
 - a. Select **Start > Run > cmd.exe**.
 - b. Enter the following commands.

```
netsh bridge show adapter
netsh bridge set adapter <N> forcecompatmode=enable
```

`<N>` is the id number of the TAP adapter that the first command lists.

1.11.4 Commands for `tap_setup_32.exe` or `tap_setup_64.exe` for Microsoft Windows

This section lists the commands for use with `tap_setup_32.exe` or `tap_setup_64.exe`. These files are located in the `ModelNetworking` directory.

help

Print help information.

set_media

Configure the TAP devices to `Always Connected`.

set_perm

Configure the TAP devices to `Non-admin Accessible`.

restart

Restart the TAP devices.

list_dev

List available TAP devices and output to a file.

rename

Rename the device to **ARMx**.

install <infile> <id>

Install a TAP Win32 or Win64 adapter.

remove <dev>

Remove TAP Win32 or Win64 adapters. Set <dev> to `All` to remove all tap devices.

setup <infile> <id>

Automated setup process.

1.11.5 Uninstalling networking for Microsoft Windows

This section describes how to uninstall TAP adapters from the base location of the Fast Models Portfolio, by default `C:\Program Files\ARM\FastModelsPortfolio_X.Y`.

Procedure

1. Run the `remove_all_adapters_32.bat` Or `remove_all_adapters_64.bat` file. These files are located in the `ModelNetworking` directory.
2. If the uninstallation does not delete the bridge, delete it manually:
 - a) Close all non-essential applications.
 - b) Select **Network Connections**.
 - c) Right-click on the bridge and select **Delete**.

1.11.6 Setting up a network connection for Red Hat Enterprise Linux

This section describes how to set up a network connection.

Before you begin

Ensure that the `brctl` utility is on your system. This utility is in the installation package, but we recommend that you use the standard Linux bridge utilities, which are in the Linux distribution.

About this task

- Perform this procedure once for each host machine.
 - The setup and configuration instructions assume that your network provides IP addresses by DHCP. Otherwise, consult your network administrator.
-

Procedure

1. In a shell, change to the `FastModelsPortfolio_<X.Y>/ModelNetworking` directory.
2. Run the following script from this directory, because it does not work correctly if run from any other location:

32-bit operating system

Run `add_adapter_32.sh` as root. For example, `sudo ./add_adapter_32.sh`.

64-bit operating system

Run `add_adapter_64.sh` as root. For example, `sudo ./add_adapter_64.sh`.

3. The prompt appears: **Specify the TAP device prefix:(ARM)**. Select **Enter** to accept the default.
 4. The prompt appears: **Specify the user list**. Enter a space-separated list of all users who are to use the model on the network, then select **Enter**. All entries in the list must be the names of existing user accounts on the host.
 5. The prompt appears: **Enter the network adapter which connects to the network:(eth0)**. Select **Enter** to accept the default, or input the name of a network adapter that connects to your network.
 6. The prompt appears: **Enter a name for the network bridge to create:(armbr0)**. Select **Enter** to accept the default, or input a name for the network bridge. You must not have an existing network interface on your system with the selected name.
 7. The prompt appears: **Enter the location to write the init script to:(/etc/init.d/FMNetwork)**. Select **Enter** to accept the default, or input another path with a new filename in an existing directory.
 8. The prompt appears: **WARNING: the script creates a bridge which includes the local network adapter and tap devices. You may suffer temporary network loss. Do you want to proceed? (Yes or No)**. Verify all values input so far, and enter **Yes** if you want to proceed. If you enter **No**, no changes are made to your system.
 9. A prompt appears to inform you of the changes that the script is to make to your system. Input **Yes** if you are happy to accept these changes, or input **No** to leave your system unchanged.
-

After entering **Yes**, you might temporarily lose network connectivity. Also, the IP address of the system might change.

Next steps

The network bridge is disabled after the host system is reset. To configure the host system to support bridged networking, you might have to create links to the `init` script (FMNetwork). The script suggests some appropriate links for Red Hat Enterprise Linux.

The default firewall configuration on Red Hat Enterprise Linux blocks packet transmission across the TAP networking bridge device. You can disable the firewall. If the context makes this unwise, then add firewall rules to allow transmission. These `iptables` commands configure the firewall to allow packets across the bridge device:

```
iptables -I FORWARD -m physdev --physdev-is-bridged -j ACCEPT
service iptables save
service iptables restart
```

1.11.7 Setting up a network connection for Ubuntu Linux

This section describes how to set up a network connection.

About this task

To use TAP networking with Fast Models on Ubuntu, set up a TAP device manually by following these steps. This guide uses a network interface `eth0` and a username `fmuser`. Replace these values as appropriate.

Typographic errors when modifying the network configuration can cause failure to connect to the network. We recommend performing these steps on a machine that you have physical access to.

Procedure

1. If it is not present, add `eth0` to the interfaces file `/etc/network/interfaces`. This step stops network-manager from managing `eth0`. It can result in network-manager indicating there is no network connection even if there is. You must have root privileges for this step.

Use one of the following ways:

- For an interface using DHCP, add:

```
auto eth0
iface eth0 inet dhcp
```

- To configure a static IP address, add the static information, for example:

```
auto eth0
iface eth0 inet static
address 192.168.0.2
netmask 255.255.255.0
gateway 192.168.0.1
```

The network notifier applet launches the GUI tool network-manager. It automatically configures network devices that `/etc/network/interfaces` does not manage, and sets up devices in a way that is incompatible with bridging. This step ensures that network-manager does not manage the network interface that you want to bridge to. If you are unsure how to configure your network interface, ask your network administrator.

2. Install the bridge-utils package:

```
sudo apt-get install bridge-utils
```

This step provides the `brctl` command for creating and managing the network bridge.

3. Create a bridge device by adding this entry to `/etc/network/interfaces`:

```
auto armbr0
iface armbr0 inet dhcp
pre-up ifconfig eth0 0.0.0.0 promisc
post-down ifconfig eth0 0.0.0.0 -promisc
```

The pre-up and post-down lines give commands to execute before bringing up `armbr0` and after bringing it down. These commands put `eth0` into promiscuous mode at pre-up and take it out of promiscuous mode at post-down. Promiscuous mode makes sure that the hardware does not filter out packets for the virtual ethernet device.

This step creates a bridge device that is called `armbr0` from Fast Models TAP devices to the physical network.

4. Create the TAP devices. TAP devices need permission for specific users, so create one for each user who is to run the model with the virtual ethernet device.
For example, to create a TAP device called `ARMfmuser` for the user `fmuser`, add the following lines to the `armbr0` section of `/etc/network/interfaces`.

```
pre-up ip tuntap add dev ARMfmuser mode tap user fmuser
pre-up ifconfig ARMfmuser 0.0.0.0 promisc
post-down ip tuntap del dev ARMfmuser mode tap
```

This step creates a TAP device for each user.

5. Create a bridge between the TAP devices and the network interface `eth0` by adding a `bridge_ports` line to the `armbr0` section of `/etc/network/interfaces`. For example, for a TAP device that is named `ARMfmuser`, add the following line:

```
bridge_ports eth0 ARMfmuser
```

6. The added `/etc/network/interfaces` code now looks like this:

```
auto armbr0
iface armbr0 inet dhcp
pre-up ifconfig eth0 0.0.0.0 promisc
post-down ifconfig eth0 0.0.0.0 -promisc
pre-up ip tuntap add dev ARMfmuser mode tap user fmuser
pre-up ifconfig ARMfmuser 0.0.0.0 promisc
post-down ip tuntap del dev ARMfmuser mode tap
bridge_ports eth0 ARMfmuser
```

- Restart network services by either restarting the computer or by running the following commands:

```
sudo ifdown eth0 && sudo ifup eth0
sudo ifup armbr0
sudo service network-manager restart
```

armbr0 must be explicitly started.

This step disconnects and reconnects all network interfaces.

1.11.8 Configuring the networking environment for Linux

This section describes how to set the parameters to make a network connection.

Before you begin

Use System Canvas or a related Fast Models tool to load a project or model, and then select a component.

About this task

Firewall software might block network traffic in the network bridge, and result in a networking failure. If the model does not work after configuration, check the firewall settings.

Procedure

Set the parameters on the `HostBridge` and `SMSC_91C111` components, or on the `virtioNetMMIO` component and its `HostBridge` subcomponent. For example:

SMSC_91C111:

```
hostbridge.interfaceName=ARM<username>
smcsc_91c111.enabled=1
```

VirtioNetMMIO:

```
virtio_net.hostbridge.interfaceName=ARM<username>
virtio_net.enabled=1
```

ARM<username> is an adapter that is built into the network bridge.

Related information

[Fast Models Tools User Guide](#)

1.11.9 Solutions to networking issues on Linux

This section describes how to solve networking issues.

The model networking works after initial setup, but stops working after reboot

Set the correct access permissions for the `/dev/net/tun` device, by executing `chmod 666 /dev/net/tun` as root. To preserve the change across reboots, modify the udev rules of the TAP device by opening `/etc/udev/rules.d/50-udev.rules` as root, and finding the line:

```
KERNEL=="tun", NAME="net/%k"
```

If it does not have `MODE="0666"` at the end of the line, append `MODE="0666"`:

```
KERNEL=="tun", NAME="net/%k", MODE="0666"
```

Model networking installs correctly, but when a model starts up, the model cannot receive packets

Disable the firewall on the host machine, or add the TAP device to `trusted devices`.

Refer to the vendor's documentation manual.

1.11.10 Disabling and re-enabling networking for Linux

This section describes how to disable and re-enable networking with an `init` script.

About this task

These operations remove/restore TAP devices and the network bridge. There is a temporary loss of network connectivity and your IP address might change.

Procedure

1. To disable networking without uninstalling it, invoke the installed `init` script (by default, `/etc/init.d/FMNetwork`) as root with the parameter `stop`:

```
sudo /etc/init.d/FMNetwork stop
```

2. To re-enable networking, invoke the `init` script as root with the parameter `start`:

```
sudo /etc/init.d/FMNetwork start
```

1.11.11 Uninstalling networking for Linux

This section describes the steps to uninstall a network.

Procedure

1. In a shell, change to the `/FastModelsPortfolio_X.Y/ModelNetworking/` directory.
2. Run `uninstall.sh` as root, passing the location of the `init` script (FMNetwork):

```
sudo ./uninstall.sh /etc/init.d/FMNetwork
```

You must run this script from the directory in which it is installed, because it does not work correctly if run from any other location.

There is a temporary loss of network connectivity and your IP address might change.

Next steps

The uninstall script removes everything that can be safely removed. It does not remove:

- symlinks to the `init` script. You must remove any symlinks that you have created.
- `/sbin/brcctl`. Removing this is optional.

1.12 Using parameters to set port values

Some processor and peripheral component ports are almost always static in value when used as part of a typical platform. For example, the reset vector base address register address (RVBARADDR) port in processor components.

To facilitate easy configuration of platform models, the IP models for these components can provide a shadow parameter for these ports. This parameter can be used to change the value that is used by the model. In these cases, the following rules apply:

- If a port is driven in the platform model, then the parameter value is ignored.
- If a port is not driven in the platform model, then the parameter value is sampled at both simulator reset, and at every subsequent simulation reset of the specific IP model.

Simulator reset corresponds with the LISA `reset()` behavior and the SystemC `start_of_simulation()` callback.

- All ports and parameters that are sampled at reset are sampled when the simulation reset signal concerned is deasserted.

- If a port is not driven in the platform model, and a parameter has not been set, then the default value for the parameter is used.

In some IP models, the value of some ports can only be set by using a parameter. That is, the parameter is provided instead of the port.

1.13 PVBUS C++ transaction and Tx_Result classes

This section describes the C++ transaction and `Tx_Result` classes.

1.13.1 Class `pv::TransactionGenerator`

This class provides efficient mechanisms for bus masters to generate transactions that are transmitted over the `pvbuss_m` port of the associated PVBUSMaster subcomponent.

You can produce `pv::TransactionGenerator` objects by invoking the `createTransactionGenerator()` method on the control port of a PVBUSMaster component.

```
class pv::TransactionGenerator
{
    // Tidy up when TransactionGenerator is deleted.
    ~TransactionGenerator()

    // Control AXI-specific signal generation for future transactions.
    // Privileged processing mode.
    void setPrivileged(bool priv = true);

    // Instruction access (vs data).
    void setInstruction(bool instr = true);

    // Normal-world access (vs secure).
    void setNonSecure(bool ns = true);

    // Locked atomic access.
    void setLocked(bool locked = true);

    // Exclusive atomic access.
    void setExclusive(bool excl = true);

    // Generate transactions.
    // Generate a read transaction.
    bool read(bus_addr_t, pv::AccessWidth width, uint32_t *data);

    // Generate a write transaction.
    bool write(bus_addr_t, pv::AccessWidth width, uint32_t const *data);

    // Generate read transactions.
    bool read8(bus_addr_t, uint8_t *data);
    bool read16(bus_addr_t, uint16_t *data);
    bool read32(bus_addr_t, uint32_t *data);
    bool read64(bus_addr_t, uint64_t *data);

    // Generate write transactions.
    bool write8(bus_addr_t, uint8_t const *data);
    bool write16(bus_addr_t, uint16_t const *data);
    bool write32(bus_addr_t, uint32_t const *data);
    bool write64(bus_addr_t, uint64_t const *data);
};
```

1.13.2 TransactionGenerator efficiency considerations

TransactionGenerators are most efficient for multiple accesses to one 4KB page.

Each TransactionGenerator caches connection information internally. This improves efficiency for multiple accesses to a single 4KB page. If a component requires repeated access data from different pages, for example when streaming from one location to another, we recommend you create a TransactionGenerator for each location.

You can dynamically create and destroy TransactionGenerators, but it is better to allocate them once at initialization and destroy them at shutdown. See the example in `$PVLIB_HOME/examples/LISA/BusComponents/DmaTransfer.lisa`.

1.13.3 Enum `pv::AccessWidth`

This enum selects the required bus width for a transaction.

Defined values are:

- `pv::ACCESS_8_BITS`
- `pv::ACCESS_16_BITS`
- `pv::ACCESS_32_BITS`
- `pv::ACCESS_64_BITS`

1.13.4 Class `pv::Transaction`

This class is a base class for read and write transactions that are visible in the PVBUSSlave subcomponent. It contains functionality common to both types of transaction.

This class provides an interface that permits bus slaves to access the details of the transaction. Do not instantiate these classes manually. The classes are generated internally by the PVBUS infrastructure.

This base class provides access methods to get the transaction address, access width, and bus signals. It also provides a method to signal that the transaction has been aborted.

```

class pv::Transaction
{
public:
    // Accessors
    bus_addr_t getAddress() const;           // Transaction address.
    pv::AccessWidth getAccessWidth() const; // Request width.
    int getAccessByteWidth() const;          // Request width in bytes.
    int getAccessBitWidth() const;           // Request width in bits.

    bool isPrivileged() const; // Privileged process mode?
    bool isInstruction() const; // Instruction request vs data?
    bool isNonSecure() const;  // Normal-world vs secure-world?
    bool isLocked() const;     // Atomic locked access?

```

```

bool isExclusive() const; // Atomic exclusive access?
uint32_t getMasterID() const;
bool hasSideEffect() const;

// Generate transaction returns
Tx_Result generateAbort(); // Cause the transaction to abort.
Tx_Result generateSlaveAbort(); // Cause the transaction to abort.
Tx_Result generateDecodeAbort(); // Cause the transaction to abort.
Tx_Result generateExclusiveAbort(); // Cause the transaction to abort.
Tx_Result generateIgnore();

};

```

1.13.5 Class pv::ReadTransaction

This class extends the pv::Transaction class to provide methods for returning data from a bus read request.

```

class ReadTransaction : public Transaction
{
public:
    /*! Return a 64-bit value on the bus. */
    Tx_Result setReturnData64(uint64_t);

    /*! Return a 32-bit value on the bus. */
    Tx_Result setReturnData32(uint32_t);

    /*! Return a 16-bit value on the bus. */
    Tx_Result setReturnData16(uint16_t);

    /*! Return an 8-bit value on the bus. */
    Tx_Result setReturnData8(uint8_t);

    /*! This method provides an alternative way of returning a Tx_Result
    * success value (instead of just using the value returned from
    * setReturnData<n>()).
    *
    * This method can only be called if one of the setReturnData<n>
    * methods has already been called for the current transaction.
    */
    Tx_Result readComplete();
};

```

1.13.6 Class pv::WriteTransaction

This class extends the pv::Transaction class to provide methods for returning data from a bus write request.

```

class WriteTransaction : public Transaction
{
public:
    /*! Get bottom 64-bits of data from the bus. If the transaction width
    * is less than 64-bits, the data is extended as appropriate.
    */
    uint64_t getData64() const;

    /*! Get bottom 32-bits of data from the bus. If the transaction width
    * is less than 32-bits, the data is extended as appropriate.
    */
    uint32_t getData32() const;
};

```

```
    /*! Get bottom 16-bits of data from the bus. If the transaction width
    * is less than 16-bits, the data is extended as appropriate.
    */
    uint16_t getData16() const;

    /*! Get bottom 8-bits of data from the bus. If the transaction width
    * is less than 8-bits, the data is extended as appropriate.
    */
    uint8_t getData8() const;

    /*! Signal that the slave has handled the write successfully.
    */
    Tx_Result writeComplete();
};
```

1.14 Visualisation library

The Visualisation library does not model hardware directly but instead provides components, protocols, and a library. These permit a GUI display that lets you interact with the external I/O from the model platform.

The types of I/O handled include:

- LCD display, such as the output from the PL110_CLCD component display port.
- LEDs representing values from a ValueState port as either single lights, or as segmented alphanumeric displays.
- DIP switches, which can drive a ValueState port.
- Capture of keyboard and mouse input, using the KeyboardStatus and MouseStatus protocols to feed input to a PS2Keyboard or PS2Mouse component.
- Background graphics, custom rendered graphics, and clickable push buttons, permitting the UI to display a skin representing the physical appearance of the device being modeled.
- Status information such as processor instruction counters, with values taken from the InstructionCount port of a processor.

The Visualisation library provides a C++ API that enables you to write your own visualization components in LISA+. These custom components can display any combination of the supported I/O types.

You can add the prebuilt GUIPoll component to your custom component. The GUIPoll component provides a LISA visualization component with a periodic signal that keeps the display updated, even when the simulation is stopped.

The Visualisation library supports one signaling protocol, the LCD protocol.

1.14.1 LISA visualisation models

The visualisation components provide a host window to display status information in addition to a frame buffer.

Each example platform model contains its own LISA visualisation model. You can use the model as the basis for your own visualization-containing components, such as the PL110_CLCD component. To use the visualisation components in your own system, copy the component LISA files from the relevant platform model directory, because they are not in the generic model library.

1.14.2 Visualisation library C++ classes

This section describes the C++ classes and structures in the Visualisation library.

1.14.2.1 C++ classes inclusion

To use these Visualisation library classes, begin your LISA component with the correct `#include` statement.

```
includes
{
#include "components/Visualisation.h"
}
```

1.14.2.2 Class Visualisation

The `visualisation` class is the API for creating a custom LISA visualization component.

A component obtains an instance of this class by calling the global function `createVisualisation()`. The component can then use this instance to control the size and layout of the visualization window:

Visualisation *createVisualisation()

This function generates an instance of the Visualisation library. You can only call this function once, because SDL only supports opening a single display window. The Visualisation library is implemented using the Simple DirectMedia Layer (SDL) cross-platform rendering library.

The `visualisation` class has the following methods:

~Visualisation()

Destructor for the Visualisation library. You must only call this method when your simulation is shutting down, after all allocated resources (`VisRenderRegions`, `VisPushButtonRegions`, `VisBitmaps`) have been deleted.

void configureWindow(unsigned int width, unsigned int height, unsigned int bit_depth)

Sets the visualization window to the requested size and bit depth. Depending on the display capabilities, the window might actually get a different bit depth from the size you requested.

VisBitmap *loadImage(char const *filename)

Allocates a new VisBitmap object, initialized by loading a Microsoft Windows Bitmap (.BMP) from the given file.

VisBitmap *loadImageWithAlphaKey(char const *filename, unsigned int red, unsigned int green, unsigned int blue)

Allocates a VisBitmap object, as with `loadImage()`. All pixels of the color specified by `red`, `green`, `blue` are converted into a transparent alpha channel.

VisBitmap *cropImage(VisBitmap *source, int x, int y, unsigned int width, unsigned int height)

Allocates a new VisBitmap object, by cropping a region from the source bitmap.

void releaseImage(VisBitmap *)

Releases the resources held by the given VisBitmap. The underlying bitmap is only to be unloaded if it is not in use.

void setBackground(VisBitmap *background, int x, int y)

Sets the background image for the visualization window. This takes a copy of the data referenced by the VisBitmap, so it is safe for the client to call `releaseImage(background)` immediately after calling `setBackground()`. The background is not displayed until the first call to `poll()`.

VisRenderRegion *createRenderRegion()

Allocates a new VisRenderRegion object that can be used to display arbitrary graphics, including LCD contents, in a rectangular region.

VisPushButtonRegion *createPushButtonRegion()

Allocates a new VisPushButtonRegion, which can be placed at a location on the display to provide a clickable push button.

bool poll(VisEvent *event)

Permits the Visualisation library to poll for GUI events. The client passes a reference to a VisEvent structure, which receives details of a single mouse/keyboard event.

The method returns false if no events have occurred.

Your LISA visualization implementations must call this periodically by using a GUIPoll component. On each `gui_callback()` event, you must ensure that the visualization component repeatedly calls `poll()` until it returns false.

void lockMouse(VisRegion *region)

Locks the mouse to the visualization window and hides the mouse pointer.

void unlockMouse()

Unlocks and redisplay the mouse pointer.

bool hasQuit()

Returns true if the user has clicked on the close icon of the visualization window.

1.14.2.3 Class VisRegion

This class is the common base class for VisPushButtonRegion and VisRenderRegion, representing a region of the visualization display.

~VisRegion()

Permits clients to delete a VisPushButtonRegion when it is no longer required.

void setId(void *id)

Permits a client-defined identifier to be associated with the region.

void *getId()

Returns the client-defined identifier.

void setVisible(bool vis)

Specifies whether the region is to be displayed on the screen. This is currently ignored by the SDL implementation.

void setLocation(intx, int y, unsigned int width, unsigned int height)

Sets the location of this region relative to the visualization window.

1.14.2.4 Class VisPushButtonRegion : public VisRegion

This class defines a region of the visualization window that represents a clickable button.

Optionally, the button can provide different VisBitmap representations for a button-up and a button-down graphic, and a graphic to use when the mouse pointer rolls over the button.

In addition to the public method defined in VisRegion, this class defines these methods:

- void setButtonUpImage(VisBitmap*bmpUp) : void
- setButtonDownImage(VisBitmap*bmpDown) : void
- setButtonRollOverImage(VisBitmap*bmpRollover)

These methods set the graphics to be used for each of the button states. If any image is not specified or is set to NULL, then the corresponding area of the visualization background image is used.

The VisPushButtonRegion takes a copy of the VisBitmap, so the client can safely call `Visualisation::releaseBitmap()` on its copy.

- void setKeyCode(intcode)

This method sets the code for the keypress event that is generated when the button is pressed or released.

1.14.2.5 Class VisRenderRegion : public VisRegion

This class defines a region of the visualization window that can render client-drawn graphics, including a representation of the contents of an LCD.

In addition to the public method defined in VisRegion, the class defines these methods:

VisRasterLayout const *lock()

Locks the region for client rendering. While the buffer is locked, the client can modify the pixel data for the buffer. You must not call the methods `writeText()` and `renderBitmap()` while the buffer is locked.

void unlock()

Releases the lock on the render buffer, permitting the buffer to be updated on screen.

void update(int left, int top, unsigned int width, unsigned int height)

Causes the specified rectangle to be drawn to the GUI.

int writeText(const char *text, int x, int y)

Renders the given ASCII text onto an unlocked VisRenderRegion. The return value is the x co-ordinate of the end of the string. The default font is 8 pixels high, and cannot be changed.

void renderBitmap(VisBitmap *bitmap, int x, int y)

Draws a bitmap onto an unlocked VisRenderRegion.

1.14.2.6 Struct VisRasterLayout

This struct defines the layout of the pixel data in a frame-buffer.

The `lock()` method of the LCD protocol expects to be given a pointer to this structure. You can generate a suitable instance by calling `VisRasterRegion::lock()`.

The structure contains these fields:

uint8_t* buffer

This points to the buffer for the rasterized pixel data. The controller can write pixels into this buffer, but must stay within the bounds specified by the width and height.

uint32_t pitch

The number of bytes between consecutive raster lines in the pixel data. This can be greater than the number of bytes per line.

uint32_t width

The width, in pixels, of the render area. This value can be less than the width requested by the LCD controller when it called `lock()`.

uint32_t height

The height, in pixels, of the render area. This value can be less than the height requested by the LCD controller when it called `lock()`.

VisPixelFormat format

This structure defines the format of the pixel data in the raster buffer.

bool changed

This is set to true if the pixel format or buffer size has changed since the previous call to `lock()`.

Pixel data is represented as a one-dimensional array of bytes. The top-left pixel is pointed to by the `buffer` member. Each pixel takes up a number of bytes, given by `format.pbytes`.

The pixel at location (x, y) is stored in the memory bytes starting at:

```
buffer[y * pitch + x * format.pbytes]
```

1.14.2.7 Struct VisPixelFormat

This struct specifies the format of pixel data within the buffer.

The members are:

uint32_trbits, gbits, bbits

The number of bits per color channel.

uint32_t roff, goff, boff

The offset within the pixel data value for the red/green/blue channels.

uint32_t pbytes

The size of a single pixel, in bytes.

`format.pbytes` specifies the number of bytes that make up the data for a single pixel. These bytes represent a single pixel value, stored in host-endian order. The pixel value contains a number of the form:

```
(R<<format.roff) + (G<<format.goff) + (B<<format.boff)
```

where (R,G,B) represents the values of the color channels for the pixel, containing values from 0 up to $(1 \ll \text{format.rbits})$, $(1 \ll \text{format.gbits})$, $(1 \ll \text{format.bbits})$.

2. Protocols

Components communicate through connected ports. Ports have protocols that define the function calls for different connections.

2.1 AMBA-PV protocols

The AMBA-PV components and protocols permit you to model a platform that interfaces with an Arm® AMBA®-based system.

The protocols are:

AMBAPV

Models the AMBA® protocols AXI4, AXI3, AHB and APB.

AMBAPVACE

Models the AMBA® ACE and DVM protocols.

AMBAPVSignal

Models interrupts.

AMBAPVSignalState

Transfers and receives signal states.

AMBAPVValue

Models propagation of 32-bit integer values between components.

AMBAPVValue64

Models propagation of 64-bit integer values between components.

AMBAPVValueState

Permits a master to retrieve the current value from a slave, using 32-bit integer values.

AMBAPVValueState64

Permits a master to retrieve the current value from a slave, using 64-bit integer values.

There are ready-to-use components that provide you with conversions between protocols.

Related information

[AMBA-PV Extensions to TLM User Guide](#)

2.1.1 AMBAPV protocol

The AMBAPV protocol defines behaviors for single read and single write transactions. This covers Arm® AMBA® AXI5, AXI4, AXI3, AHB, and APB bus protocol families, at the PV level.

In addition, the AMBAPV protocol supports AMBA® protocol additional control information:

- Protection units.

- Exclusive access and locked access mechanisms.
- System-level caches.
- Atomic accesses, including exclusive accesses, locked accesses, and atomic transactions.

The LISA definition for the AMBAPV protocol is `$PVLIB_HOME/LISA/AMBAPVProtocol.lisa`. The behaviors of the protocol are:

read()

This optional slave behavior completes a single read transaction at the given address for the given size in bytes. Additional AMBA® protocol control information can be specified using the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context.

```
read(int socket_id, const sc_dt::uint64 &addr,
     unsigned char *data, unsigned int size,
     const amba_pv::amba_pv_control *ctrl,
     sc_core::sc_time &t):
    amba_pv::amba_pv_resp_t
```

write()

This optional slave behavior completes a single write transaction at the given address with specified data and write strobes. The size of the data is specified in bytes. Additional AMBA® protocol control information can be specified using the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context.

```
write(int socket_id, const sc_dt::uint64 &addr,
      unsigned char *data, unsigned int size,
      const amba_pv::amba_pv_control *ctrl,
      unsigned char *strb, sc_core::sc_time &t):
    amba_pv::amba_pv_resp_t
```

debug_read()

This optional slave behavior completes a debug read transaction from a given address without causing any side effects. Specify the number of bytes to read in the `length` parameter. The number of successfully read values is returned. Additional AMBA® protocol control information can be specified in the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context. This behavior is empty by default and returns 0.

```
debug_read(int socket_id, const sc_dt::uint64 &addr,
           unsigned char *data, unsigned int length,
           const amba_pv::amba_pv_control *ctrl):
    unsigned int
```

debug_write()

This optional slave behavior completes a debug write transaction to a given address without causing any side effects. Specify the number of bytes to write in the `length` parameter. The number of successfully written values is returned. Additional AMBA® protocol control information can be specified in the `ctrl` parameter. The `socket_id` parameter must be set to 0 in this context. This behavior is empty by default and returns 0.

```
debug_write(int socket_id, const sc_dt::uint64 &addr,
            unsigned char *data, unsigned int length,
```

```
const amba_pv::amba_pv_control *ctrl):
    unsigned int
```

b_transport()

This is an optional slave behavior for blocking transport. It completes a single transaction using the blocking transport interface. The `amba_pv::amba_pv_extension` must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
b_transport(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sc_time
&t)
```

transport_dbg()

This optional slave behavior implements the TLM debug transport interface. An `amba_pv::amba_pv_extension` object must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
transport_dbg(int socket_id, amba_pv::amba_pv_transaction &trans,
    sc_core::sc_time &t):
    unsigned int
```

get_direct_mem_ptr()

This optional slave behavior requests a DMI access to a given address. It returns a reference to a DMI descriptor that contains the bounds of the granted DMI region. Returns `true` if a DMI region is granted, `false` otherwise.

The `amba_pv::amba_pv_extension` must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
get_direct_mem_ptr(int socket_id, amba_pv::amba_pv_transaction &trans,
    tlm::tlm_dmi &dmi_data):
    bool
```

atomic_store() and atomic_load()

These optional slave behaviors complete an AtomicStore or AtomicLoad transaction with the specified data. The data is used by the atomic transaction in the specified endianness.

The only difference between the two behaviors is that AtomicStore does not return data, while AtomicLoad returns the original data.

```
atomic_store(int socket_id, const sc_dt::uint64 & addr,
    unsigned char * data, unsigned int length,
    unsigned int size, const amba_pv::amba_pv_control * ctrl,
    amba_pv::amba_pv_atomic_subop_t subop,
    amba_pv::amba_pv_atomic_endianness_t endianness, sc_core::sc_time & t) :
    amba_pv::amba_pv_resp_t

atomic_load(int socket_id, const sc_dt::uint64 & addr,
    unsigned char * data, unsigned int length, unsigned int size,
    const amba_pv::amba_pv_control * ctrl,
    amba_pv::amba_pv_atomic_subop_t subop,
    amba_pv::amba_pv_atomic_endianness_t endianness, sc_core::sc_time & t) :
    amba_pv::amba_pv_resp_t
```

atomic_swap()

This optional slave behavior completes an AtomicSwap transaction with the specified data, which is written to the specified address. The original data is returned.

```
atomic_swap(int socket_id, const sc_dt::uint64 & addr,
            unsigned char * data, unsigned int length, unsigned int size,
            const amba_pv::amba_pv_control * ctrl, sc_core::sc_time & t) :
            amba_pv::amba_pv_resp_t
```

atomic_compare()

This optional slave behavior completes an AtomicCompare transaction with the specified compare value and swap value. If the compare value equals the values at the given address, the swap value is written to the addressed location.

It always returns the original data at the target address.

```
atomic_compare(int socket_id, const sc_dt::uint64 & addr,
              unsigned char * data, unsigned int length, unsigned int size,
              const amba_pv::amba_pv_control * ctrl, sc_core::sc_time & t) :
              amba_pv::amba_pv_resp_t
```

invalidate_direct_mem_ptr()

This optional master behavior invalidates a DMI request. It invalidates DMI pointers that were previously established for the given DMI region. The `socket_id` parameter is 0 in this context.

```
invalidate_direct_mem_ptr(int socket_id, sc_dt::uint64 start_range,
                        sc_dt::uint64 end_range)
```

The generic payload data is formatted as an array of bytes in order of ascending bus address. This means that irrespective of the host machine endianness or modeled bus width:

- A little endian master must write the bytes of a word in increasing significance as the array index increases.
- A big endian master must write the bytes of a word in decreasing significance as the array index increases.

A master or slave whose endianness does not match the endianness of the host machine must endian swap any access to the payload data that is wider than one byte. The same byte ordering rule applies to memory accesses using DMI pointers.

2.1.2 AMBAPVACE protocol

This protocol defines behaviors for bus transactions. This covers Arm® AMBA® ACE and DVM bus protocol families, all at the PV level.

In addition, this protocol provides support for AMBA® protocol additional extension information:

- Secure and privileged accesses.

- Atomic accesses.
- System-level caching and buffering control.
- Cache coherency transactions (ACE-Lite).
- Bi-directional cache coherency transactions (ACE).
- Distributed virtual memory transactions (DVM).

The behaviors of the protocol are:

b_transport()

This slave behavior implements the TLM blocking transport interface. An `amba_pv::amba_pv_extension` object must be added to the transaction before calling this behavior. The `socket_id` parameter must be set to 0 in this context.

```
b_transport(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sctime
&t)
```

transport_dbg()

This optional slave behavior implements the TLM debug transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
transport_dbg(int socket_id, amba_pv::amba_pv_transaction &trans,
sc_core::sctime &t): unsigned int
```

get_direct_mem_ptr()

This optional slave behavior is for requesting a DMI access to a given address. It returns a reference to a DMI descriptor that contains the bounds of the granted DMI region. Returns true if a DMI region is granted, false otherwise. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
get_direct_mem_ptr(int socket_id, amba_pv::amba_pv_transaction &trans,
tlm::tlm_dmi &dmi_data): bool
```

b_snoop()

This master behavior implements an upstream snooping TLM blocking transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
b_snoop(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sctime &t)
```

snoop_dbg()

This optional master behavior implements an upstream snooping TLM debug transport interface. You must add an `amba_pv::amba_pv_extension` object to the transaction before calling this behavior, setting the `socket_id` parameter to 0 in this context.

```
snoop_dbg(int socket_id, amba_pv::amba_pv_transaction &trans, sc_core::sctime
&t): unsigned int
```

invalidate_direct_mem_ptr()

Use this optional master behavior to invalidate a DMI request. It invalidates DMI pointers that were previously established for the given DMI region. The `socket_id` parameter is 0 in this context.

```
invalidate_direct_mem_ptr(int socket_id,  sc_dt::uint64 start_range,  
                           sc_dt::uint64 end_range)
```

The generic payload data is in the format of an array of bytes in order of ascending bus address. This means that irrespective of the host machine endianness or modeled bus width:

- A little endian master must write the bytes of a word in increasing significance as the array index increases.
- A big endian master must write the bytes of a word in decreasing significance as the array index increases.

A master or slave whose endianness does not match the endianness of the host machine must endian swap any access to the payload data that is wider than one byte. The same byte ordering rule applies to memory accesses using DMI pointers.

Special considerations for ACE and cache coherent interconnects

An ACE interconnect model must be able to cope with concurrent transactions in accordance with the hazard avoidance and prioritization rules in the ACE specification. Any external bus request, downstream transaction or upstream snoop transaction, can potentially cause a transaction to stall and the calling thread to be blocked, resulting in any number of other threads being scheduled.

To maintain memory coherency, apply these rules for debug transactions:

debug reads

The bus must return data that represents the values that the bus master expects to observe if it issues a bus read. This must not modify the state of any bus components.

debug writes

These must modify the contents of all copies of the location being accessed, so that a subsequent read from this location returns the data in the debug-write request. The debug write must not modify any other state, such as cache tags, clean/dirty/shared/unique MOESI state.

The implications for a coherent interconnect are that incoming debug transactions must be broadcast back upstream as debug snoop transactions to all ports other than the one the request came in on. Incoming debug snoops must propagate upwards. Debug reads can terminate as soon as they hit a cache. Debug writes must continue until they propagate to all possible copies of the location, including downstream to main memory.

For cases where a debug transaction hazards with non-debug transactions that are in-flight, the debug transaction must observe a weak memory-order model. Any component that can block a thread whilst responsible for the payload of an in-flight transaction must take particular care. In these cases, the debug transaction must be hazarded against the in-flight payload to ensure that debug reads do not return stale data and debug writes do not cause cache incoherency.

Only use DMI when you can guarantee that subsequent transactions do not result in any state transitions. This means, in general, do not use DMI for ACE coherent cacheable transactions.

2.1.3 AMBAPVSignal protocol

This protocol defines a single behavior to permit masters to change the state of signals such as interrupts. AMBA3 does not cover this behavior, but the AMBA-PV components do provide it.

set_state(int export_id, const bool &state): void

Transfers a signal state. The `export_id` parameter must be set to 0 in this context.

2.1.4 AMBAPVSignalState protocol

This protocol defines two behaviors that permit a master to change the state of signals such as interrupt and to retrieve the state of such signals from slaves. This behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const bool &state): void

Transfers a signal state. The `export_id` parameter must be set to 0 in this context.

get_state(int export_id, tlm::tlm_tag<bool> * t): bool

Retrieves a signal state. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

2.1.5 AMBAPVValue protocol

This protocol models propagation of 32-bit integer values between components. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const uint32_t &value): void

Transfers a value. The `export_id` parameter must be set to 0 in this context.

2.1.6 AMBAPVValue64 protocol

This protocol models propagation of 64-bit integer values between components. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const uint64_t &value): void

Transfers a value. The `export_id` parameter must be set to 0 in this context.

2.1.7 AMBAPVValueState protocol

This protocol permits propagation of 32-bit integer values between components and their retrieval from slaves. Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const uint32_t &value):void

Transfers a value. The `export_id` parameter must be set to 0 in this context.

get_state(unsigned int export_id, tlm::tlm_tag<uint32_t> *t): uint32_t

Retrieves a value. The `export_id` parameter must be set to 0 and the `t` parameter must be set to `NULL`, in this context.

2.1.8 AMBAPVValueState64 protocol

This protocol permits propagation of 64-bit integer values between components and their retrieval from slaves.

Strictly speaking this behavior is not covered by AMBA3, but is provided with the AMBA-PV components.

set_state(int export_id, const uint64_t &value): void

Transfers a value. The `export_id` parameter must be set to 0 in this context.

get_state(int export_id, tlm::tlm_tag<uint64_t> *t): uint64_t

Retrieves a value. The `export_id` parameter must be set to 0, and the `t` parameter must be set to `NULL`, in this context.

2.2 Clocking protocols

The clocking components and protocols provide a mechanism for systems to regulate the execution rate of components.

All clocking components that communicate use an opaque `ClockSignal` protocol. `ClockSignal` protocols have no behaviors that the user can invoke.

Related information

[Clocking components](#) on page 172

2.2.1 ClockRateControl protocol

This protocol sets the ratio of this component.

- `set(uint32_t mul, uint32_t div) : void`
- `set64(uint64_t mul, uint64_t div) : void`

Set the multiplier and divider that determine the clock divider ratio:

```
clk_outfreq= clk_infreq * mul / div
```

2.2.2 TimerCallback protocol

This protocol invokes a behavior on the component that set the timer. Do not use the `timer_control` port of the timer during the invoked behavior.

signal(): uint32_t

Invoked by the timer when the timer countdown expires. The invoked behavior returns the number of ticks after which it will be called again or 0 to make the timer one-shot.

2.2.3 TimerCallback64 protocol

This protocol invokes a behavior on the component that set the timer. Do not use the `timer_control` port of the timer during the invoked behavior.

signal(): uint64_t

Invoked by the timer when the timer countdown expires. The invoked behavior returns the number of ticks after which it will be called again or 0 to make the timer one-shot.

2.2.4 TimerControl protocol

This protocol controls the actions of the component. It permits a timer to be set to schedule a callback after a given number of ticks at the rate of the clock input.

If a timer is set while it is counting, it starts counting the new number of ticks without sending the original callback. Canceling a timer when it is not active has no effect.

set(uint32_t ticks): void

Set the timer to count down the given number of ticks.

cancel()

Cancel an active timer, preventing the callback being invoked.

isSet() : bool

Check whether a timer is set to generate a callback.

remaining() : uint32_t

Return how many ticks remain before the callback is invoked.

2.2.5 TimerControl64 protocol

This protocol controls the actions of the component. It permits a timer to be set to schedule a callback after a given number of ticks at the rate of the clock input.

If a timer is set while it is counting, it starts counting the new number of ticks without sending the original callback. Canceling a timer when it is not active has no effect.

set(uint64_t ticks): void

Set the timer to count down the given number of ticks.

cancel()

Cancel an active timer, preventing the callback being invoked.

isSet() : bool

Check whether a timer is set to generate a callback.

remaining() : uint64_t

Return how many ticks remain before the callback is invoked.

2.3 Debug interface protocols

LISA components can expose aspects of their internal state so that they become visible and usable in the debugger. Some aspects are supported by the native LISA language, and some are supported by debug interface protocols.

Registers and other state variables

See the LISA+ resource REGISTER declaration, especially the `read_function` and `write_function` attributes.

Memories and other memory-like objects

See the LISA+ resource MEMORY declaration, especially the `read_function` and `write_function` attributes.

Disassembly

See `CADIProtocol` and `CADIDisassemblerProtocol`.

Instruction count

See `CADIProtocol`.

Setting, configuring, and clearing of breakpoints

For example, code breakpoints, register breakpoints, watchpoints. See `CADIProtocol`.

Single stepping and instruction stepping support

See `CADIProtocol`.

If displaying and editing memory and registers are sufficient, you need not implement `CADIProtocol` and `CADIDisassemblerProtocol`. The component must implement them to enable the other debug features.

CADIProtocol and CADIDisassemblerProtocol permit you to implement the features on a Component Architecture Debug Interface (CADI) level, where the component code takes responsibility for the implementation of these interfaces.

Related information

[Component Architecture Debug Interface User Guide](#)

[LISA+ Language for Fast Models Reference Guide](#)

2.3.1 CADIDisassemblerProtocol protocol

To support disassembly, implement all of these functions. None of them is optional.

These functions are in a different port, of type CADIDisassemblerProtocol, that can have any name and only need to be implemented when disassembly must be exposed in the debugger. The functionality of this port is then exposed by CADIProtocol::CADIGetDisassembler(). See CADIProtocol for information on how to use this port and CADIDisassemblerAdapter.

In the function slave behavior GetType(): eslapi::CADIDisassemblerType; components must always return eslapi::CADI_DISASSEMBLER_TYPE_STANDARD.

The function slave behavior GetModeCount(): uint32_t; returns the number of supported disassembler modes, and at least 1 mode must be returned.

The function slave behavior GetModeNames(eslapi::CADIDisassemblerCB *callback_); returns information about all supported modes. A component that only supports one mode calls, for example, callback_>ReceiveModeName(0, "Normal"); only once. This is similar for multiple modes with different names and ids.

The function slave behavior GetCurrentMode(): uint32_t; returns the most suitable mode of disassembly at the time, based on the current state variables of the component:

For the function:

```
slave behavior GetSourceReferenceForAddress(eslapi::CADIDisassemblerCB *callback_,
const eslapi::CADIAddr_t &address): eslapi::CADIDisassemblerStatus;
```

components must return eslapi::CADI_DISASSEMBLER_STATUS_ERROR;

For the function:

```
slave behavior GetAddressForSourceReference(const char *sourceFile, uint32_t
sourceLine, eslapi::CADIAddr_t &address): eslapi::CADIDisassemblerStatus;
```

components must return eslapi::CADI_DISASSEMBLER_STATUS_ERROR;

The following function is the main disassembler function:

```
slave behavior GetDisassembly(eslapi::CADIDisassemblerCB *callback_,
                             const eslapi::CADIAddr_t &address,
                             eslapi::CADIAddr_t &nextAddr,
                             const uint32_t mode,
                             uint32_t desiredCount):
    eslapi::CADIDisassemblerStatus;
```

The component must call `callback_` for all disassembler lines for the specified address and `desiredCount`, and it must finally set `nextAddr` to the next disassembled address at that point after the requested block.

```
// Query if an instruction is a call instruction
slave behavior GetInstructionType(const eslapi::CADIAddr_t
&address, eslapi::CADIDisassemblerInstructionType &insn_type):
    eslapi::CADIDisassemblerStatus;
```

Components must return `insn_type = eslapi::CADI_DISASSEMBLER_INSTRUCTION_TYPE_NOCALL;` and return `eslapi::CADI_DISASSEMBLER_STATUS_OK;`

[CADIProtocol protocol](#) on page 77

[Component Architecture Debug Interface User Guide](#)

2.3.2 CADIProtocol protocol

This protocol supports debugging. To add breakpoint support, implement `CADIBpt...()` functions.

Note

All CADIProtocol protocol behaviors, that is, all sets of functionalities, are optional. A component only has to implement the set of functions for the functionality that it intends to support.

You must define an internal slave port of this type, and the name of this port must always be `cadi_port`. In this port, you can implement this functionality:

```
optional slave behavior CADIBptGetList(uint32_t, uint32_t, uint32_t *,
    eslapi::CADIBptDescription_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptRead(eslapi::CADIBptNumber_t,
    eslapi::CADIBptRequest_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptSet(eslapi::CADIBptRequest_t *,
    eslapi::CADIBptNumber_t *):eslapi::CADIReturn_t;
optional slave behavior CADIBptClear(eslapi::CADIBptNumber_t):eslapi::CADIReturn_t;
optional slave behavior CADIBptConfigure(eslapi::CADIBptNumber_t,
    eslapi::CADIBptConfigure_t):eslapi::CADIReturn_t;
optional slave behavior CADIModifyTargetFeatures(eslapi::CADITargetFeatures_t
    *):eslapi::CADIReturn_t;
```

You need to implement all of these functions to enable any kind of breakpoint for the component. The component needs to maintain and keep track of all existing breakpoints. For example:

- `CADIBptSet()` and `CADIBptClear()` add and remove breakpoints.
- `CADIBptConfigure()` enable and disable breakpoints.
- `CADIBptGetList()` and `CADIBptRead()` return the current state of the breakpoint list.

The component must also implement `CADIModifyTargetFeatures`. This function permits you to override the automatic default `CADITargetFeatures_t` that System Generator provides for this component just before it is returned to the debugger. Specifically, a component that wants to support any kind of breakpoint must override the `handledBreakpoints` and `nrBreakpointsAvailable` fields of `CADITargetFeatures_t`. For example:

```
targetFeatures->handledBreakpoints = CADI_TARGET_FEATURE_BPT_PROGRAM |
    CADI_TARGET_FEATURE_BPT_REGISTER;
    // code and register breakpoints supported
targetFeatures->nrBreakpointsAvailable = 0x7fffffff;
    // virtually infinite number of breakpoints supported.
```

By default, LISA components do not support any type of breakpoints. By implementing `CADIBpt...` functions, you can add breakpoint support. In addition to implementing the stated functions, the component must call `simBreakpointHit(bptNumber)` and then `simHalt()` when an enabled breakpoint is hit. On a breakpoint hit the component must first call `simBreakpointHit()` for each breakpoint that was hit (one or more, usually just one) and then call `simHalt()` once after all `simBreakpointHit()` calls. The `simHalt()` call must always be the last call in the sequence.

A component that wants to provide disassembly must implement the following `CADIGetDisassembler()` behavior and return a `CADIDisassembler` interface implementation. This automatically follows behind the `CADI::CADIGetDisassembler()` and the `CADI::ObtainInterface("eslapi.CADIDisassembler2")` functions.

```
optional slave behavior CADIGetDisassembler():eslapi::CADIDisassembler*;
```

To do this, instantiate a `CADIDisassemblerAdapter` object in behavior `init` and return its address in this `CADIGetDisassembler()` function. This object must point to an internal slave port that implements the `CADIDisassemblerProtocol` protocol.

Skeleton code for implementing disassembly:

```
component FOO
{
    behavior init()
    {
        disassemblerAdapter = new
        CADIDisassemblerAdapter(disassPort.getAbstractInterface());
        // ...
    }
    internal slave port <CADIProtocol> cadi_port
    {
        slave behavior CADIGetDisassembler():eslapi::CADIDisassembler*
        {
            return disassemblerAdapter;
        }
        // ...
    }
    internal slave port<CADIDisassemblerProtocol> disassPort
```

```
{
    // ...
}
```

The following function implements the instruction stepping a component. It must set up an internal state that stops the simulation when the requested number of instructions is executed completely (exactly like a breakpoint). It must call `simRun()` from within `CADIExecSingleStep()` after setting up this stepping state, and later it must call `simHalt()` when the execution of the required number of instructions finishes.

```
optional slave behavior CADIExecSingleStep(uint32_t instructionCount, int8_t
stepCycle, int8_t stepOver):eslapi::CADIReturn_t;
```

The following function is for debugging purposes only. Do not implement it. The function must not alter the state of any component in any way.

```
optional slave behavior callbackModeChange(uint32_t newMode, eslapi::CADIBptNumber_t
bptNumber);
```

By implementing any of the following functions, the component can enable the instruction and cycle count display:

```
optional slave behavior CADIGetInstructionCount(uint64_t
&instructionCount):eslapi::CADIReturn_t;
optional slave behavior CADIGetCycleCount(uint64_t &instructionCount, bool
systemCycles):eslapi::CADIReturn_t;
```

Fast Models systems are not cycle accurate, so you usually only implement an instruction counter, if at all.

2.4 Peripheral protocols

This section describes the peripheral protocols.

2.4.1 AudioControl protocol

This protocol has get and release audio buffer behaviors.

getPVAudioBuffer

Get an underlying host buffer for audio output.

releasePVAudioBuffer

Release an underlying host buffer.

2.4.2 CharacterLCD protocol

This protocol has the behaviors `setLayoutInfo` and `draw`.

setLayoutInfo

Sets the width and height of the touchscreen.

draw

Sets the character information.

2.4.3 FlashLoaderPort protocol

This protocol initializes the flash contents at model startup and saves flash contents to a file when the model terminates.

loadFlashFile(FlashLoader *) : uint32

Initiate loading of the flash contents.

saveFlashFile(FlashLoader *) : uint32

Save the flash contents to a file.

2.4.4 GUIPollCallback protocol

This protocol defines one method that signals to the visualization component the end of the update period. You can invoke this callback even when the simulation is stopped.

gui_callback(): void

This is sent by the GUIPoll component, at the configured period.

2.4.5 ICS307Configuration protocol

This protocol sets the divider ratio of an ICS307 component at runtime. The output clock rate alters accordingly and any dependent components react to the clock rate change according to their defined behavior.

setConfiguration(uint32_t vdw, uint32_t rdw, uint32_t od): void

Set the parameters for deriving the clock divider ratio.

vdw

Range: 0-255.

rdw

Range: 0-255.

od

Range: 0-7.

2.4.6 KeyboardStatus protocol

This protocol passes keyboard events to a component such as the PS2Keyboard component.

Events are only sent when the visualization window is in focus. Keyboard combinations that are filtered by the host OS such as **Ctrl+Alt+Del** are not detected by the visualization. See `$PVLIB_HOME/include/components/KeyCode.h` for a list of `ATKeyCode` values.

The protocol behaviors are:

keyDown(ATKeyCode code) : void

Sent when a key on the host keyboard is pressed.

keyUp(ATKeyCode code) : void

Sent when a key on the host keyboard is released.

Related information

[VEVisualisation ports](#) on page 4846

2.4.7 LCD protocol

This Visualisation Library signaling protocol provides the interface between an LCD controller peripheral, for example the PL110, and a visualization component. This permits the LCD controller to render the framebuffer contents into a region of the visualization GUI.

LISA visualization components can provide any number of LCD ports. The implementations of these behaviors can delegate the calls to appropriate methods on the `VisRenderRegion` class.

The behaviors are:

lock() : VisRasterLayout *

Lock the raster region of the LCD in preparation for rendering.

unlock()

Unlock the raster region, ready to be updated on the screen.

update(int x, int y, unsigned int w, unsigned int h)

Update the selected rectangular area on screen from the raster buffer.

setPreferredLayout(unsigned int width, unsigned int height, unsigned int depth)

A request from the LCD controller to set the preferred size for the raster region, to match the timing parameters used by the LCD controller.

Related information

[VEVisualisation ports](#) on page 4846

2.4.8 LCDLayoutInfo protocol

This protocol has the behavior `setLayoutInfo`.

setLayoutInfo

Sets the width and height of the touchscreen.

2.4.9 MMC_Protocol protocol

This protocol describes an abstract, untimed interface between an MMC controller and an MMC or SD card.

The protocol contains methods that must be implemented by the master (controller) and some that must be implemented by the slave (card). This protocol is used by the reference PL180 MCI and MMC models. For further information on the protocol implementation, see the source file, `$PVLIB_HOME/LISA/MMC_Protocol.lisa`.

Use of this protocol assumes knowledge of the MultiMediaCard specification, available from the MultiMediaCard Association, www.mmca.org.

The protocol has these behaviors:

cmd

Commands are sent from the controller to the card using this behavior, which is implemented by the card model. The MMC command is sent with an optional argument. The card responds as defined by the MMC specification. The controller model checks that the response type matches expectations, and updates its state appropriately. The transaction-level protocol does not model start/stop bits or CRCs on the command/response payload.

For data transfer in the card to controller direction:

Rx

After the host and controller have initiated a read through the command interface, the card calls the `Rx` behavior on the controller to provide the read data. The call provides a pointer and a length. The ARM MMC reference model simulates device read latency by waiting a number of clock cycles prior to calling this behavior. If the controller is unable to accept the data, or wants to force a protocol error, it can return false in response to this behavior.

Rx_rdy

A handshake, used by the controller to inform the card that the controller is ready to receive more data. The Arm MMC reference model does not time out, so waits indefinitely for this handshake in a multiple block data transfer.

For data transfer in the controller to card direction:

Tx

After the host and controller have initiated a write through the command interface, the card calls the `Tx` behavior on the controller. The call provides a pointer to an empty buffer to be

written, and a length. The ARM MMC reference model simulates device write latency by waiting a number of clock cycles prior to each buffer being offered.

Tx_done

The controller calls this behavior on the card when the block has been written. The card model can then commit the data to its persistent storage.

The card model must also implement:

cmd_name

This behavior returns the name of the command issued. A card must implement this behavior, but is free to return an empty string for all requests. Only call this behavior for diagnostic messages.

2.4.10 MouseStatus protocol

This protocol passes mouse movement and button events to another component such as the PS2Mouse component.

Events are only sent when the visualization window is in focus.

The protocol behaviors are:

mouseMove(int dx, int dy) : void

This is sent when the host mouse is moved. Mouse movement events are always relative.

mouseButton(uint8_t button, bool down) : void

This is sent when a button on the host mouse is pressed or released.

`button` indicates which button has been pressed or released and is typically 0, 1, or 2 but can be anything up to 7 depending on the OS and attached mouse.

`down` is true if a button is pressed and false if released.

Related information

[VEVisualisation ports](#) on page 4846

2.4.11 PL080_DMAC_DmaPortProtocol protocol

This protocol provides methods to permit handshaking between peripherals and the DMA controller.

request(uint32 request) : void

Passes requests from a peripheral to the DMA controller. The request is a bitfield with the low four bits defined. The request is level-sensitive and latched internally by the DMA controller. It is sampled and interpreted in a manner dependent on the target channel and configured flow control.

0: PL080_REQ_BURST

Burst transfer request.

1: PL080_REQ_SINGLE

Single transfer request.

2: PL080_REQ_LBURST

Last burst request.

3: PL080_REQ_LSINGLE

Last single request.

response(uint32 response): void

Passes responses from the DMA controller to peripherals. The response is a bitfield with the low two bits defined. The response is transient rather than level-sensitive.

0: PL080_RES_TC

Terminal count response.

1: PL080_RES_CLR

Clear request response.

2.4.12 PS2Data protocol

This protocol is for communication between the KMI and a PS/2-like device.

For efficiency, the interface is a parallel byte interface rather than a serial clock/data interface. The behaviors are:

setClockData(enum ps2clockdata) : void

Used by the KMI to simulate forcing the state of the data/clock lines, to indicate whether it is able to receive data, wants to send a command, or is inhibiting communication.

getData() : uint8

Used by the PS/2 device to get command data from the KMI.

putData(uint8 data): void

Used by the PS/2 device to send device data to the KMI.

2.4.13 PVBusSlaveControl protocol

The PVBusSlaveControl protocol enables you to access and modify the underlying memory that PVBusSlave controls.

- `setFillPattern(uint32_t fill1, uint32_t fill2)`

This sets a two-word alternating fill pattern to be used by uninitialized memory.

- `setAccess(pv::bus_addr_t base, pv::bus_addr_t top, pv::accessType type, pv::accessMode mode)`

This reconfigures handling for a region of memory.

`base` (inclusive value) and `top` (exclusive value) specify the address range to configure.

`type` selects what types of bus access must be reconfigured. It can be one of:

- `pv::ACCESSTYPE_READ`
- `pv::ACCESSTYPE_WRITE`
- `pv::ACCESSTYPE_RW`

`mode` controls what happens when an address is accessed. Legal values for the `pv::accessMode` enumeration are:

`pv::ACCESSMODE_MEMORY`

Act as memory. The PVBUSlave manages the underlying storage to provide memory for the selected address range, which can be ROM or RAM, depending on how you configure it to handle bus write transactions.

`pv::ACCESSMODE_DEVICE`

Act as a device. Requests to the selected address range are routed to the PVBUSlave device port, where the necessary behavior can be implemented by the component.

`pv::ACCESSMODE_ABORT`

Generate bus abort signals for any accesses to the selected address range.

`pv::ACCESSMODE_IGNORE`

Ignore accesses to the selected address range. Bus read requests return 0.

- `getReadStorage(pv::bus_addr_t address, pv::bus_addr_t *limit) : const uint8_t *`
- `getWriteStorage(pv::bus_addr_t address, pv::bus_addr_t *limit) : uint8_t *`

These two methods permit you to access the underlying storage that PVBUSlave allocates to implement a region of memory.

The return value is a pointer to the byte that represents the storage corresponding to the address of `base`.

The `limit` pointer returns the device address for the limit of the accessible memory.

The pointer value returned is not guaranteed to remain valid indefinitely. Bus activities, or other calls to the control port, might invalidate the pointer. For example, if a burst transaction straddles a 4KB boundary, PVBUSlave might reallocate the 4KB regions to be contiguous.

- `provideReadStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage)`
- `provideWriteStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage)`
- `provideReadWriteStorage(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage)`

These methods enable you to allocate blocks of memory that the PVBUSlave can use to manage regions of RAM/ROM. Only use these methods when you require a high degree of control over memory, such as when you require a device to map specific regions of host memory into the simulation.

The memory region pointed to by `storage` must be large enough to contain `(limit - base)` bytes.

After these calls, PVBUSlave controls access to the underlying memory. The owner must call `getWriteStorage()` before modifying the memory contents and `getReadStorage()` before reading the memory contents.

- `provideReadStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage, double latency)`
- `provideWriteStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, const uint8_t *storage, double latency)`
- `provideReadWriteStorageEx(pv::bus_addr_t device_base, pv::bus_addr_t device_limit, uint8_t *storage, double read_latency, double write_latency)`

These methods take additional parameters to specify average latencies (in seconds) per byte.

In all other aspects they behave the same as `provideReadStorage()`, `provideWriteStorage()` and `provideReadWriteStorage()`, respectively.

- `slave behavior getRegionIterHandle(): uint32_t;`
- `slave behavior getNextRegionInfo(uint32_t iter_handle, pv::PVBUSlaveRegionInfo *info) : bool;`
- `slave behavior closeRegionIterHandle(uint32_t iter_handle);`

These methods form an iterator-like API that allows a PVBUSlave providing storage to report all the regions of the address space that have backing store.

The iteration begins by calling `getRegionIterHandle()`. This allocates an iterator and if successful returns a nonzero `iter_handle` to identify it.

The caller can then repeatedly call `getNextRegionInfo()` with `iter_handle`. If it finds a region, the behavior returns `true` and writes to the `info` struct if the pointer is non-null. Access the data in the region using `getReadStorage()` OR `getWriteStorage()`.

The implementation can return regions in any order. They can be of any size or alignment, but must not overlap.

The implementation need not report allocated regions that are filled entirely with the default fill pattern, or allocated regions that contain only the data they had at simulation start.

On reaching the last region, the iterator closes automatically. If the handle is invalid or there are no further regions, the behavior returns `false`.

A caller can close an iterator opened by `getRegionIterHandle()` at any time using `closeRegionIterHandle()`. This deallocates the iterator, and further uses of the handle are invalid.

2.4.14 PVDevice protocol

The PVDevice protocol enables you to implement support for memory-mapped device registers. Call the two methods through the device port on the PVBusSlave to handle bus read/write transactions.

`read(pv::ReadTransaction): pv::Tx_Result`

This method permits a device to handle a bus read transaction.

`write(pv::WriteTransaction): pv::Tx_Result`

This method permits a device to handle a bus write transaction.

The PVDevice protocol uses two behaviors to differentiate between transactions originating from the processor (loads and stores) and transactions originating from an attached debugger:

`slave behavior debugRead(pv::ReadTransactiontx) : pv::Tx_Result`

This method enables the device to handle a debug read transaction.

`slave behavior debugWrite(pv::WriteTransactiontx) : pv::Tx_Result`

This method enables the device to handle a debug write transaction.

The `debugRead` and `debugWrite` behaviors are called for all debug transactions.

For an example component that uses this protocol see `$PVLIB_HOME/examples/LISA/BusComponents/BitLatch.lisa`.

Related information

[PVBus C++ transaction and Tx_Result classes](#) on page 57

2.4.15 PVTransactionMaster protocol

This protocol instantiates a `pv::TransactionGenerator` object from a PVBusMaster.

`createTransactionGenerator() : pv::TransactionGenerator *`

This behavior instantiates a new transaction generator to control the bus master. A caller can allocate as many TransactionGenerators as it wants. It is up to the caller to delete TransactionGenerators when they are no longer required. For example:

```
behavior init() {
    tg = master.createTransactionGenerator();
}

behavior terminate() {
    delete tg;
```

}

2.4.16 SerialData protocol

This protocol is implemented as a parallel interface for efficiency. All communication is driven by the master port.

This protocol has behaviors:

dataTransmit(uint16_t data) : void

Used by the master to send data to the slave.

Table 2-1: Bits for dataTransmit()

Bits	Function
15:8	Reserved
7:0	Transmit data

dataReceive(void) : uint16_t

Used by the master to receive data from the slave.

Table 2-2: Bits for dataReceive()

Bits	Function
15:13	Reserved
12	Set when no data available for reading
11	Reserved
10	Break error
9:8	Reserved
7:0	Receive data

signalsSet(uint8_t signal) : void

Used by the master to get the current signal status.

Table 2-3: Bits for signalsSet()

Bits	Function
7	Out1
6	Out2
5	RTS
4	DTR
3:0	Reserved

signalsGet() : uint8_t

Used by the master to get the current signal status.

Table 2-4: Bits for signalsGet()

Bits	Function
7:4	Reserved
3	DCD
2	DSR
1	CTS
0	RI

2.4.17 SMMUv3AEMIdentifyProtocol protocol

This protocol is used by the SMMUv3AEM model to identify the SSD, StreamID, and SubStreamID of an incoming transaction. It is only used if the parameter `howto_identify` is set to "use-identify".

```
identify(unsigned tbu_number_, const pv::TransactionAttributes* attributes_, bool*
out_ssd_ns_, unsigned* out_streamid_, unsigned* out_substreamid_) : void`
```

Architecturally, a transaction comes into the SMMUv3AEM model with the following side band signals:

- Security State Determination (SSD):
 - 0**
Transaction belongs to a device controlled by the secure world.
 - 1**
Transaction belongs to a device controlled by the non-secure world.
- StreamID.
- SubStreamID and SubStreamID valid. If you set `*out_substreamid_ = ~0u`, that is interpreted as no SubStreamID because SubStreamIDs are 20 or fewer bits.

How these are transported in the system is SoC-dependent.

The SMMUv3AEM requires that the SoC provides a way of determining this information by implementing the `identify()` function.

2.4.18 TZFilterControl protocol

This protocol controls the communication between filter units and control registers in the APB control block.

```
checkPermission(const pv::TransactionAttributes *attributes_, pv::bus_addr_t
page_base_, bool is_read_, pv::RemapRequest &req_, bool &abort_on_error_) : bool
```

Check the permission of the transactions filtered by the filter unit. Optional slave behavior.

isEnabled() : bool

Check if the filter unit is enabled or not. The APB control block controls the unit. Slave behavior.

isSecureSlave() : bool

Check if the connected slave is secure or not. Optional slave behavior.

setConfig(bool rd_spec_enable, bool wr_spec_enable, uint32_t action) : void

Pass the configurations to the filter. Optional master behavior.

2.4.19 VirtualEthernet protocol

This protocol has the `sendToSlave` and `sendToMaster` behaviors.

sendToSlave(EthernetFrame *frame)

Send an Ethernet frame to the slave port.

sendToMaster(EthernetFrame *frame)

Send an Ethernet frame to the master port.

The Ethernet frame class encapsulates an Ethernet frame in a broken-up format that is more accessible by components. For information on the class definition, see the `EthernetFrame.h` header file located in `$PVLIB_HOME/include/components/VirtualEthernet/Protocol`.

2.5 Power management protocols

This section describes the power management protocols.

2.5.1 PChannel protocol

Communicates power state changes between a power controller and a device.

The behaviors of the protocol are:

pactive (uint32_t pstate) : void

This master behavior is implemented by a power controller. A device calls this method to give a hint to the power controller that it can change to a particular power state. A power controller can then take appropriate action, typically communicating with the device by calling `device.prequest(new_power_state)`.

The power state is type `uint32_t` because it is the responsibility of the system using PChannels to enumerate the power states that it supports. For example, Armv8-A cores use the following enumeration for power states:

```
enum { OFF = 0, OFF_EMU, MEM_RET, MEM_RET_EMU, LOGIC_RET, FULL_RET, MEM_OFF,
      FUNC_RET, ON, WARM_RST, DBG_RECOV }
```

prequest (uint32_t pstate) : sg::PChannel::presp_t

This slave behavior is implemented by a device, for instance a core. A power controller typically calls this method and checks for the response from the device, which can either be ACCEPT OR DENY.

sg::PChannel::presp_t

This enumeration provides two values, ACCEPT and DENY. It is returned by the prequest () method, depending on the state requested and the current state of the core.

Usage

You can use PChannels to replace STANDBYWFI and STANDBYWFE signaling.

For example, using STANDBYWFI OR STANDBYWFE:

- Core drives STANDBYWFI signal HIGH.
- Power controller performs logic <x>.

Equivalent behavior using PChannels:

- Core calls pactive(OFF).
- Power controller calls prequest(OFF) to change the core to OFF.
- Power controller performs logic <x>.
- To wake up the core, the power controller calls prequest(ON).

Examples

- For a LISA+ example that uses PChannel, see \$PVLIB_HOME/examples/LISA/VP_PChannel/.
- For a SystemC example that uses PChannel, see \$PVLIB_HOME/examples/SystemCExport/EVS_Components/EVS_PChannel/.

2.6 Processor protocols

This section describes the processor protocols.

2.6.1 CoprocBusProtocol protocol

This protocol connects a coprocessor implementation with a CPU component, for instance ARM CortexM33CT.

A coprocessor must derive from the coprocessor callback interface, coprocessor. It can implement the CDP, MCR, MRC, STC, LDC, MCRR, and MRRC instructions.

A coprocessor must be registered with a specific coprocessor number, by calling the addCoproprocessor () method. You can only register an external coprocessor that is not already present in the CPU. If no coprocessor has been registered with the coprocessor number encoded in an instruction, the CPU raises a NOCP fault.

To register coprocessor instruction implementations with the CPU, you must initialize the function pointers. For example, the following code passes the function pointers to the `Coprocessor` constructor. This code was taken from the `$PVLIB_HOME/examples/LISA/FVP_Coproc_Demo` example.

Registering a coprocessor

```
...
class TestValCoprocessor : public Coprocessor
{
public:
    protocol_CoprocBusProtocol * coproc_bus;
    uint32_t coproc_number;
    uint32_t cp_reg[2][NUM_CP_REG] = {{0}}; // [0][NUM_CP_REG] --> Secure, [1]
[ NUM_CP_REG ] --> Non-Secure
    TestValCoprocessor()
        : Coprocessor(this, test_CDP, nullptr, test_MCR, nullptr, test_MRC, nullptr,
test_LDC, nullptr, test_STC, nullptr, test_MCRR, nullptr, test_MRRC, nullptr)
        , coproc_bus(nullptr)
        , coproc_number(0)
        {
    ...
};

PARAMETER { description("coprocessors number"), type(uint32_t), default(0x2),
min(0x0), max(16) } coprocessor_number; // CP num
TestValCoprocessor test_cp;
}

behaviour init
{
...
    if (coproc_bus.addCoprocessor.implemented())
    {
        coproc_bus.addCoprocessor(&test_cp, coprocessor_number);
    }
}
```

2.6.1.1 Coprocessor behaviors

A coprocessor can call the following master behaviors:

addCoprocessor(Coprocessor*, int num) : void

Registers the coprocessor with the CPU. `num` identifies which coprocessor to register it as.

removeCoprocessor(Coprocessor*, int num) : void

Unregisters the coprocessor from the CPU.

accessIsPriv(void) : bool

Checks whether the CPU state is privileged (true) or unprivileged (false).

accessIsNonSecure(void) : bool

Checks the security state of the CPU, either true for non-secure, or false for secure.

2.6.1.2 Coprocessor callback functions

A coprocessor can implement callback functions with these signatures.

Each function returns a `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.1 CDP()

Perform a coprocessor data processing operation.

Prototype

```
CoprocState CDP(void* context, uint32_t inst)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.2 MCR()

Perform a move to coprocessor register operation.

Prototype

```
CoprocState MCR(void* context, uint32_t inst, uint32_t data)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data

register contents.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.3 MRC()

Perform a move from coprocessor register operation.

Prototype

```
CoprocState MRC(void* context, uint32_t inst, uint32_t* data)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data

pointer to word to fill with coprocessor register contents.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.4 LDC()

Perform a load coprocessor register from memory operation.

Prototype

```
CoprocState LDC(void* context, uint32_t inst, uint32_t data, CoprocState state)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data

contents of current memory location to load into register.

state

current state in a sequence of transactions.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.5 STC()

Perform a store coprocessor register to memory operation.

Prototype

```
CoprocState STC(void* context, uint32_t inst, uint32_t data, CoprocState state)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data

pointer to word to fill with coprocessor register contents to be transferred to memory.

state

current state in a sequence of transactions.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.6 MCRR()

Perform a move to two coprocessor registers operation.

Prototype

```
CoprocState MCRR(void* context, uint32_t inst, uint32_t data1, uint32_t data2)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data1

first data word to load to a coprocessor register.

data2

second data word to load to a coprocessor register.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.2.7 MRRC()

Perform a move from two coprocessor registers operation.

Prototype

```
CoprocState MRRC(void* context, uint32_t inst, uint32_t* data1, uint32_t* data2)
```

Parameters

context

context that was registered with the coprocessor interface.

inst

the coprocessor instruction being executed.

data1

pointer to first word to fill with coprocessor register contents.

data2

pointer to second word to fill with coprocessor register contents.

Returns

A `CoprocState` value to indicate the new transaction state of the coprocessor, as listed in [CoprocState values](#).

2.6.1.3 CoprocState values

A `CoprocState` enum value is returned by coprocessor callback functions to indicate the new transaction state of the coprocessor. It is also used as a parameter for `LDC` and `STC` callback functions.

Table 2-5: CoprocState values

Value	State label	Description
0	<code>CoprocOk</code>	Complete/Ok.
1	<code>CoprocUndef</code>	Undefined operation.
2	<code>CoprocAbort</code>	Data abort.
4	<code>CoprocFirst</code>	A parameter value for <code>LDC</code> and <code>STC</code> callback functions to indicate that this is the first data transfer in a sequence.
5	<code>CoprocNext</code>	A parameter value for <code>LDC</code> and <code>STC</code> callback functions to indicate that this is a subsequent data transfer in a sequence.
12	<code>CoprocNop</code>	Treat as a NOP .

2.6.2 CounterInterface protocol

This protocol connects the `cntvalueb` port on Generic Timer components to MemoryMappedCounterModule components.

This semi-opaque protocol is exportable across a SystemC interface using a custom bridge.

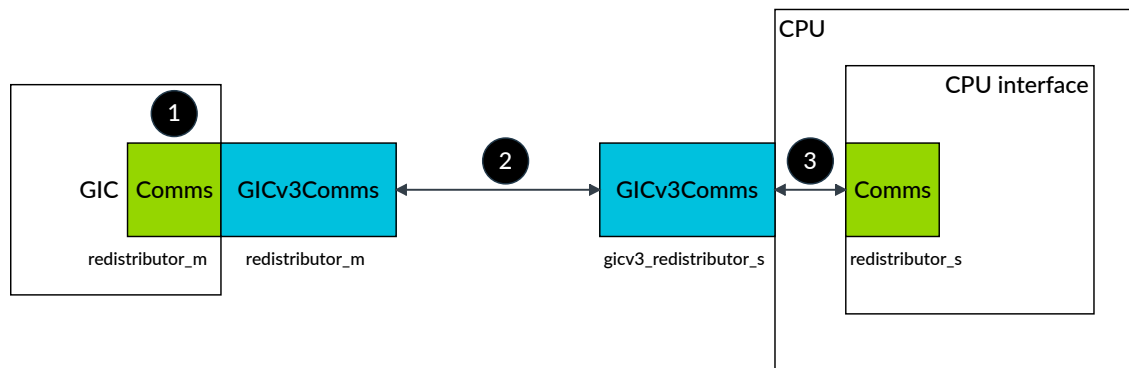

It is a LISA+ protocol.

2.6.3 GICv3Comms protocol

GICv3Comms is a protocol for communication between redistributors in the GIC and the CPU interface. It is supported by the GICv3 and GICv4 models. It is defined in `$PVLIB_HOME/LISA/GICv3Comms.lisa`.

Each GICv3Comms port in the LISA+ file is connected internally to a Comms port, which is a bi-directional communication port. Comms is derived from `sg::port`. The Comms port in the GIC is called `redistributor_m` and the one in the CPU interface is called `redistributor_s`, as shown in the following diagram:

Figure 2-1: GICv3Comms block diagram

Key:

1. GIC contains a Comms port, `redistributor_m`, which the LISA+ file exposes as a GICv3Comms port, `redistributor_m`.
2. `redistributor_m` is connected to the GICv3Comms port in the CPU, `gicv3_redistributor_s`.
3. `gicv3_redistributor_s` forwards the connection to the CPU interface Comms port, `redistributor_s`.

Each redistributor in the GIC communicates through `redistributor_m` to each CPU interface. The number of redistributors in the GIC equals the number of PEs connected.

GIC commands, for example Deactivate, Activate, ActivateAcknowledge, GenerateSGI, Set or Clear interrupt, are communicated through Comms.

The PVBUSGICv3Comms and GICv3CommsPVBUS components convert between the GICv3Comms and PVBUS protocols. The following diagram shows how they can be used in distributed systems:

Figure 2-2: Conversion between GICv3Comms and PVBUS protocols

2.6.4 InstructionCount protocol

This protocol has the behaviors `getValue()` and `getRunState()`.

`getValue()` : `uint64_t`

Obtain the number of instructions executed by the processor.

`getRunState()` : `uint32_t`

Obtain the power/run status of the processor.

Table 2-6: Run state values

Value	State label	Description
0	UNKNOWN	Run status unknown, that is, simulation has not started
1	RUNNING	Processor running, is not idle and is executing instructions
2	HALTED	External halt signal asserted
3	STANDBY_WFE	Last instruction executed was WFE and standby mode has been entered
4	STANDBY_WFI	Last instruction executed was WFI and standby mode has been entered
5	IN_RESET	External reset signal asserted
6	DORMANT	Partial processor power down
7	SHUTDOWN	Complete processor power down

2.6.5 v8EmbeddedCrossTrigger_controlprotocol protocol

This protocol connects the Cross Trigger Interface (CTI) in processor components to platform-level Cross Trigger Matrix (CTM) components.

This opaque protocol is not exportable across a SystemC interface.

2.7 Signaling protocols

Many components use the signaling protocols to indicate changes in state for signals such as interrupt and reset.

Each signaling protocol has two variants:

- One permits components to signal a state change to other components.
- One permits the other components to passively query the current state of the signal.

2.7.1 Signal protocol

The Signal protocol has the setValue behavior.

```
setValue(enum sg::Signal::State) : void  
    Indicates a state change.
```

Valid values for `sg::Signal::State` are:

- `sg::Signal::Set`.
- `sg::Signal::Clear`.

2.7.2 StateSignal protocol

The stateSignal protocol has the setValue and getValue behaviors.

```
setValue(enum sg::Signal::State): void  
    indicates a value change.
```

```
getValue() : sg::Signal::State  
    reads the current value.
```

2.7.3 Value protocol

The Value protocol has the setValue behavior.

setValue(uint32_t value)
indicates a state change.

2.7.4 Value_64 protocol

This protocol provides the rules to communicate with the TrustZone® Memory Adapter (TZMA) to signal the remapped range X.

setValue(uint64_t value)
Sets a 64-bit wide address to the slave port.

2.7.5 ValueState protocol

The ValueState protocol has the setValue and getValue behaviors.

setValue(uint32_t value): void
indicates a value change.

getValue() : uint32_t
reads the current value state.

3. Fast Models components

This chapter describes all model components in Fast Models, organized by component type.

For each component, the documentation includes notes about using the model, describes any deviations in the model from the Technical Reference Manual (TRM), and describes the ports and parameters.

3.1 Component differences

This topic lists the new and changed components in this release.

Differences between 11.26.11 and 11.27.17

Table 3-1: Components added

Component	Quality level
3.7.4 CMSDK_Watchdog_cpp on page 3153	N/A

3.2 Bridge components

This section describes the Bridge components.

These components allow conversion between the following protocols:

- PVBus and AMBAPV.
- Signal and AMBAPVSignal.
- StateSignal and AMBAPVSignalState.
- Value(_64) and AMBAPVValue(64).
- ValueState(_64) and AMBAPVValueState(64).

LISA+ source for the bridge components is located in `$PVLIB_HOME/examples/SystemCExport/Bridges/`.

The AMBAPV protocols and components are designed to interface with the AMBA® TLM PV library for ASI TLM 2.0. Fast Models provides this library as a standard way of mapping the AMBA protocol on top of ASI TLM 2.0.2 kit at PV level.

For more information about the AMBA TLM PV library for ASI TLM 2.0.2 kit, see the Fast Models documentation in `$MAXCORE_HOME/AMBA-PV/doc/`.

For more information about ASI TLM 2.0, see the Accellera documentation that is provided with the kit.

See also:

- [2.1 AMBA-PV protocols](#) on page 66

- [Accellera Systems Initiative](#)
- [AMBA-PV Extensions to TLM 2.0 Developer Guide](#)

3.2.1 AMBAPV2PVBUS

AMBA-PV to PVBUS protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPV2PVBUS

This model has the following Iris instances:

Table 3-3: AMBAPV2PVBUS Iris instances

InstanceName	ComponentName
AMBAPV2PVBUS	AMBAPV2PVBUS
AMBAPV2PVBUS.bus_master	PVBUSMaster

This model has the following MTI trace components:

Table 3-4: AMBAPV2PVBUS MTI instances

InstanceName	ComponentName
AMBAPV2PVBUS	AMBAPV2PVBUS
AMBAPV2PVBUS.bus_master	PVBUSMaster

AMBAPV2PVBUS contains the following CADI targets:

- AMBAPV2PVBUS

About AMBAPV2PVBUS

- PVBUS does not support transactions with byte_enable set (strobing transactions, in AXI terms). This bridge component rejects them.
- Variants of this component also exist with multiple input and output ports.

The bridge enables the ACP port to treat a transaction as coherent. It provides an additional parameter to specify the default shared bit value for incoming AMBA-PV transactions.

It also enables the shared bit to be specified by the “shareable” attribute of an AMBA-PV transaction using the amba_pv_attributes class. (Requires you to define the AMBA_PV_INCLUDE_ATTRIBUTES macro at compile time.)

Limitations

Fast Models bridges between PVBUS and AMBA-PV can transport Memory Tagging Extension (MTE) operations (tag stores, tag loads, and tag-checked loads and stores). These operations are transported opaquely, so the endpoint must be using PVBUS. This means you cannot handle these operations in your own TLM components.

Ports for AMBAPV2PVBUS

Table 3-5: Ports

Name	Protocol	Type	Description
amba_pv_s	AMBAPV	Slave	-
pvbust_m	PVBUS	Master	-

Parameters for AMBAPV2PVBUS

base_addr

Type

int

Default value

0x0

Base address.

report_errors

Type

bool

Default value

0x0

Report transactions which do not comply with PVBUS protocol requirements.

shareable

Type

bool

Default value

0x1

Shareable default.

3.2.2 AMBAPVACE2PVBUS

AMBA-PV ACE to PVBUS protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVACE2PVBUS

This model has the following Iris instances:

Table 3-6: AMBAPVACE2PVBUS Iris instances

InstanceName	ComponentName
AMBAPVACE2PVBUS	AMBAPVACE2PVBUS

InstanceName	ComponentName
AMBAPVACE2PVBUS.bus_master	PVBusMaster

This model has the following MTI trace components:

Table 3-7: AMBAPVACE2PVBUS MTI instances

InstanceName	ComponentName
AMBAPVACE2PVBUS	AMBAPVACE2PVBUS
AMBAPVACE2PVBUS.bus_master	PVBusMaster

AMBAPVACE2PVBUS contains the following CADI targets:

- AMBAPVACE2PVBUS

About AMBAPVACE2PVBUS

- AMBAPVACE2PVBUS depends on the AMBA-PV API, which must be at least version 1.4.
- The translation of bus transactions by the bridge has some impact on performance. Bus masters that cache memory transactions avoid much of this impact. The bridge does not support DMI.
- PVBus does not support transactions with `byte_enable` set (strobing transactions, in AXI terms). This bridge component rejects them.

Ports for AMBAPVACE2PVBUS

Table 3-8: Ports

Name	Protocol	Type	Description
amba_pv_ace_s	AMBAPVACE	Slave	-
pvbus_m	PVBus	Master	-

Parameters for AMBAPVACE2PVBUS

report_errors

Type

bool

Default value

0x0

Report transactions which do not comply with PVBus protocol requirements.

3.2.3 AMBAPVSignal2SGSignal

AMBA-PV Signal to SystemGenerator Signal protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVSignal2SGSignal

This model has the following Iris instances:

Table 3-9: AMBAPVSignal2SGSignal Iris instances

InstanceName	ComponentName
AMBAPVSignal2SGSignal	AMBAPVSignal2SGSignal

Variants of this component also exist with multiple input and output ports.

Ports for AMBAPVSignal2SGSignal

Table 3-10: Ports

Name	Protocol	Type	Description
amba_pv_signal_s	AMBAPVSignal	Slave	Input slave port for connection from top-level AMBAPVSignal slave port.
sg_signal_m	Signal	Master	Handles outgoing signal state changes. Converted signal state changes are sent out through this port.

3.2.4 AMBAPVSignalState2SGStateSignal

AMBA-PV SignalState to SystemGenerator StateSignal protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVSignalState2SGStateSignal

This model has the following Iris instances:

Table 3-11: AMBAPVSignalState2SGStateSignal Iris instances

InstanceName	ComponentName
AMBAPVSignalState2SGStateSignal	AMBAPVSignalState2SGStateSignal

Variants of this component also exist with multiple input and output ports.

identify	SMMUv3AEMIdentifyProtocol	Master	-
identify_reply	AMBAPVValue64	Master	-
identify_request	AMBAPVValue64	Slave	-

3.2.8 AMBAPVValue642VECB

AMBA-PV to VECB protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValue642VECB

This model has the following Iris instances:

Table 3-19: AMBAPVValue642VECB Iris instances

InstanceName	ComponentName
AMBAPVValue642VECB	AMBAPVValue642VECB

AMBAPVValue642VECB contains the following CADI targets:

- AMBAPVValue642VECB

Ports for AMBAPVValue642VECB

Table 3-20: Ports

Name	Protocol	Type	Description
amba_pv_ctrl_s	AMBAPVValue	Slave	-
amba_pv_data_s	AMBAPVValue64	Slave	-
vecb_m	VECBProtocol	Master	-

3.2.9 AMBAPVValueState2SGValueState

AMBA-PV ValueState to SystemGenerator ValueState protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValueState2SGValueState

This model has the following Iris instances:

Table 3-21: AMBAPVValueState2SGValueState Iris instances

InstanceName	ComponentName
AMBAPVValueState2SGValueState	AMBAPVValueState2SGValueState

Note

Variants of this component also exist with multiple input and output ports.

Ports for AMBAPVValueState2SGValueState

Table 3-22: Ports

Name	Protocol	Type	Description
amba_pv_value_s	AMBAPVValueState	Slave	-
sg_value_m	ValueState	Master	-

3.2.10 AMBAPVValueState2SGValueState64

AMBA-PV ValueState64 to SystemGenerator ValueState_64 protocol converter. This model is written in LISA+.

Iris and MTI instances for AMBAPVValueState2SGValueState64

This model has the following Iris instances:

Table 3-23: AMBAPVValueState2SGValueState64 Iris instances

InstanceName	ComponentName
AMBAPVValueState2SGValueState64	AMBAPVValueState2SGValueState64

Variants of this component also exist with multiple input and output ports.

Ports for AMBAPVValueState2SGValueState64

Table 3-24: Ports

Name	Protocol	Type	Description
amba_pv_value_s	AMBAPVValueState64	Slave	-
sg_value_m	ValueState_64	Master	-

3.2.11 BroadcastSignal2AMBAPVSignal

Broadcast signal to AMBAPVSignal coverter. This model is written in LISA+.

Iris and MTI instances for BroadcastSignal2AMBAPVSignal

This model has the following Iris instances:

Table 3-25: BroadcastSignal2AMBAPVSignal Iris instances

InstanceName	ComponentName
BroadcastSignal2AMBAPVSignal	BroadcastSignal2AMBAPVSignal

BroadcastSignal2AMBAPVSignal contains the following CADI targets:

- BroadcastSignal2AMBAPVSignal

Ports for BroadcastSignal2AMBAPVSignal

Table 3-26: Ports

Name	Protocol	Type	Description
amba_pv_signal_m	AMBAPVSignal	Master	-
amba_pv_signal_s	AMBAPVSignal	Slave	-
b_signal	Signal	Broadcast	-

3.2.12 Clock2SystemC

Clock to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for Clock2SystemC

This model has the following Iris instances:

Table 3-27: Clock2SystemC Iris instances

InstanceName	ComponentName
Clock2SystemC	Clock2SystemC

Clock2SystemC contains the following CADI targets:

- Clock2SystemC

Ports for Clock2SystemC

Table 3-28: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
current_ticks_s	AMBAPVValueState64	Slave	-
get_clock_s	AMBAPVValueState64	Slave	-
rate_in_Hz_s	AMBAPVValueState64	Slave	-
set_clock_m	AMBAPVValue64	Master	-

3.2.13 ClockRateConversion

ClockRateControl to rate in Hz (Value_64) Converter. This model is written in LISA+.

Iris and MTI instances for ClockRateConversion

This model has the following Iris instances:

Table 3-29: ClockRateConversion Iris instances

InstanceName	ComponentName
ClockRateConversion	ClockRateConversion
ClockRateConversion.clk_div0	ClockDivider
ClockRateConversion.clk_div1	ClockDivider
ClockRateConversion.clk_div2	ClockDivider
ClockRateConversion.clk_div3	ClockDivider

This model has the following MTI trace components:

Table 3-30: ClockRateConversion MTI instances

InstanceName	ComponentName
ClockRateConversion.clk_div0	ClockDivider
ClockRateConversion.clk_div1	ClockDivider
ClockRateConversion.clk_div2	ClockDivider
ClockRateConversion.clk_div3	ClockDivider

ClockRateConversion contains the following CADI targets:

- [ClockDivider](#)
- [ClockRateConversion](#)

Ports for ClockRateConversion

Table 3-31: Ports

Name	Protocol	Type	Description
clock	ClockSignal	Slave	-
rate_ctrl[4]	ClockRateControl	Slave	-
rate_hz[4]	Value_64	Master	-

Parameters for ClockRateConversion

clk_div0.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clk_div0.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clk_div1.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clk_div1.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clk_div2.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clk_div2.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clk_div3.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clk_div3.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

3.2.14 ClockSignal2SC_ClockSignal

ClockSignal to SystemC ClockSignal converter. This model is written in LISA+.

Iris and MTI instances for ClockSignal2SC_ClockSignal

This model has the following Iris instances:

Table 3-32: ClockSignal2SC_ClockSignal Iris instances

InstanceName	ComponentName
ClockSignal2SC_ClockSignal	ClockSignal2SC_ClockSignal

ClockSignal2SC_ClockSignal contains the following CADI targets:

- ClockSignal2SC_ClockSignal

Ports for ClockSignal2SC_ClockSignal

Table 3-33: Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Slave	-
sc_clk_out	SC_ClockSignal	Master	-

3.2.15 CoprocBus2SystemC

CoprocBusProtocol to SystemCCoprocBusProtocol converter. This model is written in LISA+.

Iris and MTI instances for CoprocBus2SystemC

This model has the following Iris instances:

Table 3-34: CoprocBus2SystemC Iris instances

InstanceName	ComponentName
CoprocBus2SystemC	CoprocBus2SystemC

CoprocBus2SystemC contains the following CADI targets:

- CoprocBus2SystemC

Ports for CoprocBus2SystemC

Table 3-35: Ports

Name	Protocol	Type	Description
coproc_bus_s	CoprocBusProtocol	Slave	-
sc_coproc_bus_m	SystemCCoprocBusProtocol	Master	-

3.2.16 CounterInterface2SystemC

CounterInterface to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for CounterInterface2SystemC

This model has the following Iris instances:

Table 3-36: CounterInterface2SystemC Iris instances

InstanceName	ComponentName
CounterInterface2SystemC	CounterInterface2SystemC

CounterInterface2SystemC contains the following CADI targets:

- CounterInterface2SystemC

Ports for CounterInterface2SystemC

Table 3-37: Ports

Name	Protocol	Type	Description
amba_pv_eventUpdate_m	AMBAPVValue	Master	-
amba_pv_getCounterValue_s	AMBAPVValueState64	Slave	-
amba_pv_requestEventUpdate_s	AMBAPVValue64	Slave	-
amba_pv_requestSignalUpdate_s	AMBAPVValue64	Slave	-
amba_pv_setEnabled_m	AMBAPVValue	Master	-
amba_pv_signalUpdate_m	AMBAPVValue	Master	-
cntvalueb	CounterInterface	Slave	-

3.2.17 InstructionCount2SystemC

InstructionCount to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for InstructionCount2SystemC

This model has the following Iris instances:

Table 3-38: InstructionCount2SystemC Iris instances

InstanceName	ComponentName
InstructionCount2SystemC	InstructionCount2SystemC

InstructionCount2SystemC contains the following CADI targets:

- InstructionCount2SystemC

Variants of this component also exist with multiple input and output ports.

Ports for InstructionCount2SystemC

Table 3-39: Ports

Name	Protocol	Type	Description
inst_count	AMBAPVValueState64	Slave	-
run_state	AMBAPVValueState	Slave	-
ticks	InstructionCount	Slave	-

3.2.18 LCD2SystemC

Converts LCD protocol to SystemC. This model is written in LISA+.

Iris and MTI instances for LCD2SystemC

This model has the following Iris instances:

Table 3-40: LCD2SystemC Iris instances

InstanceName	ComponentName
LCD2SystemC	LCD2SystemC

LCD2SystemC contains the following CADI targets:

- LCD2SystemC

Ports for LCD2SystemC

Table 3-41: Ports

Name	Protocol	Type	Description
all_received_sPL	AMBAPVSignal	Master	-
all_received_u	AMBAPVSignal	Master	-
lcd_s	LCD	Slave	-
lock_m	AMBAPVValueState64	Master	-
setPreferredLayout_d	AMBAPVValue	Master	-
setPreferredLayout_h	AMBAPVValue	Master	-
setPreferredLayout_w	AMBAPVValue	Master	-
unlock_m	AMBAPVSignal	Master	-
update_h	AMBAPVValue	Master	-
update_w	AMBAPVValue	Master	-
update_x	AMBAPVValue	Master	-
update_y	AMBAPVValue	Master	-

3.2.19 PChannel2SystemC

PChannel to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for PChannel2SystemC

This model has the following Iris instances:

Table 3-42: PChannel2SystemC Iris instances

InstanceName	ComponentName
PChannel2SystemC	PChannel2SystemC

PChannel2SystemC contains the following CADI targets:

- PChannel2SystemC

Ports for PChannel2SystemC

Table 3-43: Ports

Name	Protocol	Type	Description
pchannel	PChannel	Slave	-
sc_pchannel	SystemCPChannel	Master	-

3.2.20 PVBUS2AMBAPV

PVBus to AMBA-PV protocol converter. This model is written in LISA+.

Changes in 11.27.17

Parameters removed:

- dmi-container-type

Iris and MTI instances for PVBUS2AMBAPV

This model has the following Iris instances:

Table 3-44: PVBUS2AMBAPV Iris instances

InstanceName	ComponentName
PVBus2AMBAPV	PVBus2AMBAPV
PVBus2AMBAPV.bus_bridge	PVBusBridge

This model has the following MTI trace components:

Table 3-45: PVBUS2AMBAPV MTI instances

InstanceName	ComponentName
PVBus2AMBAPV	PVBus2AMBAPV

InstanceName	ComponentName
PVBus2AMBAPV.bus_bridge	PVBusBridge

PVBus2AMBAPV contains the following CADI targets:

- PVBus2AMBAPV

About PVBus2AMBAPV

Variants of PVBus2AMBAPV also exist with multiple input and output ports.

The AMBAPV protocol definition in LISA, `AMBAPVProtocol.lisa`, specifies a 64-bit bus width, so the PVBus2AMBAPV bridge also handles a 64-bit bus width.

If you need to connect to a component that uses a bus interface with a smaller or larger bus width, the recommended method is to insert a downsizer or upsizer respectively.

Alternatively, you could define a new bus protocol with the required bit width, for example AMBAPV32, and update the corresponding bridges to use the new protocol on AMBA-PV ports:

```
master port<AMBAPV32> amba_pv_m
```

Limitations

Fast Models bridges between PVBus and AMBA-PV can transport Memory Tagging Extension (MTE) operations (tag stores, tag loads, and tag-checked loads and stores).

These operations are transported opaquely, so the endpoint must be using PVBus. This means you cannot handle these operations in your own TLM components.

Dumping the DMI cache

DMI viewer provides the debugging functionality of the PVBus2AMBAPV bridge. When activated, it dumps the content of the DMI cache in the bridge in the following CSV format:

```
Range_start, Range_end_incl, Pointer, Latency, R/W, Attributes
```

To activate this functionality, a name for the counters output file must be set, using the `counters-file-name` parameter. If the counters file name is set, when `dump-dmi-cache` is set to 1 at runtime, the DMI cache of the bridge is dumped. The runtime parameter is always reset to 0 when the dump has completed.

Ports for PVBUS2AMBAPV

Table 3-46: Ports

Name	Protocol	Type	Description
amba_pv_m	AMBAPV	Master	-
pvbuss	PVBUS	Slave	-

Parameters for PVBUS2AMBAPV

counters-file-name

Type

string

Default value

""

Prefix of the file name to store counters at the end of simulation.

dump-dmi-cache

Type

bool

Default value

0x0

Dumps the content of the DMI cache into a file.

dump-dmi-file-name

Type

string

Default value

""

Prefix of the file name to dump the content of the DMI when requested.

force-dmi-size

Type

bool

Default value

0x1

Force DMI start and end address to be 4kB-aligned.

min-range-to-cache

Type
int

Default value
0x10000

Min DMI range size to cache in the bridge.

size

Type
int

Default value
0x10000000000000

Maximum size of memory region.

3.2.21 PVBUS2AMBAPVACE

PVBus to AMBA-PV ACE protocol converter. This model is written in LISA+.

Changes in 11.27.17

Parameters removed:

- dmi-container-type

Iris and MTI instances for PVBUS2AMBAPVACE

This model has the following Iris instances:

Table 3-47: PVBUS2AMBAPVACE Iris instances

InstanceName	ComponentName
PVBus2AMBAPVACE	PVBus2AMBAPVACE
PVBus2AMBAPVACE.bus_bridge	PVBusBridge
PVBus2AMBAPVACE.pvbus_tlm_switch	PVBusMapper

This model has the following MTI trace components:

Table 3-48: PVBUS2AMBAPVACE MTI instances

InstanceName	ComponentName
PVBus2AMBAPVACE	PVBus2AMBAPVACE
PVBus2AMBAPVACE.bus_bridge	PVBusBridge
PVBus2AMBAPVACE.pvbus_tlm_switch	PVBusMapper

PVBus2AMBAPVACE contains the following CADI targets:

- PVBUS2AMBAPVACE

About PVBUS2AMBAPVACE

PVBUS2AMBAPVACE depends on the AMBA-PV API, which must be at least version 1.4. The translation of bus transactions by the bridge has some impact on performance. Bus masters that cache memory transactions avoid much of this impact.

DMI viewer provides the debugging functionality of the PVBUS2AMBAPV bridge. When activated, it dumps the content of the DMI cache in the bridge in the following CSV format:

```
Range start, Range end incl, Pointer, Latency, R/W, Attributes
```

To activate this functionality, set a name for the counters output file using the `counters-file-name` parameter. If the counters file name is set, when `dump-dmi-cache` is set to 1 at runtime, the DMI cache of the bridge is dumped. The runtime parameter is always reset to 0 when the dump has completed.

Ports for PVBUS2AMBAPVACE

Table 3-49: Ports

Name	Protocol	Type	Description
amba_pv_ace_m	AMBAPVACE	Master	-
pvbus_over_tlm_control	PVBusOverTLMControl	Slave	-
pvbus_s	PVBus	Slave	-

Parameters for PVBUS2AMBAPVACE

counters-file-name

Type

string

Default value

""

Prefix of the file name to store counters at the end of simulation.

dmi-cache-name

Type

string

Default value

""

DEPRECATED: This parameter will be ignored. Name of the DMI cache. Useful for multiple bridges to share the same cache.

dump-dmi-cache**Type**

bool

Default value

0x0

Dumps the content of the DMI cache into a file.

dump-dmi-file-name**Type**

string

Default value

""

Prefix of the file name to dump the content of the DMI when requested.

force-dmi-size**Type**

bool

Default value

0x1

Force DMI start and end address to be 4kB-aligned.

min-range-to-cache**Type**

int

Default value

0x10000

Min DMI range size to cache in the bridge.

route-tlm**Type**

bool

Default value

0x1

Route all the PVBUS traffic explicitly to the TLM bus. Allows to monitor transactions on the TLM bus but slows down the emulation. The routing must always be to TLM if there is not a corresponding AMBAPVACE2PVBUS bridge downstream.

route-tlm-filter**Type**

string

Default value

""

Route TLM filter set a range (or multiple ranges) of addresses that will use PVBUS even if `route-tlm` is set to true.

The `route-tlm-filter` is specified in JSON format. Example,

```
[
  {
    "begin":0x2f000000',
    "size":0x1000
  },
  {
    "begin":0x4f000000',
    "size":0x2000
  }
]
```

set-ace-lite**Type**

bool

Default value

0x0

Set bridge mode when connecting to ace-lite ports. If true, the bridge will not deal with SNOOPs.

size**Type**

int

Default value

0x10000000000000

Maximum size of memory region, i.e. the first unsupported address.

3.2.22 PVBusBridge

A PVBusBridge bridges incoming transactions to a PVDevice port. This model is written in C++.

Changes in 11.27.17

Parameters removed:

- `dmi-container-type`

Iris and MTI instances for PVBusBridge

This model has the following Iris instances:

Table 3-50: PVBusBridge Iris instances

InstanceName	ComponentName
PVBusBridge	PVBusBridge

This model has the following MTI trace components:

Table 3-51: PVBusBridge MTI instances

InstanceName	ComponentName
PVBusBridge	PVBusBridge

Ports for PVBusBridge

Table 3-52: Ports

Name	Protocol	Type	Description
control	PVBusBridgeControl	Slave	Control signal.
device	PVDevice	Master	Optimised connection out to devices.
dump_dmi	Signal	Slave	On the assert of this signal the bridge will dump dmi cache content into a csv file
pdbus_s	PVBus	Slave	Connection in from bus master.
reset	Signal	Slave	On the assert of this signal, a reset of the bus slave will be latched this is used by the bus deadlock detection logic.

3.2.23 SC_ClockSignal2ClockSignal

SystemC ClockSignal to ClockSignal converter. This model is written in LISA+.

Iris and MTI instances for SC_ClockSignal2ClockSignal

This model has the following Iris instances:

Table 3-53: SC_ClockSignal2ClockSignal Iris instances

InstanceName	ComponentName
SC_ClockSignal2ClockSignal	SC_ClockSignal2ClockSignal

SC_ClockSignal2ClockSignal contains the following CADI targets:

- SC_ClockSignal2ClockSignal

Ports for SC_ClockSignal2ClockSignal

Table 3-54: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Master	-
sc_clk_in	SC_ClockSignal	Slave	-

3.2.24 SGSignal2AMBAPVSignal

SystemGenerator Signal to AMBA-PV Signal protocol converter. This model is written in LISA+.

Iris and MTI instances for SGSignal2AMBAPVSignal

This model has the following Iris instances:

Table 3-55: SGSignal2AMBAPVSignal Iris instances

InstanceName	ComponentName
SGSignal2AMBAPVSignal	SGSignal2AMBAPVSignal

Variants of this component also exist with multiple input and output ports.

Ports for SGSignal2AMBAPVSignal

Table 3-56: Ports

Name	Protocol	Type	Description
amba_pv_signal_m	AMBAPVSignal	Master	Output master port for connection to top-level AMBAPVSignal master port. Converted signal state changes are sent out through this port.
sg_signal_s	Signal	Slave	Handles incoming signal state changes.

3.2.25 SGStateSignal2AMBAPVSignalState

SystemGenerator StateSignal to AMBA-PV SignalState protocol converter. This model is written in LISA+.

Iris and MTI instances for SGStateSignal2AMBAPVSignalState

This model has the following Iris instances:

Table 3-57: SGStateSignal2AMBAPVSignalState Iris instances

InstanceName	ComponentName
SGStateSignal2AMBAPVSignalState	SGStateSignal2AMBAPVSignalState

Variants of this component also exist with multiple input and output ports.

Ports for SGStateSignal2AMBAPVSignalState

Table 3-58: Ports

Name	Protocol	Type	Description
amba_pv_signal_m	AMBAPVSignalState	Master	Output master port for connection to top-level AMBAPVValue64 master port. Converted value changes are sent out through this port.
sg_signal_s	StateSignal	Slave	Handles incoming value changes.

3.2.26 SGValue2AMBAPVValue

SystemGenerator Value to AMBA-PV Value protocol converter. This model is written in LISA+.

Iris and MTI instances for SGValue2AMBAPVValue

This model has the following Iris instances:

Table 3-59: SGValue2AMBAPVValue Iris instances

InstanceName	ComponentName
SGValue2AMBAPVValue	SGValue2AMBAPVValue

Variants of this component also exist with multiple input and output ports.

Ports for SGValue2AMBAPVValue

Table 3-60: Ports

Name	Protocol	Type	Description
amba_pv_value_m	AMBAPVValue	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	Value	Slave	Handles incoming value changes.

3.2.27 SGValue2AMBAPVValue64

SystemGenerator Value_64 to AMBA-PV Value64 protocol converter. This model is written in LISA+.

Iris and MTI instances for SGValue2AMBAPVValue64

This model has the following Iris instances:

Table 3-61: SGValue2AMBAPVValue64 Iris instances

InstanceName	ComponentName
SGValue2AMBAPVValue64	SGValue2AMBAPVValue64

Variants of this component also exist with multiple input and output ports.

Ports for SGValue2AMBAPVValue64

Table 3-62: Ports

Name	Protocol	Type	Description
amba_pv_value_m	AMBAPVValue64	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	Value_64	Slave	Handles incoming value changes.

3.2.28 SGValueState2AMBAPVValueState

SystemGenerator ValueState to AMBA-PV ValueState protocol converter. This model is written in LISA+.

Iris and MTI instances for SGValueState2AMBAPVValueState

This model has the following Iris instances:

Table 3-63: SGValueState2AMBAPVValueState Iris instances

InstanceName	ComponentName
SGValueState2AMBAPVValueState	SGValueState2AMBAPVValueState

Variants of this component also exist with multiple input and output ports.

Ports for SGValueState2AMBAPVValueState

Table 3-64: Ports

Name	Protocol	Type	Description
amba_pv_value_m	AMBAPVValueState	Master	Output master port for connection to top-level AMBAPVValue master port. Converted value changes are sent out through this port.
sg_value_s	ValueState	Slave	Handles incoming value changes.

3.2.29 SGValueState2AMBAPVValueState64

SystemGenerator ValueState_64 to AMBA-PV ValueState64 protocol converter. This model is written in LISA+.

Iris and MTI instances for SGValueState2AMBAPVValueState64

This model has the following Iris instances:

Table 3-65: SGValueState2AMBAPVValueState64 Iris instances

InstanceName	ComponentName
SGValueState2AMBAPVValueState64	SGValueState2AMBAPVValueState64

Variants of this component also exist with multiple input and output ports.

Ports for SGValueState2AMBAPVValueState64

Table 3-66: Ports

Name	Protocol	Type	Description
amba_pv_value_m	AMBAPVValueState64	Master	Output master port for connection to top-level AMBAPVValue64 master port. Converted value changes are sent out through this port.
sg_value_s	ValueState_64	Slave	Handles incoming value changes.

3.2.30 SMMUv3AEMIdentify2AMBAPVValue64

SMMUv3AEMIdentify to AMBA-PV Value64 protocol converter. This model is written in LISA+.

Iris and MTI instances for SMMUv3AEMIdentify2AMBAPVValue64

This model has the following Iris instances:

Table 3-67: SMMUv3AEMIdentify2AMBAPVValue64 Iris instances

InstanceName	ComponentName
SMMUv3AEMIdentify2AMBAPVValue64	SMMUv3AEMIdentify2AMBAPVValue64

Ports for SMMUv3AEMIdentify2AMBAPVValue64

Table 3-68: Ports

Name	Protocol	Type	Description
identify	SMMUv3AEMIdentifyProtocol	Slave	SMMUv3AEMIdentifyProtocol input.
identify_reply	AMBAPVValue64	Slave	From SystemC.
identify_request	AMBAPVValue64	Master	To SystemC.

3.2.31 SystemC2Clock

Clock to SystemC Converter. This model is written in LISA+.

Iris and MTI instances for SystemC2Clock

This model has the following Iris instances:

Table 3-69: SystemC2Clock Iris instances

InstanceName	ComponentName
SystemC2Clock	SystemC2Clock

SystemC2Clock contains the following CADI targets:

- SystemC2Clock

Ports for SystemC2Clock

Table 3-70: Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Master	ClockSignal output
current_ticks_m	AMBAPVValueState64	Master	To SystemC.
get_clock_m	AMBAPVValueState64	Master	To SystemC.
rate_in_Hz_m	AMBAPVValueState64	Master	To SystemC.
set_clock_s	AMBAPVValue64	Slave	From SystemC.

3.2.32 SystemC2CprocBus

SystemCCoprocBusProtocol to CoprocBusProtocol converter. This model is written in LISA+.

Iris and MTI instances for SystemC2CprocBus

This model has the following Iris instances:

Table 3-71: SystemC2CprocBus Iris instances

InstanceName	ComponentName
SystemC2CprocBus	SystemC2CprocBus

SystemC2CprocBus contains the following CADI targets:

- SystemC2CprocBus

Ports for SystemC2CprocBus

Table 3-72: Ports

Name	Protocol	Type	Description
coproc_bus_m	CoprocBusProtocol	Master	-
sc_coproc_bus_s	SystemCCoprocBusProtocol	Slave	-

3.2.33 SystemC2CounterInterface

SystemC to CounterInterface Converter. This model is written in LISA+.

Iris and MTI instances for SystemC2CounterInterface

This model has the following Iris instances:

Table 3-73: SystemC2CounterInterface Iris instances

InstanceName	ComponentName
SystemC2CounterInterface	SystemC2CounterInterface

SystemC2CounterInterface contains the following CADI targets:

- SystemC2CounterInterface

Ports for SystemC2CounterInterface

Table 3-74: Ports

Name	Protocol	Type	Description
amba_pv_eventUpdate_s	AMBAPVValue	Slave	From SystemC.
amba_pv_getCounterValue_m	AMBAPVValueState64	Master	To SystemC.
amba_pv_requestEventUpdate_m	AMBAPVValue64	Master	To SystemC.
amba_pv_requestSignalUpdate_m	AMBAPVValue64	Master	To SystemC.
amba_pv_setEnabled_s	AMBAPVValue	Slave	From SystemC.
amba_pv_signalUpdate_s	AMBAPVValue	Slave	From SystemC.
cntvalueb	CounterInterface	Master	-

3.2.34 SystemC2InstructionCount

SystemC to InstructionCount Converter. This model is written in LISA+.

Iris and MTI instances for SystemC2InstructionCount

This model has the following Iris instances:

Table 3-75: SystemC2InstructionCount Iris instances

InstanceName	ComponentName
SystemC2InstructionCount	SystemC2InstructionCount

SystemC2InstructionCount contains the following CADI targets:

- SystemC2InstructionCount

Variants of this component also exist with multiple input and output ports.

Ports for SystemC2InstructionCount

Table 3-76: Ports

Name	Protocol	Type	Description
inst_count	AMBAPVValueState64	Master	To SystemC to request instruction count.
run_state	AMBAPVValueState	Master	To SystemC to request run state.
ticks	InstructionCount	Master	InstructionCount input.

3.2.35 SystemC2LCD

Converts SystemC to LCD protocol. This model is written in LISA+.

Iris and MTI instances for SystemC2LCD

This model has the following Iris instances:

Table 3-77: SystemC2LCD Iris instances

InstanceName	ComponentName
SystemC2LCD	SystemC2LCD

SystemC2LCD contains the following CADI targets:

- SystemC2LCD

Ports for SystemC2LCD

Table 3-78: Ports

Name	Protocol	Type	Description
all_received_sPL	AMBAPVSignal	Slave	From SystemC.
all_received_u	AMBAPVSignal	Slave	From SystemC.
lcd_m	LCD	Master	LCD output.
lock_s	AMBAPVValueState64	Slave	From SystemC.
setPreferredLayout_d	AMBAPVValue	Slave	From SystemC.
setPreferredLayout_h	AMBAPVValue	Slave	From SystemC.
setPreferredLayout_w	AMBAPVValue	Slave	From SystemC.
unlock_s	AMBAPVSignal	Slave	From SystemC.
update_h	AMBAPVValue	Slave	From SystemC.
update_w	AMBAPVValue	Slave	From SystemC.

response_s	AMBAPVSignal	Slave	From SystemC.
v7_vgic_config_s	v7_VGIC_Configuration_Protocol	Slave	v7_VGIC_Configuration_Protocol input.

3.3 Bus components

This section describes the Bus components.

PVBus is the bus protocol that is used to model all memory-like buses in Fast Models. PVBus is an internal protocol. The PVBus components, which abstract the internal details, are the interface to the PVBus API.

PVBus components provide functionally accurate communication between bus masters and slaves. They are not software implementations of specific hardware, but instead are abstract components that are required by the software model environment.

There is no modeling of handshaking or cycle counts. By removing this level of detail, and by using efficient internal communication mechanisms, PVBus components can provide very fast modeling of bus accesses. You must use these components correctly to achieve high simulation speeds.

Each bus master must contain a `PVBusMaster` subcomponent, and each bus slave must contain a `PVBusSlave` subcomponent. These subcomponents provide `PVBus` master and slave ports. Each `PVBus` master port can only connect to one slave, but any number of other masters can connect to the same slave. `PVBusDecoder`, `PVBusMaster` and `PVBusSlave` components communicate using the `PVBus` protocol.

`PVBusDecoder` components can be added to the bus system. Each of these permits its masters to connect to multiple slaves, each associated with a different bus address range.

`PVBusSlave` subcomponents provide built-in support for declaring memory-like, device-like, abort or ignore address ranges. `PVBus` has support for dealing efficiently with memory-like devices such as RAM, ROM, and Flash.

Figure 3-1: Sample bus topology

All communication over the `PVBus` is performed using transactions that are generated by `PVBusMaster` subcomponents and fulfilled by `PVBusSlave` components. Transactions have a 32-bit Master ID, which is the ID of the bus master. Transactions can be routed to the slave device through its `PVBusSlave` subcomponent. When configured, the `PVBusSlave` can handle memory-like transactions efficiently without having to route these transactions to the slave device. Transactions are atomic unless slave devices block transactions, for example an SMMU with stall mode enabled. A slave device that can block transactions and all its upstream bus components must be re-entrant safe for bus transactions.

Fast Models provides some example `PVBus` systems:

- `$PVLIB_HOME/examples/LISA/common/LISA/RemapDecoder.lisa`. This example dynamically modifies routing of requests based on a remap signal, using the `tzswitch` component.
- The directory `$PVLIB_HOME/examples/LISA/BusComponents/` contains a set of example components that show various ways of using the `PVBus` interface.

3.3.1 Labeller

This model is written in LISA+.

Iris and MTI instances for Labeller

This model has the following Iris instances:

Table 3-91: Labeller Iris instances

InstanceName	ComponentName
Labeller	Labeller
Labeller.pvbusmodifier	PVBusMapper

This model has the following MTI trace components:

Table 3-92: Labeller MTI instances

InstanceName	ComponentName
Labeller.pvbusmodifier	PVBusMapper

Labeller contains the following CADI targets:

- Labeller

About Labeller

Labeller and LabellerForDMA330 are utility components that allow the system designer to embed values into the Label field for transactions generated by a Bus Master. They are located between PVBus Master and Slave ports.

As FastModels have no direct concept of AXI ID, those components that use AXI ID information have to use a proxy for it.

We use the top 16 bits of the component's `MasterID` to store a label (see `PVMemoryAttributes.h`)

Those components that need to know an analog of AXI ID should have a configurable mapping from 'label' to its internal representation of AXI ID.

When assembling a SoC the designer has to place a labeller under every component that has to be distinguished and assign it a unique label.

The following example creates a labeller to add an ID for an HDLCD controller that is upstream of a TZC_400. The system designer specifies a unique set of IDs for use as Non-Secure Access IDs (NSAIDs) in the TZC_400. The labeller can insert these IDs directly into the transaction.

```
pl370_hdlcd : PL370_HDLCDC();
hdlcd_labeller : Labeller( "label" = 2 );
pl370_hdlcd.pvbus_m => hdlcd_labeller.pvbus_s;
hdlcd_labeller.pvbus_m => output_bus.pvbus_s;
```

Ports for Labeller

Table 3-93: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for Labeller

label

Type

int

Default value

0x0

The label to apply to all transactions flowing through the labeller.

3.3.2 LabellerForDMA330

This model is written in LISA+.

Iris and MTI instances for LabellerForDMA330

This model has the following Iris instances:

Table 3-94: LabellerForDMA330 Iris instances

InstanceName	ComponentName
LabellerForDMA330	LabellerForDMA330
LabellerForDMA330.pvbusmapper	PVBusMapper

This model has the following MTI trace components:

Table 3-95: LabellerForDMA330 MTI instances

InstanceName	ComponentName
LabellerForDMA330.pvbusmapper	PVBusMapper

LabellerForDMA330 contains the following CADI targets:

- LabellerForDMA330

About LabellerForDMA330

As FastModels have no direct concept of AXI ID those components that use AXI ID information have to use a proxy for it.

We use the top 16 bits of the component's `MasterID` to store a label (see `PVMemoryAttributes.h`)

Those components that need to know an analog of AXI ID should have a configurable mapping from `label` to its internal representation of AXI ID.

When assembling a SoC the designer has to place a Labeller under every component that has to be distinguished and assign it a unique label.

This specific labeller understands the `MasterID` used by the instruction stream and uses a different label for it. It also provides the option of discriminating the DMA-330 data channels.

Ports for LabellerForDMA330

Table 3-96: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for LabellerForDMA330

dma330_data_label**Type**

int

Default value

0x0

The label to apply to all _data_ transactions flowing through the labeller. Used as a base value in conjunction with the channel ID if data-channel discrimination is enabled.

dma330_discriminate_data_channels**Type**

bool

Default value

0x0

Discriminate between DMA-330 data channels. Channel ID is added to the data label.

dma330_ns_instruction_label**Type**

int

Default value

0x0

The label to apply to all non-secure _instructions_ transactions flowing through the labeller.

dma330_s_instruction_label**Type**

int

Default value

0x0

The label to apply to all secure _instructions_ transactions flowing through the labeller.

3.3.3 LabellerForDMA330_cpp

This model is written in C++.

Iris and MTI instances for LabellerForDMA330_cpp

This model has the following Iris instances:

Table 3-97: LabellerForDMA330_cpp Iris instances

InstanceName	ComponentName
LabellerForDMA330_cpp	LabellerForDMA330
LabellerForDMA330_cpp.PVBusMapper	PVBusMapper

This model has the following MTI trace components:

Table 3-98: LabellerForDMA330_cpp MTI instances

InstanceName	ComponentName
LabellerForDMA330_cpp.PVBusMapper	PVBusMapper

LabellerForDMA330_cpp contains the following CADI targets:

- LabellerForDMA330

Ports for LabellerForDMA330_cpp

Table 3-99: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for LabellerForDMA330_cpp

dma330_data_label

Type

int

Default value

0x0

The label to apply to all _data_ transactions flowing through the labeller. Used as a base value in conjunction with the channel ID if data-channel discrimination is enabled.

dma330_discriminate_data_channels

Type

bool

Default value

0x0

Discriminate between DMA-330 data channels. Channel ID is added to the data label.

dma330_ns_instruction_label

Type
int
Default value
0x0

The label to apply to all non-secure _instructions_ transactions flowing through the labeller.

dma330_s_instruction_label

Type
int
Default value
0x0

The label to apply to all secure _instructions_ transactions flowing through the labeller.

3.3.4 LabellerForGPUProtMode

This model is written in LISA+.

Iris and MTI instances for LabellerForGPUProtMode

This model has the following Iris instances:

Table 3-100: LabellerForGPUProtMode Iris instances

InstanceName	ComponentName
LabellerForGPUProtMode	LabellerForGPUProtMode
LabellerForGPUProtMode.pvbusmodifier	PVBusMapper

This model has the following MTI trace components:

Table 3-101: LabellerForGPUProtMode MTI instances

InstanceName	ComponentName
LabellerForGPUProtMode.pvbusmodifier	PVBusMapper

LabellerForGPUProtMode contains the following CADI targets:

- LabellerForGPUProtMode

About LabellerForGPUProtMode

This component adds Non-Secure Access IDs (NSAIDs) to the transactions generated by the GPU. The NSAID is a four-bit number. It allows other components, such as a TrustZone Controller

(TZC) or a Dynamic Memory Controller (DMC) to filter transactions and control access to memory regions that are designated as protected.

Certain Bifrost GPUs support a protected mode of operation intended to stop valuable or 'protected' data, for example the decoded frames of a DRM protected movie being written to memory that is generally accessible.

They tell the rest of the system they are in this mode by setting the signal `PROTMODE`.

External hardware outside the GPU must respond to this by making whatever adjustment is required to ensure the content goes to memory that is not generally accessible.

This labeller represents such hardware in an effort to ensure it is not forgotten in the corresponding RTL.

Ports for LabellerForGPUProtMode

Table 3-102: Ports

Name	Protocol	Type	Description
<code>prot_mode</code>	Signal	Slave	Input to determine whether output is supposed to be protected or not
<code>pvbuse_m</code>	PVBus	Master	Output with modified MasterID.
<code>pvbuse_s</code>	PVBus	Slave	Unmodified input.

Parameters for LabellerForGPUProtMode

`gpu_id_normal`

Type

int

Default value

0x0

NSAID to apply to all transactions flowing through the labeller when `prot_mode` is low.

`gpu_id_protected`

Type

int

Default value

0x0

NSAID to apply to all transactions flowing through the labeller when `prot_mode` is high.

3.3.5 LabellerForGPUProtMode_cpp

This model is written in C++.

Iris and MTI instances for LabellerForGPUProtMode_cpp

This model has the following Iris instances:

Table 3-103: LabellerForGPUProtMode_cpp Iris instances

InstanceName	ComponentName
LabellerForGPUProtMode_cpp	LabellerForGPUProtMode
LabellerForGPUProtMode_cpp.PVBusModifier	PVBusMapper

This model has the following MTI trace components:

Table 3-104: LabellerForGPUProtMode_cpp MTI instances

InstanceName	ComponentName
LabellerForGPUProtMode_cpp.PVBusModifier	PVBusMapper

LabellerForGPUProtMode_cpp contains the following CADI targets:

- LabellerForGPUProtMode

Ports for LabellerForGPUProtMode_cpp

Table 3-105: Ports

Name	Protocol	Type	Description
prot_mode	Signal	Slave	Input to determine whether output is supposed to be protected or not
pvbus_m	PVBus	Master	Output with modified MasterID.
pvbus_s	PVBus	Slave	Unmodified input.

Parameters for LabellerForGPUProtMode_cpp

gpu_id_normal

Type

int

Default value

0x0

NSAID to apply to all transactions flowing through the labeller when prot_mode is low.

gpu_id_protected

Type

int

Default value

0x0

NSAID to apply to all transactions flowing through the labeller when `prot_mode` is high.

3.3.6 Labeller_cpp

This model is written in C++.

Iris and MTI instances for Labeller_cpp

This model has the following Iris instances:

Table 3-106: Labeller_cpp Iris instances

InstanceName	ComponentName
Labeller_cpp	Labeller
Labeller_cpp.PVBusModifier	PVBusMapper

This model has the following MTI trace components:

Table 3-107: Labeller_cpp MTI instances

InstanceName	ComponentName
Labeller_cpp.PVBusModifier	PVBusMapper

Labeller_cpp contains the following CADI targets:

- Labeller

Ports for Labeller_cpp

Table 3-108: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	-
pvbus_s	PVBus	Slave	-

Parameters for Labeller_cpp

label

Type

int

Default value

0x0

The label to apply to all transactions flowing through the labeller.

3.3.7 MSIRewriter

Recognise writes to the GITS_TRANSLATER register and rewrite them to go to the GITS_TRANSLATE64R register. The DeviceID is expected to be in the bottom 32 bits of ExtendedID of the transaction. Debug transactions and reads are not rewritten. This component can also, optionally, apply a 16 bit 'label' to the top 16 bits of the MasterID in the same way that the Labeller component does. This model is written in LISA+.

Iris and MTI instances for MSIRewriter

This model has the following Iris instances:

Table 3-109: MSIRewriter Iris instances

InstanceName	ComponentName
MSIRewriter	MSIRewriter
MSIRewriter.mapper	PVBusMapper
MSIRewriter.pvbusmaster	PVBusMaster
MSIRewriter.pvbusslave	PVBusSlave

This model has the following MTI trace components:

Table 3-110: MSIRewriter MTI instances

InstanceName	ComponentName
MSIRewriter	MSIRewriter
MSIRewriter.mapper	PVBusMapper
MSIRewriter.pvbusmaster	PVBusMaster
MSIRewriter.pvbusslave	PVBusSlave

MSIRewriter contains the following CADI targets:

- MSIRewriter

About MSIRewriter

MSIRewriter is a component that implements the functionality of the MSI-64 Encapsulator in GIC IP, for example GIC-700. For more information about GIC-700, see [GIC-700 Technical Reference Manual](#). For the GIC architecture specification version 3 and version 4, see [GIC Architecture Specification](#).

If an MSIRewriter component is used, it converts writes to the GITS_TRANSLATER register to writes to a model-only register called GITS_TRANSLATE64R. GITS_TRANSLATE64R holds the DeviceID in the upper 32 bits and the EventID in the lower 32 bits. The lower 32 bits of GITS_TRANSLATE64R correspond to the GITS_TRANSLATER register.

The GITS_TRANSLATER register is in a page by itself except for the GITS_TRANSLATE64R register.

Any 16/32 bit, single beat write to `GITS_TRANSLATER` is rewritten to a 64 bit write to `GITS_TRANSLATE64R` where the top 32 bits represent the DeviceID and are assumed to come from the bottom 32 bits of ExtendedID.

Ports for MSIRewriter

Table 3-111: Ports

Name	Protocol	Type	Description
<code>pvbus_m</code>	PVBus	Master	-
<code>pvbus_s</code>	PVBus	Slave	-

Parameters for MSIRewriter

`GITS_TRANSLATE64R_OFFSET`

Type

int

Default value

0x10048

It is an offset from ITS0-Base.

`ITS0-base`

Type

int

Default value

0x0

Register base address for ITS0. This base address is used to recognise writes to the `GITS_TRANSLATER` register within the ITS0's register frame.

`enable_rewriting`

Type

bool

Default value

0x1

Enable rewriting.

`label`

Type

int

Default value

0xffffffff

If $< 2^{16}$ then this is a label that is put in the top 16 bits of MasterID in the same way that the component Labeller does. This labelling is not controlled by enable_rewriting and is performed on all transactions (even rewritten ones).

log

Type

int

Default value

0x0

Log level, 0 is off.

3.3.8 PASSwitch

Allow transactions from Realm Management Extension(RME) worlds (realm/root/secure/non_secure) to be routed separately. This model is written in C++.

Ports for PASSwitch

Table 3-112: Ports

Name	Protocol	Type	Description
control	PASSwitchControl	Slave	Controls routing of transactions
pvbus_m[4]	PVBus	Master	Manager ports of PASSwitch
pvbus_s	PVBus	Slave	Subordinate port of PASSwitch

Parameters for PASSwitch

non_secure_port_index

Type

int32_t

Default value

1

Port Index for Non-Secure world transactions to exit or:

-2

IGNORE

-1

ABORT

port_map_json

Type

string

Default value

""

A JSON value describing ports for different address regions.

The begin address and size values should be aligned to 4KiB. The format is as follows:

```
[
  {
    "begin": 0x0,
    "size": 0x1000,
    "port": 0
  },
  {
    "begin": 0x20000,
    "size": 0x5000,
    "port": 2
  }
]
```

realm_port_index**Type**

int32_t

Default value

3

Port Index for Realm world transactions to exit or:

-2

IGNORE

-1

ABORT

root_port_index**Type**

int32_t

Default value

2

Port Index for Root world transactions to exit or:

-2

IGNORE

-1

ABORT

secure_port_index**Type**

int32_t

Default value

0

Port Index for Secure world transactions to exit or:

-2

IGNORE

-1

ABORT

3.3.9 PVBUS4KBTo1KBSplitter

Takes 4KB of address range input on slave port and routes each 1KB to four different master ports. This model is written in LISA+.

Iris and MTI instances for PVBUS4KBTo1KBSplitter

This model has the following Iris instances:

Table 3-113: PVBUS4KBTo1KBSplitter Iris instances

InstanceName	ComponentName
PVBUS4KBTo1KBSplitter	PVBUS4KBTo1KBSplitter
PVBUS4KBTo1KBSplitter.input_slave	PVBUSSlave
PVBUS4KBTo1KBSplitter.output_master0	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master1	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master2	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master3	PVBUSMaster

This model has the following MTI trace components:

Table 3-114: PVBUS4KBTo1KBSplitter MTI instances

InstanceName	ComponentName
PVBUS4KBTo1KBSplitter.input_slave	PVBUSSlave
PVBUS4KBTo1KBSplitter.output_master0	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master1	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master2	PVBUSMaster
PVBUS4KBTo1KBSplitter.output_master3	PVBUSMaster

PVBUS4KBTo1KBSplitter contains the following CADI targets:

- PVBUS4KBTo1KBSplitter

About PVBus4KBTo1KBSplitter

The purpose of this component is to allow an upstream component to access four downstream components in the same 4KB address range. It splits the 4KB range from 0 to 0xfff into the following four 1KB ranges, which allows four different components to be attached to the 4KB range:

- 0x0-0x3ff
- 0x400-0x7ff
- 0x800-0xbff
- 0xc00-0xfff

This overcomes a limitation of PVBus which only allows components to be attached to memory addresses that are a multiple of 4KB in size.

The forwarded transactions have an address re-aligned with 1KB boundary in the range 0, 0x3FF. For example address 0x0402 becomes address 0x002 of the second peripheral, which is the one attached to pvbus_m[1].

Limitations

Unaligned transactions that cross the boundaries between two peripherals are not supported. For example, when unaligned transactions are enabled by your models, you can access two double words at address 0x03ed, but you cannot access two double words at address 0x3f7.

Ports for PVBus4KBTo1KBSplitter

Table 3-115: Ports

Name	Protocol	Type	Description
pvbus_m[4]	PVBus	Master	The four downstream ports to be connected to peripherals. Each port covers 1KiB of the address space. Output address on each port will be in the range 0x0 - 0x03FF.
pvbus_s	PVBus	Slave	The upstream port. Accepts addresses in range 0x0 - 0x0FFF. Outside of this range transactions will abort.

3.3.10 PVBusCache

A PVBusCache manages cache-line data and supports forwarding of transactions. This model is written in C++.

Ports for PVBusCache

Table 3-116: Ports

Name	Protocol	Type	Description
bus_in[4]	PVBus	Slave	Connections in from bus master.
bus_out[4]	PVBus	Master	Connections out to bus slaves.
control	PVBusCacheControl	Slave	Configuration/control port.

Name	Protocol	Type	Description
device	PVBusCacheDevice	Master	Connection out to cache device.

3.3.11 PVBusDecoder

A PVBusDecoder allows bus transactions to be routed to one of many slaves, based on the address given in the transaction. This model is written in C++.

About PVBusDecoder

Each slave connection is associated with a specific address range on the `pdbus_m_range` port. In LISA+, the syntax for this is:

```
decoder.pdbus_m_range[start..end] = slave.pdbus
```

The values for start (inclusive) and end (inclusive) must specify a 4KB-aligned region of a multiple of 4K bytes. You can specify an address range for the slave, where the decoder remaps addresses into the appropriate range. The default address range for a slave is $[0-(\text{sizeofMasterRange} - 1)]$.

Examples of usage:

```
component PlatformDecoder
{
    slave port<PVBus> pdbus_s;
    master port<PVBus> sdram;
    master port<PVBus> flash;
    master port<PVBus> uart;

    composition
    {
        pvdecoder : PVBusDecoder;
    }

    connection
    {
        self.pdbus_s => pvdecoder.pdbus_s;
        pvdecoder.pdbus_m_range[0x000000..0x0ffffff] => sdram;
        pvdecoder.pdbus_m_range[0x100000..0x1ffffff] => flash;
        pvdecoder.pdbus_m_range[0x200000..0x2ffffff] => uart;
        pvdecoder.pdbus_m_range[0xff0000..0xffffffff] => sdram[0x070000..0x07ffff];
    }
}
```

Ports for PVBusDecoder

Table 3-117: Ports

Name	Protocol	Type	Description
pdbus_m_range	PVBus	Master	Specifies the address range for the bus master. The range must be 4KB aligned and a multiple of 4KB in size. If the address range is larger than the size of the slave device, the slave is aliased.
pdbus_s	PVBus	Slave	Accepts incoming transactions. Connect this port to a bus master, or to the output of another bus decoder.

3.3.12 PVBusExclusiveMonitor

Global exclusive monitor. This model is written in C++.

Iris and MTI instances for PVBusExclusiveMonitor

This model has the following Iris instances:

Table 3-118: PVBusExclusiveMonitor Iris instances

InstanceName	ComponentName
PVBusExclusiveMonitor	PVBusExclusiveMonitor

PVBusExclusiveMonitor	PVBusExclusiveMonitor
PVBusExclusiveMonitor.bus_mapper	PVBusMapper

PVBusExclusiveMonitor contains the following CADI targets:

- PVBusExclusiveMonitor

Ports for PVBusExclusiveMonitor

Table 3-120: Ports

Name	Protocol	Type	Description
excl_cleared	Signal	Master	Exclusive monitor clear signal port.
pdbus_m	PVBus	Master	Bus master port.
pdbus_s	PVBus	Slave	Bus slave port.

Parameters for PVBusExclusiveMonitor

apply_access_width_criteria_to_non_excl_stores

Type

bool

Default value

0x1

Apply the given exclusive store width matching criteria to non-exclusive stores.

clear_on_strex_address_mismatch

Type

bool

Default value

0x1

Whether monitor is cleared when strex fails due to address mismatch.

enable_component**Type**

bool

Default value

0x1

Enable component.

exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Monitor atomics from the same master.

log2_granule_size**Type**

int

Default value

0x0

log2 of address granule size.

match_access_width**Type**

bool

Default value

0x0

Fail STREX if not the same access width as LDREX.

match_secure_state**Type**

bool

Default value

0x1

Treat the secure state like an address bit.

monitor_access_level

Type

uint32_t

Default value

0

Which accesses to monitor:

0

Monitor all accesses

1

Monitor all accesses except WriteBack

2

Only monitor accesses with memory type NonCacheable or Device

monitor_non_excl_stores

Type

bool

Default value

0x0

Monitor non-exclusive stores from the same master.

number_of_monitors

Type

int

Default value

0x8

Number of monitors.

shareability_domain

Type

unsigned

Default value

3

Maximum shareability domain of interest, transactions outside of the domain will pass through un-monitored

0

non-shared

- 1
inner
- 2
outer
- 3
system

3.3.13 PVBusExclusiveSquasher

Squashes the exclusive attribute on bus transactions. This model is written in LISA+.

Iris and MTI instances for PVBusExclusiveSquasher

This model has the following Iris instances:

Table 3-121: PVBusExclusiveSquasher Iris instances

Ports for PVBusLogger

Table 3-129: Ports

Name	Protocol	Type	Description
pdbus_m	PVBus	Master	Bus master port.
pdbus_s	PVBus	Slave	Bus slave port.

Parameters for PVBusLogger

trace_debug

Type

bool

Default value

0x0

Enable tracing of debug transactions.

trace_snoops

Type

bool

Default value

0x0

Enable tracing of ACE snoop requests.

3.3.16 PVBusMapper

Allow transactions to be remapped arbitrarily. This model is written in C++.

Iris and MTI instances for PVBusMapper

This model has the following Iris instances:

Table 3-130: PVBusMapper Iris instances

InstanceName	ComponentName
PVBusMapper	PVBusMapper

This model has the following MTI trace components:

Table 3-131: PVBusMapper MTI instances

InstanceName	ComponentName
PVBusMapper	PVBusMapper

About PVBUSMapper

This component is similar to `PVBusModifier`, but in addition:

- It has multiple downstream ports
- It allows routing of transactions to any one of these ports
- It allows arbitrary remapping of transaction addresses and attributes

As a generic modeling component, it does not have a hardware revision code.

For an example of how to use `PVBusMapper`, SEE `$PVLIB_HOME/examples/LISAPlus/RemappingWithPVBusMapper/`.

Ports for PVBUSMapper

Table 3-132: Ports

Name	Protocol	Type	Description
control	PVBusMapperControl	Master	Configuration port to determine mappings.
pvbus_m[64]	PVBus	Master	Bus master ports.
pvbus_s	PVBus	Slave	Bus slave port.
reset	Signal	Slave	Reset signal.

3.3.17 PVBusMaster

The `PVBusMaster` subcomponent allows a device to generate PVBus transactions. This model is written in C++.

Iris and MTI instances for PVBusMaster

This model has the following Iris instances:

Table 3-133: PVBusMaster Iris instances

InstanceName	ComponentName
PVBusMaster	PVBusMaster

This model has the following MTI trace components:

Table 3-134: PVBusMaster MTI instances

InstanceName	ComponentName
PVBusMaster	PVBusMaster

About PVBusMaster

The `PVBusMaster` subcomponent allows a device to generate PVBus transactions. It does this by providing a control port that allows a component to instantiate `pv::TransactionGenerator` objects. These objects can be used to generate bus transactions.

See `PVTransactionMasterProtocol.lisa` for details.

A bus mastering component should connect the `pdbus_m` port to its own bus port.

Example:

```
component DmaTransfer
{
  master port<PVBUS> pdbus_m;
  master port<PVTransactionMaster> busmaster_control;
  composition {
    busmaster : PVBUSMaster;
  }
  resources {
    pv::TransactionGenerator* stream_in;
    pv::TransactionGenerator* stream_out;
  }
  connection {
    busmaster.pdbus_m => self.pdbus_m;
    self.busmaster_control => busmaster.control;
  }
  behaviour init() {
    stream_in = busmaster_control.createTransactionGenerator();
    stream_out = busmaster_control.createTransactionGenerator();
    composition.init();
  }
  behaviour terminate() {
    delete stream_in;
    delete stream_out;
    composition.terminate();
  }
  behaviour transfer(pv::bus_addr_t start,
                    pv::bus_addr_t end,
                    pv::bus_addr_t destination)
  {
    uint32_t data;
    bool ok = true;
    while (ok && start < end) {
      ok = stream_in->read32(start, &data);
      if (ok) {
        ok = stream_out->write32(destination, &data);
      }
      start += 4;
      destination += 4;
    }
  }
}
```

Ports for PVBUSMaster

Table 3-135: Ports

Name	Protocol	Type	Description
control	PVTransactionMaster	Slave	Enables the owning component to instantiate <code>pv::TransactionGenerator</code> objects.
pdbus_m	PVBUS	Master	Sends out generated transactions to the bus.
reset	Signal	Slave	On the de-assert of this signal, a reset of the bus master will be latched this is used by the bus deadlock detection logic.

3.3.18 PVBusModifier

Allow transactions to be remapped arbitrarily. This model is written in C++.

Iris and MTI instances for PVBusModifier

This model has the following Iris instances:

Table 3-136: PVBusModifier Iris instances

InstanceName	ComponentName
PVBusModifier	PVBusMapper

This model has the following MTI trace components:

Table 3-137: PVBusModifier MTI instances

InstanceName	ComponentName
PVBusModifier	PVBusMapper

About PVBusModifier

Allow the connections to be modified through the component.

When a transaction is made to a 4 KiB address region, then the transaction is made through a channel, and if one doesn't exist then it must create one. The channel creation request is made with the specific attributes of the transaction and it is up to the system to determine where the end point of that channel should be.

This component allows you to intercept the channel creation process and change the attributes for that channel as it flows through this component.

For example, you could remap the address, or the attributes, or both.

Note

Channels are created and destroyed for any reason and so for a simulation to be deterministic then the component should always remap channels idempotently.

Ports for PVBusModifier

Table 3-138: Ports

Name	Protocol	Type	Description
control	PVBusMapperControl	Master	Configuration port to determine mappings.
pvbus_m	PVBus	Master	Bus master port.
pvbus_s	PVBus	Slave	Bus slave port.
reset	Signal	Slave	Reset signal.

3.3.19 PVBusRouter

Allow transactions to be routed arbitrarily. This model is written in LISA+.

Iris and MTI instances for PVBusRouter

This model has the following Iris instances:

Table 3-139: PVBusRouter Iris instances

InstanceName	ComponentName
PVBusRouter	PVBusRouter
PVBusRouter.mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-140: PVBusRouter MTI instances

InstanceName	ComponentName
PVBusRouter.mapper	PVBusMapper

PVBusRouter contains the following CADI targets:

- PVBusRouter

Ports for PVBusRouter

Table 3-141: Ports

Name	Protocol	Type	Description
control	PVBusRouterControl	Master	Configuration port to determine filters.
pdbus_m[64]	PVBus	Master	Bus master ports.
pdbus_s	PVBus	Slave	Bus slave port.

3.3.20 PVBusSlave

A PVBusSlave handles incoming transactions, and handles support for mapping regions of device address space to work as RAM/ROM/device memory. This model is written in C++.

Iris and MTI instances for PVBusSlave

This model has the following Iris instances:

Table 3-142: PVBusSlave Iris instances

InstanceName	ComponentName
PVBusSlave	PVBusSlave

This model has the following MTI trace components:

Table 3-143: PVBUSSlave MTI instances

InstanceName	ComponentName
PVBUSSlave	PVBUSSlave

About PVBUSSlave

Any component that acts as a bus slave must:

- Provide a `PVBUS` slave port.
- Instantiate a `PVBUSSlave` subcomponent, with the size parameter configured for the address range covered by the device.
- Connect the slave port to the `pvbus_s` port on the `PVBUSSlave`.

A `PVBUSSlave` handles incoming transactions, and handles support for mapping regions of device address space to work as RAM/ROM/device memory.

See `PVBUSSlaveControlProtocol.lisa` for details of the mechanisms for configuring the memory regions.

The `PVBUSSlave` `size` parameter controls the addressable size of the device. Addresses outside of this range will wrap around.

By default, the entire device address range is treated as device memory, meaning that all accesses will be routed to the device port. A component implementing device registers should connect the device port to a slave port that implements the `read()` and `write()` behaviors. (See the first example below).

A component that wants to implement regions of RAM or ROM must use the control port to reconfigure the `PVBUSSlave`'s decoding. See the second example below.

Example of usage:

```
component BitLatch
{
    resources
    {
        flag : bool;
    }
    slave port<PVBUS> pvbus_s;

    slave port<PVDevice> device_port
    {
        behaviour read(pv::ReadTransaction tx)
        {
            if (tx.getAddress() != 0)
            {
                return tx.generateAbort();
            }
            return tx.write8(flag ? 1 : 0);
        }
        behaviour write(pv::WriteTransaction tx)
        {
            if (tx.getAddress() != 0)
            {
                return tx.generateAbort();
            }
        }
    }
}
```

```

        flag = ((tx.read8() & 1) != 0);
        return tx.writeComplete();
    }

    behavior debugRead(pv::ReadTransaction tx) : pv::Tx_Result
    {
        return device_port.read(tx);
    }

    behavior debugWrite(pv::WriteTransaction tx) : pv::Tx_Result
    {
        return device_port.write(tx);
    }
}
composition
{
    busslave : PVBusSlave(size=0x1000);
}
connection
{
    self.pvbus_s => busslave.pvbus_s;
    busslave.device => self.device_port;
}
}

component RAM
{
    slave port<PVBus> pvbus_s;
    master port<PVBusSlaveControl> busslave_control;

    composition
    {
        busslave : PVBusSlave(size=0x01000000);
    }
    connection
    {
        self.pvbus_s => busslave.pvbus_s;
        self.busslave_control => busslave.control;
    }
    behavior init()
    {
        busslave_control.setAccess(0, 0x01000000, pv::RW, pv::MEMORY);
    }
}

```

Ports for PVBusSlave

Table 3-144: Ports

Name	Protocol	Type	Description
control	PVBusSlaveControl	Slave	Enables the owning component to control which regions of the device memory are to be handled as RAM/ROM/Device. These settings can be changed dynamically. For example, when a Flash component is being programmed, it can switch to treating reads as Device requests instead of ROM requests.
device	PVDevice	Master	Passes on requests for peripheral register accesses to permit the owning component to handle the request.
pvbus_s	PVBus	Slave	Handles incoming requests from bus masters.
reset	Signal	Slave	On the assert of this signal, a reset of the bus slave will be latched this is used by the bus deadlock detection logic.

3.3.21 PVMemoryProtectionEngine

Encrypt memory transactions for each encryption context with an independent key to prevent mismatch access. This model is written in C++.

Iris and MTI instances for PVMemoryProtectionEngine

This model has the following Iris instances:

Table 3-145: PVMemoryProtectionEngine Iris instances

InstanceName	ComponentName
PVMemoryProtectionEngine	PVMemoryProtectionEngine
PVMemoryProtectionEngine.mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-146: PVMemoryProtectionEngine MTI instances

InstanceName	ComponentName
PVMemoryProtectionEngine	PVMemoryProtectionEngine
PVMemoryProtectionEngine.mapper	PVBusMapper

PVMemoryProtectionEngine contains the following CADI targets:

- PVMemoryProtectionEngine

About PVMemoryProtectionEngine

PVMemoryProtectionEngine is a simplified implementation of a Memory Protection Engine (MPE) component as described in [Arm Realm Management Extension \(RME\) System Architecture](#).

PVMemoryProtectionEngine supports the following features:

- Memory encryption.
- Each 4KiB page in memory is encrypted based on an encryption key. Each Physical Address Space (PAS) has a separate encryption key.
- Two or more encryption keys can be the same value.
- Configurable encryption keys for each PAS.
- Configurable encryption block size.
- Configurable corruption strategy. You can control the behavior of memory contents that are not written by the access within the encryption block.
- Encryption/decryption algorithm is a simple XOR of data with the corresponding encryption key.
- Downstream memory is always stored as plain text, allowing debuggers to view data.

For example, if a block is currently encrypted by the ns-PAS and then a byte is written by the rl-PAS, if the `block_size_in_bytes` is 4KiB, the rest of the data in the 4KiB page is corrupted such that even if you read a different byte back through the ns-PAS, you would not get the original data.

The primary use case for this component is to identify software mis-programming, where the same Physical address is accessed through more than one PAS. With PVMemoryProtectionEngine enabled, a PE sees encrypted or corrupted data when it is accessed using a different PAS to the original PAS that wrote to that page in memory.

The PVMemoryProtectionEngine component is expected to be connected in a platform at the Point of Physical Aliasing (PoPA) if storage is shared, otherwise before each specific storage for a subset of the PASes.

PVMemoryProtectionEngine imposes a runtime cost when enabled. Normally, it is only needed when debugging and verifying the Realm Management Monitor (RMM) software. If the RMM software is correct, memory contents encrypted with the wrong key would not be visible.

The PVMemoryProtectionEngine does not encrypt or corrupt the tag data for MTE, but this feature will be supported in future.

Ports for PVMemoryProtectionEngine

Table 3-147: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Manager ports of the MPE
pvbus_s	PVBus	Slave	Subordinate port of the MPE

Parameters for PVMemoryProtectionEngine

block_size_in_bytes

Type

int

Default value

0x1000

Encryption block size, supported sizes are 1 or 4096.

corruption_strategy

Type

uint8_t

Default value

0

Corruption strategy:

0

fill with constants per-old-encryption-context

1

fill with constants per-new-encryption-context

2

random data

enable

Type

bool

Default value

0x0

Enables the Memory Protection Engine.

ignore_mecid

Type

bool

Default value

0x0

Ignore MECID during encryption key calculation.

non_secure_pas_enc_key

Type

int

Default value

0x22

Non-secure PAS encryption key.

output_attributes_parameter_of_core

Type

string

Default value

"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS"

Encoding of various attributes on the bus.

realm_pas_enc_key

Type

int

Default value

0x88

Realm PAS encryption key.

root_pas_enc_key**Type**

int

Default value

0x44

Root PAS encryption key.

secure_pas_enc_key**Type**

int

Default value

0x11

Secure PAS encryption key.

3.3.22 PVWriteBuffer

The PVWriteBuffer subcomponent buffers PVBus transactions. This model is written in C++.

Iris and MTI instances for PVWriteBuffer

This model has the following Iris instances:

Table 3-148: PVWriteBuffer Iris instances

InstanceName	ComponentName
PVWriteBuffer	PVWriteBuffer
PVWriteBuffer.mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-149: PVWriteBuffer MTI instances

InstanceName	ComponentName
PVWriteBuffer	PVWriteBuffer
PVWriteBuffer.mapper	PVBusMapper

Ports for PVWriteBuffer**Table 3-150: Ports**

Name	Protocol	Type	Description
barrier_notify_s	PVWriteBuffer_BarrierPort	Slave	Barrier notification input.
clk_in	ClockSignal	Slave	Clock input.
pvbuss_m	PVBus	Master	Master connection to memory bus.
pvbuss_s	PVBus	Slave	Slave connection for transactions to be buffered.

Name	Protocol	Type	Description
reset_in	Signal	Slave	Reset input.
serror_notify_m	PVWriteBuffer_SErrorPort	Master	SError output generation.

3.3.23 SimplePVBUSMaster

Component to generate PVTransactions with configurable attributes and address. This model is written in LISA+.

Iris and MTI instances for SimplePVBUSMaster

This model has the following Iris instances:

Table 3-151: SimplePVBUSMaster Iris instances

InstanceName	ComponentName
SimplePVBUSMaster	SimplePVBUSMaster
SimplePVBUSMaster.clocktimer64	ClockTimerThread64
SimplePVBUSMaster.clocktimer64.thread	SchedulerThread
SimplePVBUSMaster.clocktimer64.thread_event	SchedulerThreadEvent
SimplePVBUSMaster.pvbusmaster	PVBusMaster
SimplePVBUSMaster.pvbusslave	PVBusSlave

This model has the following MTI trace components:

Table 3-152: SimplePVBUSMaster MTI instances

InstanceName	ComponentName
SimplePVBUSMaster.pvbusmaster	PVBusMaster
SimplePVBUSMaster.pvbusslave	PVBusSlave

SimplePVBUSMaster contains the following CADI targets:

- ClockTimerThread64
- SchedulerThread
- SchedulerThreadEvent
- SimplePVBUSMaster

Ports for SimplePVBUSMaster

Table 3-153: Ports

Name	Protocol	Type	Description
pvbus_m	PVBus	Master	Output of generated transactions.
pvbus_s	PVBus	Slave	-

Parameters for SimplePVBusMaster

verbose

Type

bool

Default value

0x0

verbose.

3.3.24 TZSwitch

Allow TrustZone secure/normal bus signals to be routed separately. This model is written in LISA+.

Iris and MTI instances for TZSwitch

This model has the following Iris instances:

Table 3-154: TZSwitch Iris instances

InstanceName	ComponentName
TZSwitch	TZSwitch
TZSwitch.pvbus_mapper	PVBusMapper

This model has the following MTI trace components:

Table 3-155: TZSwitch MTI instances

InstanceName	ComponentName
TZSwitch.pvbus_mapper	PVBusMapper

TZSwitch contains the following CADI targets:

- TZSwitch

About TZSwitch

Allow TrustZone secure/normal bus signals to be routed separately.

Transactions received on the pvbus_input slave port will be routed according to a configuration that is set up using parameters and/or the control port. Separate rules can be given for secure and for normal transactions. Transactions can be routed to one of the two master ports (pvbus_port_a or pvbus_port_b), can be ignored, or can generate aborts.

The control port behaviour routeAccesses () takes two arguments.

input selects which types of signals will be reconfigured:

TZINPUT_SECURE

change the routing for secure transactions

TZINPUT_NORMAL

change the routing for normal transactions

TZINPUT_ANY

change the routing for all transactions

`destination` selects how the chosen transactions will be routed:

TZROUTE_IGNORE

transactions will be ignored (reads return 0)

TZROUTE_TO_PORT_A

route transactions to `pvbus_port_a`

TZROUTE_TO_PORT_B

route transactions to `pvbus_port_b`

TZROUTE_ABORT

cause transactions to generate an abort

Initial routing is configured using parameters `secure` and `normal` based on the following values:

0

Ignore these transactions.

1

Forward the transactions to `pvbus_port_a`.

2

Forward the transactions to `pvbus_port_b`.

3

Generate an abort for these transactions.

Both default and explicit parameter values will be overridden by any runtime calls to `routeAccesses()` on the control port.

Ports for TZSwitch

Table 3-156: Ports

Name	Protocol	Type	Description
<code>control</code>	<code>TZSwitchControl</code>	Slave	Controls routing of transactions.
<code>pvbus_input</code>	<code>PVBus</code>	Slave	Slave port for connection to PVBus master/decoder.
<code>pvbus_port_a</code>	<code>PVBus</code>	Master	Output port a.
<code>pvbus_port_b</code>	<code>PVBus</code>	Master	Output port b.

Parameters for TZSwitch

normal**Type**

int

Default value

0x2

Normal Port.

secure**Type**

int

Default value

0x1

Secure Port.

3.4 Clocking components

This section describes the Clocking components.

The clocking components and protocols provide a mechanism for systems to regulate the execution rate of components. Clocking includes the concept of clock rates, dividers to change clock rates, and timers to generate callbacks based on those clock rates.

If the MasterClock component is instantiated in a system, it provides a consistent master clock rate. Although this rate is not defined, you can consider this to be 1Hz, even for non-SystemC systems. ClockDivider components are able to convert this clock rate into a new rate using a multiplier and divider, although the clock rate cannot be divided to be less than 1Hz. You can cascade ClockDivider components to produce many different clock rates within a system. The maximum ratio of any two clocks in the system must be less than 2^{32} .

ClockTimer components can be instantiated by a component and connected to any MasterClock or ClockDivider output. ClockTimers can generate callbacks after a given number of ticks of that clock. ClockTimers can invoke a behavior on the component to permit the component to perform work. The component can then request the ClockTimer to repeat its count.

3.4.1 ClockDivider

A ClockDivider is a library component that takes a ClockSignal on its input port (which could come from the output of a MasterClock, or from another ClockDivider), and generates a new ClockSignal on its output port, representing a clock frequency that is related to the input clock by the ratio of the multiply and divide parameters. This model is written in C++.

Iris and MTI instances for ClockDivider

This model has the following Iris instances:

Table 3-157: ClockDivider Iris instances

InstanceName	ComponentName
ClockDivider	ClockDivider

This model has the following MTI trace components:

Table 3-158: ClockDivider MTI instances

InstanceName	ComponentName
ClockDivider	ClockDivider

ClockDivider contains the following CADI targets:

- ClockDivider

About ClockDivider

This component uses a configurable ratio to convert the `clockSignal` rate at its input to a new `clockSignal` rate at its output. Changes to the input rate or ratio take effect immediately and clocking components dependent on the output rate continue counting at the new rate.

This component does not normally incur a runtime performance cost. However, reprogramming the clock rate causes all related clocks and timers to be recalculated.

Ports for ClockDivider

Table 3-159: Ports

Name	Protocol	Type	Description
<code>clk_in</code>	ClockSignal	Slave	Input clock signal, coming from a MasterClock or another ClockDivider.
<code>clk_out</code>	ClockSignal	Master	Clock signal generated by this ClockDivider.
<code>rate</code>	ClockRateControl	Slave	Permits you to dynamically change the clock divider ratio.

Parameters for ClockDivider

div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

3.4.2 ClockGate

Clock gate for dis/enabling the clock. This model is written in C++.

Iris and MTI instances for ClockGate

This model has the following Iris instances:

Table 3-160: ClockGate Iris instances

InstanceName	ComponentName
ClockGate	ClockGate
ClockGate.ClockDivider	ClockDivider

This model has the following MTI trace components:

Table 3-161: ClockGate MTI instances

InstanceName	ComponentName
ClockGate.ClockDivider	ClockDivider

ClockGate contains the following CADI targets:

- ClockGate

Ports for ClockGate

Table 3-162: Ports

Name	Protocol	Type	Description
clk_enable	Signal	Slave	-
clk_in	ClockSignal	Slave	-
clk_out	ClockSignal	Master	-
halt	Signal	Master	-

Parameters for ClockGate

diagnostics

Type

int

Default value

0x0

Diagnostics.

divider.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

divider.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

3.4.3 ClockSelector

ClockSignal Selector. This model is written in C++.

Iris and MTI instances for ClockSelector

This model has the following Iris instances:

Table 3-163: ClockSelector Iris instances

InstanceName	ComponentName
ClockSelector	ClockSelector
ClockSelector.ClockDivider	ClockDivider

This model has the following MTI trace components:

Table 3-164: ClockSelector MTI instances

InstanceName	ComponentName
ClockSelector.ClockDivider	ClockDivider

ClockSelector contains the following CADI targets:

- ClockSelector

Ports for ClockSelector

Table 3-165: Ports

Name	Protocol	Type	Description
clk_in[11]	ClockSignal	Slave	-
clk_out	ClockSignal	Master	-

Name	Protocol	Type	Description
clk_sel	Signal	Slave	-
clk_sel_num	Value	Slave	-

Parameters for ClockSelector

clkdiv0.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv0.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv1.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv1.mul

Type

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv10.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv10.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv2.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv2.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv3.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv3.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv4.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv4.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv5.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv5.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv6.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv6.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv7.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv7.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv8.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv8.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv9.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv9.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkdivider.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdivider.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

diagnostics**Type**

int

Default value

0x0

Diagnostics.

3.4.4 ClockTimer

A ClockTimer provides support for counting a number of ticks at the rate determined by the input clock. This model is written in C++.

About ClockTimer

When the countdown reaches zero, the timer can send a signal to another component. That component can return a value that causes the timer to start counting down again.

Setting up a timer is very efficient, and no host processing time is used while a counter is counting down: when a timer is started, the scheduler precomputes the finish time.

See `ClockSignalProtocol.lisa` and `CounterDivider.lisa` for more details of the scheduler system. See `TimerControlProtocol.lisa` and `TimerCallbackProtocol.lisa` for the methods used to control a timer and to handle the signal when the countdown is complete.

To use a ClockTimer:

1. Connect the ClockTimer's `timer_callback` port to a slave port that implements the `signal()` behaviour.
2. Connect a clock signal to the `clk_in` port.
3. Use the `timer_control` port to start the timer counting down for a given number of ticks.

Ports for ClockTimer

Table 3-166: Ports

Name	Protocol	Type	Description
<code>clk_in</code>	<code>ClockSignal</code>	Slave	Determines the tick rate of the timer.
<code>timer_callback</code>	<code>TimerCallback</code>	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
<code>timer_control</code>	<code>TimerControl</code>	Slave	Permits the timer to be set, canceled and queried.

3.4.5 ClockTimer64

A ClockTimer64 provides support for counting a number of ticks at the rate determined by the input clock. This model is written in C++.

About ClockTimer64

When the countdown reaches zero, the timer can send a signal to another component. That component can return a value that causes the timer to start counting down again.

Setting up a timer is very efficient, and no host processing time is used while a counter is counting down: when a timer is started, the scheduler precomputes the finish time.

This version of the timer provides 64 bit resolution.

See `ClockSignalProtocol64.lisa` and `CounterDivider.lisa` for more details of the scheduler system. See `TimerControlProtocol64.lisa` and `TimerCallbackProtocol.lisa` for the methods used to control a timer and to handle the signal when the countdown is complete.

To use a `ClockTimer64`:

1. Connect the `ClockTimer64`'s `timer_callback` port to a slave port that implements the `signal()` behaviour.
2. Connect a clock signal to the `clk_in` port.
3. Use the `timer_control` port to start the timer counting down for a given number of ticks.

Ports for `ClockTimer64`

Table 3-167: Ports

Name	Protocol	Type	Description
<code>clk_in</code>	<code>ClockSignal</code>	Slave	Determines the tick rate of the timer.
<code>timer_callback</code>	<code>TimerCallback64</code>	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
<code>timer_control</code>	<code>TimerControl64</code>	Slave	Permits the timer to be set, canceled and queried.

3.4.6 `ClockTimerThread`

A `ClockTimerThread(64)` is a drop-in replacement for a `ClockTimer(64)` component. This model is written in LISA+.

Iris and MTI instances for `ClockTimerThread`

This model has the following Iris instances:

Table 3-168: `ClockTimerThread` Iris instances

InstanceName	ComponentName
<code>ClockTimerThread</code>	<code>ClockTimerThread</code>
<code>ClockTimerThread.timer</code>	<code>ClockTimerThread64</code>
<code>ClockTimerThread.timer.thread</code>	<code>SchedulerThread</code>
<code>ClockTimerThread.timer.thread_event</code>	<code>SchedulerThreadEvent</code>

`ClockTimerThread` contains the following CADI targets:

- `ClockTimerThread`
- `ClockTimerThread64`
- `SchedulerThread`
- `SchedulerThreadEvent`

About `ClockTimerThread`

A `ClockTimerThread(64)` is a drop-in replacement for a `ClockTimer(64)` component. The main difference to the `clockTimer` component is that the `clockTimerThread` runs the `signal()` callback from a proper scheduler thread. This means that the `signal()` function may directly or indirectly

invoke `wait()` functions to wait for time or events. This is not allowed for the `clockTimer` component which does not use a thread.

Components that issue bus transactions from within the timer `signal()` callback must use `ClockTimerThread(64)` rather than `clockTimer(64)`.

Ports for ClockTimerThread

Table 3-169: Ports

Name	Protocol	Type	Description
<code>clk_in</code>	<code>ClockSignal</code>	Slave	Determines the tick rate of the timer.
<code>timer_callback</code>	<code>TimerCallback</code>	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
<code>timer_control</code>	<code>TimerControl</code>	Slave	Permits the timer to be set, canceled and queried.

3.4.7 ClockTimerThread64

A `ClockTimerThread64` is a drop-in replacement for `ClockTimer64`. This model is written in LISA+.

Iris and MTI instances for ClockTimerThread64

This model has the following Iris instances:

Table 3-170: ClockTimerThread64 Iris instances

InstanceName	ComponentName
<code>ClockTimerThread64</code>	<code>ClockTimerThread64</code>
<code>ClockTimerThread64.thread</code>	<code>SchedulerThread</code>
<code>ClockTimerThread64.thread_event</code>	<code>SchedulerThreadEvent</code>

`ClockTimerThread64` contains the following CADI targets:

- `ClockTimerThread64`
- `SchedulerThread`
- `SchedulerThreadEvent`

About ClockTimerThread64

A `ClockTimerThread(64)` is a drop-in replacement for a `ClockTimer(64)` component. The main difference to the `clockTimer` component is that the `clockTimerThread` runs the `signal()` callback from a proper scheduler thread. This means that the `signal()` function may directly or indirectly invoke `wait()` functions to wait for time or events. This is not allowed for the `clockTimer` component which does not use a thread.

Components that issue bus transactions from within the timer `signal()` callback must use `ClockTimerThread(64)` rather than `clockTimer(64)`.

Ports for ClockTimerThread64

Table 3-171: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	Determines the tick rate of the timer.
timer_callback	TimerCallback64	Master	Port on which a signal is sent after the number of scheduled ticks has elapsed.
timer_control	TimerControl64	Slave	Permits the timer to be set, canceled and queried.

3.4.8 ClockTimerThread64_cpp

A ClockTimerThread64 is a drop-in replacement for ClockTimer64. The main difference to the ClockTimer component is that the ClockTimerThread runs the sg::Signal() callback from a proper scheduler thread. This mean that the sg::Signal() function may directly or indirectly invoke wait() functions to wait for time or events. This is not allowed for the ClockTimer component which does not use a thread. Components which issue bus transactions from within the timer sg::Signal() callback must use ClockTimerThread(64) rather than ClockTimer(64). This model is written in C++.

Iris and MTI instances for ClockTimerThread64_cpp

This model has the following Iris instances:

Table 3-172: ClockTimerThread64_cpp Iris instances

InstanceName	ComponentName
ClockTimerThread64_cpp	ClockTimerThread64
ClockTimerThread64_cpp.SchedulerThread	SchedulerThread
ClockTimerThread64_cpp.SchedulerThreadEvent	SchedulerThreadEvent

ClockTimerThread64_cpp contains the following CADI targets:

- ClockTimerThread64

Ports for ClockTimerThread64_cpp

Table 3-173: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
timer_callback	TimerCallback64	Master	-
timer_control	TimerControl64	Slave	-

3.4.9 ClockTimerThread_cpp

A ClockTimerThread(64) is a drop-in replacement for a ClockTimer(64) component. The main difference to the ClockTimer component is that the ClockTimerThread runs the sg::Signal() callback from a proper scheduler thread. This mean that the sg::Signal() function may directly or indirectly invoke wait() functions to wait for time or events. This is not allowed for the ClockTimer component which does not use a thread. Components which issue bus transactions from within the timer

sg::Signal() callback must use ClockTimerThread(64) rather than ClockTimer(64). This model is written in C++.

Iris and MTI instances for ClockTimerThread_cpp

This model has the following Iris instances:

Table 3-174: ClockTimerThread_cpp Iris instances

InstanceName	ComponentName
ClockTimerThread_cpp	ClockTimerThread
ClockTimerThread_cpp.ClockTimerThread64	ClockTimerThread64
ClockTimerThread_cpp.ClockTimerThread64.SchedulerThread	SchedulerThread
ClockTimerThread_cpp.ClockTimerThread64.SchedulerThreadEvent	SchedulerThreadEvent

ClockTimerThread_cpp contains the following CADI targets:

- ClockTimerThread

Ports for ClockTimerThread_cpp

Table 3-175: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
timer_callback	TimerCallback	Master	-
timer_control	TimerControl	Slave	-

3.4.10 MasterClock

A source of a clock signal representing the base clock rate of the simulation (nominally 1Hz). The signal from the output port can be connected to a ClockDivider, to generate clock signals at a different clock rate. The output can also be connected to a ClockTimer in order to generate scheduled events, or to any other components that accept a ClockSignal input. See ClockSignal.lisa for more information. This model is written in C++.

About MasterClock

This component provides a single clockSignal output that can be used to drive the clockSignal input of ClockDividers, ClockTimers and other clocking components.

The rate of the MasterClock is not defined because all clocking is relative, but can be considered to be 1 Hz.

A system might contain more than one MasterClock, all of which generate the same clockSignal rate.

Ports for MasterClock

Table 3-176: Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Master	Master clock rate.

3.4.11 PLLControl

Simulate PLL clock frequency control logic. This model is written in C++.

Iris and MTI instances for PLLControl

This model has the following Iris instances:

Table 3-177: PLLControl Iris instances

InstanceName	ComponentName
PLLControl	PLLControl
PLLControl.ClockDivider	ClockDivider

This model has the following MTI trace components:

Table 3-178: PLLControl MTI instances

InstanceName	ComponentName
PLLControl.ClockDivider	ClockDivider

PLLControl contains the following CADI targets:

- PLLControl

Ports for PLLControl

Table 3-179: Ports

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	-
clk_out	ClockSignal	Master	-
lock	Signal	Master	-
rate	ClockRateControl	Slave	-
unlock	Signal	Master	-

Parameters for PLLControl

clkdiv.div

Type

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkdiv.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

3.4.12 ScalableClockControl

Clock control allows input selection, rate control and gating. This model is written in C++.

Iris and MTI instances for ScalableClockControl

This model has the following Iris instances:

Table 3-180: ScalableClockControl Iris instances

InstanceName	ComponentName
ScalableClockControl	ScalableClockControl
ScalableClockControl.ClockDivider	ClockDivider
ScalableClockControl.ClockGate	ClockGate
ScalableClockControl.ClockGate.ClockDivider	ClockDivider
ScalableClockControl.ClockSelector	ClockSelector
ScalableClockControl.ClockSelector.ClockDivider	ClockDivider

This model has the following MTI trace components:

Table 3-181: ScalableClockControl MTI instances

InstanceName	ComponentName
ScalableClockControl.ClockDivider	ClockDivider
ScalableClockControl.ClockGate.ClockDivider	ClockDivider
ScalableClockControl.ClockSelector.ClockDivider	ClockDivider

ScalableClockControl contains the following CADI targets:

- ScalableClockControl

Ports for ScalableClockControl

Table 3-182: Ports

Name	Protocol	Type	Description
clk_out	ClockSignal	Master	-
clkEnable	Signal	Slave	-
clkSel	Value	Slave	-
clock_in[10]	ClockSignal	Slave	-
clock_rate[10]	ClockRateControl	Slave	-
halt	Signal	Master	-
refClk_in	ClockSignal	Slave	-

Parameters for ScalableClockControl

clkDiv1.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv1.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv10.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv10.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv2.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv2.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv3.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv3.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv4.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv4.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv5.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv5.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv6.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv6.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv7.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv7.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv8.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv8.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv9.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkDiv9.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkGate.diagnostics**Type**

int

Default value

0x0

Diagnostics.

clkGate.divider.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkGate.divider.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv0.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv0.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv1.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv1.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv10.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv10.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv2.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv2.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv3.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv3.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv4.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv4.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv5.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv5.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv6.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv6.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv7.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv7.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv8.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv8.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv9.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv5.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv5.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv6.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv6.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv7.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv7.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv8.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv8.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv9.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdiv9.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdivider.div**Type**

int

Default value

0x1

Clock Rate Divider. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.clkdivider.mul**Type**

int

Default value

0x1

Clock Rate Multiplier. This parameter is not exposed via CADI and can only be set in LISA.

clkSelect.diagnostics**Type**

int

Default value

0x0

Diagnostics.

3.5 Core components

This section describes the Core components.

Code Translation (CT) components translate instructions on the fly and cache the translations to enable fast execution of code, but sacrificing timing accuracy. They also use efficient PV bus models to enable fast access to memory and devices.

CT components differ in some ways from the modeled IP:

- They do not model cycle timing. In aggregate, all instructions execute in one processor master clock cycle, except for Wait For Interrupt.
- Write buffers are not modeled on all processors.
- Most aspects of TLB behavior are implemented in the models. In Arm®v7 models and later, the TLB memory attribute settings are used when stateful cache is enabled.
- No device-accurate MicroTLB is implemented.
- Device-accurate modeling of multiple TLBs is off by default.
- A single memory access port is implemented. The port combines accesses for instruction, data, DMA, and peripherals. Configuration of the peripheral port memory map register is ignored.
- All memory accesses are atomic and are performed in Programmer's View order. Unaligned accesses are always performed as byte transfers.
- Some instruction sequences are executed atomically so that system time does not advance during their execution. This difference in behavior can affect sequential accesses of device registers where devices are expecting time to move on between each access.
- Interrupts are not taken at every instruction boundary.
- Integration and test registers are not implemented.
- Models do not support running Software Test Libraries (STLs).
- Not all CP14 debug registers are implemented on all processors.
- Breakpoint types that the models support directly are:
 - Single address unconditional instruction breakpoints.
 - Single address unconditional data breakpoints.
 - Unconditional instruction address range breakpoints.

- Pseudoregisters in the debugger support processor exception breakpoints. Setting an exception register to a nonzero value stops execution on entry to the associated exception vector.
- Cluster models do not simulate all cores at the same time. They execute a number of instructions on each core in turn. There can be a bias in the order in which cores run after a restart (for example, core 0 always runs first), so the simulation might hit breakpoints on the favored core more often.
- Performance counters are not implemented on all models.
- Some models implement caches, although all processor models implement cache control registers.
- ECC and parity schemes are hardware-specific so are not modeled.
- Models use a simplified view of the external buses.
- Clusters based on DSU-110 and later support OFF, ON, AND DBG_RECOV modes.

3.5.1 AEMv8RMPCT

AEMv8RMPCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-186: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for AEMv8RMPCT

This model has the following Iris instances:

Table 3-187: AEMv8RMPCT Iris instances

InstanceName	ComponentName
AEMv8RMPCT	Cluster_ARMAEMv8-R_MP
AEMv8RMPCT.AMU	PVBusLogger
AEMv8RMPCT.AMU.mapper	PVBusMapper
AEMv8RMPCT.DAP	PVBusLogger
AEMv8RMPCT.DAP.mapper	PVBusMapper
AEMv8RMPCT.MMAP	PVBusLogger
AEMv8RMPCT.MMAP.mapper	PVBusMapper
AEMv8RMPCT.RAS	PVBusLogger
AEMv8RMPCT.RAS.mapper	PVBusMapper
AEMv8RMPCT.acp_mapper	PVBusMapper
AEMv8RMPCT.cpu0	ARMAEMv8-R_MP
AEMv8RMPCT.cpu0.UTLB	TLB

InstanceName	ComponentName
AEMv8RMPCT.cpu0.dtlb	TlbCadi
AEMv8RMPCT.cpu0.l1dcache	PVCache
AEMv8RMPCT.cpu0.l1dcache.upstream[0]	PVBusSlave
AEMv8RMPCT.cpu0.l1icache	PVCache
AEMv8RMPCT.cpu0.l1icache.upstream[0]	PVBusSlave
AEMv8RMPCT.ext_bus	PVBusLogger
AEMv8RMPCT.ext_bus.mapper	PVBusMapper
AEMv8RMPCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
AEMv8RMPCT.l2_cache	PVCache
AEMv8RMPCT.l2_cache.upstream[0]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[10]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[11]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[12]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[13]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[14]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[15]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[16]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[1]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[2]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[3]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[4]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[5]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[6]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[7]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[8]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[9]	PVBusSlave
AEMv8RMPCT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-188: AEMv8RMPCT MTI instances

InstanceName	ComponentName
AEMv8RMPCT	ARMv8Cluster
AEMv8RMPCT.AMU	PVBusLogger
AEMv8RMPCT.AMU.mapper	PVBusMapper
AEMv8RMPCT.DAP	PVBusLogger
AEMv8RMPCT.DAP.mapper	PVBusMapper
AEMv8RMPCT.MMAP	PVBusLogger
AEMv8RMPCT.MMAP.mapper	PVBusMapper
AEMv8RMPCT.RAS	PVBusLogger

InstanceName	ComponentName
AEMv8RMPCT.RAS.mapper	PVBusMapper
AEMv8RMPCT.acp_mapper	PVBusMapper
AEMv8RMPCT.cpu0	ARM_AEMv8-R_MP
AEMv8RMPCT.cpu0.UTLB	TLB
AEMv8RMPCT.cpu0.l1dcache	PVCache
AEMv8RMPCT.cpu0.l1dcache.upstream[0]	PVBusSlave
AEMv8RMPCT.cpu0.l1icache	PVCache
AEMv8RMPCT.cpu0.l1icache.upstream[0]	PVBusSlave
AEMv8RMPCT.ext_bus	PVBusLogger
AEMv8RMPCT.ext_bus.mapper	PVBusMapper
AEMv8RMPCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
AEMv8RMPCT.l2_cache	PVCache
AEMv8RMPCT.l2_cache.upstream[0]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[10]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[11]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[12]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[13]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[14]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[15]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[16]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[1]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[2]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[3]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[4]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[5]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[6]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[7]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[8]	PVBusSlave
AEMv8RMPCT.l2_cache.upstream[9]	PVBusSlave
AEMv8RMPCT.l2_flusher	AsyncCacheFlushUnit

AEMv8RMPCT contains the following CADI targets:

- ARMAEMv8-R_MP
- Cluster_ARMAEMv8-R_MP
- PVCache
- TlbCadi

About AEMv8RMPCT

AEMv8RMPCT allows you to target AArch32 or AArch64, RAS, VFP, EL2, and other Arm®v8-R features.

This table lists the major differences between AEMv8RMPCT and Arm Cortex®-R82 Fast Models:

Table 3-189: Major differences between AEMv8RMPCT and Arm Cortex-R82 Fast Models

Feature	AEMv8R	Cortex-R82
VMSA_supported	Configurable	Not available
has_aarch64	Configurable	Not available
has_pl2	Configurable	Always true
has_pmu	Configurable	Always true
has_ras	Configurable	Always true
PA_SIZE	Configurable	Always 40
Armv8.5 feature-specific parameters	Configurable	Not available
stage1_tlb_size	Configurable	Not available
stage12_tlb_size	Configurable	Not available
has_writebuffer	Configurable	Not available
vfp-present	Configurable	Always true
def_mem_map	Configurable	Fixed, according to the specification
IMPDEF registers, for example all IMP_* registers in the R82 specification.	Not available	Supported

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for AEMv8RMPCT

Table 3-190: Ports

Name	Protocol	Type	Description
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cache_validation_control	Value	Slave	This signal provides default exception handling state.
cfgend[4]	Signal	Slave	This signal if for EE bit initialisation
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.

Name	Protocol	Type	Description
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC
CNTHPSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module
CNTVIRQ[4]	Signal	Master	Timer signals to SOC
commirq[4]	Signal	Master	Interrupt signal from debug communication channel.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	-
cti0extin[4]	Signal	Slave	-
cti0extout[4]	Signal	Master	-
ctilextin[4]	Signal	Slave	-
ctilextout[4]	Signal	Master	-
cti2extin[4]	Signal	Slave	-
cti2extout[4]	Signal	Master	-
cti3extin[4]	Signal	Slave	-
cti3extout[4]	Signal	Master	-
ctidbgirq[4]	Signal	Master	-
dbgen[4]	Signal	Slave	-
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrdownack[4]	Signal	Master	Debug power down acknowledge.
dbgpwrdownreq[4]	Signal	Slave	Debug power down request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
ext_slave_s	PVBus	Slave	External Slave port. Equivalent to AXIS port.
external_trace_reset[4]	Signal	Slave	ETMv4 External Trace Reset signal.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
flash_m[4]	PVBus	Master	Flash Port
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
hiden[4]	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
hniden[4]	Signal	Slave	External debug interface.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
irqs[224]	Signal	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	Signal	Slave	This signal resets timer and interrupt controller and l2cache
llpp_m[4]	PVBus	Master	LLPP (Low-Latency Peripheral Port).
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg[4]	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	-
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbar[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins
smpnamp[4]	Signal	Master	This signals AMP or SMP mode for each core
spiden[4]	Signal	Slave	Secure invasive debug enable.
spniden[4]	Signal	Slave	Secure non-invasive debug enable.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state
teinit[4]	Signal	Slave	This signal provides default exception handling state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[4]	Signal	Slave	ETMv4 Trace Unit Reset signal.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Name	Protocol	Type	Description
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for AEMv8RMPCT

ADFSR-AIFSR-implemented

Type

bool

Default value

0x0

ADFSR and AIFSR are implemented.

AIDR

Type

int

Default value

0x0

Value of AIDR_EL1 register.

AMIIDR

Type

int

Default value

0x43b

Value of AMU Implementation Identification Register.

AMPIDR

Type

int

Default value

0x4000bb000

Value of AMU Peripheral Identification Register.

BPIMVA_causes_translation_lookup

Type

bool

Default value

0x0

Do a translation when BPIMVA instruction is executed (which may cause a translation fault).

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation to NC/DEV memory. The broadcastatomic signal will override this value if used.

BROADCASTATOMICL

Type

bool

Default value

0x1

Enable broadcasting of atomic operation to LLRAM memory. The broadcastatomicl signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CCSIDR-L1D_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

CCSIDR-L1I_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

CCSIDR-L2_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

CCSIDR-L3_override**Type**

int

Default value

0x0

If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).

CFGTFPEN_pin_reset**Type**

bool

Default value

0x0

CFGTFPEN Configuration pin at reset for bitfield IMP_MEMPROTCTLR_EL1.TFPEN.

CHI**Type**

bool

Default value

0x0

Selects the type of protocol the Main Manager(MM) interface implements. 0, MM port configured as AXI. 1, MM port configured as CHI.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

CTIPIDR**Type**

int

Default value

0x0

If non-zero, override the CTI Peripheral Identification Register.

CTR-L1Ip-override**Type**

int

Default value

0x0

If non-zero, override the L1Ip bits in CTR/CTR_ELO system register. This does not change the behaviour of the cache, only what is present in the CTR register.

DBGBCR_BT_applies_RES0_before_valid_check**Type**

bool

Default value

0x1

If true, RES0 behaviour is applied to DBGBCR(_EL1).BT before checking for reserved values for this field.

DBGPIDR**Type**

int

Default value

0x0

If non-zero, override the Debug Peripheral Identification Register.

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

ERRIIDR**Type**

int

Default value

0xd800143b

Value of RAS Implementation Identification Register.

ERRPIDR**Type**

int

Default value

0x4100bbd80

Value of RAS Peripheral Identification Register.

ERXMISC0_mask**Type**

int

Default value

0x0

Write Mask for ERXMISC0 RAS Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

MIDR**Type**

int

Default value

0x410fd0f0

Value of MIDR_EL1 register.

NUM_CORES**Type**

int

Default value

0x1

Number of cores in cluster.

PA_SIZE**Type**

int

Default value

0x28

Physical address range supported (FEAT_LPA).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

PMCEID0**Type**

int

Default value

0xffffffff

Performance Monitor Common Event ID Reg 0 value - 64 bit.

PMCEID1**Type**

int

Default value

0xffffffff

Performance Monitor Common Event ID Reg 1 value - 64 bit.

PMSIDR.ArchInst**Type**

bool

Default value

0x1

Defines whether architecture instruction sampling is implemented or not, if not only micro op sampling is implemented. Model only supports architecture instruction sampling, but allows ID register field to be configured.

PMSIDR.CRR**Type**

bool

Default value

0x0

Defines whether call return branch records (FEAT_SPE_CRR) is implemented or not.

PMSIDR.LDS**Type**

bool

Default value

0x0

Defines whether data source for sampled load instruction is implemented or not. Model does not implement loaded data source, but allows ID register field to be configured.

PMUPIDR**Type**

int

Default value

0x0

If non-zero, override the PMU Peripheral Identification Register.

VMSA_supported**Type**

bool

Default value

0x1

VMSA is supported at EL1.

abort_execution_from_device_memory**Type**

bool

Default value

0x0

Execution from device memory generates a prefetch abort.

advsimd_overread**Type**

bool

Default value

0x0

AdvSIMD element load operations access all bytes of a 16-byte aligned window, even in Device memory.

align_pc_on_branch_to_unaligned_pc_aarch32**Type**

bool

Default value

0x0

Force PC align for branches to an unaligned PC counter in A32 state.

align_pc_on_debug_exit_to_aarch32**Type**

bool

Default value

0x0

Exit to AARCH32 state from debug state forces pc bit0 to 0.

align_pc_on_illegal_exception_return_to_aarch32**Type**

bool

Default value

0x1

Align PC when performing an illegal exception return from AArch64 to AArch32.

amu_aux_type_fixed**Type**

string

Default value

""

Lists which AMU auxiliary registers that are fixed and to which event type. The JSON schema is: {fixed_aux_reg:evt_type, ...}. For example {"0":0x300} would make auxiliary register 0 fixed to event type 0x300.

amu_mmap_address**Type**

string

Default value

""

AMU base address for each core on system bus. 0 means the AMU is not mapped, otherwise the address must be 4KB aligned. JSON schema for the parameter value is: {"format":"all_addrs_are_absolute_wrt_systembus", "cores": [{"amu":0x0}, {"amu":0x0}, {"amu":0x0}, {"amu":0x0}]}.

amu_num_auxiliary_counters**Type**

int

Default value

0x0

Number of AMU auxiliary counters implemented.

apsr_read_restrict**Type**

bool

Default value

0x0

At EL0, unknown bits of APSR are RAZ.

atomic_memtype_fault_priority

Type

int

Default value

0x0

This parameter describes the priority of unsupported atomic/exclusive memtype fault w.r.t alignment and permission fault. 0, BEFORE_ALIGN_MEM_FAULT. 1, AFTER_ALIGN_BEFORE_PERM_FAULT. 2, AFTER_PERM_FAULT.

auxilliary_feature_register0

Type

int

Default value

0x0

Value of AFR0 ID register.

branch-predictor-clear-policy

Type

int

Default value

0x2

Set branch prediction policy as defined for MMFR1[31:28]. This does not change the behaviour of the branch predictor, only what is reported in MMFR1.BPred.

branch-predictor-supported-ops

Type

int

Default value

0x1

Set branch prediction policy as defined for MMFR3[11:8]. This does not change the behaviour of the branch predictor, only what is reported in MMFR3.BPMaint.

bus_protection_enable_at_reset

Type

bool

Default value

0x0

Enable TCM, L1Cache bus protection after reset.

cache-log2linelen**Type**

int

Default value

0x6

Log2 of the cache line length in bytes.

cache_maintenance_hits_watchpoints**Type**

bool

Default value

0x0

DCIMVA operations executed in AArch32 modes hit watchpoints.

changing_block_size_without_bbm_support**Type**

int

Default value

0x0

Level of support for changing block size without break-before-make (FEAT_BBM).

check_memory_attributes**Type**

bool

Default value

0x1

Detect and report TLB use of conflicting memory attributes for views of the same physical address.

clean_invalidate_cache_on_warm_reset**Type**

bool

Default value

0x0

Clean and invalidate caches on warm reset.

clear_reg_top_eret**Type**

int

Default value

0x1

Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32.

clear_reg_top_set**Type**

bool

Default value

0x1

Whether to clear upper 32-bits of the Xn register when corresponding AArch32 register is set via CADI/Iris.

cluster_utid**Type**

int

Default value

0x0

Unique cluster transaction identifier for interconnect protection.

configure_pmu_events_with_json**Type**

string

Default value

""

"Configure v8.6 and newer PMU events. Note : This param has high priority and overrides the setting of "has_*_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["EVENT_NAME_1","EVENT_NAME_2"]}."

configure_v8_6_pmu_events_with_json**Type**

string

Default value

""

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.6 PMU events. Note : This param has high priority and overrides the setting of "has_v8_6_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_INDNR_RETIRE", "BR_IND_RETIRE", "BR_RETURN_SKIP_RETIRE", "BR_RETURN_ANY_RETIRE", "BR_INDNR_SKIP_RETIRE", "BR_INDNR_TAKEN_RETIRE", "BR_IND_SKIP_RETIRE", "BR_IND_TAKEN_RETIRE", "BR_IMMED_SKIP_RETIRE", "BR_IMMED_TAKEN_RETIRE", "BR_SKIP_RETIRE"]}]".

configure_v8_8_pmu_events_with_json

Type

string

Default value

""

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.8 PMU events. Note : This param has high priority and overrides the setting of "has_v8_8_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_HINT_COND_RETIRE", "BR_COND_TAKEN_RETIRE", "BR_UNCOND_RETIRE", "BR_COND_RETIRE", "BRNL_TAKEN_RETIRE", "BRNL_IND_TAKEN_RETIRE", "BRNL_INDNR_TAKEN_RETIRE", "BRNL_IMMED_TAKEN_RETIRE", "BL_TAKEN_RETIRE", "BL_IND_TAKEN_RETIRE", "BL_IMMED_TAKEN_RETIRE"]}]".

configure_v8_9_pmu_events_with_json

Type

string

Default value

""

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.9 PMU events. Note : This param has high priority and overrides the setting of "has_v8_9_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["ASE_SVE_RETIRE", "ASE_RETIRE", "VFP_RETIRE", "SVE_RETIRE", "CRYPTO_RETIRE", "SIMD_INST_RETIRE", "ASE_INST_RETIRE", "SVE_INST_RETIRE", "ASE_SVE_INST_RETIRE", "LD_ANY_RETIRE", "ST_ANY_RETIRE", "LDST_ANY_RETIRE", "DP_RETIRE"]}]".

core_cache_protection

Type

int

Default value

0xffffffffffffffff

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

cpacr_trcdis_behaviour**Type**

int

Default value

0x2

Behaviour of CPACR.TRCDIS/NSACR.NSTRCDIS when there is no CP14 ETM interface. 0, RAZ/WI. 2, implemented.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CP15SDISABLE2**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.DCZID-log2-block-size**Type**

int

Default value

0x8

Log2 of the block size cleared by DC ZVA instruction (as read from DCZID_ELO).

cpuX.DCZVA_single_write**Type**

bool

Default value

0x0

Execute the DCZVA as a single write.

cpuX.MPIDR-override**Type**

int

Default value

0x0

Override of MPIDR value. If nonzero will override the MT, cluster and CPU ID bits in MPIDR.

cpuX.RVBAR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.RVBAR32**Type**

int

Default value

0x0

Reset vector address in AARCH32 when VINITHI is not set and ignore_rvbar_in_aarch32 is set.

cpuX.SMPnAMP**Type**

bool

Default value

0x1

Enable broadcast messages necessary for correct SMP operation at reset.

cpuX.TEINIT**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTL.R.V.

cpuX.aarch32_reset_from_impdef_addr**Type**

bool

Default value

0x1

If PE resets into AArch32, Whether execution starts from IMPDEF address or hi/low vector.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether the model has been built with NEON support.

cpuX.clock_divider**Type**

int

Default value

0x1

Clock divider ratio for asymmetric MP clocking.

cpuX.clock_multiplier**Type**

int

Default value

0x1

Clock divider ratio for asymmetric MP clocking.

cpuX.crypto_aes**Type**

int

Default value

0x2

AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 2, AES and PMULL instructions implemented (FEAT_AES, FEAT_PMULL).

cpuX.crypto_sha1**Type**

int

Default value

0x1

SHA-1 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA1 instructions implemented (FEAT_SHA1).

cpuX.crypto_sha256**Type**

int

Default value

0x1

SHA-256 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA256 instructions implemented (FEAT_SHA256).

cpuX.cti-intack_mask**Type**

int

Default value

0x1

Set bits represent that the corresponding trigger requires software acknowledge via CTIINTACK.

cpuX.cti-number_of_claim_bits**Type**

int

Default value

0x0

Number of implemented bits in CTICLAIMSET.

cpuX.cti-number_of_triggers**Type**

int

Default value

0x8

Number of cti event triggers (default: 8, valid values: {3, 8-32}).

cpuX.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

cpuX.enable_crc32**Type**

int

Default value

0x0

CRC32 instructions supported. 0, not implemented. 1, CRC32 instructions implemented (FEAT_CRC32).

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.etm-present**Type**

bool

Default value

0x1

Set whether the model has ETM support.

cpuX.flash.enable**Type**

bool

Default value

0x0

Enable flash by default after reset.

cpuX.force-fpsid**Type**

bool

Default value

0x0

Override the FPSID value.

cpuX.force-fpsid-value**Type**

int

Default value

0x0

Value to override the FPSID value to.

cpuX.has_hcptr_tase**Type**

bool

Default value

0x1

If false, HCPTR.TASE is RES0.

cpuX.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

cpuX.llpp.base**Type**

int

Default value

0x0

Sets the base address of Low Latency Peripheral Port.

cpuX.llpp.size**Type**

int

Default value

0x1000

Sets the size of LLPP(in bytes).

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.number-of-breakpoints**Type**

int

Default value

0x10

Number of breakpoints.

cpuX.number-of-context-breakpoints**Type**

int

Default value

0x10

Number of breakpoints that are context aware.

cpuX.number-of-watchpoints**Type**

int

Default value

0x10

Number of watchpoints.

cpuX.operation_bandwidth**Type**

int

Default value

0x1

Operation width for ARMv8.4 PMU extension.

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.semihosting-stderr_istty**Type**

bool

Default value

0x1

Result for semihost istry call when argument is stderr.

cpuX.semihosting-stdin_istty**Type**

bool

Default value

0x1

Result for semihost istry call when argument is stdin.

cpuX.semihosting-stdout_istty**Type**

bool

Default value

0x1

Result for semihost istry call when argument is stdout.

cpuX.semihosting-use_stderr**Type**

bool

Default value

0x0

Send stderr from the simulated process to host stderr.

cpuX.tcm-present**Type**

bool

Default value

0x0

Disables the TCMs.

cpuX.tcm-supports-exclusive**Type**

bool

Default value

0x0

Whether TCM supports exclusive access.

cpuX.tcm.a.base**Type**

int

Default value

0x0

Sets the base address of the ATCM. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only.

cpuX.tcm.a.enable**Type**

bool

Default value

0x0

Enable ATCM by default after reset. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only.

cpuX.tcm.a.size**Type**

int

Default value

0x4000

Sets the size of the ATCM(in bytes). The size should be aligned with 4KB. The lower 12 bits will be masked out.

cpuX.tcm.a.stretch_clk**Type**

bool

Default value

0x0

Whether ATCM clock stretched to occupy full cycle.

cpuX.tcm.a.wait**Type**

int

Default value

0x0

ATCM accesses wait states.

cpuX.tcm.b.base**Type**

int

Default value

0x0

Sets the base address of the BTCM. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only.

cpuX.tcm.b.enable**Type**

bool

Default value

0x0

Enable BTCM by default after reset. TCMs are implementation defined in the v8R architecture. TCMs are configurable on the model via parameter only.

cpuX.tcm.b.size**Type**

int

Default value

0x4000

Sets the size of the BTCM(in bytes). The size should be aligned with 4KB. The lower 12 bits will be masked out.

cpuX.tcm.b.stretch_clk**Type**

bool

Default value

0x0

Whether BTCM clock stretched to occupy full cycle.

cpuX.tcm.b.wait**Type**

int

Default value

0x0

BTCLM accesses wait states.

cpuX.tcm.c.base**Type**

int

Default value

0x0

Sets the base address of the CTCLM. CTCLMs are implementation defined in the v8R architecture. CTCLMs are configurable on the model via parameter only.

cpuX.tcm.c.enable**Type**

bool

Default value

0x0

Enable CTCLM by default after reset. CTCLMs are implementation defined in the v8R architecture. CTCLMs are configurable on the model via parameter only.

cpuX.tcm.c.size**Type**

int

Default value

0x2000

Sets the size of the CTCLM(in bytes). The size should be aligned with 4KB. The lower 12 bits will be masked out.

cpuX.tcm.c.stretch_clk**Type**

bool

Default value

0x0

Whether CTCLM clock stretched to occupy full cycle.

cpuX.tcm.c.wait**Type**

int

Default value

0x0

CTCM accesses wait states.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.unpredictable_WPMASKANDBAS**Type**

int

Default value

0x1

Constrained unpredictable handling of watchpoints when mask and BAS fields specified. 0, IGNOREMASK. 1, IGNOREBAS (default). 2, REPEATBAS8. 3, REPEATBAS.

cpuX.vfp-dp-present**Type**

bool

Default value

0x1

Whether double-precision floating point feature is implemented (FEAT_F64MM).

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

cpuX.vfp-traps**Type**

bool

Default value

0x1

Implement support for trapping floating-point exceptions.

cpuX.vfp-traps-show-all**Type**

bool

Default value

0x0

Report all trapped floating-point exceptions in the syndrome when a combination occurs.

cpuX.wfet_early_or_delayed_timeout**Type**

int

Default value

0x0

WFET early or delayed timeout beyond the threshold value of CNTVCT_ELO in percentage.

cpuX.wfit_early_or_delayed_timeout**Type**

int

Default value

0x0

WFIT early or delayed timeout beyond the threshold value of CNTVCT_ELO in percentage.

dbg-bcr-reserved-behavior**Type**

int

Default value

0x1

This is the behavior of the reserved values of the BT field in DBGBCR. Possible values are: - 0 = Disabled. - 1 = BT[2] is ignored. .

dbg_rom_dap_addr**Type**

int

Default value

0x0

Debug ROM dap base address.

dbgitr_buffer_size**Type**

int

Default value

0x0

Number of instructions which can be buffered before EDSCR.ITE is cleared.

dbgxvr_ress_is_stateful**Type**

bool

Default value

0x0

Whether DBGWVR/DBGBVR.RESS returns last written value. if set to false, RESS returns sign extended value.

dc_fault_unaligned_s1_device_s2_fwb**Type**

bool

Default value

0x0

Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_bus_width_in_bytes`

Type

int

Default value

0x8

L1 D-Cache read bus width in bytes used to calculate per-access timing annotations.

`dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-ways**Type**

int

Default value

0x2

L1 D-Cache number of ways (sets are implicit from size).

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_bus_width_in_bytes**Type**

int

Default value

0x8

L1 D-Cache write bus width in bytes used to calculate per-access timing annotations.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

dcimva_requires_s2_write_permissions**Type**

bool

Default value

0x0

Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).

debug_auth_signals_sampled_at_reset**Type**

bool

Default value

0x0

Debug authentication signals can be configured as either sampled at reset only or at any time for External Root Debug.

debug_components_dap_address**Type**

string

Default value

""

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on debug bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is: {"format": "all_addrs_are_absolute_wrt_debugbus", "cores": [{"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}]}

debug_components_mmap_address**Type**

string

Default value

""

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on system bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is: {"format": "all_addrs_are_absolute_wrt_systembus", "cores": [{"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}]}

debug_entry_is_context_sync**Type**

bool

Default value

0x0

If true, Entry in debug state is Context sync. Exiting debug state is a context synchronising operation, but entering is not. However some cpu implementation can consider also the Entry in Debug state as a CSE.

debug_rom_is_class_9**Type**

bool

Default value

0x0

If true, present a debug ROM table as a class 9 device. Otherwise, use a class 1 ROM table.

debug_rom_is_flat**Type**

bool

Default value

0x0

If true, present a debug ROM table recommended by ARMv8 Debug Architecture. Otherwise, use nested ROM tables.

def_mem_map**Type**

string

Default value

{ "*": "NORMAL INC ONC OSH" }

Default memory map in a json format which is: { "start-end_inclusive" : "attributes", "*" : "attributes" } Where the * represents the entire physical address range and must be provided and the attributes can be a combination of following. MemoryType - NORMAL, GRE, nGRE, nGnRE, nGnRnE Shareability - ISH, OSH, NSH InnerAttributes - IWB, IWT, INC OuterAttribute - OWB, OWT, ONC ExecuteNever - XN.

def_mem_map_file_path**Type**

string

Default value

""

Path of file describing default memory map in json format. When a valid path is provided, the below parameter 'def_mem_map' will be ignored.

default_inner_shareable**Type**

bool

Default value

0x0

shareability for default memory map regions which are shareable.

delay_serror**Type**

int

Default value

0x0

Add a propagation delay of serror signal into the core.

dic-spi_count**Type**

int

Default value

0x40

Number of shared peripheral interrupts implemented.

disable_impdef_abort_on_ic_maintenance**Type**

bool

Default value

0x0

Disable IMP_INTLATENCY_EL2.MMDVM/LLRAMDVM controlling the abort on IC maintenance on MM port/LLRAM.

disable_sve_plugin**Type**

bool

Default value

0x0

If true, SVE will not be implemented in this processor even if the plugin is loaded (FEAT_SVE).

disable_unknown_update_event_on_reset**Type**

bool

Default value

0x0

Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserved or resets to architecturally unknown value.

dsb_accumulate_threshold**Type**

int

Default value

0x100

Limit the maximum number of observable DSB side effects which can be queued (e.g. TLBI), after which DSB sync will be done automatically.

edpfr_ras_unknown_bits_read_as_0**Type**

bool

Default value

0x0

If true then UNKNOWN bits in RAS field in EDPFR are read as 0.

e10_can_access_imp_def_functionality**Type**

bool

Default value

0x0

If not made UNDEF by imp_def_functionality_behaviour, ELO can access IMPLEMENTATION DEFINED registers and system instructions.

e13_trap_priority_when_secure_debug_disabled**Type**

bool

Default value

0x0

Undef when secure debug is disabled (EDSCR.SDD == 1) && boolean
IMPLEMENTATION_DEFINED 'EL3 trap priority when SDD == 1'.

enable_address_contig_check**Type**

bool

Default value

0x0

Check the input address range for the table entries that have the contiguous hint bit set.

enable_debug_auth_signals_config**Type**

int

Default value

0xf

Debug Authentication Signals DBGEN, SPIDEN (and if RME is enabled RLPIDEN and RTPIDEN) are configurable (default) or not configurable, (hardwired to 1). This parameter is the integer representation of a bitmap to enable configuration of these signals, with: - BIT[0] = DBGEN - BIT[1] = SPIDEN - BIT[2] = RLPIDEN - BIT[3] = RTPIDEN .

enable_lock_step**Type**

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_tlb_contig_check**Type**

bool

Default value

0x0

Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set.

enhanced_pac2_level**Type**

int

Default value

0x0

Implements Enhanced PAC2. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only, 2: EnhancedPAC2 with FPAC, 3: EnhancedPAC2 with FPACCombined.

error_record_feature_register**Type**

string

Default value

""

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

error_record_feature_register_json_file**Type**

string

Default value

""

File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value.

erxpgctl_res0_stateful_mask**Type**

int

Default value

0x0

Mask for stateful bits for ERXPGCTL which are RES0.

exception_catch_before_software_step**Type**

bool

Default value

0x1

Exception catch priority for the exception trapping form of exception catch (Armv8.2 or later, or exception_catch_type=0). If true, the exception catch debug event has higher priority than software step and halting step.

exception_catch_type**Type**

int

Default value

0x0

Type of exception catch (ARMv8.0 - ARMv8.1 only). 0, exception trapping. 1, non-exception trapping, higher priority than step. 2, non-exception trapping, lower priority than step.

exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Exclusive monitors in the cluster will be cleared by a atomic by the same master to the monitored address.

exclusive_monitor_clear_on_store_from_same_master**Type**

bool

Default value

0x1

Exclusive monitors in the cluster will be cleared by a store by the same master to the monitored address.

exclusive_monitor_clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Exclusive monitors in the cluster will be cleared when a strex fails because the address does not match.

exclusive_monitor_clear_on_strex_success**Type**

bool

Default value

0x1

Exclusive monitors in the cluster will be cleared when a strex succeeds.

exercise_stxr_fail**Type**

bool

Default value

0x0

Reject a pseudo-random majority of exclusive store instructions.

ext_abort_device_GRE_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_GRE_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_GRE_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-GRE read external aborts.

ext_abort_device_GRE_read_is_sync**Type**

int

Default value

0x2

Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

ext_abort_device_GRE_read_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_GRE_read_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_GRE_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-GRE write external aborts.

ext_abort_device_GRE_write_is_sync**Type**

int

Default value

0x2

Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as `ext_abort_device_write_is_sync`.

`ext_abort_device_GRE_write_ras_index`

Type

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as `ext_abort_device_write_ras_index`, Valid indices in range [0, `number_of_error_records`-1].

`ext_abort_device_GRE_write_ras_type`

Type

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as `ext_abort_device_write_ras_type`, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

`ext_abort_device_nGRE_prefetch_ras_index`

Type

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as `ext_abort_prefetch_ras_index`, Valid indices in range [0, `number_of_error_records`-1].

`ext_abort_device_nGRE_prefetch_ras_type`

Type

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as `ext_abort_prefetch_ras_type`, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

`ext_abort_device_nGRE_read_is_critical`

Type

bool

Default value

0x0

Critical reporting of device-nGRE read external aborts.

ext_abort_device_nGRE_read_is_sync**Type**

int

Default value

0x2

Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

ext_abort_device_nGRE_read_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_nGRE_read_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_nGRE_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGRE write external aborts.

ext_abort_device_nGRE_write_is_sync**Type**

int

Default value

0x2

Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

ext_abort_device_nGRE_write_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_nGRE_write_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_read_acquire_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device read with acquire external aborts.

ext_abort_device_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGnRE read external aborts.

ext_abort_device_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_device_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGnRE write external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_device_write_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_device_write_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_fill_data**Type**

int

Default value

0xfdfdfdfcfdfdfdf

Returned data, if external aborts are asynchronous.

ext_abort_normal_cacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal write-back cacheable-read external aborts.

ext_abort_normal_cacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of normal write-back cacheable-read external aborts.

ext_abort_normal_cacheable_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_cacheable_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_cacheable_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal write-back cacheable write external aborts.

ext_abort_normal_cacheable_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of normal write-back cacheable write external aborts.

ext_abort_normal_cacheable_write_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_cacheable_write_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_noncacheable_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_noncacheable_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_noncacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal noncacheable-read external aborts.

ext_abort_normal_noncacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of normal noncacheable-read external aborts.

ext_abort_normal_noncacheable_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_noncacheable_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_noncacheable_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal noncacheable write external aborts.

ext_abort_normal_noncacheable_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of normal noncacheable write external aborts.

ext_abort_normal_noncacheable_write_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_noncacheable_write_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_wt_cacheable_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_wt_cacheable_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_wt_cacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal write-through cacheable-read external aborts.

ext_abort_normal_wt_cacheable_read_is_sync**Type**

int

Default value

0x2

Synchronous reporting of normal write-through read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_read_is_sync.

ext_abort_normal_wt_cacheable_read_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_wt_cacheable_read_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_wt_cacheable_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal write-through write external aborts.

ext_abort_normal_wt_cacheable_write_is_sync**Type**

int

Default value

0x2

Synchronous reporting of normal write-through write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_write_is_sync.

ext_abort_normal_wt_cacheable_write_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_wt_cacheable_write_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_prefetch_device_GRE_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of external aborts generated by device-GRE instruction fetches.

ext_abort_prefetch_device_GRE_read_is_sync**Type**

int

Default value

0x2

Behaviour of external aborts generated by device-GRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_prefetch_device_nGRE_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of external aborts generated by device-nGRE instruction fetches.

ext_abort_prefetch_device_nGRE_read_is_sync**Type**

int

Default value

0x2

Behaviour of external aborts generated by device-nGRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_prefetch_device_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of external aborts generated by device-nGnRE instruction fetches.

ext_abort_prefetch_device_read_is_sync**Type**

int

Default value

0x2

Behaviour of external aborts generated by device-nGnRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_prefetch_is_critical**Type**

bool

Default value

0x0

Critical reporting of external aborts generated by normal writeback cacheable instruction fetches.

ext_abort_prefetch_is_sync**Type**

bool

Default value

0x1

Behaviour of external aborts generated by normal writeback cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort.

ext_abort_prefetch_noncacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of external aborts generated by normal noncacheable instruction fetches.

ext_abort_prefetch_noncacheable_read_is_sync**Type**

int

Default value

0x2

Behaviour of external aborts generated by normal noncacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_prefetch_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_prefetch_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_prefetch_so_read_is_critical

Type

bool

Default value

0x0

Critical reporting of external aborts generated by device-nGnRnE instruction fetches.

ext_abort_prefetch_so_read_is_sync

Type

int

Default value

0x2

Behaviour of external aborts generated by device=nGnRnE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_prefetch_wt_cacheable_read_is_critical

Type

bool

Default value

0x0

Critical reporting of external aborts generated by normal writethrough cacheable instruction fetches.

ext_abort_prefetch_wt_cacheable_read_is_sync

Type

int

Default value

0x2

Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_so_prefetch_ras_index

Type

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_so_prefetch_ras_type

Type

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_so_read_is_critical

Type

bool

Default value

0x0

Critical reporting of device-nGnRnE read external aborts.

ext_abort_so_read_is_sync

Type

bool

Default value

0x1

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_read_ras_index

Type

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_so_read_ras_type

Type

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_so_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGnRnE write external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of device-nGnRnE write external aborts.

ext_abort_so_write_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_so_write_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_ttw_cacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of TTW cacheable read external aborts.

ext_abort_ttw_cacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of TTW cacheable read external aborts.

ext_abort_ttw_cacheable_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_ttw_cacheable_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_ttw_noncacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of TTW noncacheable read external aborts.

ext_abort_ttw_noncacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of TTW noncacheable read external aborts.

ext_abort_ttw_noncacheable_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_ttw_noncacheable_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_ttw_wt_cacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of TTW write-through cacheable read external aborts.

ext_abort_ttw_wt_cacheable_read_is_sync**Type**

int

Default value

0x2

Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.

ext_abort_ttw_wt_cacheable_read_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_ttw_wt_cacheable_read_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

external_oslar_access_disabled_by_authentication**Type**

bool

Default value

0x0

If true, external accesses to OSLAR, when external debugging is not enabled, will generate an error (FEAT_Debugv8p2).

fault_on_nT_bit_set**Type**

bool

Default value

0x1

Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.

fault_unalign_to_unsupported_access**Type**

int

Default value

0x8

If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB or the access crossing a 16-byte boundary generate fault. Bits 0,1,2,3 should be set accordingly to enable the fault behaviour. bit 0: atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault, bit 3: the access crossing a 16-byte boundary should fault.

fault_unaligned_s1_device_s2_fwb**Type**

int

Default value

0x0

Whether unaligned fault with stage1 Device memory and final memory attribute forced to normal by FWB. 0, No fault. 1, will fault. 2 No fault if final Shareability is NSH.

flash_protection_enable_at_reset**Type**

bool

Default value

0x0

Enable flash memory protection after reset.

force_align_pc**Type**

bool

Default value

0x0

UNPREDICTABLE branch to non-word-aligned address in ARM state is forced to be aligned.

fpcr_short_vector_raz**Type**

bool

Default value

0x0

FPSCR and FPCR fields LEN and STRIDE are hardwired to 0.

fpsr_res0_stateful_mask**Type**

int

Default value

0x0

Mask for stateful bits of FPSR which are RES0.

gic.GICC-offset**Type**

int

Default value

0x2000

Offset from PERIPHBASE for GICC registers.

gic.GICD-offset**Type**

int

Default value

0x1000

Offset from PERIPHBASE for GICD registers. Will be ignored when GICv3 CPU interface is enabled, as distributor is then external to the cluster.

gic.GICH-offset**Type**

int

Default value

0x4000

Offset from PERIPHBASE for GICH registers.

gic.GICH-other-CPU-offset**Type**

int

Default value

0x5000

Offset from PERIPHBASE for GICH registers for accessing other CPUs in the cluster. Set to 0 to disable.

gic.GICV-alias**Type**

int

Default value

0x0

Offset from PERIPHBASE for alias of GICV registers. When gicv2-only, if zero no alias will be created; if gicv2-only=0, the param is deprecated, when zero or unset an alias is created in the place mandated by the architecture (GICV-base+0xF000).

gic.GICV-offset**Type**

int

Default value

0x6000

Offset from PERIPHBASE for GICV registers.

gic.PERIPH-size**Type**

int

Default value

0x8000

Size of registers based at PERIPHBASE that are considered to be owned by the GIC. Any accesses in the range PERIPHBASE to PERIPHBASE+gic.PERIPH-size-1 that do not match GIC registers will be treated as RAZ/WI.

gic_iri.ARE-fixed-to-one**Type**

bool

Default value

0x1

GICv2 compatibility is not supported and GICD_CTLR.ARE_* is always one.

gic_iri.DPG-ARE-only**Type**

bool

Default value

0x0

Limit application of DPG bits to interrupt groups for which ARE=1.

gic_iri.DPG-bits-implemented**Type**

bool

Default value

0x0

Enable implementation of interrupt group participation bits or DPG bits in GICR_CTLR.

gic_iri.GICD-alias**Type**

int

Default value

0x0

In GICv2 mode: the base address for a 4k page alias of the first 4k of the Distributor page, in GICv3 mode: the base address of a 64KB page containing message based SPI signalling register aliases(0:Disabled).

gic_iri.GICD_ITARGETSR-RAZWI**Type**

bool

Default value

0x0

If true, the GICD_ITARGETS registers are RAZ/WI.

gic_iri.GICD_PIDR**Type**

int

Default value

0x0

The value for the GICD_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

gic_iri.GICR_PIDR**Type**

int

Default value

0x0

The value for the GICR_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

gic_iri.GITS_PIDR**Type**

int

Default value

0x0

The value for the GITS_PIDR registers, if non-zero. Note: fixed fields (device type etc.) will be overridden in this value.

gic_iri.ICFGR-rsvd-bit**Type**

bool

Default value

0x1

If ARE=0, the value of reserved bits i.e. bit 0,2,4..30 of ICFGRn for n>0.

`gic_iri.IIDR`**Type**

int

Default value

0x0

GICD_IIDR and GICR_IIDR value.

`gic_iri.IRI-ID-bits`**Type**

int

Default value

0x10

Number of bits used to represent interrupts IDs in the Distributor and Redistributors, forced to 10 when none of LPIs, extended SPIs or extended PPIs is supported.

`gic_iri.ITS-count`**Type**

int

Default value

0x0

Number of Interrupt Translation Services to be instantiated (0=none).

`gic_iri.SPI-count`**Type**

int

Default value

0x20

Number of SPIs that are implemented.

`gic_iri.SPI-message-based-support`**Type**

bool

Default value

0x1

Distributor supports message based signaling of SPI.

`gic_iri.STATUSR-implemented`**Type**

bool

Default value

0x0

Determines whether the GICR_STATUSR register is implemented.

`gic_iri.enable_protocol_checking`**Type**

bool

Default value

0x0

Enable/disable protocol checking at cpu interface.

`gic_iri.enabled`**Type**

bool

Default value

0x1

Enable GICv3 functionality; when false the component is inactive.

`gic_iri.has-two-security-states`**Type**

bool

Default value

0x0

If true, has two security states.

`gic_iri.irouter-default-mask`**Type**

string

Default value

0.0.0.7

Default Mask value for IROUTER[32..1019] register in the form 'a.b.c.d'.

`gic_iri.irouter-default-reset`**Type**

string

Default value

0.0.0.0

Default Reset Value of IROUTER[32..1019] register in the form 'a.b.c.d' or '*'.

`gic_iri.monolithic`**Type**

bool

Default value

0x1

Indicate that the implementation is not distributed.

`gic_iri.non-ARE-core-count`**Type**

int

Default value

0x4

Maximum number of non-ARE cores; normally used to pass the cluster-level NUM_CORES parameter to the top-level redistributor.

`gic_iri.periph-size`**Type**

int

Default value

0x0

Size in bytes allocated to internal GIC Distributor.

`gic_iri.priority-bits`**Type**

int

Default value

0x5

Number of implemented priority bits.

`gic_iri.processor-numbers`**Type**

string

Default value

""

Specify processor numbers (as appears in GICR_TYPER) in the form 0.0.0.0=0,0.0.0.1=1 etc.) If not specified, will number processors starting at 0.

`gic_iri.redistributor-offset`**Type**

int

Default value

0x0

Offset from reg-offset where the Redistributors are accessible.

`gic_iri.redistributor-size`**Type**

int

Default value

0x0

Per Redistributor register space in bytes.

`gic_iri.reg-offset`**Type**

int

Default value

0x0

Offset from PERIPHBASE allocated to internal GIC Distributor.

`gic_iri.supports-shareability`**Type**

bool

Default value

0x0

Device supports shareability attributes on outgoing memory bus (i.e. is modelling an ACElite port rather than an AXI4 port).

`gic_iri.virtual-lpi-support`**Type**

bool

Default value

0x0

GICv4 Virtual LPIs and Direct injection of Virtual LPIs supported.

`gic_iri.wakeup-on-reset`**Type**

bool

Default value

0x0

Go against specification and start redistributors in woken-up state at reset. This allows software that was written for previous versions of the GICv3 specification to work correctly. This should not be used for production code or when the distributor is used separately from the core fast model.

`gicv3.A3-affinity-supported`**Type**

bool

Default value

0x0

Whether a non-zero value for affinity at level 3 is supported.

`gicv3.BPR-min`**Type**

int

Default value

0x2

The minimum value for the GICC_BPR register (non-secure version will be 1 + this value).

`gicv3.EOI-check-CPUID`**Type**

bool

Default value

0x0

Check CPU ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

gicv3.EOI-check-ID**Type**

bool

Default value

0x0

Check Interrupt ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

gicv3.EOI-deactivate-any-interrupt**Type**

bool

Default value

0x0

Allow an EOI to deactivate interrupts that aren't the highest priority active interrupt (EOI-ignore-out-of-order must be false otherwise this is ignored).

gicv3.EOI-ignore-out-of-order**Type**

bool

Default value

0x1

Ignore EOI writes that cannot end the highest priority active interrupt.

gicv3.FIQEn-RAO**Type**

bool

Default value

0x0

GICC_CTLR.FIQEn is read as one, write insensitive.

gicv3.IIDR_base**Type**

int

Default value

0x43b

The base value for calculating the GICC_IIDR register value.

gicv3.LR-count**Type**

int

Default value

0x10

The number of implemented list registers.

gicv3.PMHE-RAO-WI**Type**

bool

Default value

0x0

ICC_CTLR_EL*.PHME is read as one, write insensitive.

gicv3.PMHE-RAZ-WI**Type**

bool

Default value

0x0

ICC_CTLR_EL*.PHME is read as zero, write insensitive.

gicv3.PMHE-release-set-packet**Type**

bool

Default value

0x0

if PHME is enabled, whether a SET packet is released by CPU Intf in Upstream Ack window.

gicv3.SRE-EL2-enable-RAO**Type**

bool

Default value

0x0

When ICC_SRE_EL2.SRE is RAO/WI, makes ICC_SRE_EL2.Enable RAO/WI.

gicv3.SRE-EL3-enable-RAO**Type**

bool

Default value

0x0

When ICC_SRE_EL3.SRE is RAO/WI, makes ICC_SRE_EL3.Enable RAO/WI.

gicv3.SRE-EL3-set-once**Type**

bool

Default value

0x0

Restrict SRE EL3 to be set only once.

gicv3.SRE-enable-action-on-mmap**Type**

int

Default value

0x0

Allowed values are: 0-SRE one allows mmap access. 1-SRE one disables mmap access. 2-SRE one makes mmap access RAZ-WI.

gicv3.STATUSR-implemented**Type**

bool

Default value

0x1

If GICv3 CPU interface is being used, this determines whether the STATUS registers are implemented.

gicv3.VBPR-min**Type**

int

Default value

0x2

The minimum value for the GICV_BPR register (non-secure version will be 1 + this value).

gicv3.VFIQEn-RAO**Type**

bool

Default value

0x0

ICH_VMCR_EL2.VFIQEn is read as one, write insensitive.

gicv3.cpuintf-mmap-access-level**Type**

int

Default value

0x0

Allowed values are: 0-mmap access is supported for GICC,GICH,GICV registers. 1-mmap access is supported only for GICV registers. 2-mmap access is not supported.

gicv3.dir-trap-support**Type**

bool

Default value

0x1

The cpu supports separate trapping of ICC_DIR_EL1 to EL2.

gicv3.el3_trap_priority_when_secure_debug_disabled**Type**

bool

Default value

0x0

Undef to access priorities group register when secure debug is disabled.

gicv3.extended-interrupt-range-support**Type**

bool

Default value

0x0

Device has support for extended SPI/PPI ID ranges.

gicv3.gicv2-only**Type**

bool

Default value

0x0

Limit the GIC implementation to GICv2 features only.

gicv3.idle-is-ff**Type**

bool

Default value

0x1

For GICC/GICV RPR, when idle, return FF when true, minimum supported priority otherwise.

gicv3.ignore-DIR-write-when-EOImode-not-set**Type**

bool

Default value

0x1

Ignore UNPREDICTABLE access to GICC_DIR register.

gicv3.interrupt-bypass-support**Type**

bool

Default value

0x1

Interrupt bypass support, set to false for devices not supporting interrupt bypass.

gicv3.local-SEIs**Type**

bool

Default value

0x0

Generate SEI to signal internal issues.

gicv3.local-VSEIs**Type**

bool

Default value

0x0

Generate VSEI to signal internal issues.

gicv3.physical-ID-bits**Type**

int

Default value

0x10

Number of physical ID bits implemented.

gicv3.priority-bits**Type**

int

Default value

0x5

Number of priority bits implemented.

gicv3.send-PMHE-command-only-when-priority-changes**Type**

bool

Default value

0x0

Send PMHE upstream command to distributor only when write to ICC_PMR_EL1 changes the priority.

gicv3.sgi-range-selector-support**Type**

bool

Default value

0x0

Device has support for the Range Selector feature for SGI.

gicv3.suppress-virtual-enables-comms**Type**

bool

Default value

0x1

In GICv3 only mode, prevents the GIC CPUIF from communicating UpstreamWrite/VirtualEnables to the IRI.

gicv3.virtual-ID-bits**Type**

int

Default value

0x10

Number of virtual ID bits implemented.

gicv3.virtual-lpi-support**Type**

bool

Default value

0x1

When GICv3 is supported, indicates a cut down CPUIF interface with no support of VLPI (GICv3 only) when false.

gicv3.virtual-priority-bits**Type**

int

Default value

0x5

Number of virtual priority bits implemented.

gicv3.without-DS-support**Type**

bool

Default value

0x0

GICv3 CPU interfaces do not support disabling security in the distributor (GICD_CTLR.DS=1).

gicv4.mask-virtual-interrupt**Type**

bool

Default value

0x0

If true, virtual interrupts can be masked from being reported to virtual CPU interface by setting ICH_HCR_EL2.DVIM 1. No control otherwise.

global_debug_rom.ROMDEVID**Type**

int

Default value

0x0

Value of Debug Rom Device Identification Register.

global_debug_rom.ROMPIDR**Type**

int

Default value

0x4000bb000

Value of Debug Rom Peripheral Identification Register.

global_debug_rom.ROMPRIDR0**Type**

int

Default value

0x1

Value of Debug ROM Power RequestID Register.

hardware_translation_table_update_implemented**Type**

int

Default value

0x1

Implement hardware translation table updates from ARMv8R-64. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has-gicv4.1**Type**

bool

Default value

0x0

GICv4.1 is enabled, and all the features with GICv4.1 are implemented (FEAT_GICv4p1).

has_16bit_asids**Type**

bool

Default value

0x1

Enable 16-bit ASIDs.

has_16bit_vmids**Type**

int

Default value

0x1

Implement support for 16-bit VMIDs from ARMv8R-64. Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_16k_granule**Type**

bool

Default value

0x0

Implement the 16k LPAE translation granule.

has_4k_granule**Type**

bool

Default value

0x1

Implement the 4k LPAE translation granule.

has_64k_granule**Type**

bool

Default value

0x1

Implement the 64k LPAE translation granule.

has_aarch32_dbgdidr_etc**Type**

bool

Default value

0x1

DBGDIDR, DBGDRAR, DBGDSAR exist even if EL1 doesn't implement AArch32.

has_aarch64**Type**

bool

Default value

0x0

All implemented exception levels can run in AArch64.

has_bc**Type**

int

Default value

0x1

Implement Armv8.8 Hinted Conditional Branch (FEAT_HBC) Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_ccidx**Type**

bool

Default value

0x0

Implement the ARMv8R-64 CCSIDR Extension. Extending the ccidr number of sets (FEAT_CCIDX).

has_cluster_l1cache_size**Type**

bool

Default value

0x1

Whether core supports cluster level l1cache size.

has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_const_pac**Type**

int

Default value

0x0

Feature for singular selection of PAC field (FEAT_CONSTPACFIELD). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_cvadp_support**Type**

int

Default value

0x0

Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 (FEAT_DPB, FEAT_DPB2). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_debug_rom**Type**

bool

Default value

0x1

If true, a debug ROM will be generated describing the cluster's debug components.

has_delayed_ctireg**Type**

bool

Default value

0x0

Delay the functional effect of CTI register writes until ISB or implicit barrier.

has_delayed_dbgreg**Type**

bool

Default value

0x0

Delay the functional effect of external debug register writes until ISB or implicit barrier.

has_delayed_mdscr_el1**Type**

bool

Default value

0x0

Delay the functional effect of MDSCR_EL1 register writes until ISB or implicit barrier.

has_delayed_oslar_el1**Type**

bool

Default value

0x0

Delay the functional effect of OSLAR_EL1 register writes until ISB or implicit barrier.

has_delayed_pmureg**Type**

bool

Default value

0x0

Delay the functional effect of PMU register writes until ISB or implicit barrier.

has_delayed_sysreg**Type**

bool

Default value

0x0

Delay the functional effect of system register writes until ISB or implicit barrier.

has_dgh**Type**

int

Default value

0x1

Implements Data Gathering Hint instruction from ARMv8.6 (FEAT_DGH). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

has_e0pd**Type**

int

Default value

0x0

Implement ARMv8-R64 feature to prevent unprivileged access to one half of the memory Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_edacr**Type**

bool

Default value

0x1

Implement EDACR register.

has_enhanced_pac**Type**

bool

Default value

0x0

If pointer authentication is enabled then implement enhanced PAC.

has_exception_trapping_form_of_vector_catch**Type**

bool

Default value

0x1

Implement the exception trapping form of vector catch debug event.

has_export_m_port**Type**

bool

Default value

0x1

The interrupt distributor has an optional interrupt export port for routing interrupts to an external device.

has_far_not_valid**Type**

bool

Default value

0x0

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts.

has_far_not_valid_dfsc**Type**

bool

Default value

0x0

Implements FnV bit in ESR_ELx, FAR not valid for synchronous external aborts for Data Abort.

has_far_not_valid_ifsc**Type**

bool

Default value

0x0

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts for Instruction Abort.

has_flash**Type**

bool

Default value

0x0

Flash Port present.

has_flash_protection**Type**

bool

Default value

0x0

Implement flash memory protection.

has_fp16**Type**

int

Default value

0x1

Implement the half-precision floating-point data processing instructions from ARMv8R-64 (FEAT_FP16). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_generic_authentication**Type**

int

Default value

0x1

Implement ARMv8.3 generic authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_hardware_translation_table_update**Type**

int

Default value

0x2

Type of hardware translation table supported (when enabled by `hardware_translation_table_update_implemented`). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented.

`has_internal_gic_iri`

Type

bool

Default value

0x0

Is Internal GIC IRI implemented.

`has_itd`

Type

bool

Default value

0x1

Implement the optional IT disable feature.

`has_large_system_ext`

Type

bool

Default value

0x0

Implement the ARMv8 Large System Extensions (FEAT_LSE).

`has_large_va`

Type

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8R-64 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

`has_1lpp`

Type

bool

Default value

0x0

Low Latency Peripheral Port present.

has_mpm**Type**

bool

Default value

0x0

Implement max-power mitigation mechanism (MPMM).

has_no_os_double_lock**Type**

int

Default value

0x0

Do not implement the OS double-lock (FEAT_DoubleLock). Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_par_bit10_razwi**Type**

bool

Default value

0x0

Whether PAR_EL1[10] is RAZ/WI.

has_partial_delayed_mdscr_el1**Type**

bool

Default value

0x0

has_delayed_oslar_el1 only apply to some bits of MDSCR_EL1 (MDE, KDE, TDCC, SS).

has_pc_sample_based_profiling**Type**

bool

Default value

0x1

If true, pc sample-based profiling is enabled (FEAT_PCSRv8, FEAT_PCSRv8p2).

has_per_cluster_debug_auth_ports**Type**

bool

Default value

0x0

If true then the debug authentication ports i.e. spniden, niden, rpliden, rtpiden, dbgen, spiden are available per cluster.

has_pl2**Type**

bool

Default value

0x1

Whether EL2 is implemented.

has_pmc**Type**

bool

Default value

0x0

Programmable MBIST controllers implemented.

has_pmu**Type**

int

Default value

0x1

Implement the optional Performance Monitors Extension (FEAT_PMUv3). 0, Not Implemented. 1, Implemented. 2, PMU is IMPLEMENTATION_DEFINED, PMU version would be set to 0xF and would behave as if no PMU is implemented.

has_pointer_authentication**Type**

int

Default value

0x1

Implement ARMv8.3 pointer authentication (FEAT_PAuth). Possible values of this parameter are: - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_prediction_invalidation_instructions**Type**

int

Default value

0x1

Implement execution and data prediction invalidation from ARMv8-R64 (FEAT_SPECRES). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_qarma3_pac**Type**

bool

Default value

0x0

Supports QARMA3 pointer authentication algorithm (FEAT_PACQARMA3).

has_ras**Type**

int

Default value

0x0

Implements the ARMv8 RAS Extension. 0 = NO_RAS, 1 = MINIMAL_RAS, 2 = FULL_RAS (FEAT_RAS).

has_ras_armv84_extension**Type**

int

Default value

0x0

Implement ARMv8R-64 RAS Extension (FEAT_RASv1p1). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_ras_double_fault**Type**

int

Default value

0x0

Implement ARMv8.4 RAS Double Fault Extension (FEAT_DoubleFault). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_restriction_on_speculative_data_loaded

Type

int

Default value

0x1

Implements the ARMv8-R64 security feature (Restrictions on the effects of speculation) (FEAT_CSV3). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_self_hosted_trace_extension

Type

int

Default value

0x1

Implement support for the Self-hosted Trace Extensions from ARMv8R-64 (FEAT_TRF). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_small_page_table

Type

int

Default value

0x1

Implement small page table support which increases the maximum value of TxSZ field from ARMv8R-64 (FEAT_TTST). Note: will be unimplemented only if both has_small_page_table=0x0 and has_pl2=0x0. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_software_lock

Type

bool

Default value

0x1

Implement software lock in memory-mapped CTI, PMU, and external debug interfaces.

has_speculation_barrier_inst**Type**

int

Default value

0x1

Implement speculation barrier instruction (SB) from ARMv8-R64 (FEAT_SB). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_speculative_sei**Type**

bool

Default value

0x0

If true, the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches.

has_spp**Type**

bool

Default value

0x0

Shared Peripheral Port present.

has_stage2_ap_speculative_update**Type**

int

Default value

0x0

Speculative update of S2 AP bit on S1 TTW. 0 = No Update, 1 = Update, 2 = Update including for AT ops.

has_synchronous_load_atomics**Type**

bool

Default value

0x1

Report asynchronous abort due to unsupported load atomics as synchronous (Cacheable).

has_synchronous_load_atomics_noncacheable**Type**

bool

Default value

0x1

Report asynchronous abort due to unsupported load atomics as synchronous (Non-Cacheable).

has_synchronous_store_atomics**Type**

bool

Default value

0x0

Report asynchronous abort due to unsupported store atomics as synchronous (Cacheable).

has_synchronous_store_atomics_noncacheable**Type**

bool

Default value

0x0

Report asynchronous abort due to unsupported store atomics as synchronous (Non-Cacheable).

has_tlb_conflict_abort**Type**

bool

Default value

0x0

Detected inconsistent TLB content generate aborts.

has_tlb_pa_caching**Type**

bool

Default value

0x0

Whether intermediate caching of translation table walks might include NonCoherent caches of previous valid walks. 0, NonCoherent caches might be included. 1, No NonCoherent caches included (FEAT_nTLBPA).

has_unsupported_exclusive_fault**Type**

bool

Default value

0x1

Report unsupported exclusive access with Unsupported Exclusive fault status (otherwise use external abort).

has_v8_4_pmu_extension**Type**

int

Default value

0x1

Implement PMU extension from ARMv8.4 (FEAT_PMUv3p4). Possible values of this parameter are:
- 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_v8_5_debug_over_power_down**Type**

int

Default value

0x0

Implement ARMv8.5 Debug over powerdown Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8R-64 is enabled. - 2, feature is implemented.

has_v8_6_pmu_events**Type**

int

Default value

0x1

Implements PMU events from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

has_writebuffer**Type**

bool

Default value

0x0

Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.

hcptr_tta_behaviour**Type**

int

Default value

0x2

Behaviour of HCPTR.TTA when there is no CP14 ETM interface. 0, RAZ/WI. 1, RAO/WI. 2, stateful.

hcr_el2_miocnce_is_rw**Type**

bool

Default value

0x0

If true, HCR_EL2.MIOCNCE is treated as R/W instead of RAZ/WI.

hcr_swio_res1**Type**

bool

Default value

0x0

Whether HCR.SWIO and/or HCR_EL2.SWIO are RES1.

hsr_uncond_cc**Type**

bool

Default value

0x0

Condition codes reported in HSR as AL if it passes.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-log2linelen**Type**

int

Default value

0x0

If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-nprefetch**Type**

int

Default value

0x1

Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-prefetch_level`

Type

int

Default value

0x0

0 based cache level at which instructions are pre-fetched. This is only used when `icache-prefetch_enabled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_bus_width_in_bytes`

Type

int

Default value

0x8

L1 I-Cache read bus width in bytes used to calculate per-access timing annotations.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

icache-ways**Type**

int

Default value

0x2

L1 I-Cache number of ways (sets are implicit from size).

ignore_tag_check_dcc_load_store_in_ma_mode_when_tco_is_disabled**Type**

bool

Default value

0x0

Constrained unpredictable behavior for reads/writes to external debug interface DTR regs in memory access mode when PSTATE.TCO is 0. If true, tag check is ignored else, tag check is performed if required.

imp_def_functionality_behaviour**Type**

int

Default value

0x0

Behaviour of IMPLEMENTATION DEFINED registers and system instructions. 0, UNDEF. 1, RAZ/WI.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

internal_vgic**Type**

bool

Default value

0x0

Instantiate VGIC peripheral in this processor.

is_debug_state_pmu_snapshot_allowed**Type**

bool

Default value

0x1

If true, PMU snapshot is allowed in debug state.

is_first_pcsr_sample_ignored**Type**

bool

Default value

0x0

If true, First read of PMPCSR register after reset returns 0xFFFFFFFF.

is_serror_edge_triggered**Type**

bool

Default value

0x1

If true, SError is edge-triggered. Otherwise, its level-triggered.

is_uniprocessor**Type**

bool

Default value

0x0

Value for the U bit in MPIDR. true disables L1 cache coherency protocols.

isb_is_branch**Type**

bool

Default value

0x0

If true, ISB is traced as an immediate branch. This allows to count ISB as a branch in debug extensions (e.g. PMU).

ish_is_osh**Type**

bool

Default value

0x0

Whether Innershareable is same as OuterShareable.

itd_conditional_instructions_are_32bit**Type**

bool

Default value

0x0

When SCTLR_ELx.ITD=1, an IT instruction plus a T16 instruction are considered a single 32bit conditional instruction.

jidr_is_undef_at_el0**Type**

bool

Default value

0x0

If true, JIDR register access is UNDEF at EL0.

jmcr_is_undef_at_el0**Type**

bool

Default value

0x0

If true, JMCR register access is UNDEF at EL0.

joscr_is_undef_at_el0**Type**

bool

Default value

0x0

If true, JOSCR register access is UNDEF at EL0.

l1cache_has_r52_cache_policy**Type**

bool

Default value

0x0

Whether l1cache has r52 cache policy.

l1cache_has_rsvd_flash_ways**Type**

bool

Default value

0x0

Whether l1 cache segregates ways for flash and AXI data.

l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x8

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l2cache-ways`

Type

int

Default value

0x10

L2 Cache number of ways (sets are implicit from size).

`l2cache-write_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x8

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

l3cache-has_mpam**Type**

bool

Default value

0x0

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-mpamf.arch_major_ver**Type**

int

Default value

0x0

L3 Cache MPAMF_AIDR architecture major version.

l3cache-mpamf.arch_minor_ver**Type**

int

Default value

0x0

L3 Cache MPAMF_AIDR architecture minor version.

l3cache-mpamf.esr_mask**Type**

int

Default value

0xffffffff

L3 Cache MPAMF_ESR mask value.

l3cache-mpamf.has_esr**Type**

bool

Default value

0x0

L3 Cache's MPAMF_ESR, MPAMF_ECR, and MPAM error handling implemented.

l3cache-mpamf.has_extd_esr**Type**

bool

Default value

0x0

L3 Cache's MPAMF_ESR is 64-bits.

l3cache-mpamf.has_impl_idr**Type**

bool

Default value

0x0

L3 Cache's MPAMF_IMPL_IDR is present.

l3cache-mpamf.has_mbwu_long_counter**Type**

bool

Default value

0x0

L3 Cache has long MBWU counter and capture registers.

l3cache-mpamf.has_mpamfidr_ext**Type**

bool

Default value

0x0

MPAMF_IDR.EXT support.

l3cache-mpamf.has_partid_nrw**Type**

bool

Default value

0x0

Narrowing part ID register is present. This is global rather than per-instance.

l3cache-mpamf.has_priority_partitioning**Type**

bool

Default value

0x0

The selected resource has priority partitioning described in MPAMF_PRI_IDR.

l3cache-mpamf.has_prod_id**Type**

int

Default value

0x0

L3 Cache MPAMF_IIDR product ID supported.

l3cache-mpamf.has_prod_rev**Type**

int

Default value

0x0

L3 Cache MPAMF_IIDR product REVISION supported.

l3cache-mpamf.has_prod_var**Type**

int

Default value

0x0

L3 Cache MPAMF_IIDR product VARIENT supported.

l3cache-mpamf.has_ris**Type**

bool

Default value

0x0

L3 Cache has resource instance selection support.

l3cache-mpamf.max_partid_ns**Type**

int

Default value

0xffff

L3 Cache Maximum value of non-secure PARTID supported.

l3cache-mpamf.max_partid_rl**Type**

int

Default value

0xffff

L3 Cache Maximum value of realm PARTID supported for RME implementations.

l3cache-mpamf.max_partid_rt**Type**

int

Default value

0xffff

L3 Cache Maximum value of root PARTID supported for RME implementations.

l3cache-mpamf.max_partid_s**Type**

int

Default value

0xffff

L3 Cache Maximum value of secure PARTID supported.

l3cache-mpamf.max_pmg_ns**Type**

int

Default value

0xff

L3 Cache Maximum value of non-secure PMG supported.

l3cache-mpamf.max_pmg_rl**Type**

int

Default value

0xff

L3 Cache Maximum value of realm PMG supported for RME implementations.

l3cache-mpamf.max_pmg_rt**Type**

int

Default value

0xff

L3 Cache Maximum value of root PMG supported for RME implementations.

l3cache-mpamf.max_pmg_s**Type**

int

Default value

0xff

L3 Cache Maximum value of secure PMG supported.

l3cache-mpamf.mbwu_long_counter_width**Type**

int

Default value

0x0

L3 Cache long MBWU counter width. 0: 63 bits, 1: 44 bits.

l3cache-mpamf.no_impl_msmon**Type**

bool

Default value

0x0

L3 Cache's MPAMF_IMPL_IDR does not describe resource monitors.

l3cache-mpamf.no_impl_part**Type**

bool

Default value

0x0

L3 Cache's MPAMF_IMPL_IDR does not describe resource partitioning controls.

l3cache-mpamf.ris_max**Type**

int

Default value

0x0

L3 Cache's largest resource instance selector value defined.

l3cache-mpamf_base**Type**

int

Default value

0x0

L3 Cache memory mapped MPAM registers base address.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_bus_width_in_bytes**Type**

int

Default value

0x8

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x0

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-ways`

Type

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

`l3cache-write_access_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l3cache-write_bus_width_in_bytes`

Type

int

Default value

0x8

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

`l3cache-write_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`legacy_combining_exc_catch_trace`

Type

bool

Default value

0x1

Whether exception catch is traced as part of exception entry/exit in same cycle.

ls64_ignore_s1_unpred_memattr_transformation**Type**

bool

Default value

0x0

If true, stage 1 unpredictable memory attribute transformations are ignored for FEAT_LS64 single-copy atomic 64-byte load/store instructions' (FEAT_LS64, FEAT_LS64_V, FEAT_LS64_ACCDATA).

ls64_memtype_check_use_combined_memattr**Type**

bool

Default value

0x0

If true, FEAT_LS64 single-copy atomic 64-byte load/store instructions' memory attributes check is done on the combined memory attributes at the end of all enabled translation stages.

mdrar_el1_res0**Type**

bool

Default value

0x0

MDRAR_EL1 is RES0.

memory.ext_slave_base**Type**

int

Default value

0x0

Base address of Slave Port. Each core's region will offset by ext_slave_size_per_core.

memory.ext_slave_size_per_core**Type**

int

Default value

0x0

Size of Slave region for each core.

`memory.flash_base`**Type**

int

Default value

0x0

Base address of Flash.

`memory.flash_size`**Type**

int

Default value

0x0

Size of the Flash RAM.

`memory.has_llram`**Type**

bool

Default value

0x0

Low-Latency RAM present.

`memory.l2_cache.is_inner_cacheable`**Type**

bool

Default value

0x1

L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes).

`memory.l2_cache.is_inner_shareable`**Type**

bool

Default value

0x1

L2 cache obeys inner shareable attributes (rather than outer shareable attributes).

memory.llram_base**Type**

int

Default value

0x0

Base address of LLRAM.

memory.llram_enable_at_reset**Type**

bool

Default value

0x0

Whether llram is enabled at reset.

memory.llram_shared**Type**

bool

Default value

0x0

Controls the Low-Latency RAM's sharability attribute.

memory.llram_size**Type**

int

Default value

0x0

Size of the LLRAM.

memory.scu_present**Type**

bool

Default value

0x1

L1 Caches are coherent.

memory.transmit_vmid_in_user_flags**Type**

bool

Default value

0x0

Transmit VMID in transaction attributes.

mixed_endian**Type**

int

Default value

0x1

Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at ELO only.

mpidr_layout**Type**

int

Default value

0x0

Layout of MPIDR. 0 AFF0 is CPUID, 1 AFF1 is CPUID.

non_secure_vgic_alias_when_ns_only**Type**

int

Default value

0x0

If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).

num_protection_regions_s1**Type**

int

Default value

0x20

Number of v8-R protection regions.

num_protection_regions_s2**Type**

int

Default value

0x20

Number of v8-R hyp protection regions.

num_spi**Type**

int

Default value

0x20

Number of interrupts (SPI) into the internal GIC controller.

number_of_error_records**Type**

int

Default value

0x0

Cores Number of Error records supported for RAS.

page_based_hardware_attributes**Type**

int

Default value

0x0

Implement the page based hardware attributes from ARMv8R-64. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy (FEAT_HPDS2).

par_ns_set_unknown_bit**Type**

bool

Default value

0x1

Whether NS bit of PAR is set/clear when executing AT to perform non-secure regime translation. When true, NS is set to 1 else 0.

per_core_master_supported**Type**

bool

Default value

0x0

If master port from each core is exposed out of cluster.

pfr1_csv2_frac**Type**

int

Default value

0x0

Fractional revision number ID_AA64PFR1_EL1.CSV2_frac when ID_AA64PFR0_EL1.CSV==1 for CSV2 extension (FEAT_CSV2_1p1, FEAT_CSV2_1p2).

pmb_idr_external_abort**Type**

int

Default value

0x0

Describes how the PE manages External aborts on writes made by the Statistical Profiling Extension to the Profiling Buffer. 0, External abort is reported to SPE, From Armv8.8 and Armv9.3, the value 0 is not permitted. 1, External abort is ignored. 2, The External abort generates an SError and the error is not reported to SPE.

pmb_idr_flag_updates**Type**

bool

Default value

0x1

Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.

pmcr_disable_events_export**Type**

bool

Default value

0x1

If true, export for PMU events is disabled. This configures PMCFGR.EX field.

pme-cr-res0-fields-razwi**Type**

bool

Default value

0x0

If true, RES0 fields of PME-CR_EL1 are accessed with a Read-As-Zero/Write-Ignore policy.

pmmir-el1-bus-slots**Type**

int

Default value

0x0

Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles.

pmmir-el1-bus-width**Type**

int

Default value

0x0

Width, in bytes, of accesses counted by BUS_ACCESS.

pms-idr-max-size**Type**

int

Default value

0x6

Defines largest size for a single SPE record (rounded up to a power of 2).

pmu-num-counters**Type**

int

Default value

0x8

Number of PMU counters implemented.

pmu_cycle_counter_counts_actual_cycles**Type**

bool

Default value

0x0

If true and Timing annotation is enabled, PMU cycle counter counts actual cycles, otherwise counts instructions executed.

pmu_has_chain_event**Type**

bool

Default value

0x1

PMU (if present) implements event number 0x1e, CHAIN.

pseudo_fault_generation_feature_register**Type**

string

Default value

""

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

pstate_ssbs_type**Type**

int

Default value

0x0

Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS (FEAT_SSBS). 2, fully supported (FEAT_SSBS2).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

ram_protection_enable_at_reset**Type**

bool

Default value

0x0

Enable TCM, L1Cache memory protection after reset.

randomize_unknowns_at_reset**Type**

bool

Default value

0x0

Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset.

ras_extra_configurations**Type**

string

Default value

""

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}].

ras_pfg_clock_mhz**Type**

int

Default value

0x18

RAS Pseudo-Fault generation clock rate in MHz.

register_reset_data**Type**

int

Default value

0x0

Data used to fill register bits when they become UNKNOWN at reset.

register_reset_data_hi**Type**

int

Default value

0x0

Data used to fill the upper-half of 128-bit registers when the bits become UNKNOWN at reset.

report_iside_cmo_ifsr**Type**

bool

Default value

0x1

fault info for an iside cache maintenance operation is reported in the IFSR.

report_second_access_align_fault_non_atomic_pair_access**Type**

bool

Default value

0x0

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an alignment fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

report_second_access_mmu_fault_non_atomic_pair_access**Type**

bool

Default value

0x0

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an MMU fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

reported_fp_revision**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored. Updates the FPSID.revision value.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reserved_HMC_SSC_PAC_treated_disabled**Type**

bool

Default value

0x0

When DBG[B|W]CR.{HMC,SSC,PAC} bits configuration is reserved, this parameter controls whether breakpoints/watchpoints are treated as Disabled or not.

restore_fpsr_on_trapped_fp_exception**Type**

bool

Default value

0x0

If true, FPSR is restored to the value of the FPSR immediately before the instruction that generated the trapped floating-point exception.

restriction_on_speculative_execution**Type**

int

Default value

0x0

Implements the ARMv8-R64 security feature (Restrictions on the effects of speculation): 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported) (FEAT_CSV2, FEAT_CSV2_2).

rnr_always_implemented**Type**

bool

Default value

0x0

Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.

s1_align_memtype_fault_prio_more_than_s2_perm_fault_on_s1_walk**Type**

bool

Default value

0x1

If true, s1 alignment fault has priority over s2 permission faults.

scheduler_mode**Type**

int

Default value

0x0

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional

context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!.

scr_nET_writeable**Type**

bool

Default value

0x0

Whether SCR.nET is writeable. Writing to it is purely cosmetic (nET behavior not implemented).

scramble_unknowns_at_reset**Type**

bool

Default value

0x1

Will fill in unknown bits in registers at reset with register_reset_data.

serror_clear_delay**Type**

int

Default value

0x0

Delay for clearing of SError if SError is level-triggered, in cpu cycles.

skip_trace_on_write_to_oseccr_el1_when_oslock_is_unlocked**Type**

bool

Default value

0x0

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an unknown value on reads and ignores writes. When true, also skips the traces on writes to OSECCR_EL1 when OSLSR_EL1.OSLK == 0.

spp.base**Type**

int

Default value

0x0

Sets the base address of Shared Peripheral Port.

spp.size**Type**

int

Default value

0x1000

Sets the size of SPP(in bytes).

spsr_el3_is_mapped_to_spsr_mon**Type**

bool

Default value

0x0

Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon.

spsr_m4_res0**Type**

bool

Default value

0x0

Whether SPSR_ELx.M[4] bit should be RES0 for AARCH64 only implementations.

stage12_tlb_size**Type**

int

Default value

0x0

If VMSEA is supported at stage1, number of stage1+2 tlb entries. If instruction_tlb_size !=0, this is treated as dtlb size.

stage1_tlb_size**Type**

int

Default value

0x0

Number of stage1 only tlb entries.

stage1_walkcache_size**Type**

int

Default value

0x0

Number of stage1 only walk cache entries.

strex_fail_can_hit_watchpoint**Type**

bool

Default value

0x0

If true, a strex fail can hit watchpoint.

supports_multi_threading**Type**

bool

Default value

0x0

Sets the MPIDR.MT bit. Setting this to true hints the the cluster is multi-threading compatible.

swp_with_xzr_is_st_atomic**Type**

bool

Default value

0x1

If true, swp with dest as xzr is treated as store atomic.

take_ccfail_tsc_trap**Type**

bool

Default value

0x0

When take_ccfail_undef=1 this parameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.

take_ccfail_undef**Type**

bool

Default value

0x1

UNDEF exception is taken even if condition code check fails.

tidcp_traps_el0_undef_imp_def**Type**

bool

Default value

0x1

TIDCP has priority over UNDEF for accesses to IMPLEMENTATION DEFINED functionality from EL0.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_or_ic_invalid_xt**Type**

int

Default value

0x0

Behavior of TLBI and IC instructions that don't take Xt as an argument when Xt != 0b11111. 0: TLB and IC not UNDEF, 1: TLBI UNDEF, IC not UNDEF, 2: TLBI not UNDEF, IC UNDEF, 3: TLBI and IC UNDEF.

trace_has_sysreg_access**Type**

bool

Default value

0x1

ETM trace registers support access via system registers.

trace_icc_registers_as_icv_when_redirected**Type**

bool

Default value

0x0

If true, update trace with ICV, instead of ICC when ICV registers are accessed depending on the core state.

trace_physical_registers_when_host_virtualisation_enabled**Type**

int

Default value

0x0

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers).

trap_dc_cmo_to_pou_if_nop**Type**

bool

Default value

0x1

Whether traps to DC CMO operations to PoU are ignored if the same is treated as NOP.

trap_ic_cmo_to_pou_if_nop**Type**

bool

Default value

0x1

Whether traps to IC CMO operations to PoU are ignored if the same is treated as NOP.

trap_reserved_group3_id_regs**Type**

bool

Default value

0x0

Whether setting HCR_EL2.TID3 traps reserved group3 id registers.

treat-dcache-cmos-to-poc-as-nop**Type**

int

Default value

0x0

Whether dcache maintenance operations to the point of coherency are required for instruction to data coherence. 0 - Clean/Invalidate ops required, 1 - Clean/Invalidate ops not required and cannot generate faults, 2 - Clean/Invalidate ops not required but can generate faults.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

treat-dcache-invalidate-as-clean-invalidate**Type**

bool

Default value

0x0

Treat data cache invalidate operations as clean and invalidate.

treat-icache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

If has_coherent_icache is true, whether instruction cache invalidation operations to PoU which are treated as NOP can generate fault. 0 - cannot generate faults, 1 - can generate faults.

treat_forced_normal_as_device_for_excl_atomics**Type**

bool

Default value

0x0

Whether exclusive/atomic access is supported in same manner as access to device if stage1 is Device memory and final memory attribute forced to normal by FWB.

treat_pld_as_nop**Type**

bool

Default value

0x0

If true, treat PLD as NOP.

treat_pli_as_nop**Type**

bool

Default value

0x0

If true, treat PLI as NOP.

treat_wfi_wfe_as_nop**Type**

bool

Default value

0x0

If true, never go into wait state for WFI or WFE instructions.

truncate_pc_on_illegal_exception_return_to_aarch32**Type**

bool

Default value

0x1

On Illegal ERET to AArch32, truncate PC to 32-bits.

unification-level**Type**

int

Default value

0x1

Level of Unification Inner Shareable for the cache hierarchy.

unification-uniprocessor-level**Type**

int

Default value

0x1

Level of Unification Uniprocessor for the cache hierarchy.

unpred_LSE128_overlap**Type**

int

Default value

0x1

Constrained unpredictable behaviours for 128-bit LSE overlap. 1 Constraint_UNDEF, 2 Constraint_NOP.

unpred_clear_ISV_for_exception_before_software_step**Type**

bool

Default value

0x0

Whether ESR_ELx.ISV bit is cleared/set, when it is constrained unpredictable due to a different exception before a software step exception.

unpred_edscr_ns_set_unknown_bit**Type**

bool

Default value

0x0

Unknown(x) bit in NS field in EDSCR can be configure to 0 or 1.

unpred_edscr_rw_unknown_bits_read_as_1**Type**

bool

Default value

0x0

Unknown(x) bits in RW field in EDSCR are read as 1 instead of 0.

unpred_edscr_status_read_as_no_syndrome**Type**

bool

Default value

0x0

Controls the choice of EDSCR.STATUS bit-values, when it is constrained unpredictable behaviour due to a different exception before a halting step debug event.

unpred_extdbg_unknown_bits**Type**

int

Default value

0x0

Data used to fill only in UNKNOWN bit-fields of external debug registers e.g., EDPFR and EDDFR.

unpred_load_single_reg_overlap_with_wb**Type**

int

Default value

0x0

Constrained unpredictable behaviours for single load with writeback(might impact certain load pair instructions) 0 Constraint_WBSUPPRESS, 1 Constraint_UNDEF, 2 Constraint_NOP.

unpred_mrsmsr_currentlymapped_undef**Type**

bool

Default value

0x0

UNPREDICTABLE register access (accessible from current mode using different instruction) modeled as NOP when false and UNDEF when true.

unpred_mrsmsr_protfailed_undef**Type**

bool

Default value

0x0

UNPREDICTABLE register access (not accessible from current PL and security state) modeled as NOP when false and UNDEF when true.

unpred_par_attr_returns_mair**Type**

bool

Default value

0x0

If true, PAR_EL1.ATTR represents the memory attributes as per the MAIR value instead of the ones in the descriptor.

unpred_sctlr_c_0_taggable_behaviour**Type**

int

Default value

0x2

Controls unpredictable effects when SCTLTR_ELx.C=0 for a stage 1 translation regime on whether memory is treated as taggable. Values: 0=Tagged, 1=Untagged but forced to Tagged when FWB=1 and stage 2 restores WB, 2 = Untagged.

unpred_stage2_mpu_and_bg_disabled**Type**

int

Default value

0x0

Constrained unpredictable when stage2 MPU and background disabled. 0, Stage-2 level 0 translation fault(Default). 1, Unknown memory attributes.

unpred_store_exclusive_base_overlap**Type**

int

Default value

0x0

Constrained unpredictable behaviours for store exclusive when s==n. 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP.

unpred_store_pair_and_single_reg_overlap_with_wb**Type**

int

Default value

0x0

Constrained unpredictable behaviours for pair and single store with writeback(doesn't cover store exclusive) 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP.

unpred_tlbi_not_in_monitor_mode

Type

int

Default value

0x0

Constrained unpredictable behaviors for AArch32 TLBI instructions executed in secure privileged mode other than Monitor mode. 0: Preferred behavior (default), 1: UNDEF, 2: NOP, 3: execute as if had been executed in Monitor mode.

unpred_tsize_aborts

Type

bool

Default value

0x0

Behaviour when TSize is out of range. 0, force into range. 1, translation fault, forces unpred_tsize_pamax_aborts to 1.

unpred_tsize_pamax_aborts

Type

bool

Default value

0x0

Behaviour when stage 2 TSize exceeds the physical address size (or 40bits, from AArch32). 0, force into range. 1, translation fault. Ignored if unpred_tsize_aborts is 1.

unpredictable_exclusive_abort_memtype

Type

int

Default value

0x0

Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable).

unpredictable_hvc_behaviour**Type**

int

Default value

0x0

HVC unpredictable behaviour. 0, UNDEF. 1, NOP.

unpredictable_smc_behaviour**Type**

int

Default value

0x0

SMC unpredictable behaviour. 0, UNDEF. 1, NOP.

unpredictable_wfet_and_wfit_behaviour**Type**

int

Default value

0x1

WFET and WFIT unpredictable behaviour in debug state. 0, UNDEFINED. 1, NOP.

unsupported_atomic_fault_type**Type**

int

Default value

0x0

Type of fault reported on unsupported atomic access. 0 = external abort if any reported by interconnect, 1 = precise unsupported atomic fault, 2 = precise external abort, 3 = imprecise external abort.

unsupported_hw_update_fault_type**Type**

int

Default value

0x0

Type of abort reported when hw update to descriptor is done using unsupported memtype (0=No abort, 1=IMPDEF abort caused by memtype, 2=Sync external abort).

use_architectural_names**Type**

bool

Default value

0x0

Use names SP/LR/PC instead of R13/R14/R15.

use_stage1_sh_as_input_to_stage2**Type**

bool

Default value

0x0

IMPDEF case of whether to use stage1 shareability or OuterShareable as input to stage2 if stage1 is Device memtype.

use_tlb_contig_hint**Type**

bool

Default value

0x0

Translation table entries with the contiguous hint bit set generate large TLB entries.

user_defined_rom_table_debug_power_config**Type**

string

Default value

""

User defined ROM Table debug power domains for ED,CTI,PMU and TRACE, and DBGPCR configuration. The "version" field and "cores" array are mandatory. The "dbgpcr" array, if provided, must contain unique integers in the range [0, 32) describing which debug power domains have power control implemented. The "rom" and "dbgpcr" fields in objects in the "cores" array are only allowed when 'debug_rom_is_flat' is false. All power domain ID fields ("rom", "ed/pmu", "cti", "etm") must be in the range [0, 32). The "ed/pmu" field is mandatory. Example JSON for a hierarchical debug ROM layout: '{"version": 0, "dbgpcr": [0, 1], "cores":[{"dbgpcr": [1, 31], "rom": 0, "ed/pmu": 0, "cti": 31, "etm": 1}, {"ed/pmu": 0}]}'.

vpu_datapath_width**Type**

int

Default value

0x80

VPU data path width.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

warn_unpredictable_in_v7**Type**

bool

Default value

0x1

If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning.

watchpoint-log2secondary_restriction**Type**

int

Default value

0x0

log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.

wfe_wakeup_delay**Type**

int

Default value

0x0

Configure WFE wakeup delay in CPU cycles.

wfi_wakeup_delay**Type**

int

Default value

0x0

Configure WFI wakeup delay in CPU cycles.

wp_ignores_dbm_update

Type

bool

Default value

0x0

If true, dbm update is ignored on watchpoint hit.

3.5.2 AEMvACT

ARM AEM A-Profile(MP) CPU component - number of cores configurable at runtime. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-191: IP revisions support

Revision	Quality level
N/A	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

Ports added:

- pmusnapshotacks
- pmusnapshotreqs

Parameters added:

- has_arm_v9-6
- has_cmpbr
- has_f8f16mm
- has_f8f32mm
- has_feat_pops
- has_fprcvt
- has_lsfe
- has_lsui
- has_occmo
- has_pcdphint
- has_pmu_extpmn

- `has_ras_mmap_view`
- `has_rme_gdi`
- `has_rme_gpc3`
- `has_spe_nvm`
- `has_srmask`
- `has_uinj`
- `has_v9_6_spe_extension`
- `illegal_state_exception_priority`
- `l3cache-mpamf.esr_mask`
- `mpam_bw_bwa_wd`
- `mpam_bw_has_hw_scale`
- `mpam_bw_max_lim`
- `mpam_bw_us_frac`
- `mpam_bw_us_int`
- `mpam_has_bw_ctrl`
- `nv_frac_support_level`
- `pmecr_res0_fields_razwi`
- `poison_range_end_addr`
- `poison_range_start_addr`
- `pstate_pm_reset`
- `ras_mmap_address`
- `rme_nsh_cacheable_is_shareable`
- `sve.has_bfscale`
- `sve.has_sme_b16b16`
- `sve.has_ssve_aes`
- `sve.has_ssve_f8f16mm`
- `sve.has_ssve_f8f32mm`
- `sve.has_sve_f16f32mm`
- `sve.sme_highest_implemented_priority`
- `treat-dcache-cmos-to-occ-as-nop`

Iris and MTI instances for AEMvACT

This model has the following Iris instances:

Table 3-192: AEMvACT Iris instances

InstanceName	ComponentName
AEMvACT	Cluster_ARM_AEM-A_MP

AEMvACT contains the following CADI targets:

- ARM_AEM-A_MP
- Cluster_ARM_AEM-A_MP
- PVCache
- TlbCadi

About AEMvACT

AEMvACT implements all architectural features in Arm®v8-A and Armv9-A.

It provides parameters to enable or disable support for particular architectural features. Some of these parameters allow you to enable features in versions of the architecture earlier than the one in which they were introduced. They have the possible values:

- 0** Feature is not enabled.
- 1** Feature is enabled, but only if the model is set to implement a version of the architecture in which the feature is supported.
- 2** Feature is enabled, regardless of which architecture version the model implements.

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Mapping architectural features to Fast Models releases

The following table shows which Fast Models releases support new architectural features, from Armv8.3-A onwards. Support is at EAC quality unless otherwise stated.

Table 3-194: Architectural features implemented in Fast Models

Architecture version	Feature	Fast Models version									
		11.27	11.26	11.25	11.24	11.23	11.22	11.21	11.20	11.19	11.18
Armv8.3-A	All. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.4-A	All. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓

Architecture version	Feature	Fast Models version									
		11.27	11.26	11.25	11.24	11.23	11.22	11.21	11.20	11.19	11.18
Armv8.5-A	Memory Tagging Extension (MTE) functionality	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	MTE performance	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	All except MTE. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.6-A	All. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.7-A	Limited TLBI maintenance	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	All except TLBI maintenance. For details, see list after table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.8-A	All	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv8.9-A	Guarded Call Stack, 128-bit page table descriptors, and PMU updates	✓	✓	✓	✓	✓	✓	✓	✓	-	-
	All other features	✓	✓	✓	✓	✓	✓	✓	✓	-	-
Armv9.0-A to Armv9.3-A	Branch Record Buffer Extension (BRBE).	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	Trace Buffer Extension (TRBE) and Embedded Trace Extension (ETE). Reading TRBE registers was supported from 11.15.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	Realm Management Extension (RME) and Scalable Matrix Extension (SME).	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
	Scalable Matrix Extension 2 (SME2).	✓	✓	✓	✓	✓	✓	✓	✓	✓	-
	All other features. For details, see the list below this table.	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Armv9.4-A	RME without Secure EL2.	✓	✓	✓	✓	✓	✓	✓	-	-	-

Architecture version	Feature	Fast Models version									
		11.27	11.26	11.25	11.24	11.23	11.22	11.21	11.20	11.19	11.18
	All other features.	✓	✓	✓	✓	✓	✓	✓	✓	-	-
Armv9.5-A	All features.	✓	✓	✓	✓	-	-	-	-	-	-

- Armv8.3-A features implemented include:
 - Pointer authentication
 - Nested virtualization
 - Advanced SIMD complex number support
 - Improved Javascript data type conversion support
 - Memory consistency model changes
 - Support for larger system-visible caches
 - Debug over powerdown
- Armv8.4-A features implemented include:
 - Secure EL2
 - Additional cryptographic hashes
 - Activity monitors
 - Enhanced support for nested virtualization
 - Memory Partitioning and Monitoring (MPAM)
 - Stage 2 forced write-back
 - Dot product instructions
 - Data independent timing instructions
 - Large System Extensions (LSE)
 - Support for TLB maintenance instructions and for TLB range instructions
 - Translation Table Level (TTL)
 - Enhancements to weaker release consistency
 - Debug relaxations and extensions
 - Flag manipulation instructions
- Armv8.5-A features implemented include:
 - Branch Target Indicators (BTI)
 - Enhanced Virtualization Traps (EVT)
 - Random Number Generator (RNG)
 - Flag Manipulation instructions
 - Floating-point round to integer
 - DC CVADP
- Armv8.6-A features implemented include:

- General Matrix Multiply (GEMM)
- EnhancedPAC2
- FPAC
- Data Gathering Hint
- Additional PMU events
- Enhanced Counter Virtualization
- Armv8.7-A features implemented include:
 - WFE and WFI with timeouts
 - Larger physical address for 4KB and 16KB translation granules
 - MTE Asymmetric Fault Handling
 - Enhancements to Privilege Access Never (PAN)
 - Enhancements to PMU and SPE
- Other Armv9-A features implemented include:
 - Scalable Vector Extension version 2 (SVE2)
 - Transactional Memory Extension (TME)

AEMvA core personalities

The AEM core personalities feature allows you to configure AEM instances in a platform to use the **IMPLEMENTATION_DEFINED** registers and **UNPREDICTABLE** behavior for a specific implementation of your choice at model startup.

Configuring an AEM with a core personality requires a license for both the AEM and the selected implementation.

Set the personality using either:

- The environment variable `FASTSIM_AEM_A_PROFILE`.
- The parameter `impdef_regs_and_unpred_from_implementation`.

The parameter allows you to configure different instances in the same platform with different personalities, including subclusters in a heterogeneous AEM. The environment variable takes precedence over the parameter and affects all instances of the AEM in the platform. Otherwise the two options function identically.

To see the available values for the environment variable or parameter, set either of them to the special value `list`. The model prints the list of available values and exits. An example value is `ARM_Cortex-X2`. Then set the parameter or environment variable to the required value.

Configuring a core personality only affects **IMPLEMENTATION_DEFINED** registers and **UNPREDICTABLE** behavior. In other respects, the cluster or subcluster still behaves like the AEM. For example, all parameters default to the AEM default values. Therefore, you must manually set parameters to valid values for the configured personality, as many of the defaults are incompatible with any given implementation.

To assist with this configuration, the AEM prints warnings for any parameter with an invalid value for the configured personality. The warning lists the parameter name and the valid value or range of values it can be set to for the selected personality.

Running the model with invalid parameter configurations for the selected personality can lead to unexpected behavior.

Ports for AEMvACT

Table 3-195: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcasttinner	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
cfgend[8]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHVSIQ[8]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPSIQ[8]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[8]	Signal	Master	Timer signals to SOC.
commirq[8]	Signal	Master	Interrupt signal from debug communications channel.
config64[8]	Signal	Slave	Register width after reset.
cp15sdisable[8]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
CRITICALIRQ[8]	Signal	Master	RAS Critical Error Interrupt.

Name	Protocol	Type	Description
cryptodisable[8]	Signal	Slave	Disable cryptography extensions after reset.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
cti0extin[4]	Signal	Slave	CTI trace inputs for core 0.
cti0extout[4]	Signal	Master	CTI trace outputs for core 0.
cti1extin[4]	Signal	Slave	CTI trace inputs for core 1.
cti1extout[4]	Signal	Master	CTI trace outputs for core 1.
cti2extin[4]	Signal	Slave	CTI trace inputs for core 2.
cti2extout[4]	Signal	Master	CTI trace outputs for core 2.
cti3extin[4]	Signal	Slave	CTI trace inputs for core 3.
cti3extout[4]	Signal	Master	CTI trace outputs for core 3.
cti4extin[4]	Signal	Slave	CTI trace inputs for core 4.
cti4extout[4]	Signal	Master	CTI trace outputs for core 4.
cti5extin[4]	Signal	Slave	CTI trace inputs for core 5.
cti5extout[4]	Signal	Master	CTI trace outputs for core 5.
cti6extin[4]	Signal	Slave	CTI trace inputs for core 6.
cti6extout[4]	Signal	Master	CTI trace outputs for core 6.
cti7extin[4]	Signal	Slave	CTI trace inputs for core 7.
cti7extout[4]	Signal	Master	CTI trace outputs for core 7.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen[8]	Signal	Slave	External debug interface.
dbgnopwrdown[8]	Signal	Master	Debug no power down request.
dbgpwrdownack[8]	Signal	Master	Debug power down acknowledge.
dbgpwrdownreq[8]	Signal	Slave	Debug power down request.
dbgpwrupreq[8]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
ERRORIRQ[8]	Signal	Master	RAS Error Recovery Interrupt.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
external_trace_reset[8]	Signal	Slave	ETMv4 External Trace Reset signal.
FAULTIRQ[8]	Signal	Master	RAS Fault Handling Interrupt
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
fiq_nmi[8]	Signal	Slave	-
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 cpu interface ports.
hacdbsirq[8]	Signal	Master	Interrupt signal from the HACDBS unit.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.
irq_nmi[8]	Signal	Slave	-

Name	Protocol	Type	Description
irqs[224]	Signal	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	Signal	Slave	This signal resets timer and interrupt controller.
memorymapped_amu_s	PVBus	Slave	External interface for amu.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[8]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmbirq[8]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.
pmusnapshotacks[8]	Signal	Master	-
pmusnapshotreqs[8]	Signal	Slave	-
presetdbg[8]	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[8]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rlpiden[8]	Signal	Slave	External debug interface.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rtpiden[8]	Signal	Slave	External debug interface.
rvbar[8]	Value_64	Slave	Reset vector base address.
sei[8]	Signal	Slave	Per core System Error physical pins.
smpnamp[8]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[8]	Signal	Slave	External debug interface.
spniden[8]	Signal	Slave	External debug interface.
standbywfe[8]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[8]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	This signal indicated all cores and L2 are in a power down state
teinit[8]	Signal	Slave	This signal provides default exception handling state.
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trace_unit_reset[8]	Signal	Slave	ETMv4 Trace Unit Reset signal.

Name	Protocol	Type	Description
trbirq[8]	Signal	Master	Interrupt signal from the trace buffer unit.
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	Signal	Slave	Virtual FIQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[8]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	Signal	Slave	Virtual IRQ input. Note that the irq/fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	Signal	Slave	Processor Virtual System Error Interrupt request.

Parameters for AEMvACT

ADFSR-AIFSR-implemented

Type

bool

Default value

0x0

ADFSR and AIFSR are implemented.

AIDR

Type

int

Default value

0x0

Value of AIDR_EL1 register.

AMIIDR

Type

int

Default value

0x43b

Value of AMU Implementation Identification Register.

AMPIDR**Type**

int

Default value

0x4000bb000

Value of AMU Peripheral Identification Register.

BPIMVA_causes_translation_lookup**Type**

bool

Default value

0x0

Do a translation when BPIMVA instruction is executed (which may cause a translation fault).

BROADCASTCACHEMAINT**Type**

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER**Type**

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CCSIDR-L1D_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

CCSIDR-L1I_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

CCSIDR-L2_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

CCSIDR-L3_override**Type**

int

Default value

0x0

If nonzero, allow L3 selection in CSSELR and present this value in CCSIDR (this is cosmetic and does not affect cache behaviour).

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

CTIPIDR**Type**

int

Default value

0x0

If non-zero, override the CTI Peripheral Identification Register.

CTR-L1Ip-override**Type**

int

Default value

0x0

If non-zero, override the L1Ip bits in CTR/CTR_ELO system register. This does not change the behaviour of the cache, only what is present in the CTR register.

DBGBCR_BT_applies_RES0_before_valid_check**Type**

bool

Default value

0x1

If true, RES0 behaviour is applied to DBGBCR(_EL1).BT before checking for reserved values for this field.

DBGPIDR**Type**

int

Default value

0x0

If non-zero, override the Debug Peripheral Identification Register.

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

ERRIIDR**Type**

int

Default value

0xd800143b

Value of RAS Implementation Identification Register.

ERRPIDR**Type**

int

Default value

0x4100bbd80

Value of RAS Peripheral Identification Register.

ERXMISC0_mask**Type**

int

Default value

0x0

Write Mask for ERXMISC0 RAS Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

GMID-log2-block-size**Type**

int

Default value

0x4

Log2 of the block size accessed by STGM/LDGM/STZGM instructions.

ISV_set_to_0_for_stage2_synch_external_abort**Type**

bool

Default value

0x0

Whether ESR_EL2.ISV is set to 0 on stage 2 synchronous external aborts.

MIDR**Type**

int

Default value

0x410fd0f0

Value of MIDR_EL1 register.

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

PA_SIZE**Type**

int

Default value

0x28

Physical address range supported For ARMv8.0 and ARMv8.1 this is limited to 48 bits (FEAT_LPA/FEAT_LPA3).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

PMCEID0**Type**

int

Default value

0xffffffff

Performance Monitor Common Event ID Reg 0 value - 64 bit.

PMCEID1**Type**

int

Default value

0xffffffff

Performance Monitor Common Event ID Reg 1 value - 64 bit.

PMSIDR.ArchInst**Type**

bool

Default value

0x1

Defines whether architecture instruction sampling is implemented or not, if not only micro op sampling is implemented. Model only supports architecture instruction sampling, but allows ID register field to be configured.

PMSIDR.CRR**Type**

bool

Default value

0x0

Defines whether call return branch records (FEAT_SPE_CRR) is implemented or not.

PMSIDR.LDS**Type**

bool

Default value

0x0

Defines whether data source for sampled load instruction is implemented or not. Model does not implement loaded data source, but allows ID register field to be configured.

PMUPIDR**Type**

int

Default value

0x0

If non-zero, override the PMU Peripheral Identification Register.

abort_execution_from_device_memory**Type**

bool

Default value

0x0

Execution from device memory generates a prefetch abort.

advsimd_bf16_support_level**Type**

int

Default value

0x0

Implement BFloat16 operations from ARMv8.6. AArch64 Advanced SIMD and FP BFloat16 instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP BFloat16 instructions only (FEAT_BF16). - 2, AArch32 Advanced SIMD and VFP BFloat16 instructions only (FEAT_AA32BF16). - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP BFloat16 instructions.

advsimd_i8mm_support_level**Type**

int

Default value

0x0

Implement Int8 matrix multiply operations from ARMv8.6. AArch64 Advanced SIMD and FP Int8 matrix multiply instructions are automatically enabled when has_arm_v8-6 is true. - 0, Not implemented. - 1, AArch64 Advanced SIMD and FP Int8 matrix multiply instructions only (FEAT_I8MM). - 2, AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions only (FEAT_AA32I8MM). - 3, Both AArch64 Advanced SIMD and FP and AArch32 Advanced SIMD and VFP Int8 matrix multiply instructions (FEAT_I8MM, FEAT_AA32I8MM).

advsimd_overread**Type**

bool

Default value

0x0

AdvSIMD element load operations access all bytes of a 16-byte aligned window, even in Device memory.

align_pc_on_branch_to_unaligned_pc_aarch32**Type**

bool

Default value

0x0

Force PC align for branches to an unaligned PC counter in A32 state.

align_pc_on_debug_exit_to_aarch32**Type**

bool

Default value

0x0

Exit to AARCH32 state from debug state forces pc bit0 to 0.

align_pc_on_illegal_exception_return_to_aarch32**Type**

bool

Default value

0x1

Align PC when performing an illegal exception return from AArch64 to AArch32.

allow_s1_dbm_update_on_s2_mmu_fault**Type**

bool

Default value

0x1

Whether s1 dirty bit update is done when s2 of ipa (not s1 ttw) generates mmu fault.

amair_reg_rw_mask**Type**

int

Default value

0x0

RW mask for implementation-defined registers.

amu_aux_type_fixed**Type**

string

Default value

""

Lists which AMU auxiliary registers that are fixed and to which event type. The JSON schema is: {fixed_aux_reg:evt_type, ...}. For example {"0":0x300} would make auxiliary register 0 fixed to event type 0x300.

amu_aux_voffset_mask**Type**

int

Default value

0x0

If ARMv8.6 is implemented, each bit of the field, 0 to 15, when 1 indicates that the corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2, is implemented.

amu_has_external_interface**Type**

int

Default value

0x0

Implement external memory-mapped access to system register of activity monitor unit from ARMv8.4. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

amu_has_sysreg_interface**Type**

bool

Default value

0x1

Implement system register access to activity monitor unit from ARMv8.4.

amu_mmap_address**Type**

string

Default value

""

AMU base address for each core on system bus. 0 means the AMU is not mapped, otherwise the address must be 4KB aligned. JSON schema for the parameter value is: {"format": "all_addrs_are_absolute_wrt_systembus", "cores": [{"amu": 0x0}, {"amu": 0x0}, {"amu": 0x0}, {"amu": 0x0}]}.

amu_num_auxiliary_counters**Type**

int

Default value

0x0

Number of AMU auxiliary counters implemented.

amu_reset_domain**Type**

int

Default value

0x0

Reset domain for activity monitor unit. 0, COLD_RESET. 1, WARM_RESET. 2, NONE.

amu_version**Type**

int

Default value

0x1

Selects the activity monitor version implemented - 1, AMUv1 for Armv8.4 is implemented. - 2, AMUv1 for Armv8.6 is implemented (FEAT_AMUv1p1).

apsr_read_restrict**Type**

bool

Default value

0x0

At EL0, unknown bits of APSR are RAZ.

arm_v8_7_accelerator_support_level**Type**

int

Default value

0x0

Implements accelerator support instructions: 0, Not implemented 1, FEAT_LS64 implemented 2, FEAT_LS64_V implemented 3, FEAT_LS64_ACCDATA implemented 4, FEAT_LS64WB implemented.

atomic_memtype_fault_priority**Type**

int

Default value

0x0

This parameter describes the priority of unsupported atomic/exclusive memtype fault w.r.t alignment and permission fault. 0, BEFORE_ALIGN_MEM_FAULT. 1, AFTER_ALIGN_BEFORE_PERM_FAULT. 2, AFTER_PERM_FAULT.

auxilliary_feature_register0

Type

int

Default value

0x0

Value of AFRO ID register.

branch-predictor-clear-policy

Type

int

Default value

0x2

Set branch prediction policy as defined for MMFR1[31:28]. This does not change the behaviour of the branch predictor, only what is reported in MMFR1.BPred.

branch-predictor-supported-ops

Type

int

Default value

0x1

Set branch prediction policy as defined for MMFR3[11:8]. This does not change the behaviour of the branch predictor, only what is reported in MMFR3.BPMaint.

brbe_log2_num_records

Type

int

Default value

0x6

Log2 of number of BRB records supported. 3 -> 8 records, ... 6 -> 64 records.

cache-log2linelen

Type

int

Default value

0x6

Log2 of the cache line length in bytes.

cache_maintenance_hits_watchpoints

Type

bool

Default value

0x0

DCIMVA operations executed in AArch32 modes hit watchpoints.

changing_block_size_without_bbm_support

Type

int

Default value

0x0

Level of support for changing block size without break-before-make (FEAT_BBM).

check_memory_attributes

Type

bool

Default value

0x1

Detect and report TLB use of conflicting memory attributes for views of the same physical address.

checked_pointer_arithmetic_support_level

Type

int

Default value

0x0

Specify the Checked Pointer Arithmetic support level: 0, not implemented. 1, FEAT_CPA is implemented. 2, FEAT_CPA2 is implemented.

clean_invalidate_cache_on_warm_reset

Type

bool

Default value

0x0

Clean and invalidate caches on warm reset.

clear_IT_when_IL_set**Type**

bool

Default value

0x0

Clear IT bits when performing a *legal* exception return to AArch32 when IL is set.

clear_IT_when_IL_set_explicitly**Type**

bool

Default value

0x0

Apart from clear_IT_when_IL_set, also clear IT bits when loading CPSR from SPSR/memory and IL == 1 in the value being loaded.

clear_ec_in_debug_state**Type**

bool

Default value

0x0

When ARMv8.8 debug extension is implemented, whether EDESR.EC bit is set/cleared on entering debug state due to pending exception catch caused by EDESR.EC=1.

clear_reg_top_eret**Type**

int

Default value

0x1

Behaviour of the upper 32-bits of the Xn registers when changing between AArch32 state and AArch64 state. 0, upper 32-bits preserved for all registers. 1, upper 32-bits set to 0 for all accessible registers. 2, upper 32-bits set to 0 for a random selection of accessible registers. 3, upper-32-bits set to 0 for registers touched in AArch32.

clear_reg_top_set**Type**

bool

Default value

0x1

Whether to clear upper 32-bits of the Xn register when corresponding AArch32 register is set via CADI/Iris.

configure_pmu_events_with_json

Type

string

Default value

""

"Configure v8.6 and newer PMU events. Note : This param has high priority and overrides the setting of "has_*_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["EVENT_NAME_1","EVENT_NAME_2"]}."

configure_v8_6_pmu_events_with_json

Type

string

Default value

""

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.6 PMU events. Note : This param has high priority and overrides the setting of "has_v8_6_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_INDNR_RETIRE", "BR_IND_RETIRE", "BR_RETURN_SKIP_RETIRE", "BR_RETURN_ANY_RETIRE", "BR_INDNR_SKIP_RETIRE", "BR_INDNR_TAKEN_RETIRE", "BR_IND_SKIP_RETIRE", "BR_IND_TAKEN_RETIRE", "BR_IMMED_SKIP_RETIRE", "BR_IMMED_TAKEN_RETIRE", "BR_SKIP_RETIRE"]}."

configure_v8_8_pmu_events_with_json

Type

string

Default value

""

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.8 PMU events. Note : This param has high priority and overrides the setting of "has_v8_8_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["BR_HINT_COND_RETIRE", "BR_COND_TAKEN_RETIRE", "BR_UNCOND_RETIRE", "BR_COND_RETIRE", "BRNL_TAKEN_RETIRE", "BRNL_IND_TAKEN_RETIRE", "BRNL_INDNR_TAKEN_RETIRE", "BRNL_IMMED_TAKEN_RETIRE", "BL_TAKEN_RETIRE", "BL_IND_TAKEN_RETIRE", "BL_IMMED_TAKEN_RETIRE"]}."

configure_v8_9_pmu_events_with_json**Type**

string

Default value

""

"[DEPRECATED: Set configure_pmu_events_with_json to the same value instead] Configure v8.9 PMU events. Note : This param has high priority and overrides the setting of "has_v8_9_pmu_events" if both the params are provided. JSON schema for the parameter value is e.g. 1. {"all":false} 2. {"pmu_events":["ASE_SVE_RETIRE", "ASE_RETIRE", "VFP_RETIRE", "SVE_RETIRE", "CRYPTO_RETIRE", "SIMD_INST_RETIRE", "ASE_INST_RETIRE", "SVE_INST_RETIRE", "ASE_SVE_INST_RETIRE", "LD_ANY_RETIRE", "ST_ANY_RETIRE", "LDST_ANY_RETIRE", "DP_RETIRE"]}".

core_cache_protection**Type**

int

Default value

0xffffffffffffffff

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

cpacr_trcdis_behaviour**Type**

int

Default value

0x2

Behaviour of CPACR.TRCDIS/NSACR.NSTRCDIS when there is no CP14 ETM interface. 0, RAZ/WI. 2, implemented.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CONFIG64**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CP15SDISABLE2**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.DCZID-log2-block-size**Type**

int

Default value

0x8

Log2 of the block size cleared by DC ZVA instruction (as read from DCZID_ELO).

cpuX.DCZVA_single_write**Type**

bool

Default value

0x0

Execute the DCZVA as a single write.

cpuX.MPIDR-override**Type**

int

Default value

0x0

Override of MPIDR value. If nonzero will override the MT, cluster and CPU ID bits in MPIDR.

cpuX.RVBAR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.RVBAR32**Type**

int

Default value

0x0

Reset vector address in AARCH32 when VINITHI is not set and ignore_rvbar_in_aarch32 is set.

cpuX.SMPnAMP**Type**

bool

Default value

0x1

Enable broadcast messages necessary for correct SMP operation at reset.

cpuX.TEINIT**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.aarch32_reset_from_impdef_addr**Type**

bool

Default value

0x1

If PE resets into AArch32, Whether execution starts from IMPDEF address or hi/low vector.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether the model has been built with NEON support.

cpuX.clock_divider**Type**

int

Default value

0x1

Clock divider ratio for asymmetric MP clocking.

cpuX.clock_multiplier**Type**

int

Default value

0x1

Clock divider ratio for asymmetric MP clocking.

cpuX.crypto_aes**Type**

int

Default value

0x2

AES instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 2, AES and PMULL instructions implemented (FEAT_AES, FEAT_PMULL).

cpuX.crypto_sha1**Type**

int

Default value

0x1

SHA-1 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA1 instructions implemented (FEAT_SHA1).

cpuX.crypto_sha256**Type**

int

Default value

0x1

SHA-256 instructions supported (requires CryptoPlugin to be loaded). 0, not implemented. 1, SHA256 instructions implemented (FEAT_SHA256).

cpuX.crypto_sha3**Type**

int

Default value

0x0

Implement ARMv8.4 SHA-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA3). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sha512**Type**

int

Default value

0x0

Implement ARMv8.4 SHA-512 instructions (requires CryptoPlugin to be loaded) (FEAT_SHA512). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sm3**Type**

int

Default value

0x0

Implement ARMv8.4 SM-3 instructions (requires CryptoPlugin to be loaded) (FEAT_SM3). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.crypto_sm4**Type**

int

Default value

0x0

Implement ARMv8.4 SM-4 instructions (requires CryptoPlugin to be loaded) (FEAT_SM4). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

cpuX.cti-intack_mask**Type**

int

Default value

0x1

Set bits represent that the corresponding trigger requires software acknowledge via CTIINTACK.

cpuX.cti-number_of_claim_bits**Type**

int

Default value

0x0

Number of implemented bits in CTICLAIMSET.

cpuX.cti-number_of_triggers**Type**

int

Default value

0x8

Number of cti event triggers (default: 8, valid values: {3, 8-32}).

cpuX.enable_crc32**Type**

int

Default value

0x0

CRC32 instructions supported. 0, not implemented. 1, CRC32 instructions implemented (FEAT_CRC32).

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.etm-present**Type**

bool

Default value

0x1

Set whether the model has ETM support.

cpuX.force-fpsid**Type**

bool

Default value

0x0

Override the FPSID value.

cpuX.force-fpsid-value**Type**

int

Default value

0x0

Value to override the FPSID value to.

cpuX.has_hcptr_tase**Type**

bool

Default value

0x1

If false, HCPTR.TASE is RES0.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.number-of-breakpoints**Type**

int

Default value

0x10

Number of breakpoints.

cpuX.number-of-context-breakpoints**Type**

int

Default value

0x10

Number of breakpoints that are context aware.

cpuX.number-of-watchpoints**Type**

int

Default value

0x10

Number of watchpoints.

cpuX.operation_bandwidth**Type**

int

Default value

0x1

Operation width for ARMv8.4 PMU extension.

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.semihosting-stderr_istty**Type**

bool

Default value

0x1

Result for semihost istty call when argument is stderr.

cpuX.semihosting-stdin_istty**Type**

bool

Default value

0x1

Result for semihost istty call when argument is stdin.

cpuX.semihosting-stdout_istty**Type**

bool

Default value

0x1

Result for semihost istty call when argument is stdout.

cpuX.semihosting-use_stderr**Type**

bool

Default value

0x0

Send stderr from the simulated process to host stderr.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.unpredictable_WPMASKANDBAS**Type**

int

Default value

0x1

Constrained unpredictable handling of watchpoints when mask and BAS fields specified. 0, IGNOREMASK. 1, IGNOREBAS (default). 2, REPEATBAS8. 3, REPEATBAS.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

cpuX.vfp-traps**Type**

bool

Default value

0x1

Implement support for trapping floating-point exceptions.

cpuX.vfp-traps-show-all**Type**

bool

Default value

0x0

Report all trapped floating-point exceptions in the syndrome when a combination occurs.

cpuX.wfet_early_or_delayed_timeout**Type**

int

Default value

0x0

WFET early or delayed timeout beyond the threshold value of CNTVCT_ELO in percentage.

cpuX.wfit_early_or_delayed_timeout**Type**

int

Default value

0x0

WFIT early or delayed timeout beyond the threshold value of CNTVCT_ELO in percentage.

cpuselr_el3_sync_immediate**Type**

bool

Default value

0x1

Adjust when the patching selection register synchronises - either immediately (true - default), or awaiting for barrier event.

cpy_mops_option**Type**

int

Default value

0x0

Set option for Armv8.8 CPY(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B.

cpyf_mops_option**Type**

int

Default value

0x0

Set option for Armv8.8 CPYF(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B.

cycle_counter_freeze_on_spe_event**Type**

bool

Default value

0x0

If true, pmu cycle counter does not count when pmcr_el0.dp=1 and pmu event counters are frozen by pmcr_el0.fzs. (FEAT_SPE_DPFZS).

d128_disabled_ps_resvd_size**Type**

int

Default value

0x2

Physical size treated when TCR.(I)PS is programmed with value seven and D128 is disabled via TCR. 0, 48 bits. 1, 52 bits. 2, 56.

dbg-bcr-reserved-behavior**Type**

int

Default value

0x1

This is the behavior of the reserved values of the BT field in DBGBCR. Possible values are: - 0 = Disabled. - 1 = BT[2] is ignored. .

dbg_rom_dap_addr

Type

int

Default value

0x0

Debug ROM dap base address.

dbgitr_buffer_size

Type

int

Default value

0x0

Number of instructions which can be buffered before EDSCR.ITE is cleared.

dbgxvr_ress_is_stateful

Type

bool

Default value

0x0

Whether DBGWVR/DBGBVR.RESS returns last written value. if set to false, RESS returns sign extended value.

dc_fault_unaligned_s1_device_s2_fwb

Type

bool

Default value

0x0

Whether takes an Alignment Fault caused by the memory type on a DC {ZVA,GZVA,GVA} if the stage 1 memory type is any Device memory type.

dcache-hit_latency

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`dcache-maintenance_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`dcache-miss_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`dcache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

`dcache-read_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

dcache-read_bus_width_in_bytes**Type**

int

Default value

0x8

L1 D-Cache read bus width in bytes used to calculate per-access timing annotations.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-ways**Type**

int

Default value

0x2

L1 D-Cache number of ways (sets are implicit from size).

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_bus_width_in_bytes**Type**

int

Default value

0x8

L1 D-Cache write bus width in bytes used to calculate per-access timing annotations.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

dcimva_requires_s2_write_permissions**Type**

bool

Default value

0x0

Data-cache invalidate by MVA operations require stage 2 write permission (virtualised AArch32 guest).

dczva_reports_lowest_addr_on_tag_check_fail

Type

bool

Default value

0x0

Whether DC ZVA reports lowest address in FAR on tag check fail.

dczva_wp_far_behaviour

Type

int

Default value

0x0

Set option for address stored in FAR/EDWARD after watchpoints hit by DC ZVA. 0 - FAR recorded matches lowest watchpointed address accessed by the instruction 1 - FAR recorded matches lowest address accessed by the instruction within same translation granule as watchpointed address 2 - FAR recorded matches highest address accessed by the instruction within same translation granule as watchpointed address.

debug_auth_signals_sampled_at_reset

Type

bool

Default value

0x0

Debug authentication signals can be configured as either sampled at reset only or at any time for External Root Debug.

debug_components_dap_address

Type

string

Default value

""

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on debug bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is: {"format": "all_addrs_are_absolute_wrt_debugbus", "cores": [{"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}, {"rom": 0x0, "ed": 0x0, "cti": 0x0, "pmu": 0x0, "etm": 0x0, "trbu": 0x0}]}

debug_components_mmap_address**Type**

string

Default value

""

Debug components ROM,ED,CTI,PMU,TRACE and TRBU base address for each core on system bus. The "rom" field in the "cores" array are only allowed when 'debug_rom_is_flat' is false. JSON schema for the parameter value is: {"format":"all_addrs_are_absolute_wrt_systembus", "cores": [{"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}, {"rom":0x0, "ed":0x0, "cti":0x0, "pmu":0x0, "etm":0x0, "trbu":0x0}]}

debug_entry_is_context_sync**Type**

bool

Default value

0x0

If true, Entry in debug state is Context sync. Exiting debug state is a context synchronising operation, but entering is not. However some cpu implementation can consider also the Entry in Debug state as a CSE.

debug_rom_is_class_9**Type**

bool

Default value

0x0

If true, present a debug ROM table as a class 9 device. Otherwise, use a class 1 ROM table.

debug_rom_is_flat**Type**

bool

Default value

0x0

If true, present a debug ROM table recommended by ARMv8 Debug Architecture. Otherwise, use nested ROM tables.

delay_serror**Type**

int

Default value

0x0

Add a propagation delay of serror signal into the core.

delayed_dbgreg_between_secure_views**Type**

int

Default value

0x1

If delayed_dbgreg is enabled, whether the secure and nonsecure external views require explicit synchronization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

delayed_pmureg_between_secure_views**Type**

int

Default value

0x1

If delayed_pmureg is enabled, whether the secure and nonsecure external views require explicit synchronization. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

dfr1_reads_actual_bp_wp_ctx_cmp**Type**

bool

Default value

0x0

If true, the register ID_AA64DFR1_EL1/EDDFR1 reports the actual number of BRPs, WRPs and CTX_CMPS even when the number of bp/wp/ctx_cmp is less than 16.

dic-spi_count**Type**

int

Default value

0x40

Number of shared peripheral interrupts implemented.

disable_sve_plugin**Type**

bool

Default value

0x0

If true, SVE will not be implemented in this processor even if the plugin is loaded (FEAT_SVE).

disable_unknown_update_event_on_reset**Type**

bool

Default value

0x0

Disables SYSREG_UPDATE event notification on reset for the registers whose bitfields are all reserved or resets to architecturally unknown value.

dsb_accumulate_threshold**Type**

int

Default value

0x100

Limit the maximum number of observable DSB side effects which can be queued (e.g. TLBI), after which DSB sync will be done automatically.

early_implicit_error_sync_event_behaviour**Type**

int

Default value

0x0

Set option for Early Implicit Error Synchronization event (FEAT_IESB) 0x0 - Behavior is not described ID_AA64MMFR4_EL1.EIESB = 0x0 0x1 - Implicit Error synchronization event is inserted before an exception is taken to EL3 (depending on SCR_EL3.NMEA) ID_AA64MMFR4_EL1.EIESB = 0x1 0x2 - Implicit Error synchronization event is inserted before an exception is taken to ELx (depending on SCR_EL3.NMEA and SCTLR2_ELx.NMEA) ID_AA64MMFR4_EL1.EIESB = 0x2 0xF - Implicit Error synchronization event is inserted after an exception is taken ID_AA64MMFR4_EL1.EIESB = 0xF.

ecv_support_level**Type**

int

Default value

0x0

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT_ECV).

eddfr1_reads_idreg_mask**Type**

int

Default value

0xffffffffffffffff

Mask to configure each bitfield for EDDFR1 register, whether to be read from corresponding bitfield in AA64DFR1 register. Note: Only those bitfield which supports 'same as ID register or res0' functionality can be configured.

eddfr2_reads_idreg_mask**Type**

int

Default value

0xffffffffffffffff

Mask to configure each bitfield for EDDFR2 register, whether to be read from corresponding bitfield in ID_AA64DFR2 register. Note: Only those bitfield which supports 'same as ID register or res0' functionality can be configured.

eddfr_reads_idreg_mask**Type**

int

Default value

0xffffffffffffffff

Mask to configure each bitfield for EDDFR register, whether to be read from corresponding bitfield in AA64DFR register. Note: Only those bitfield which supports 'same as ID register or res0' functionality can be configured.

edpfr_ras_unknown_bits_read_as_0**Type**

bool

Default value

0x0

If true then UNKNOWN bits in RAS field in EDPFR are read as 0.

edxfr_reads_idreg**Type**

bool

Default value

0x0

Whether EDDFR,EDDFR1 and EDDFR2 reads corresponding bitfield value from ID_AA64DFR reg. Also, when this parameter is enabled, bitfields of these registers are configurable through 'eddfrr*_reads_idreg_mask' parameter.

el0_can_access_imp_def_functionality**Type**

bool

Default value

0x0

If not made UNDEF by imp_def_functionality_behaviour, EL0 can access IMPLEMENTATION DEFINED registers and system instructions.

el0_el1_only_non_secure**Type**

bool

Default value

0x0

Secure/non-secure state if EL2 and EL3 are not implemented. 0, secure. 1, non-secure.

el3_trap_priority_when_secure_debug_disabled**Type**

bool

Default value

0x0

Undef when secure debug is disabled (EDSCR.SDD == 1) && boolean IMPLEMENTATION_DEFINED 'EL3 trap priority when SDD == 1'.

enable_address_contig_check**Type**

bool

Default value

0x0

Check the input address range for the table entries that have the contiguous hint bit set.

enable_debug_auth_signals_config**Type**

int

Default value

0xf

Debug Authentication Signals DBGEN, SPIDEN (and if RME is enabled RLPIDEN and RTPIDEN) are configurable (default) or not configurable, (hardwired to 1). This parameter is the integer representation of a bitmap to enable configuration of these signals, with: - BIT[0] = DBGEN - BIT[1] = SPIDEN - BIT[2] = RLPIDEN - BIT[3] = RTPIDEN .

enable_tlb_contig_check**Type**

bool

Default value

0x0

Perform extra pagetable walks to check translation table entries that have the contiguous hint bit set.

enhanced_pac2_level**Type**

int

Default value

0x0

Implements Enhanced PAC2 from ARMv8.6 (FEAT_PAuth2), and PAC enhancements from ARMv9.5 (FEAT_PAuth_LR). options 0-3 of this feature are mandatory for ARMv8.6 but can be cherry-picked to a ARMv8.3(or greater) implementation. 0: No EnhancedPAC2, 1: EnhancedPAC2 Only (FEAT_PAuth2), 2: EnhancedPAC2 with FPAC (FEAT_FPAC), 3: EnhancedPAC2 with FPACCombined (FEAT_FPACCOMBINE), 4: EnhancedPAC2 with LR signing (FEAT_PAuth_LR).

error_record_feature_register**Type**

string

Default value

""

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"}, other_feature_register_values]. Where ED, UI, FI, CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0, 0x2 or 0x4. RP, CEO, INJ, FRX, UC, UEU, UER, UEO, DE has valid

values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

error_record_feature_register_json_file

Type

string

Default value

""

File path to the RAS feature register values as JSON. The file uses the same format as the error_record_feature_register parameter value.

erxpfctl_res0_stateful_mask

Type

int

Default value

0x0

Mask for stateful bits for ERXPFGCTL which are RES0.

esr_write_update_res0

Type

bool

Default value

0x0

If true, and RASv2 is enabled, then ESR_ELx.WU field is RES0 for errors on both loads and stores (FEAT_RASv2).

ete.ASYNC_PACKETS_WHEN_VIEWINST_OFF

Type

bool

Default value

0x0

Generate the non-periodic alignment synchronisation packet generation when trace unit is operative.

ete.ATBTRIG

Type

bool

Default value

0x1

ATB trigger support.

ete.CCITMIN**Type**

int

Default value

0x4

Minimum cycle count value.

ete.CCSIZE**Type**

int

Default value

0xc

Cycle counter size.

ete.CLAIMTAGS**Type**

int

Default value

0x8

Number of claim tags.

ete.COMMOPT**Type**

bool

Default value

0x1

Commit mode.

ete.COMMTRANS**Type**

bool

Default value

0x0

Commit transaction mode.

ete.DEBUG**Type**

int

Default value

0x2

DEBUG.

ete.DESIGNER**Type**

int

Default value

0x41

DESIGNER value.

ete.ETE_REVISION**Type**

int

Default value

0x0

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

ete.EXCEPTION_WITH_CONTEXT**Type**

bool

Default value

0x1

Whether EXCEPTION_WITH_CONTEXT packet is supported.

ete.EXPLICITLY_COMMIT_PO_ELEMS**Type**

bool

Default value

0x0

Whether to unilaterally explicitly emit a commit after a PO packet.

ete.IMPDEFEXCEPPERCENTAGE**Type**

int

Default value

0x0

Percentage of IMPDEF exceptions inserted in instruction blocks.

ete.IMPDEF_TRACE_ON**Type**

int

Default value

0x0

Whether trace is flushed and trace on packet generated by events described by bitmap value. bit 0 - PE entering low power state, bit 1 - PE entering debug state.

ete.IMPRECISE_FILTERING**Type**

int

Default value

0x0

Number of instruction blocks traced on a transition in the filtering.

ete.LPOVERRIDE**Type**

bool

Default value

0x1

Low power override.

ete.MAXSPEC**Type**

int

Default value

0x0

Maximum speculation depth.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NOOVERFLOW**Type**

bool

Default value

0x0

No overflow.

ete.NUMACPAIRS**Type**

int

Default value

0x4

Number of instruction address comparators pairs.

ete.NUMCIDC**Type**

int

Default value

0x1

Number of context ID comparators.

ete.NUMCNTR**Type**

int

Default value

0x2

Number of counters.

ete.NUMEXTINSEL**Type**

int

Default value

0x4

Number of external input selectors.

ete.NUMPC**Type**

int

Default value

0x0

Number of PE comparators.

ete.NUMSEQSTATE**Type**

int

Default value

0x4

Number of sequencer states.

ete.NUMSSCC**Type**

int

Default value

0x1

Number of single shot comparators.

ete.NUMVMIDC**Type**

int

Default value

0x1

Number of virtual ID comparators.

ete.NumberOfETEEEvents**Type**

int

Default value

0x2

Number of trace events.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_DESIGNER**Type**

int

Default value

0x0

TRCPIDR DESIGNER value.

ete.PIDR_PART**Type**

int

Default value

0x0

TRCPIDR PART number value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.QFILT**Type**

bool

Default value

0x0

Q filtering.

ete.QSUP**Type**

int

Default value

0x0

Q support.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RAZWI_REG_SEL_TOP_BIT**Type**

bool

Default value

0x0

Implement Resource Selectors or Resource Selector Pairs bits as RAZ/WI.

ete.REG_ACCESS_ONLY_MODE**Type**

bool

Default value

0x0

If enabled, all traces are disabled. Plugin only allows register acceses.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.STALLCTRL**Type**

bool

Default value

0x1

Stall control.

ete.SYSSTALL**Type**

bool

Default value

0x1

System stall.

ete.TRACEIDSIZE**Type**

int

Default value

0x7

Trace ID size.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRACE_OUTPUT_ENABLE**Type**

bool

Default value

0x0

ETE Trace output enable: 1=enable, 0=disable.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

ete.TSMARK**Type**

bool

Default value

0x0

Whether timestamp markers are supported.

ete.TSSIZE**Type**

int

Default value

0x8

Timestamp size.

ete.WFXMODE**Type**

bool

Default value

0x1

WFX mode.

ets_level**Type**

int

Default value

0x0

Level of Enhanced Translation Synchronization supported. 0: not supported (may be override to 1 if has_ets=true), 1: supported FEAT_ETS, 2: supported FEAT_ETS2.

exception_catch_before_software_step**Type**

bool

Default value

0x1

Exception catch priority for the exception trapping form of exception catch (Armv8.2 or later, or exception_catch_type=0). If true, the exception catch debug event has higher priority than software step and halting step.

exception_catch_type**Type**

int

Default value

0x0

Type of exception catch (ARMv8.0 - ARMv8.1 only). 0, exception trapping. 1, non-exception trapping, higher priority than step. 2, non-exception trapping, lower priority than step.

exclusive_monitor_clear_on_atomic_from_same_master**Type**

bool

Default value

0x1

Exclusive monitors in the cluster will be cleared by a atomic by the same master to the monitored address.

exclusive_monitor_clear_on_store_from_same_master**Type**

bool

Default value

0x1

Exclusive monitors in the cluster will be cleared by a store by the same master to the monitored address.

exclusive_monitor_clear_on_strex_address_mismatch**Type**

bool

Default value

0x1

Exclusive monitors in the cluster will be cleared when a strex fails because the address does not match.

exclusive_monitor_clear_on_strex_success**Type**

bool

Default value

0x1

Exclusive monitors in the cluster will be cleared when a strex succeeds.

exercise_stxr_fail**Type**

bool

Default value

0x0

Reject a pseudo-random majority of exclusive store instructions.

ext_abort_device_GRE_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_GRE_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_GRE_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-GRE read external aborts.

ext_abort_device_GRE_read_is_sync**Type**

int

Default value

0x2

Synchronous reporting of device-GRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

ext_abort_device_GRE_read_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_GRE_read_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_GRE_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-GRE write external aborts.

ext_abort_device_GRE_write_is_sync**Type**

int

Default value

0x2

Synchronous reporting of device-GRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

ext_abort_device_GRE_write_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_GRE_write_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_nGRE_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_nGRE_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_nGRE_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGRE read external aborts.

ext_abort_device_nGRE_read_is_sync**Type**

int

Default value

0x2

Synchronous reporting of device-nGRE read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_read_is_sync.

ext_abort_device_nGRE_read_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_read_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_nGRE_read_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_nGRE_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGRE write external aborts.

ext_abort_device_nGRE_write_is_sync**Type**

int

Default value

0x2

Synchronous reporting of device-nGRE write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_device_write_is_sync.

ext_abort_device_nGRE_write_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_device_write_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_nGRE_write_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_device_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_device_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_read_acquire_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device read with acquire external aborts.

ext_abort_device_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGnRE read external aborts.

ext_abort_device_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_device_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_device_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGnRE write external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_device_write_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_device_write_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_fill_data**Type**

int

Default value

0xfdfdfdfcfcfdfdfd

Returned data, if external aborts are asynchronous.

ext_abort_normal_cacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal write-back cacheable-read external aborts.

ext_abort_normal_cacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of normal write-back cacheable-read external aborts.

ext_abort_normal_cacheable_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_cacheable_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_normal_cacheable_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal write-back cacheable write external aborts.

ext_abort_normal_cacheable_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of normal write-back cacheable write external aborts.

ext_abort_normal_cacheable_write_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_cacheable_write_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_normal_noncacheable_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_noncacheable_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_noncacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal noncacheable-read external aborts.

ext_abort_normal_noncacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of normal noncacheable-read external aborts.

ext_abort_normal_noncacheable_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_noncacheable_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_normal_noncacheable_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal noncacheable write external aborts.

ext_abort_normal_noncacheable_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of normal noncacheable write external aborts.

ext_abort_normal_noncacheable_write_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_noncacheable_write_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_normal_wt_cacheable_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_wt_cacheable_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_wt_cacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal write-through cacheable-read external aborts.

ext_abort_normal_wt_cacheable_read_is_sync**Type**

int

Default value

0x2

Synchronous reporting of normal write-through read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_read_is_sync.

ext_abort_normal_wt_cacheable_read_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_wt_cacheable_read_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_normal_wt_cacheable_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of normal write-through write external aborts.

ext_abort_normal_wt_cacheable_write_is_sync**Type**

int

Default value

0x2

Synchronous reporting of normal write-through write external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_normal_cacheable_write_is_sync.

ext_abort_normal_wt_cacheable_write_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_normal_wt_cacheable_write_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_normal_cacheable_write_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_prefetch_device_GRE_read_is_critical

Type

bool

Default value

0x0

Critical reporting of external aborts generated by device-GRE instruction fetches.

ext_abort_prefetch_device_GRE_read_is_sync

Type

int

Default value

0x2

Behaviour of external aborts generated by device-GRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_prefetch_device_nGRE_read_is_critical

Type

bool

Default value

0x0

Critical reporting of external aborts generated by device-nGRE instruction fetches.

ext_abort_prefetch_device_nGRE_read_is_sync

Type

int

Default value

0x2

Behaviour of external aborts generated by device-nGRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_prefetch_device_read_is_critical

Type

bool

Default value

0x0

Critical reporting of external aborts generated by device-nGnRE instruction fetches.

ext_abort_prefetch_device_read_is_sync**Type**

int

Default value

0x2

Behaviour of external aborts generated by device-nGnRE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_prefetch_is_critical**Type**

bool

Default value

0x0

Critical reporting of external aborts generated by normal writeback cacheable instruction fetches.

ext_abort_prefetch_is_sync**Type**

bool

Default value

0x1

Behaviour of external aborts generated by normal writeback cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort.

ext_abort_prefetch_noncacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of external aborts generated by normal noncacheable instruction fetches.

ext_abort_prefetch_noncacheable_read_is_sync**Type**

int

Default value

0x2

Behaviour of external aborts generated by normal noncacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as `ext_abort_prefetch_is_sync`.

`ext_abort_prefetch_ras_index`

Type

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

`ext_abort_prefetch_ras_type`

Type

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

`ext_abort_prefetch_so_read_is_critical`

Type

bool

Default value

0x0

Critical reporting of external aborts generated by device-nGnRnE instruction fetches.

`ext_abort_prefetch_so_read_is_sync`

Type

int

Default value

0x2

Behaviour of external aborts generated by device=nGnRnE instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as `ext_abort_prefetch_is_sync`.

`ext_abort_prefetch_wt_cacheable_read_is_critical`

Type

bool

Default value

0x0

Critical reporting of external aborts generated by normal writethrough cacheable instruction fetches.

ext_abort_prefetch_wt_cacheable_read_is_sync**Type**

int

Default value

0x2

Behaviour of external aborts generated by normal writethrough cacheable instruction fetches. 0, asynchronous abort. 1, synchronous abort. 2, same as ext_abort_prefetch_is_sync.

ext_abort_so_prefetch_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_so_prefetch_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_prefetch_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_so_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGnRnE read external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_so_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

ext_abort_so_write_is_critical**Type**

bool

Default value

0x0

Critical reporting of device-nGnRnE write external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of device-nGnRnE write external aborts.

ext_abort_so_write_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_so_write_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_ttw_cacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of TTW cacheable read external aborts.

ext_abort_ttw_cacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of TTW cacheable read external aborts.

ext_abort_ttw_cacheable_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_ttw_cacheable_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_ttw_noncacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of TTW noncacheable read external aborts.

ext_abort_ttw_noncacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of TTW noncacheable read external aborts.

ext_abort_ttw_noncacheable_read_ras_index**Type**

int

Default value

0x0

External Aborts are reported in RAS record index specified in this param. Values: Valid indices in range [0, number_of_error_records-1].

ext_abort_ttw_noncacheable_read_ras_type**Type**

int

Default value

0x0

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

ext_abort_ttw_wt_cacheable_read_is_critical**Type**

bool

Default value

0x0

Critical reporting of TTW write-through cacheable read external aborts.

ext_abort_ttw_wt_cacheable_read_is_sync**Type**

int

Default value

0x2

Synchronous reporting of TTW write-through cacheable read external aborts. 0, asynchronous. 1, synchronous. 2, same as ext_abort_ttw_cacheable_read_is_sync.

ext_abort_ttw_wt_cacheable_read_ras_index**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported in RAS record index specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_index, Valid indices in range [0, number_of_error_records-1].

ext_abort_ttw_wt_cacheable_read_ras_type**Type**

int

Default value

0xffffffffffffffff

External Aborts are reported as RAS error type specified in this param. Values: -1 = Same as ext_abort_ttw_cacheable_read_ras_type, 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

external_debug_request_delay**Type**

int

Default value

0x0

Configure External Debug Request delay in CPU cycles.

external_oslar_access_disabled_by_authentication**Type**

bool

Default value

0x0

If true, external accesses to OSLAR, when external debugging is not enabled, will generate an error (FEAT_Debugv8p2).

fault_on_misprogrammed_gpt_contig_region**Type**

bool

Default value

0x0

Whether GPF faults occur when GPT contiguous entries are misprogrammed.

fault_on_nT_bit_set**Type**

bool

Default value

0x1

Whether block translation table entries with the nT bit set should always fault. Only applies when changing_block_size_without_bbm_support_level is 1 or higher.

fault_unalign_to_unsupported_access**Type**

int

Default value

0x8

If has_unaligned_single_copy_atomicity is true, whether unaligned A64 atomic, exclusive and acquire/release instructions to non iWB-oWB or the access crossing a 16-byte boundary generate fault. Bits 0,1,2,3 should be set accordingly to enable the fault behaviour. bit 0: atomic access should fault, bit 1: exclusive access should fault, bit 2: acquire/release should fault, bit 3: the access crossing a 16-byte boundary should fault.

fault_unaligned_s1_device_s2_fwb**Type**

int

Default value

0x0

Whether unaligned fault with stage1 Device memory and final memory attribute forced to normal by FWB. 0, No fault. 1, will fault. 2 No fault if final Shareability is NSH.

force_align_pc**Type**

bool

Default value

0x0

UNPREDICTABLE branch to non-word-aligned address in ARM state is forced to be aligned.

force_deterministic_irg_tag_generation**Type**

bool

Default value

0x0

Force the random tag generated by the IRG instruction when GCR_EL1.RRND=1 to equal RGSr_EL1.SEED[3:0] rather than a non-deterministic value.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_wnr_read_unsupported_exclusive_or_atomic**Type**

bool

Default value

0x0

Whether ESR_ELx.WnR is forced to 0 for unsupported atomic and exclusives.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

fp8_support_level**Type**

int

Default value

0x0

0->No support for Advanced SIMD, SVE2 FP8 instructions 1->Support for FEAT_FP8 2->Support for FEAT_FP8FMA 3->Support for FEAT_FP8DOT4 4->Support for FEAT_FP8DOT2.

fpcr_short_vector_raz**Type**

bool

Default value

0x0

FPSCR and FPCR fields LEN and STRIDE are hardwired to 0.

fpsr_res0_stateful_mask**Type**

int

Default value

0x0

Mask for stateful bits of FPSR which are RES0.

fsr_ext_bit_update_kind**Type**

int

Default value

0x3

Set/Clear DFSR/IFSR EA bit on Synchronous/Async External Aborts. 0: Never Set, 1: Set on Synchronous Ext Aborts 2: Set on Asynchronous Ext Aborts 3: Set on both Sync and Async Ext Aborts.

gcs_data_check_overrides_data_abort**Type**

bool

Default value

0x0

GCS Data check exceptions are taken before Data Aborts.

gcs_overshoot_writes**Type**

int

Default value

0x0

Number of overshooting GCS records written after a writing a record.

gic.GICC-offset**Type**

int

Default value

0x2000

Offset from PERIPHBASE for GICC registers.

gic.GICD-offset**Type**

int

Default value

0x1000

Offset from PERIPHBASE for GICD registers. Will be ignored when GICv3 CPU interface is enabled, as distributor is then external to the cluster.

gic.GICH-offset**Type**

int

Default value

0x4000

Offset from PERIPHBASE for GICH registers.

gic.GICH-other-CPU-offset**Type**

int

Default value

0x5000

Offset from PERIPHBASE for GICH registers for accessing other CPUs in the cluster. Set to 0 to disable.

gic.GICV-alias**Type**

int

Default value

0x0

Offset from PERIPHBASE for alias of GICV registers. When gicv2-only, if zero no alias will be created; if gicv2-only=0, the param is deprecated, when zero or unset an alias is created in the place mandated by the architecture (GICV-base+0xF000).

gic.GICV-offset**Type**

int

Default value

0x6000

Offset from PERIPHBASE for GICV registers.

gic.PERIPH-size**Type**

int

Default value

0x8000

Size of registers based at PERIPHBASE that are considered to be owned by the GIC. Any accesses in the range PERIPHBASE to PERIPHBASE+gic.PERIPH-size-1 that do not match GIC registers will be treated as RAZ/WI.

gicv3.A3-affinity-supported**Type**

bool

Default value

0x0

Whether a non-zero value for affinity at level 3 is supported.

`gicv3.BPR-min`**Type**

int

Default value

0x2

The minimum value for the GICC_BPR register (non-secure version will be 1 + this value).

`gicv3.EOI-check-CPUID`**Type**

bool

Default value

0x0

Check CPU ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

`gicv3.EOI-check-ID`**Type**

bool

Default value

0x0

Check Interrupt ID specified for accesses to EOI registers (rather than just ending highest priority active interrupt).

`gicv3.EOI-deactivate-any-interrupt`**Type**

bool

Default value

0x0

Allow an EOI to deactivate interrupts that aren't the highest priority active interrupt (EOI-ignore-out-of-order must be false otherwise this is ignored).

`gicv3.EOI-ignore-out-of-order`**Type**

bool

Default value

0x1

Ignore EOI writes that cannot end the highest priority active interrupt.

`gicv3.FIQEn-RAO`**Type**

bool

Default value

0x0

GICC_CTLR.FIQEn is read as one, write insensitive.

`gicv3.IIDR_base`**Type**

int

Default value

0x43b

The base value for calculating the GICC_IIDR register value.

`gicv3.LR-count`**Type**

int

Default value

0x10

The number of implemented list registers.

`gicv3.PMHE-RAO-WI`**Type**

bool

Default value

0x0

ICC_CTLR_EL*.PHME is read as one, write insensitive.

`gicv3.PMHE-RAZ-WI`**Type**

bool

Default value

0x0

ICC_CTLR_EL*.PHME is read as zero, write insensitive.

gicv3.PMHE-release-set-packet

Type

bool

Default value

0x0

if PHME is enabled, whether a SET packet is released by CPU Intf in Upstream Ack window.

gicv3.SRE-EL2-enable-RAO

Type

bool

Default value

0x0

When ICC_SRE_EL2.SRE is RAO/WI, makes ICC_SRE_EL2.Enable RAO/WI.

gicv3.SRE-EL3-enable-RAO

Type

bool

Default value

0x0

When ICC_SRE_EL3.SRE is RAO/WI, makes ICC_SRE_EL3.Enable RAO/WI.

gicv3.SRE-EL3-set-once

Type

bool

Default value

0x0

Restrict SRE EL3 to be set only once.

gicv3.SRE-enable-action-on-mmap

Type

int

Default value

0x0

Allowed values are: 0-SRE one allows mmap access. 1-SRE one disables mmap access. 2-SRE one makes mmap access RAZ-WI.

gicv3.STATUSR-implemented**Type**

bool

Default value

0x1

If GICv3 CPU interface is being used, this determines whether the STATUS registers are implemented.

gicv3.VBPR-min**Type**

int

Default value

0x2

The minimum value for the GICV_BPR register (non-secure version will be 1 + this value).

gicv3.VFIQEn-RAO**Type**

bool

Default value

0x0

ICH_VMCR_EL2.VFIQEn is read as one, write insensitive.

gicv3.cpuintf-mmmap-access-level**Type**

int

Default value

0x0

Allowed values are: 0-mmmap access is supported for GICC,GICH,GICV registers. 1-mmmap access is supported only for GICV registers. 2-mmmap access is not supported.

gicv3.dir-trap-support**Type**

bool

Default value

0x1

The cpu supports separate trapping of ICC_DIR_EL1 to EL2.

gicv3.el3_trap_priority_when_secure_debug_disabled**Type**

bool

Default value

0x0

Undef to access priorities group register when secure debug is disabled.

gicv3.extended-interrupt-range-support**Type**

bool

Default value

0x0

Device has support for extended SPI/PPI ID ranges.

gicv3.gicv2-only**Type**

bool

Default value

0x0

Limit the GIC implementation to GICv2 features only.

gicv3.idle-is-ff**Type**

bool

Default value

0x1

For GICC/GICV RPR, when idle, return FF when true, minimum supported priority otherwise.

gicv3.ignore-DIR-write-when-EOImode-not-set**Type**

bool

Default value

0x1

Ignore UNPREDICTABLE access to GICC_DIR register.

gicv3.interrupt-bypass-support**Type**

bool

Default value

0x1

Interrupt bypass support, set to false for devices not supporting interrupt bypass.

gicv3.local-SEIs**Type**

bool

Default value

0x0

Generate SEI to signal internal issues.

gicv3.local-VSEIs**Type**

bool

Default value

0x0

Generate VSEI to signal internal issues.

gicv3.physical-ID-bits**Type**

int

Default value

0x10

Number of physical ID bits implemented.

gicv3.priority-bits**Type**

int

Default value

0x5

Number of priority bits implemented.

gicv3.send-PMHE-command-only-when-priority-changes**Type**

bool

Default value

0x0

Send PMHE upstream command to distributor only when write to ICC_PMR_EL1 changes the priority.

gicv3.sgi-range-selector-support**Type**

bool

Default value

0x0

Device has support for the Range Selector feature for SGI.

gicv3.suppress-virtual-enables-comms**Type**

bool

Default value

0x1

In GICv3 only mode, prevents the GIC CPUIF from communicating UpstreamWrite/VirtualEnables to the IRI.

gicv3.virtual-ID-bits**Type**

int

Default value

0x10

Number of virtual ID bits implemented.

gicv3.virtual-lpi-support**Type**

bool

Default value

0x1

When GICv3 is supported, indicates a cut down CPUIF interface with no support of VLPI (GICv3 only) when false.

gicv3.virtual-priority-bits**Type**

int

Default value

0x5

Number of virtual priority bits implemented.

gicv3.without-DS-support**Type**

bool

Default value

0x0

GICv3 CPU interfaces do not support disabling security in the distributor (GICD_CTLR.DS=1).

gicv4.mask-virtual-interrupt**Type**

bool

Default value

0x0

If true, virtual interrupts can be masked from being reported to virtual CPU interface by setting ICH_HCR_EL2.DVIM 1. No control otherwise.

global_debug_rom.ROMDEVID**Type**

int

Default value

0x0

Value of Debug Rom Device Identification Register.

global_debug_rom.ROMPIDR**Type**

int

Default value

0x4000bb000

Value of Debug Rom Peripheral Identification Register.

global_debug_rom.ROMPRIDR0**Type**

int

Default value

0x1

Value of Debug ROM Power RequestID Register.

gpccr_el3_gpcp_behaviour**Type**

int

Default value

0x2

Used to control impdef behaviour when GPCP=1 (0->Faults are always generated and reported, 1->Faults are not generated and reported), 2->Faults are generated and reported only for Arm recommended cases.

gpt_tlb_size**Type**

int

Default value

0x0

Number of separate GPT TLB entries.

gpt_walkcache_size**Type**

int

Default value

0x0

Number of GPT walk cache entries.

hardware_translation_table_update_implemented**Type**

int

Default value

0x1

Implement hardware translation table updates from ARMv8.1 (FEAT_HAFDBS). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

has-gicv4.1**Type**

bool

Default value

0x0

GICv4.1 is enabled, and all the features with GICv4.1 are implemented (FEAT_GICv4p1).

has_128_bit_atomic_instructions**Type**

int

Default value

0x0

Implement 128-bit Atomic Instructions (FEAT_LSE128) Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_128_bit_tt_descriptors**Type**

int

Default value

0x0

Implement 128-bit Translation Table Descriptors (FEAT_D128) Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_16bit_asids**Type**

bool

Default value

0x1

Enable 16-bit ASIDs.

has_16bit_vmids**Type**

int

Default value

0x1

Implement support for 16-bit VMIDs from ARMv8.1 (FEAT_VMID16). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

has_16k_granule**Type**

bool

Default value

0x0

Implement the 16k LPAE translation granule.

has_4k_granule**Type**

bool

Default value

0x1

Implement the 4k LPAE translation granule.

has_52bit_address_with_16k**Type**

int

Default value

0x0

Implements Armv8.7 52-bit IPA/PA support for 16k (FEAT_LPA2). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_52bit_address_with_4k**Type**

int

Default value

0x0

Implements Armv8.7 52-bit IPA/PA support for 4k (FEAT_LPA2). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_56_bit_va**Type**

int

Default value

0x0

56-bit Physical Address, identified as (FEAT_LVA3) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_64bit_pmu_ext_access**Type**

int

Default value

0x0

Implement 64-bit pmu external interface access (FEAT_PMU_EXT64) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_64k_granule**Type**

bool

Default value

0x1

Implement the 64k LPAE translation granule.

has_aarch32_dbgdidr_etc**Type**

bool

Default value

0x1

DBGDIDR, DBGDRAR, DBGDSAR exist even if EL1 doesn't implement AArch32.

has_aarch32_hpd**Type**

bool

Default value

0x0

If true then hierarchical permission disable is supported in AArch32 (FEAT_AA32HPD).

has_aarch64**Type**

bool

Default value

0x1

All implemented exception levels can run in AArch64.

has_actlr2**Type**

bool

Default value

0x0

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

has_actlr_virtualisation**Type**

bool

Default value

0x0

If true ACTLR_EL12 is implemented and ACTLR_EL1 supports virtualisation.

has_address_breakpoint_linking**Type**

int

Default value

0x0

Implement Address Breakpoint Linking Extension (FEAT_ABLE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_amu**Type**

int

Default value

0x0

Implement activity monitor functionality from ARMv8.4 (FEAT_AMUv1). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_amu_ext64**Type**

int

Default value

0x0

Implement 64-bit external interface to the Activity Monitors (FEAT_AMU_EXT64). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_arm_v8-1**Type**

bool

Default value

0x0

Implement the ARMv8.1 Extension.

has_arm_v8-2**Type**

bool

Default value

0x0

Implement the ARMv8.2 Extension.

has_arm_v8-3**Type**

bool

Default value

0x0

Implement the ARMv8.3 Extension.

has_arm_v8-4**Type**

bool

Default value

0x0

Implement the ARMv8.4 Extension.

has_arm_v8-5**Type**

bool

Default value

0x0

Implement the ARMv8.5 Extension.

has_arm_v8-6**Type**

bool

Default value

0x0

Implement the ARMv8.6 Extension.

has_arm_v8-7**Type**

bool

Default value

0x0

Implement the Armv8.7 Extension.

has_arm_v8-8**Type**

bool

Default value

0x0

Implement the ARMv8.8 Extension.

has_arm_v8-9**Type**

bool

Default value

0x0

Implement the ARMv8.9 Extension.

has_arm_v9-0**Type**

bool

Default value

0x0

Implement the ARMv9.0 Extension.

has_arm_v9-1**Type**

bool

Default value

0x0

Implement the ARMv9.1 Extension.

has_arm_v9-2**Type**

bool

Default value

0x0

Implement the ARMv9.2 Extension.

has_arm_v9-3**Type**

bool

Default value

0x0

Implement the ARMv9.3 Extension.

has_arm_v9-4**Type**

bool

Default value

0x0

Implement the ARMv9.4 Extension.

has_arm_v9-5**Type**

bool

Default value

0x0

Implement the ARMv9.5 Extension.

has_arm_v9-6**Type**

bool

Default value

0x0

Implement the ARMv9.6 Extension. This feature is incomplete and under development.

has_asid2**Type**

int

Default value

0x1

If true then support for use of two concurrent ASIDs (FEAT_ASID2) Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_at_with_pan**Type**

int

Default value

0x1

Implement new AT instructions with PAN support (FEAT_PAN2). Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_ats1a**Type**

int

Default value

0x0

Support for ATS1ExR instructions (FEAT_ATS1A) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_attribute_index_enhancement**Type**

int

Default value

0x0

Memory Attribute Index Enhancement (FEAT_AIE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_axflag_xaflag**Type**

int

Default value

0x1

Implement flag manipulation instructions (AXFlag, XAFlag) from ARMv8.5 (FEAT_FlagM2). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_axflag_xaflag_frint**Type**

int

Default value

0x1

Implement flag manipulation instructions (AXFlag, XAFlag) and floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5. If this parameter is enabled, it also enables both has_axflag_xaflag and has_frint. If support for only one of the features is needed, please use the individual parameters and do not enable this one (FEAT_FlagM2, FEAT_FRINTTS). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_bc**Type**

int

Default value

0x1

Implement Armv8.8 Hinted Conditional Branch (FEAT_HBC) Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_branch_target_exception**Type**

int

Default value

0x1

Implement Branch target identification mechanism from ARMv8.5 (FEAT_BTI). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_brbe**Type**

bool

Default value

0x0

If true, implements branch record buffer extension (FEAT_BRBE).

has_brbe_v1p1**Type**

bool

Default value

0x0

If true, implements FEAT_BRBEv1p1.

has_ccidx**Type**

bool

Default value

0x0

Implement the ARMv8.3 CCSIDR Extension. Extending the ccsidr number of sets.

has_cfinv_rmif_setf**Type**

int

Default value

0x1

Implement flag manipulation (CFINV, RMIF, SETF8, SETF16) instructions from ARMv8.4 (FEAT_FlagM). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_chkfeat**Type**

int

Default value

0x0

Implement CHKFEAT instruction from ARMv9.4 (FEAT_CHK). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_clear_bhb**Type**

int

Default value

0x1

Implement Clear Branch History information instruction (FEAT_CLRBHB). Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_clear_other_speculation_by_context**Type**

int

Default value

0x1

Implement execution and data prediction invalidation from Armv8.9 (FEAT_SPECRES2). Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_cmo_wr_control**Type**

int

Default value

0x1

Whether stage1/2 CMO write perm control is supported (FEAT_CMOW) Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_cmpbr**Type**

int

Default value

0x0

Implement compare and branch instructions from ARMv9.6, optional in ARMv9.5 (FEAT_CMPBR). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_coherent_icache

Type

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

has_common_not_private_translations

Type

int

Default value

0x1

Implement the TTBRn_ELx.CnP (Common not Private) controls from ARMv8.2 (FEAT_TTCNP). Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_complex_number

Type

int

Default value

0x1

Implement ARMv8.3 complex number support, Multiply Accumulate and Add instructions (FEAT_FCMA). Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

has_const_pac

Type

int

Default value

0x0

Feature for singular selection of PAC field (FEAT_CONSTPACFIELD). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_cssc**Type**

int

Default value

0x1

Support for common short sequence compression instructions (FEAT_CSSC) Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_cvadp_support**Type**

int

Default value

0x0

Implement instruction to support cache clean by deep persistence (DC CVADP) from ARMv8.5, can be selected for core implemented on any arch version starting ARMv8.2 (FEAT_DPB, FEAT_DPB2). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_data_alignment_flag**Type**

int

Default value

0x0

Implement non-optimal misalignment flag for PMU/SPE from ARMv8.5 Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_debug_rom**Type**

bool

Default value

0x1

If true, a debug ROM will be generated describing the cluster's debug components.

has_delayed_brbe_records**Type**

bool

Default value

0x1

If true, a synchronization barrier is required to update the BRB records (FEAT_BRBE).

has_delayed_ctireg**Type**

bool

Default value

0x0

Delay the functional effect of CTI register writes until ISB or implicit barrier.

has_delayed_dbgreg**Type**

bool

Default value

0x0

Delay the functional effect of external debug register writes until ISB or implicit barrier.

has_delayed_mdscr_el1**Type**

bool

Default value

0x0

Delay the functional effect of MDSCR_EL1 register writes until ISB or implicit barrier.

has_delayed_oslar_el1**Type**

bool

Default value

0x0

Delay the functional effect of OSLAR_EL1 register writes until ISB or implicit barrier.

has_delayed_pmureg**Type**

bool

Default value

0x0

Delay the functional effect of PMU register writes until ISB or implicit barrier.

has_delayed_sysreg**Type**

bool

Default value

0x0

Delay the functional effect of system register writes until ISB or implicit barrier.

has_delayed_wfe_trap**Type**

int

Default value

0x0

Implements Configurable Delayed WFE trapping from ARMv8.6 (FEAT_TWED). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

has_dgh**Type**

int

Default value

0x1

Implements Data Gathering Hint instruction from ARMv8.6 (FEAT_DGH). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

has_dot_product**Type**

int

Default value

0x1

Implement the dot product (UDOT, SDOT) instructions from ARMv8.4 (FEAT_DotProd). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_e0pd**Type**

int

Default value

0x1

Implement ARMv8.5 feature to prevent unprivileged access to one half of the memory (FEAT_EOPD). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_e2h_rao

Type

int

Default value

0x0

Whether the implementation treats HCR_EL2.E2H as Read-As-One (RAO). 0 : FEAT_E2H0 implemented Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

has_ebep

Type

int

Default value

0x0

Implement Exception-Based Event Profiling from ARMv9.4 (FEAT_EBEP). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_ebf16

Type

int

Default value

0x0

Support for Extended BFloat16 Behaviours (FEAT_EBF16) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_ecbhb

Type

int

Default value

0x1

Implement Exploitative Control using Branch History information between exception levels (FEAT_ECBHB). Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_edacr**Type**

bool

Default value

0x1

Implement EDACR register.

has_edhsr**Type**

int

Default value

0xf

Implement external debug halt status register (FEAT_EDHSR). 0: FEAT_EDHSR is not implemented unless architecturally required by another feature, 1: FEAT_EDHSR is implemented, 2: FEAT_EDHSR is implemented (extends EDHSR to include the VNCR, CM, and WnR fields), 0xF: FEAT_EDHSR implementation is dependent on FEAT_SME.

has_el2**Type**

bool

Default value

0x1

Implements EL2.

has_el3**Type**

bool

Default value

0x1

Implements EL3.

has_enhanced_pac**Type**

bool

Default value

0x0

If pointer authentication is enabled then implement enhanced PAC (FEAT_EPAC).

has_enhanced_pan**Type**

int

Default value

0x1

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3). Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_enhanced_software_step**Type**

int

Default value

0x1

Implement Enhanced Software Step Extension (FEAT_STEP2). Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_ets**Type**

bool

Default value

0x0

Whether Enhanced Translation Synchronization is supported (FEAT_ETS).

has_exception_trapping_form_of_vector_catch**Type**

bool

Default value

0x1

Implement the exception trapping form of vector catch debug event.

has_extended_recip_estimate**Type**

int

Default value

0x0

Implements increased precision of reciprocal instructions (FEAT_RPRES). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_external_rndr**Type**

int

Default value

0x0

Implement external random number generator module. When enabling this with has_rndr enabled, the external random number generator will be used instead of internal random number generator. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_f8f16mm**Type**

bool

Default value

0x0

Implement FEAT_F8F16MM and dependent features.

has_f8f32mm**Type**

bool

Default value

0x0

Implement FEAT_F8F32MM and dependent features.

has_faminmax**Type**

bool

Default value

0x0

Implement FEAT_FAMINMAX.

has_far_not_valid**Type**

bool

Default value

0x0

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts.

has_far_not_valid_dfsc**Type**

bool

Default value

0x0

Implements FnV bit in ESR_ELx, FAR not valid for synchronous external aborts for Data Abort.

has_far_not_valid_ifsc**Type**

bool

Default value

0x0

Implements FnV bit in ESR_ELx and xFSR, FAR not valid for synchronous external aborts for Instruction Abort.

has_feat_pops**Type**

bool

Default value

0x0

Whether ARMv9.6 RAS support for clean-and-invalidate of data by virtual address to Point of Physical Storage (FEAT_PoPS).

has_fgt**Type**

int

Default value

0x1

Implements Fine-grained Virtualization Traps extension from ARMv8.6 (FEAT_FGT). Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

has_fgt2**Type**

int

Default value

0x1

Implement additional FGT traps introduced in ARMv8.9 (FEAT_FGT2). Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_fgwt3**Type**

bool

Default value

0x0

If true then Fine Grained Write EL3 is enabled (FEAT_FGWTE3).

has_fixed_function_instr_counter**Type**

int

Default value

0x0

Implement fixed-function instruction counter (FEAT_PMUV3_ICNTR) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_fp16**Type**

int

Default value

0x1

Implement the half-precision floating-point data processing instructions from ARMv8.2 (FEAT_FP16). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_fp16_fmlal**Type**

int

Default value

0x1

Implement the New Floating Point Multiplication Variant (FP16 FMLAL, FMLSL) instructions from ARMv8.4. Only supported if has_fp16=0x1 (FEAT_FHM). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_fpmr**Type**

bool

Default value

0x0

Implement FPMR (FEAT_FPMR).

has_fprcvt**Type**

int

Default value

0x1

Implement FEAT_FPRCVT FP convert instructions from ARMv9.6, optional in ARMv9.5 (FEAT_FPRCVT). Possible values of this parameter are: - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_frint**Type**

int

Default value

0x1

Implement floating-point rounding to int instructions (FRINT[32|64][X|Z]) from ARMv8.5 (FEAT_FRINTTS). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_gcs**Type**

int

Default value

0x0

Implement Guarded Control Stack Extension from ARMv9.4 (FEAT_GCS). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_generic_authentication

Type

int

Default value

0x1

Implement ARMv8.3 generic authentication. Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

has_guest_translation_granule

Type

int

Default value

0x1

Implement mechanism for guest translation granule identification from ARMv8.5, ID values determined by stage1 granule configuration parameters (FEAT_GTG). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_haft

Type

int

Default value

0x0

Implement Hardware managed Access Flag for Table Descriptors (FEAT_HAFT) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_hardware_accelerator_for_cleaning_dirty_state

Type

int

Default value

0x0

Whether hardware accelerator for cleaning Dirty state is supported (FEAT_HACDBS). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_hardware_dirty_state_tracking_structure**Type**

int

Default value

0x0

Whether hardware Dirty state tracking Structure is supported (FEAT_HDBSS). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_hardware_translation_table_update**Type**

int

Default value

0x2

Type of hardware translation table supported (when enabled by hardware_translation_table_update_implemented). 0, not implemented. 1, access bit updates implemented. 2, access bit updates and dirty bit mechanism implemented (FEAT_HAFDBS).

has_hcrx_el2**Type**

int

Default value

0x1

Implements new HCRX_EL2 id register from Armv8.7 (FEAT_HCX). Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_hpmn0**Type**

int

Default value

0x0

Allow hypervisor to set MDCR_EL2.HPMN to 0 (FEAT_HPMNO) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_id_reg_read**Type**

int

Default value

0x1

Implement read access to the ID registers (ESR_ELx.EC=0x18) (FEAT_IDST). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_iesb**Type**

int

Default value

0x1

Implement support for implicit error sync event from ARMv8.2 (FEAT_IESB). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_itd**Type**

bool

Default value

0x1

Implement the optional IT disable feature.

has_ite**Type**

int

Default value

0x0

Implement Instrumentation Trace Extension from ARMv9.4 (FEAT_ITE). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_jscvt**Type**

int

Default value

0x1

Implement ARMv8.3 javascript Floating-point to Integer conversion instruction (FEAT_JSCVT). Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

has_large_system_ext**Type**

bool

Default value

0x0

Implement the ARMv8 Large System Extensions (FEAT_LSE).

has_large_ttbr_ba_without_lpa**Type**

bool

Default value

0x1

When FEAT_LPA is not implemented, whether TTBR base address supports large values (52 bits) or not (48 bits).

has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_ldapur_stlur**Type**

int

Default value

0x1

Implement support for LDAPR and STLUR instructions with immediate offsets from ARMv8.4 (FEAT_LRCPC2). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_ldm_stm_ordering_control**Type**

int

Default value

0x0

Implement the SCTLR_ELx.LSMAOE (Load/Store Multiple Atomicity and Ordering Enable) and SCTLR_ELx.nTLSMD (no Trap Load/Store Multiple to Device) controls from ARMv8.2 (FEAT_LSMAOC). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_lrcpc

Type

bool

Default value

0x0

If true then it support the RCpc feature from ARMv8.3 (FEAT_LRCPC).

has_lrcpc3

Type

int

Default value

0x0

Implement Release Consistency processor consistent (RCpc) feature from Armv8.9 (FEAT_LRCPC3). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_lsfe

Type

int

Default value

0x0

Implement A64 base Atomic floating-point in-memory instructions (FEAT_LSFE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_lsui

Type

int

Default value

0x1

Implement additional load and store unprivileged instructions (FEAT_LSUI). Possible values of this parameter are: - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_lut**Type**

bool

Default value

0x0

Implement FEAT_LUT.

has_mismatch_and_range_breakpoints**Type**

int

Default value

0x0

Implement Mismatch and Range Breakpoints (FEAT_BWE). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_mismatch_watchpoints**Type**

int

Default value

0x0

Implement Breakpoints and Watchpoints Enhancements (FEAT_BWE2). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_mops_option**Type**

int

Default value

0x0

Implement Armv8.8 standard instructions for memory operations (FEAT_MOPS). 0, not implemented (unsupported if Armv8.8 is enabled). 1, implemented using Option A. 2, implemented using Option B.

has_mpam**Type**

int

Default value

0x0

Implement ARMv8.4 MPAM Registers and associated functionality (FEAT_MPAM). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_mpm**Type**

bool

Default value

0x0

Implement max-power mitigation mechanism (MPMM).

has_mt_pmu_disable_feature**Type**

int

Default value

0x0

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT_MTPMU). 0: FEAT_MTPMU is disabled, 1: FEAT_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT_MTPMU is cherry-picked, 0xF: The feature is disabled and is represented by value 0xF in ID_AA64DFR0_EL1.MTPMU.

has_mte_async_faults**Type**

bool

Default value

0x1

Whether MTE asynchronous faults are supported (FEAT_MTE_ASYNC).

has_mte_ctrl_bits_stateful**Type**

bool

Default value

0x0

if memory_tagging_support_level == 1, Whether mte specific control bits in system registers are stateful.

has_mte_perm**Type**

bool

Default value

0x0

Implement tag access permission (FEAT_MTE_PERM).

has_mte_tag_related_fault_high_prio_than_data**Type**

bool

Default value

0x0

For DC GZVA, Whether MMU faults generated by tag access has higher priority than faults due to data access.

has_nested_virtualization**Type**

int

Default value

0x1

Implement ARMv8.3 nested virtualization (FEAT_NV). Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

has_nmi**Type**

int

Default value

0x1

Implement AARCH64 Non-Maskable Interrupts (FEAT_NMI) Possible values of this parameter are:
- 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_no_os_double_lock**Type**

int

Default value

0x0

Do not implement the OS double-lock (FEAT_DoubleLock). Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_non_context_synchronizing_exception_controls**Type**

int

Default value

0x1

Implement cosmetic controls for whether exception entry and exit are context synchronizing events (SCTLR_ELx.{EIS,EOS}) from ARMv8.5 (FEAT_ExS). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_nv1_raz**Type**

int

Default value

0x0

Whether the implementation treats HCR_EL2.NV1 as Read-As-Zero (RAZ), if has_e2h_rao = 1. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

has_nv_frac**Type**

int

Default value

0x0

Whether the NV_frac behavior is supported. (DEPRECATED: use nv_frac_support_level) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_occmo**Type**

int

Default value

0x1

Implement The DC CIVAOC instruction (FEAT_OCCMO) Possible values of this parameter are: - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_par_bit10_razwi**Type**

bool

Default value

0x0

Whether PAR_EL1[10] is RAZ/WI.

has_partial_delayed_mdscr_el1**Type**

bool

Default value

0x0

has_delayed_oslar_el1 only apply to some bits of MDSCR_EL1 (MDE, KDE, TDCC, SS).

has_pc_sample_based_profiling**Type**

bool

Default value

0x1

If true, pc sample-based profiling is enabled (FEAT_PCSRv8, FEAT_PCSRv8p2).

has_pc_sample_profiling_enable**Type**

bool

Default value

0x0

Whether PC Sample profiling enable is implemented (FEAT_PCSRv8p9).

has_pcdphint**Type**

int

Default value

0x0

Support for producer-consumer data placement hints instructions (FEAT_PCDPHINT) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_per_cluster_debug_auth_ports**Type**

bool

Default value

0x0

If true then the debug authentication ports i.e. spniden, niden, rpliden, rtpiden, dbgen, spiden are available per cluster.

has_permission_indirection_s1**Type**

int

Default value

0x0

Implement the Permission Indirection Extension at stage 1 (FEAT_S1PIE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_permission_indirection_s2**Type**

int

Default value

0x0

Implement the Permission Indirection Extension at stage 2 (FEAT_S2PIE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_permission_overlay_s1**Type**

int

Default value

0x0

Implement the Permission Overlay Extension at stage 1 (FEAT_S1POE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_permission_overlay_s2**Type**

int

Default value

0x0

Implement the Permission Overlay Extension at stage 2 (FEAT_S2POE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_pmss

Type

int

Default value

0x0

Implement PMU Snapshot Extension from Armv8.9 (FEAT_PMUv3_SS). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_pmu

Type

int

Default value

0x1

Implement the optional Performance Monitors Extension (FEAT_PMUv3). 0, Not Implemented. 1, Implemented. 2, PMU is IMPLEMENTATION_DEFINED, PMU version would be set to 0xF and would behave as if no PMU is implemented.

has_pmu_edge_detection

Type

int

Default value

0x0

Implement PMU Event edge detection (FEAT_PMUv3_EDGE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_pmu_extpmn

Type

int

Default value

0x0

Implement optional PMU extension feature to reserve event counters for external agents from ARMv9.6 (FEAT_PMUv3_EXTPMN). 0 not implemented, 1 implemented Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_pmu_for_sme_extension**Type**

int

Default value

0x0

Implement PMUv3 for Scalable Matrix Extension (SME) from ARMv9.5 (FEAT_PMUv3_SME). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_pmu_threshold_linking_control**Type**

int

Default value

0x0

Implement PMU threshold linking control (FEAT_PMUv3_TH2). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_pointer_authentication**Type**

int

Default value

0x1

Implement ARMv8.3 pointer authentication (FEAT_PAuth). Possible values of this parameter are: - 1, feature is implemented if ARMv8.3 is enabled. - 2, feature is implemented.

has_prediction_invalidation_instructions**Type**

int

Default value

0x1

Implement execution and data prediction invalidation from ARMv8.5 (FEAT_SPECRES). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_prfm_slc**Type**

int

Default value

0x0

Implement PRFM with SLC hint (FEAT_PRFM_SLC). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_pstate_dit**Type**

int

Default value

0x1

Implement timing insensitivity of data processing instructions from ARMv8.4 (FEAT_DIT). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_pstate_pan**Type**

int

Default value

0x1

Implement the PSTATE.PAN (Privileged Access Never) control from ARMv8.1 (FEAT_PAN). Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

has_pstate_uao**Type**

int

Default value

0x1

Implement the PSTATE.UAO (User Access Override) control from ARMv8.2 (FEAT_UAO). Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_qarma3_pac**Type**

bool

Default value

0x0

Supports QARMA3 pointer authentication algorithm (FEAT_PACQARMA3).

has_ras**Type**

int

Default value

0x0

Implements the ARMv8 RAS Extension. 0 = NO_RAS, 1 = MINIMAL_RAS, 2 = FULL_RAS (FEAT_RAS).

has_ras_aderr**Type**

int

Default value

0x0

Implement RAS Asynchronous Device Read Error from Armv8.9 (FEAT_ADERR). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_ras_anerr**Type**

int

Default value

0x0

Implement RAS Asynchronous Normal Read Error from Armv8.9 (FEAT_ANERR). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_ras_armv84_extension**Type**

int

Default value

0x1

Implement ARMv8.4 RAS Extension (FEAT_RASv1p1). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_ras_armv89_double_fault**Type**

int

Default value

0x0

Implement RAS Double Fault Extension from Armv8.9 (FEAT_DoubleFault2). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_ras_armv89_extension

Type

int

Default value

0x1

Implement RAS extension from Armv8.9 (FEAT_RASv2). Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_ras_critical_error

Type

int

Default value

0x0

[DEPRECATED: Set CI field on first register in error_record_feature_register JSON instead]

ARMv8.4 AArch64 RAS Critical Error is implemented or not. 0 - Feature Not Supported, 1 - Feature always enabled, 2 - Feature is controllable.

has_ras_delegated_serror_exceptions_for_el3

Type

int

Default value

0x1

Implement Delegated SError exceptions for EL3 (FEAT_E3DSE). Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_ras_double_fault

Type

int

Default value

0x1

Implement ARMv8.4 RAS Double Fault Extension (FEAT_DoubleFault). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_ras_fault_injection**Type**

int

Default value

0x0

[DEPRECATED: Set INJ field on first register in error_record_feature_register JSON instead]
Implement ARMv8.4 Standard Fault Injection mechanism. Possible values of this parameter are:
- 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_ras_mmap_view**Type**

bool

Default value

0x0

Implement memory mapped view of RAS Registers for cores.

has_ras_pfar**Type**

int

Default value

0x0

Implement RAS Physical Fault Address Registers from Armv8.9 (FEAT_PFAR). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_ras_timestamp**Type**

int

Default value

0x0

[DEPRECATED: Set TS field on first register in error_record_feature_register JSON instead]
ARMv8.4 AArch64 RAS Timestamp register is implemented or not. 0 - No Timestamp is recorded, 1 - Generic Timer timestamp is recorded, 2 - IMP DEF timestamp is recorded.

has_restriction_on_speculative_data_loaded**Type**

int

Default value

0x1

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation) (FEAT_CSV3). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_rme**Type**

bool

Default value

0x0

If true, implements full realm management extension (FEAT_RME). Note: This parameter is deprecated and will be removed in future releases, please use rme_support_level parameter.

has_rme_gdi**Type**

int

Default value

0x0

Support for RME granular data isolation (FEAT_RME_GDI)) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_rme_gpc2**Type**

bool

Default value

0x0

If true then RME GPC2 extension is enabled (FEAT_RME_GPC2).

has_rme_gpc3**Type**

bool

Default value

0x0

If true then RME GPC3 extension is enabled (FEAT_RME_GPC3).

has_rndr**Type**

int

Default value

0x0

Implement random number instructions to read from RNDR and RNDRSS random number registers from ARMv8.5 (FEAT_RNG). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_rndr_trap**Type**

int

Default value

0x0

Implement trapping for RNDR and RNDRSS random number registers from ARMv8.8. (FEAT_RNG_TRAP) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_rounding_doubling_multiply_add_subtract**Type**

int

Default value

0x1

Implement the rounding doubling multiply add and subtract instructions from ARMv8.1 (FEAT_RDM). Possible values of this parameter are: - 1, feature is implemented if ARMv8.1 is enabled. - 2, feature is implemented.

has_rprfm**Type**

bool

Default value

0x0

Support for RPRFM hint instruction (FEAT_RPRFM).

has_sctlr2**Type**

int

Default value

0x1

Implement SCTLR2_ELx registers (FEAT_SCTLR2). Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_sebep**Type**

int

Default value

0x0

Implement Synchronous-Exception-Based Event Profiling from ARMv9.4 (FEAT_SEBEP). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_secure_el2**Type**

int

Default value

0x1

Implement support for Secure EL2 (FEAT_SEL2). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_self_hosted_trace_extension**Type**

int

Default value

0x1

Implement support for the Self-hosted Trace Extensions from ARMv8.4 (FEAT_TRF). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_small_page_table**Type**

int

Default value

0x1

Implement small page table support which increases the maximum value of TxSZ field from ARMv8.4 (FEAT_TTST). Note: will be unimplemented only if both has_small_page_table=0x0 and has_secure_el2=0x0. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_software_lock**Type**

bool

Default value

0x1

Implement software lock in memory-mapped CTI, PMU, and external debug interfaces.

has_spe_eft**Type**

int

Default value

0x1

Implement SPE extended operation type filtering from ARMv9.5 (FEAT_SPE_EFT) Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_spe_fds**Type**

int

Default value

0x0

Implement SPE filter by data source from ARMv8.9 (FEAT_SPE_FDS) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_spe_for_sme_extension**Type**

int

Default value

0x1

Implement support of SME to SPE from ARMv9.5 (FEAT_SPE_SME). Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_spe_fpf**Type**

int

Default value

0x1

Implement SPE operation type extension for ASIMD and FP from ARMv9.5 (FEAT_SPE_FPF). Possible values of this parameter are: - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_spe_nvm**Type**

int

Default value

0x1

Implement Statistical Profiling physical address mode (FEAT_SPE_nVM). Possible values of this parameter are: - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_speculation_barrier_inst**Type**

int

Default value

0x1

Implement speculation barrier instruction (SB) from ARMv8.5 (FEAT_SB). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_speculative_sei**Type**

bool

Default value

0x0

If true, the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches.

has_srmask**Type**

int

Default value

0x1

Implement bitwise write masks for EL1 control registers (FEAT_SRMASK). Possible values of this parameter are: - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_stage2_ap_speculative_update**Type**

int

Default value

0x0

Speculative update of S2 AP bit on S1 TTW. 0 = No Update, 1 = Update, 2 = Update including for AT ops.

has_stage2_fwb**Type**

int

Default value

0x1

Implement HCR_EL2.FWB, stage 2 control of memory types and cacheability (FEAT_S2FWB). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_stage2_xnx**Type**

int

Default value

0x1

Implement the extended XN[1:0] stage 2 control from ARMv8.2 (FEAT_XNX). Possible values of this parameter are: - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

has_stage2_xnx_in_aarch32**Type**

bool

Default value

0x1

Implement the extended XN[1:0] stage 2 control from ARMv8.2 for Aarch32 (FEAT_XNX).

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

has_supersections**Type**

bool

Default value

0x1

Whether VMSAv8-32 supersection to support more than 32-bit PA using short descriptor is implemented.

has_sve**Type**

int

Default value

0x0

Whether SVE is implemented (FEAT_SVE). Note: this is required to enable SME (FEAT_SME) with sve.has_sme=1. An SME only implementation can be enabled by setting both as well as sve.sme_only=1.

has_synchronous_load_atomics**Type**

bool

Default value

0x1

Report asynchronous abort due to unsupported load atomics as synchronous (Cacheable).

has_synchronous_load_atomics_noncacheable**Type**

bool

Default value

0x1

Report asynchronous abort due to unsupported load atomics as synchronous (Non-Cacheable).

has_synchronous_store_atomics**Type**

bool

Default value

0x0

Report asynchronous abort due to unsupported store atomics as synchronous (Cacheable).

has_synchronous_store_atomics_noncacheable**Type**

bool

Default value

0x0

Report asynchronous abort due to unsupported store atomics as synchronous (Non-Cacheable).

has_sysinstr128**Type**

int

Default value

0x0

Support for System Instructions that can take 128-bit inputs (FEAT_SYSINSTR128) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_sysreg128**Type**

int

Default value

0x0

Support for 128-bit System Registers (FEAT_SYSREG128) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_tcr2**Type**

int

Default value

0x1

Implement TCR2_ELx registers (FEAT_TCR2) Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_tidcp1**Type**

int

Default value

0x1

Implement Armv8.8 ELO use of implementation defined functionality (FEAT_TIDCP1) Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_tlb_conflict_abort

Type

bool

Default value

0x0

Detected inconsistent TLB content generate aborts.

has_tlb_pa_caching

Type

bool

Default value

0x0

Whether intermediate caching of translation table walks might include NonCoherent caches of previous valid walks. 0, NonCoherent caches might be included. 1, No NonCoherent caches included (FEAT_nTLBPA).

has_tlbi_range

Type

int

Default value

0x1

Implement support for TLB Range Maintenance instructions (TLBI RVAE1, etc) from ARMv8.4 (FEAT_TLBIRANGE). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_tlbi_to_outer_shareable

Type

int

Default value

0x1

Implement support for TLB Maintenance instructions that extend to the Outer Shareable domain (TLBI VAE1OS, etc) from ARMv8.4 (FEAT_TLBIOS). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_tlbi_ttl**Type**

int

Default value

0x1

Implement support for the TTL level hint in by-address TLB Maintenance instructions from ARMv8.4 (FEAT_TTL). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_tlbiw**Type**

int

Default value

0x0

Implement TLBI instruction for stage2 dirty (FEAT_TLBIW). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.5 is enabled. - 2, feature is implemented.

has_tme**Type**

bool

Default value

0x0

If true, implements TME, the Transactional Memory Extension (FEAT_TME).

has_translation_hardening**Type**

int

Default value

0x0

Implement the Translation Hardening Extension (FEAT_THE) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_trbe**Type**

bool

Default value

0x0

If true, implements the Trace Buffer Extension (FEAT_TRBE).

has_trbe_ext**Type**

int

Default value

0x0

Implements the Trace Buffer external mode extension (FEAT_TRBE_EXT). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv9.4 is enabled. - 2, feature is implemented.

has_uinj**Type**

int

Default value

0x1

Implement software injection of Undefined Instruction exceptions (FEAT_UINJ). Possible values of this parameter are: - 1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_unaligned_single_copy_atomicity**Type**

int

Default value

0x1

Implement support for SCTLRL_ELx.nAA from ARMv8.4, and A64 atomic, exclusive and acquire/release instructions accessing unaligned bytes inside a 16byte window will not generate alignment fault (FEAT_LSE2). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_unsupported_exclusive_fault**Type**

bool

Default value

0x1

Report unsupported exclusive access with Unsupported Exclusive fault status (otherwise use external abort).

has_v8_4_debug_extension**Type**

int

Default value

0x1

Implement ARMv8.4 debug extensions (FEAT_Debugv8p4). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_v8_4_pmu_extension**Type**

int

Default value

0x1

Implement PMU extension from ARMv8.4 (FEAT_PMUv3p4). Possible values of this parameter are: - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_v8_5_debug_over_power_down**Type**

int

Default value

0x0

Implement ARMv8.5 Debug over powerdown (FEAT_DoPD). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_v8_5_pmu_extension**Type**

int

Default value

0x1

Implement PMU extension from ARMv8.5 (FEAT_PMUv3p5). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_v8_5_spe_extension**Type**

int

Default value

0x1

Implement SPE extension from ARMv8.5 (FEAT_SPEv1p1). Possible values of this parameter are: - 1, feature is implemented if ARMv8.5 is enabled. - 2, feature is implemented.

has_v8_6_pmu_events**Type**

int

Default value

0x1

Implements PMU events from ARMv8.6 Possible values of this parameter are: - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

has_v8_7_fp_enhancements**Type**

int

Default value

0x1

Implements the Floating Point enhancements from Armv8.7 (introduces FPCR.FIZ/AH/NEP, etc. (FEAT_AFP).) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_v8_7_pmu_events**Type**

int

Default value

0x1

Implement PMU events from ARMv8.7. Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_v8_7_pmu_extension**Type**

int

Default value

0x1

Implement PMU extension from ARMv8.7 (FEAT_PMUv3p7). Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_v8_7_spe_extension**Type**

int

Default value

0x1

Implement SPE extension from ARMv8.7 (FEAT_SPEv1p2) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_v8_7_spe_inverted_filtering**Type**

bool

Default value

0x1

Where FEAT_SPEv1p2 is implemented, whether the inverting filtering by events.

has_v8_7_spe_previous_branch_target**Type**

bool

Default value

0x1

Where FEAT_SPEv1p2 is implemented, whether the optional branch target feature is implemented.

has_v8_8_debug_extension**Type**

int

Default value

0x1

Implement ARMv8.8 debug extensions (FEAT_Debugv8p8) Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_v8_8_pmu_events**Type**

int

Default value

0x1

Implement PMU events from ARMv8.8 (FEAT_PMUv3). Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_v8_8_pmu_extension**Type**

int

Default value

0x1

Implement PMU extension from ARMv8.8 (FEAT_PMUv3p8). Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_v8_8_spe_extension**Type**

int

Default value

0x1

Implement SPE extension from ARMv8.8 (FEAT_SPEv1p3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.8 is enabled. - 2, feature is implemented.

has_v8_9_debug_extension**Type**

int

Default value

0x1

Implement ARMv8.9 debug extensions (FEAT_Debugv8p9) Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_v8_9_pc_sample_based_profiling**Type**

int

Default value

0x1

Implement PC Sample-based Profiling from ARMv8.9 (FEAT_PCSRv8p9) Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_v8_9_pmu_events**Type**

int

Default value

0x1

Implement PMU events from ARMv8.9 (FEAT_PMUv3). Possible values of this parameter are: - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_v8_9_pmu_extension**Type**

int

Default value

0x1

Implement PMU extension from ARMv8.9 (FEAT_PMUv3p9). Possible values of this parameter are:
- 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_v8_9_spe_extension**Type**

int

Default value

0x1

Implement SPE extension from ARMv8.9 (FEAT_SPEv1p4) Possible values of this parameter are: -
1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

has_v9_6_spe_extension**Type**

int

Default value

0x1

Implement FEAT_SPEv1p5 and FEAT_SPE_EXC from ARMv9.6. Possible values of this parameter are: -
1, feature is implemented if ARMv9.6 is enabled. - 2, feature is implemented.

has_vnocr_el2**Type**

int

Default value

0x1

Implement support for nested virtualization enhancements from ARMv8.4 (FEAT_NV2). Possible values of this parameter are: -
0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

has_wfet_and_wfit**Type**

int

Default value

0x1

Implements WFE and WFI with Timeout from Armv8.7 (FEAT_WFxT). Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

has_writebuffer

Type

bool

Default value

0x0

Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.

has_xs

Type

int

Default value

0x1

Implements Armv8.7 XS, TLBInXS, DSBnXS instruction (FEAT_XS). Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

hcptr_tta_behaviour

Type

int

Default value

0x2

Behaviour of HCPTR.TTA when there is no CP14 ETM interface. 0, RAZ/WI. 1, RAO/WI. 2, stateful.

hcr_el2_miocnce_is_rw

Type

bool

Default value

0x0

If true, HCR_EL2.MIOCNCE is treated as R/W instead of RAZ/WI.

hcr_swio_res1

Type

bool

Default value

0x0

Whether HCR.SWIO and/or HCR_EL2.SWIO are RES1.

hdbss_error_fault_type**Type**

int

Default value

0x0

Type of fault reported for HDBSS errors. 0 = precise exception, 1 = fault logged in HDBSSPROD_EL2.FSC (FEAT_HDBSS).

hpfar_unknown_when_ipa_invalid**Type**

bool

Default value

0x0

If true, HPFAR_EL2 is set to 0 when IPA is not valid for stage 2 faults.

hsr_uncond_cc**Type**

bool

Default value

0x0

Condition codes reported in HSR as AL if it passes.

hvbar_reset_is_rvbar**Type**

bool

Default value

0x0

If true then the reset value of HVBAR is RVBAR, if false the reset value is UNKNOWN.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-log2linelen**Type**

int

Default value

0x0

If nonzero, Log2 of the instruction cache line length in bytes (valid values in range 4-8). Otherwise the value of cache-log2linelen is used.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-nprefetch**Type**

int

Default value

0x1

Number of next sequential instruction cache lines to prefetch. This is only used when icache-prefetch_enabled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-prefetch_level`

Type

int

Default value

0x0

0 based cache level at which instructions are pre-fetched. This is only used when `icache-prefetch_enabled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_bus_width_in_bytes`

Type

int

Default value

0x8

L1 I-Cache read bus width in bytes used to calculate per-access timing annotations.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

icache-ways**Type**

int

Default value

0x2

L1 I-Cache number of ways (sets are implicit from size).

id_spec_fpacc_raz**Type**

bool

Default value

0x0

If true, implementation opts not to disclose the speculative use of pointers processed by a PAC authentication failure by having value 0 for Spec_FPACC bits of ID_AA64MMFR3_EL1 register.

ignore_DBGPRCR_CWRR**Type**

bool

Default value

0x0

Ignore writes to the deprecated DBGPRCR.CWRR bit.

ignore_access_flag_update_by_at_ops**Type**

bool

Default value

0x0

If true, AT operations do not update access flag.

ignore_data_abt_on_af_update_by_at_ops**Type**

bool

Default value

0x1

If true, Data abort generated on AF update by AT operations are ignored. This parameter is only valid if ignore_access_flag_update_by_at_ops is false.

ignore_large_address_top_bits_in_page_walk**Type**

bool

Default value

0x0

Whether page table bits [15:12] are ignored if PA_SIZE < 52 and output address is configured < 52 with large page.

ignore_tag_check_dcc_load_store_in_ma_mode_when_tco_is_disabled**Type**

bool

Default value

0x0

Constrained unpredictable behavior for reads/writes to external debug interface DTR regs in memory access mode when PSTATE.TCO is 0. If true, tag check is ignored else, tag check is performed if required.

ignore_traps_to_dcc_regs_in_debug**Type**

bool

Default value

0x0

Whether traps get ignored for the following registers in debug state: * AArch64: MDCCSR_EL0, OSDTREX_EL1, OSDTRTX_EL1, MDCCINT_EL1. * AArch32: DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR, DBGDTRRext, DBGDTRTXext, DBGDCCINT.

illegal_state_exception_priority

Type

int

Default value

0x0

IMPDEF priority of Illegal State Exception. 0: After breakpoint exceptions 1: Before Instruction Abort.

imp_def_functionality_behaviour

Type

int

Default value

0x0

Behaviour of IMPLEMENTATION DEFINED registers and system instructions. 0, UNDEF. 1, RAZ/WI.

impdef_regs_and_unpred_from_implementation

Type

string

Default value

""

Configure implementation defined registers and unpredictable behaviour to match the specified implementation. Requires a license for the selected implementation model. User has to provide the default values for the published or configurable parameters through commandline arguments. Use ARM_Cortex-A<num> or ARM_<codename> for licensed pre-release cores.

impdef_sysreg_json

Type

string

Default value

"[]"

Configure mask/reset bitmasks for impdef. registers in a JSON format which is (where 'bitwise' indicates 'reset'/'mask' to flip existing bits): [{ "name": "IMP_SYSREG0_EL1", "reset":0, "mask":0, "encoding":0, "bitwise":true}*].

independent_cache_control_traps**Type**

int

Default value

0x0

Implement Independent Cache Control traps from ARMv8.5. 0, No support. 1, Supported but not for tlb maintenance instructions. 2, Full support. (FEAT_EVT).

insert_iesb_before_exception**Type**

bool

Default value

0x0

If true then inserts an IESB before taking with Exception otherwise has no effect and IESB is taken after PState is changed due to the Exception.

instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

internal_vgic**Type**

bool

Default value

0x0

Instantiate VGIC peripheral in this processor.

is_debug_state_pmu_snapshot_allowed**Type**

bool

Default value

0x1

If true, PMU snapshot is allowed in debug state.

is_first_pcsr_sample_ignored**Type**

bool

Default value

0x0

If true, First read of PMPCSR register after reset returns 0xFFFFFFFF.

is_mt_res0**Type**

bool

Default value

0x0

If ARMv8.6 is not implemented, and PMUv3 is implemented, this parameter controls whether PMEVTYPER<n>.MT bit is RES0 or RW. For other implementations, this parameter has no effect.

is_serror_edge_triggered**Type**

bool

Default value

0x1

If true, SError is edge-triggered. Otherwise, its level-triggered.

is_tagged_nsh_treated_as_tagged**Type**

bool

Default value

0x1

Whether a tagged NonShared memory attribute is treated as tagged or not.

is_uniprocessor**Type**

bool

Default value

0x0

Value for the U bit in MPIDR. true disables L1 cache coherency protocols.

isb_is_branch**Type**

bool

Default value

0x0

If true, ISB is traced as an immediate branch. This allows to count ISB as a branch in debug extensions (e.g. PMU).

ish_is_osh**Type**

bool

Default value

0x0

Whether Innershareable is same as OuterShareable.

itd_conditional_instructions_are_32bit**Type**

bool

Default value

0x0

When SCTLR_ELx.ITD=1, an IT instruction plus a T16 instruction are considered a single 32bit conditional instruction.

jidr_is_undef_at_el0**Type**

bool

Default value

0x0

If true, JIDR register access is UNDEF at EL0.

jmcr_is_undef_at_el0**Type**

bool

Default value

0x0

If true, JMCR register access is UNDEF at EL0.

joscr_is_undef_at_el0**Type**

bool

Default value

0x0

If true, JOSCR register access is UNDEF at EL0.

l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

l2cache-read_bus_width_in_bytes

Type

int

Default value

0x8

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

l2cache-read_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l2cache-size

Type

int

Default value

0x80000

L2 Cache size in bytes.

l2cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

l2cache-snoop_issue_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l2cache-ways**Type**

int

Default value

0x10

L2 Cache number of ways (sets are implicit from size).

l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x8

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

l3cache-has_mpam**Type**

bool

Default value

0x0

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-mpamf.arch_major_ver**Type**

int

Default value

0x0

L3 Cache MPAMF_AIDR architecture major version.

l3cache-mpamf.arch_minor_ver**Type**

int

Default value

0x0

L3 Cache MPAMF_AIDR architecture minor version.

l3cache-mpamf.bwa_width_ns**Type**

int

Default value

0x10

L3 Cache width of MPAM bandwidth allocation fields for non-secure accesses.

l3cache-mpamf.bwa_width_s**Type**

int

Default value

0x10

L3 Cache width of MPAM bandwidth allocation fields for secure accesses.

l3cache-mpamf.cmax_width_ns**Type**

int

Default value

0x0

L3 Cache number of fractional bits in MPAM cache capacity partition control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

l3cache-mpamf.cmax_width_s**Type**

int

Default value

0x0

L3 Cache number of fractional bits in MPAM cache capacity partition control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

l3cache-mpamf.cpbm_width_ns**Type**

int

Default value

0x0

L3 Cache width of MPAM cache portion bitmap for non-secure accesses. If 0, the feature is not implemented, and all ways are available.

l3cache-mpamf.cpbm_width_rl**Type**

int

Default value

0x0

L3 Cache width of MPAM cache portion bitmap for realm accesses. If 0, the feature is not implemented, and all ways are available.

l3cache-mpamf.cpbm_width_rt**Type**

int

Default value

0x0

L3 Cache width of MPAM cache portion bitmap for root accesses. If 0, the feature is not implemented, and all ways are available.

l3cache-mpamf.cpbm_width_s**Type**

int

Default value

0x0

L3 Cache width of MPAM cache portion bitmap for secure accesses. If 0, the feature is not implemented, and all ways are available.

l3cache-mpamf.csu_num_mon_ns**Type**

int

Default value

0x0

L3 Cache number of MPAM cache storage usage monitors for non-secure accesses.

l3cache-mpamf.csu_num_mon_rl**Type**

int

Default value

0x0

L3 Cache number of MPAM cache storage usage monitors for realm accesses.

l3cache-mpamf.csu_num_mon_rt**Type**

int

Default value

0x0

L3 Cache number of MPAM cache storage usage monitors for root accesses.

l3cache-mpamf.csu_num_mon_s**Type**

int

Default value

0x0

L3 Cache number of MPAM cache storage usage monitors for secure accesses.

l3cache-mpamf.esr_mask**Type**

int

Default value

0xffffffff

L3 Cache MPAMF_ESR mask value.

l3cache-mpamf.has_esr**Type**

bool

Default value

0x0

L3 Cache's MPAMF_ESR, MPAMF_ECR, and MPAM error handling implemented.

l3cache-mpamf.has_extd_esr**Type**

bool

Default value

0x0

L3 Cache's MPAMF_ESR is 64-bits.

l3cache-mpamf.has_impl_idr**Type**

bool

Default value

0x0

L3 Cache's MPAMF_IMPL_IDR is present.

l3cache-mpamf.has_mbwu_long_counter**Type**

bool

Default value

0x0

L3 Cache has long MBWU counter and capture registers.

l3cache-mpamf.has_mpamfidr_ext**Type**

bool

Default value

0x0

MPAMF_IDR.EXT support.

l3cache-mpamf.has_partid_nrw**Type**

bool

Default value

0x0

Narrowing part ID register is present. This is global rather than per-instance.

l3cache-mpamf.has_priority_partitioning**Type**

bool

Default value

0x0

The selected resource has priority partitioning described in MPAMF_PRI_IDR.

l3cache-mpamf.has_prod_id**Type**

int

Default value

0x0

L3 Cache MPAMF_IIDR product ID supported.

l3cache-mpamf.has_prod_rev**Type**

int

Default value

0x0

L3 Cache MPAMF_IIDR product REVISION supported.

l3cache-mpamf.has_prod_var**Type**

int

Default value

0x0

L3 Cache MPAMF_IIDR product VARIENT supported.

l3cache-mpamf.has_prop_ns**Type**

bool

Default value

0x0

Enable memory bandwidth proportional stride control for non-secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

l3cache-mpamf.has_prop_s**Type**

bool

Default value

0x0

Enable memory bandwidth proportional stride control for secure accesses. Only the register interface is implemented - the control is NOT FUNCTIONAL.

l3cache-mpamf.has_ris**Type**

bool

Default value

0x0

L3 Cache has resource instance selection support.

l3cache-mpamf.max_partid_ns**Type**

int

Default value

0xffff

L3 Cache Maximum value of non-secure PARTID supported.

l3cache-mpamf.max_partid_rl**Type**

int

Default value

0xffff

L3 Cache Maximum value of realm PARTID supported for RME implementations.

l3cache-mpamf.max_partid_rt**Type**

int

Default value

0xffff

L3 Cache Maximum value of root PARTID supported for RME implementations.

l3cache-mpamf.max_partid_s**Type**

int

Default value

0xffff

L3 Cache Maximum value of secure PARTID supported.

l3cache-mpamf.max_pmg_ns**Type**

int

Default value

0xff

L3 Cache Maximum value of non-secure PMG supported.

l3cache-mpamf.max_pmg_rl**Type**

int

Default value

0xff

L3 Cache Maximum value of realm PMG supported for RME implementations.

l3cache-mpamf.max_pmg_rt**Type**

int

Default value

0xff

L3 Cache Maximum value of root PMG supported for RME implementations.

l3cache-mpamf.max_pmg_s**Type**

int

Default value

0xff

L3 Cache Maximum value of secure PMG supported.

l3cache-mpamf.mbwu_long_counter_width**Type**

int

Default value

0x0

L3 Cache long MBWU counter width. 0: 63 bits, 1: 44 bits.

l3cache-mpamf.no_impl_msmon**Type**

bool

Default value

0x0

L3 Cache's MPAMF_IMPL_IDR does not describe resource monitors.

l3cache-mpamf.no_impl_part**Type**

bool

Default value

0x0

L3 Cache's MPAMF_IMPL_IDR does not describe resource partitioning controls.

l3cache-mpamf.ris_max**Type**

int

Default value

0x0

L3 Cache's largest resource instance selector value defined.

l3cache-mpamf_base**Type**

int

Default value

0x0

L3 Cache memory mapped MPAM registers base address.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_bus_width_in_bytes**Type**

int

Default value

0x8

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x0

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_issue_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-ways`**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

`l3cache-write_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l3cache-write_bus_width_in_bytes`**Type**

int

Default value

0x8

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

legacy_combining_exc_catch_trace**Type**

bool

Default value

0x1

Whether exception catch is traced as part of exception entry/exit in same cycle.

log2_trace_buffer_alignment**Type**

int

Default value

0x0

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

ls64_ignore_s1_unpred_memattr_transformation**Type**

bool

Default value

0x0

If true, stage 1 unpredictable memory attribute transformations are ignored for FEAT_LS64 single-copy atomic 64-byte load/store instructions' (FEAT_LS64, FEAT_LS64_V, FEAT_LS64_ACCDATA).

ls64_memtype_check_use_combined_memattr**Type**

bool

Default value

0x0

If true, FEAT_LS64 single-copy atomic 64-byte load/store instructions' memory attributes check is done on the combined memory attributes at the end of all enabled translation stages.

max_32bit_el**Type**

int

Default value

0x3

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, x:[0:3] - All the levels below supplied ELx supports A32.

mdrar_el1_res0**Type**

bool

Default value

0x0

MDRAR_EL1 is RES0.

mdselr_le_16_bps_wps_behaviour**Type**

int

Default value

0x0

Behaviour of MDSELR_EL1 and related traps/enables if fewer than 16 watchpoints and fewer than 16 breakpoints are implemented: 0 - MDSELR_EL1 is stateful 1 - MDSELR_EL1, EBWE, FGTS are RAZ/WI, traps and enables do not apply.

mec_support_level**Type**

int

Default value

0x0

0 -> Memory Encryption Contexts not implemented, 1 -> LEGACY_TZ_EN mode i.e. MEC register fields are stateful but only supports secure/non-secure states, 2 -> Memory Encryption Contexts fully implemented (FEAT_MEC).

memory.acp.AxCACHE_mask**Type**

int

Default value

0x0

Used with `memory.acp.AxCACHE_pattern` to define which memory types the ACP port accepts. All transactions which do not satisfy $(\text{AxCACHE} \& \text{mask}) == \text{pattern}$ will abort.

`memory.acp.AxCACHE_pattern`

Type

int

Default value

0x0

Used with `memory.acp.AxCACHE_mask` to define which memory types the ACP port accepts. All transactions which do not satisfy $(\text{AxCACHE} \& \text{mask}) == \text{pattern}$ will abort.

`memory.l2_cache.is_inner_cacheable`

Type

bool

Default value

0x1

L2 cache obeys inner cacheable attributes (rather than outer cacheable attributes).

`memory.l2_cache.is_inner_shareable`

Type

bool

Default value

0x1

L2 cache obeys inner shareable attributes (rather than outer shareable attributes).

`memory_tagging_support_level`

Type

int

Default value

0x0

Specify the memory tagging extension support level: 0, not implemented. 1, instructions and registers only are implemented (FEAT_MTE). 2, implemented (FEAT_MTE2). 3, implemented with asymmetric handling of exceptions (FEAT_MTE3). 4, implemented (FEAT_MTE4).

`mixed_endian`

Type

int

Default value

0x1

Implement support for mixed endianness. 0, not supported. 1, supported at all exception levels. 2, supported at ELO only.

mops_cpy_block_size**Type**

int

Default value

0x40

Block size used for memcpy memory accesses.

mops_cpy_default_dir**Type**

int

Default value

0x0

Default direction for non-overlapping memcpy operations: 0, forwards. 1, backwards.

mops_cpy_handle_async_exceptions**Type**

bool

Default value

0x0

Handle any pending async exceptions after copying a block of data, instead of waiting until instruction end.

mops_cpy_post_size**Type**

int

Default value

0xa

Percentage of data copied in memcpy 'E' instructions.

mops_cpy_pre_size**Type**

int

Default value

0xa

Percentage of data copied in memcpy 'P' instructions.

mops_cpy_pre_size_threshold**Type**

int

Default value

0x0

Size threshold in Bytes for CPY*P* instructions.

mops_cpy_single_access**Type**

bool

Default value

0x0

Execute memcpy as a single read and single write access.

mops_cpy_write_abort_before_read**Type**

bool

Default value

0x0

Report the data aborts and watchpoint of the write accesses, before those of the read accesses.

mops_cpy_zero_size_can_fault**Type**

bool

Default value

0x1

Fault because of mismatched implementation option when the operation is of size 0.

mops_exec_order_can_fault**Type**

bool

Default value

0x0

Enable exception on the Main/Epilogue instruction when executed after a mismatched Prologue/Main in a CPY/SET sequence, or after another random instruction.

mops_inst_cpy_zero_size_can_fault**Type**

bool

Default value

0x1

Fault because of mismatched implementation option when inst_cpy_size is 0.

mops_inst_set_zero_size_can_fault**Type**

bool

Default value

0x1

Fault because of mismatched implementation option when inst_set_size is 0.

mops_mismatched_page_crossing_access_unpred**Type**

int

Default value

0x0

Constrained unpredictable behaviour for FEAT_MOPS instructions when crossing page boundary with different memory types, 0 : Memory block access uses the attributes of it's own address block
1: Alignment Fault.

mops_mmu_abort_far_aligned**Type**

bool

Default value

0x0

If true, in case of an MMU abort on a MOPS instruction, report FAR aligned to current translation granule.

mops_set_block_size**Type**

int

Default value

0x40

Block size used for memset memory accesses.

mops_set_handle_async_exceptions**Type**

bool

Default value

0x0

Handle any pending async exceptions after setting a block of data, instead of waiting until instruction end.

mops_set_post_size**Type**

int

Default value

0xa

Percentage of data copied in memset 'E' instructions.

mops_set_pre_size**Type**

int

Default value

0xa

Percentage of data copied in memset 'P' instructions.

mops_set_single_access**Type**

bool

Default value

0x0

Execute memset as a single read and single write access.

mops_set_zero_size_can_fault**Type**

bool

Default value

0x1

Fault because of mismatched implementation option when the operation is of size 0.

mops_setg_unaligned_does_mismatch_fault**Type**

bool

Default value

0x0

If true, in case of unaligned SETGM / SETGE, raise a mismatched memset exception because of impdef reasons, instead of alignment fault.

mops_wp_far_behaviour**Type**

int

Default value

0x0

Set option for address stored in FAR/EDWARD after watchpoints hit by MOPS instructions
0 - FAR recorded matches lowest watchpointed address accessed by the instruction
1 - FAR recorded matches lowest address accessed by the instruction within same translation granule as watchpointed address
2 - FAR recorded matches highest watchpointed address accessed by the instruction that triggered the watchpoint.

mpam_bw_bwa_wd**Type**

int

Default value

0x1

MPAM MPAMBWIDR_EL1.BWA_WD: The number of implemented bits in the bandwidth allocation fields {MPAMBWn_ELx, MPAMBWSM_EL1}.MAX and MPAMBWCAP_EL2.CAP.

mpam_bw_has_hw_scale**Type**

bool

Default value

0x0

MPAM Whether has hardware support for auto-scaling of {MPAMBWn_ELx, MPAMBWSM_EL1}.MAX and MPAMBWCAP_EL2.CAP limits.

mpam_bw_max_lim**Type**

int

Default value

0x0

MPAM the implemented maximum-bandwidth limit partitioning behaviors: - 0, Both soft limit and hard limit behaviors are implemented. - 1, Soft limit behavior is implemented. - 2, Hard limit behavior is implemented.

mpam_bw_us_frac**Type**

int

Default value

0x0

MPAM MPAMBWIDR_EL1.US_FRAC: The fractional part of the window width in microseconds.

mpam_bw_us_int**Type**

int

Default value

0x0

MPAM MPAMBWIDR_EL1.US_INT: The integer part of the window width in microseconds.

mpam_force_ns_rao**Type**

bool

Default value

0x0

Whether MPAM3_EL3.FORCE_NS bit is RAO/WI.

mpam_frac**Type**

int

Default value

0x0

MPAM fractional revision number in ID_AA64PFR1_EL1.MPAM_frac field. Combines with has_mpam to give the mpam version has_mpam = false, mpam_frac = 0 -> Not implemented
has_mpam = false, mpam_frac = 1 -> FEAT_MPAMv0p1 has_mpam = true, mpam_frac = 0 -> FEAT_MPAMv1p0 has_mpam = true, mpam_frac = 1 -> FEAT_MPAMv1p1.

mpam_has_altsp**Type**

bool

Default value

0x0

MPAM Whether MPAMIDR_EL1.HAS_ALTSP bit is set or clear.

mpam_has_bw_ctrl**Type**

bool

Default value

0x0

MPAM Whether MPAMIDR_EL1.HAS_BW_CTRL bit is set or clear.

mpam_has_hcr**Type**

bool

Default value

0x0

MPAM Whether MPAMIDR_EL1 HAS_HCR bit is set or clear.

mpam_max_partid**Type**

int

Default value

0xffff

MPAM Maximum PARTID Supported.

mpam_max_pmg**Type**

int

Default value

0xff

MPAM Maximum PMG Supported.

mpam_max_vpmr**Type**

int

Default value

0x0

MPAM Maximum VPMR Supported.

mpamidr_has_force_ns**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_FORCE_NS bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_sdeflt**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_SDEFLT bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpamidr_has_tidr**Type**

int

Default value

0x0

Whether MPAMIDR_EL1.HAS_TIDR bit is set or clear. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.6 is enabled. - 2, feature is implemented.

mpidr_layout**Type**

int

Default value

0x0

Layout of MPIDR. 0 AFF0 is CPUID, 1 AFF1 is CPUID.

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

mpmm_config

Type

string

Default value

""

MPMMTUNE register value. The JSON schema is : { "DT_THR":0, "MPMM_G2_TP":2, "MPMM_G2_ATHR":100, "MPMM_G1_TP":2, "MPMM_G1_ATHR":75, "MPMM_G0_TP":2, "MPMM_G0_ATHR":50 } . The value given for threshold value is just an indication, not specific to any core. This parameter is used only when has_mpmm is set.

mte_report_which_failed_address

Type

string

Default value

"first, mops_first_failing_address_in_range"

Set to <OPT>, <MOPS_OPT>Applicable only for MTE synchronous check. OPT defines the range for the failing address to report and MOPS_OPT defines the choice within that range for MOPS operations only. Non-MOPS operations report the first address in the range defined by OPT. OPT is set to "first" or "last". If "first" then report an address from the intersection of the first failed MTE granule and the transaction's range. If "last" then report an address from the intersection of the last failed MTE granule and the transaction's range. MOPS_OPT is set to "mops_first_failing_address_in_range" or "mops_random_address_in_range". If "mops_first_failing_address_in_range" then report the first failing address in the range defined by OPT. If "mops_random_address_in_range" then report a random address within the range defined by OPT.

mte_tminline**Type**

int

Default value

0x0

Value of CTR_EL0.TminLine for reading purpose only. A value configured using this does not indicate the presence of separate tag cache. 0, TminLine evaluated from smallest data cache line.

mvbar_reset_is_rvbar**Type**

bool

Default value

0x1

If true then the reset value of MVBAR is RVBAR, if false the reset value is UNKNOWN.

non_secure_vgic_alias_when_ns_only**Type**

int

Default value

0x0

If ! has_el3 and only non-secure side exists, then the normal position of the VGIC is a secure alias. If this parameter is non-zero then in addition a non-secure alias of the VGIC will be placed at this position (aligned to 32 KB).

num_loregion_descriptors**Type**

int

Default value

0x0

Number of Limited Ordering Region descriptors implemented (if ARM v8.1 extensions are implemented) (FEAT_LOR).

num_loregions**Type**

int

Default value

0x0

Number of Limited Ordering Regions implemented excluding background region (if ARM v8.1 extensions are implemented) (FEAT_LOR).

number_of_abl_breakpoints**Type**

int

Default value

0x0

if FEAT_ABLE is implemented, Number of address matching breakpoints that support address linking.

number_of_error_records**Type**

int

Default value

0x0

Cores Number of Error records supported for RAS.

nv_frac_support_level**Type**

int

Default value

0x0

Support for a subset of FEAT_NV and FEAT_NV2 behaviours: 0 - Not implemented. 1 - Implemented. 2 - Implemented with FEAT_NV2p1.

optimal_alignment_size**Type**

int

Default value

0x1

Alignment boundary which does not incur additional performance penalty from ARMv8.5. - 1, architectural misalignment is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 2, access crossing 4 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] - 3, access crossing 8 byte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] ... - 12, access crossing 4 Kbyte boundary is used to set PMU event LDST_ALIGN_LAT and SPE event E[11] .

output_attributes**Type**

string

Default value`"ExtendedID[62:55]=MPAM_PMG, ExtendedID[54:39]=MPAM_PARTID,
ExtendedID[38]=MPAM_NS"`

User-defined transform to be applied to bus attributes like MasterID, ExtendedID or UserFlags. Currently, only works for MPAM Attributes encoding into bus attributes.

pacm_support_level**Type**

int

Default value

0x2

Implements PSTATE.PACM from ARMv9.5. 0: Not supported, 1: Trivial implementation when FEAT_PAuth_LR and FEAT_PACIMP are supported, 2: Full implementation when FEAT_PAuth_LR is supported.

page_based_hardware_attributes**Type**

int

Default value

0x0

Implement the page based hardware attributes from ARMv8.2. This parameter indicates which page table bits are available for hardware, where bits[3:0] correspond to PTE[62:59] and to TCR_ELx.HWUnyy (FEAT_HPDS2).

par_ns_set_unknown_bit**Type**

bool

Default value

0x1

Whether NS bit of PAR is set/clear when executing AT to perform non-secure regime translation. When true, NS is set to 1 else 0.

pfar_is_valid**Type**

bool

Default value

0x1

IMPLEMENTATION DEFINED choice to configure ESR_ELx.PFV: whether PFAR_ELx is valid or UNKNOWN when ESR_ELx.PFV is not forced to be 0.

pfr1_csv2_frac**Type**

int

Default value

0x0

Fractional revision number ID_AA64PFR1_EL1.CSV2_frac when ID_AA64PFR0_EL1.CSV==1 for CSV2 extension (FEAT_CSV2_1p1, FEAT_CSV2_1p2).

pmb_idr_external_abort**Type**

int

Default value

0x0

Describes how the PE manages External aborts on writes made by the Statistical Profiling Extension to the Profiling Buffer. 0, External abort is reported to SPE, From Armv8.8 and Armv9.3, the value 0 is not permitted. 1, External abort is ignored. 2, The External abort generates an SError and the error is not reported to SPE.

pmb_idr_flag_updates**Type**

bool

Default value

0x1

Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state.

pmcr_disable_events_export**Type**

bool

Default value

0x1

If true, export for PMU events is disabled. This configures PMCFGR.EX field.

pmeocr_res0_fields_razwi**Type**

bool

Default value

0x0

If true, RES0 fields of PMEOCR_EL1 are accessed with a Read-As-Zero/Write-Ignore policy.

pmmir_el1_bus_slots**Type**

int

Default value

0x0

Largest value by which BUS_ACCESS can increment over BUS_CYCLES cycles. From v8.7 PMU extension.

pmmir_el1_bus_width**Type**

int

Default value

0x0

Width, in bytes, of accesses counted by BUS_ACCESS. From v8.7 PMU extension.

pms_idr_max_size**Type**

int

Default value

0x6

Defines largest size for a single SPE record (rounded up to a power of 2).

pmu-num_counters**Type**

int

Default value

0x8

Number of PMU counters implemented.

pmu_async_exception_delay**Type**

int

Default value

0x0

Configure PMU asynchronous exception delay in CPU cycles (FEAT_SEBEP).

pmu_cycle_counter_counts_actual_cycles**Type**

bool

Default value

0x0

If true and Timing annotation is enabled, PMU cycle counter counts actual cycles, otherwise counts instructions executed.

pmu_has_chain_event**Type**

bool

Default value

0x1

PMU (if present) implements event number 0x1e, CHAIN.

pmu_precise_events**Type**

string

Default value

""

"Configure v9.4 Precise PMU events. {"pmu_events":["SW_INCR", "PC_WRITE_RETIRED", "BR_RETIRED", "BR_IND_RETIRED", "BR_RETURN_RETIRED", "BR_RETURN_ANY_RETIRED", "BR_IND_TAKEN_RETIRED", "LD_RETIRED", "ST_RETIRED", "UNALIGNED_LD_ST", "INST_RETIRED", "EXCEP_TAKEN", "EXCEP_RETURN", "CHAIN"]}".

pmu_threshold_bit_width**Type**

int

Default value

0x0

Implement FEAT_PMUv3_TH and if so the width of PMEVTYPER<n>_ELO.TH in bits. 0, not implemented. 1-12 number of bits in PMEVTYPER<n>_ELO.TH.

poison_range_end_addr

Type

int

Default value

0x0

End PA of poisoned range.

poison_range_start_addr

Type

int

Default value

0x0

Start PA of poisoned range.

pseudo_fault_generation_feature_register

Type

string

Default value

""

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_psuedo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

pstate_pm_reset

Type

bool

Default value

0x0

Reset value of PSTATE.PM.

pstate_ssbs_reset**Type**

bool

Default value

0x0

Reset value of pstate.ssbs.

pstate_ssbs_type**Type**

int

Default value

0x0

Implement speculative store bypass safe feature from ARMv8.5. 0, Not supported. 1, Supported without MSR/MRS access to SSBS (FEAT_SSBS). 2, fully supported (FEAT_SSBS2).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

randomize_unknowns_at_reset**Type**

bool

Default value

0x0

Will fill in unknown bits in registers at reset with random value using register_reset_data as seed, it overrides scramble_unknowns_at_reset.

ras_aderr_anerr_controls_are_same**Type**

bool

Default value

0x0

If true and FEAT_ADERR and FEAT_ANERR is implemented then ADERR and ANERR controls should always be set to the same value (FEAT_ADERR) (FEAT_ANERR).

ras_err_registers_undef_if_no_error_records**Type**

bool

Default value

0x0

If true, all RAS error record registers, along with ERRSELR_EL1, will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.

ras_errselr_undef_if_no_error_records**Type**

bool

Default value

0x0

If true, ERRSELR_EL1 will be undefined if ERRIDR_EL1 indicates that zero error records are implemented.

ras_extra_configurations**Type**

string

Default value

""

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}].

ras_frac**Type**

int

Default value

0x0

0, No additional feature implemented. 1, Additional ERXMISC*, ERXPFG* registers and FaultInjection trap from RAS v1.1. implemented.

ras_log2_fault_granule_size**Type**

int

Default value

0x2

Log2 of the RAS fault granule size in KB.

ras_mmap_address**Type**

string

Default value

""

Base address of memory mapped RAS Registers for each core on system bus. 0 means the RAS is not mapped, otherwise the address must be at least 4KB aligned or more depending upon the features implemented. JSON schema for the parameter value is: {"format": "all_addrs_are_absolute_wrt_systembus", "cores": [{"ras": 0x0}, {"ras": 0x0}, {"ras": 0x0}, {"ras": 0x0}]}.

ras_pfg_clock_mhz**Type**

int

Default value

0x18

RAS Pseudo-Fault generation clock rate in MHz.

ras_report_aligned_pa_in_pfar**Type**

bool

Default value

0x0

If true, the PFAR_ELx register reports the PA aligned to the RAS fault granule size on a sync external abort or SError exception.

register_reset_data**Type**

int

Default value

0x0

Data used to fill register bits when they become UNKNOWN at reset.

register_reset_data_hi**Type**

int

Default value

0x0

Data used to fill the upper-half of 128-bit registers when the bits become UNKNOWN at reset.

report_iside_cmo_ifsr**Type**

bool

Default value

0x1

fault info for an iside cache maintenance operation is reported in the IFSR.

report_second_access_align_fault_non_atomic_pair_access**Type**

bool

Default value

0x0

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an alignment fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

report_second_access_mmu_fault_non_atomic_pair_access**Type**

bool

Default value

0x0

If true, the non-atomic load/store pair accesses report the 2nd register as faulting address for an MMU fault. This is IMP-DEF behavior as defined in FEAT_LRCPC3.

reported_fp_revision**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored. Updates the FPSID.revision value.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reserved_HMC_SSC_PAC_treated_disabled**Type**

bool

Default value

0x0

When DBG[B|W]CR.{HMC,SSC,PAC} bits configuration is reserved, this parameter controls whether breakpoints/watchpoints are treated as Disabled or not.

restore_fpsr_on_trapped_fp_exception**Type**

bool

Default value

0x0

If true, FPSR is restored to the value of the FPSR immediately before the instruction that generated the trapped floating-point exception.

restriction_on_speculative_execution**Type**

int

Default value

0x0

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation), ID_AA64PFR0_EL1.CSV2: 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx not supported), 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context (SCXTNUM_ELx supported) (FEAT_CSV2, FEAT_CSV2_2), 3: FEAT_CSV2_3 is supported.

restriction_on_speculative_execution_aarch32**Type**

int

Default value

0x0

Implements the ARMv8.5 security feature (Restrictions on the effects of speculation), ID_PFR0.CSV2: 0: No disclosure whether branch targets trained in one context can affect speculative execution in a different context, 1: Branch targets trained in one context cannot affect speculative execution in a different hardware described context, 2: Branch targets trained in one context cannot affect speculative execution in a different hardware described context or at a different address in the same hardware described context (FEAT_CSV2, FEAT_CSV2_2).

revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

rgsr_res0_stateful**Type**

bool

Default value

0x0

Whether RGSr read of RES0 bits return last written value.

rme_default_mecid_nonsecure**Type**

int

Default value

0x0

Default MECID value for NON-SECURE PAS.

rme_default_mecid_realm**Type**

int

Default value

0x0

Default MECID value for REALM PAS.

rme_default_mecid_root**Type**

int

Default value

0x0

Default MECID value for ROOT PAS.

rme_default_mecid_secure**Type**

int

Default value

0x0

Default MECID value for SECURE PAS.

rme_full_is_tagged_nsh_treated_as_tagged**Type**

bool

Default value

0x0

Whether a tagged NonShared memory attribute is treated as tagged or not. Does nothing if effective RME support is not full.

rme_level0_gpt_size**Type**

int

Default value

0x0

The range of address space protected by each entry in the level 0 GPT (0->1GB 1->16GB, 2->64GB, 3->512GB).

rme_mecid_width**Type**

int

Default value

0x1

Width of MECID in bits.

rme_nsh_cacheable_is_shareable**Type**

bool

Default value

0x0

If true, NSH cacheable becomes shareable cacheable (FEAT_RME).

rme_support_level**Type**

int

Default value

0x0

0 -> Realm management extension not implemented, 1 -> LEGACY_TZ_EN mode i.e. RME register fields are stateful but only supports secure/non-secure states, 2 -> Realm management extension fully implemented (FEAT_RME).

rmr_always_implemented**Type**

bool

Default value

0x0

Always implement RMR_ELx, RMR, or HRMR at the highest implemented exception level, even if that exception level cannot use both AArch32 and AArch64.

rndr_rndrrs_seed**Type**

int

Default value

0x0

Initial seed for random engine used in RNDR register.

s1_align_memtype_fault_prio_more_than_s2_perm_fault_on_s1_walk**Type**

bool

Default value

0x1

If true, s1 alignment fault has priority over s2 permission faults.

scheduler_mode**Type**

int

Default value

0x0

Control the interleaving of instructions in this processor. 0, default long quantum. 1, low latency mode, short quantum and signal checking. 2, lock-breaking mode, long quantum with additional context switches near load-exclusive instructions. WARNING: This parameter is intended for validation purposes and may result in unwanted behaviour if altered!.

scr_nET_writeable**Type**

bool

Default value

0x0

Whether SCR.nET is writeable. Writing to it is purely cosmetic (nET behavior not implemented).

scramble_unknowns_at_reset**Type**

bool

Default value

0x1

Will fill in unknown bits in registers at reset with register_reset_data.

seerror_clear_delay**Type**

int

Default value

0x0

Delay for clearing of SError if SError is level-triggered, in cpu cycles.

set_mops_option**Type**

int

Default value

0x0

Set option for Armv8.8 SET(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B.

set_rasv10_for_armv84_and_higher**Type**

bool

Default value

0x0

ARMv8.4 mandates RAS System Architecture v1.1, but when there are no error records and FEAT_DoubleFault is not implemented then there is no functional difference between the RAS System Architecture v1.0 (that is, the RAS extension as in pre-ARMv8.4 implementations) and the RAS System Architecture v1.1 (also known as FEAT_RASv1p1). This flag if true will set the RAS ID to declare RAS v1.0 rather than RAS v1.1 for ARMv8.4 and higher implementations. If this is set and the core does not conform to the restrictions then this parameter is ignored.

setg_mops_option**Type**

int

Default value

0x0

Set option for Armv8.8 SETG(FEAT_MOPS). 0, use default(i.e. use value configured through has_mops_option). 1, implemented using Option A. 2, implemented using Option B.

skip_trace_on_write_to_oseccr_el1_when_oslock_is_unlocked**Type**

bool

Default value

0x0

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an unknown value on reads and ignores writes. When true, also skips the traces on writes to OSECCR_EL1 when OSLSR_EL1.OSLK == 0.

spe_counter_size**Type**

int

Default value

0x1

Size of counter packet payload in Statistical Profiling Extension - 1, Counter packet payloads are 12-bit saturating counters - 2, Counter packet payloads are 16-bit saturating counters.

spmu_support_level**Type**

int

Default value

0x0

Implement System PMU: 0: Not supported, 1: v8.9 System PMU Extension is implemented (FEAT_SPMU), 2: v9.5 System PMU2 Extension is implemented (FEAT_SPMU2) Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.9 is enabled. - 2, feature is implemented.

spsr_el3_is_mapped_to_spsr_mon**Type**

bool

Default value

0x1

Whether SPSR_EL3 is mapped to AArch32 register SPSR_mon.

spsr_m4_res0**Type**

bool

Default value

0x0

Whether SPSR_ELx.M[4] bit should be RES0 for AARCH64 only implementations.

stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

stage1_tlb_size**Type**

int

Default value

0x0

Number of stage1 only tlb entries.

stage1_walkcache_size**Type**

int

Default value

0x0

Number of stage1 only walk cache entries.

stage2_tlb_size**Type**

int

Default value

0x0

Number of stage2 only tlb entries.

stage2_walkcache_size**Type**

int

Default value

0x0

Number of stage2 only walk cache entries.

statistical_profiling_buffer_alignment**Type**

int

Default value

0x1

Statistical profiling alignment constraint for sample buffer.

statistical_profiling_random_interval_is_separate**Type**

bool

Default value

0x0

Statistical profiling random interval gets added to the main timer interval(false) or (true) runs as separate timer.

statistical_profiling_recommended_min_sampling**Type**

int

Default value

0x100

Statistical profiling recommended minimum sampling interval.

stex_fail_suppress_sync_data_aborts**Type**

bool

Default value

0x0

If true, synchronous data aborts are not reported if store exclusive fails.

store_excl_fail_tag_check_action**Type**

int

Default value

0x0

Behavior of tag check by core when a store exclusive fails. 0, Tag check ignored, 1, Tag check done if exclusive fails by global monitor.

strex_fail_can_hit_watchpoint**Type**

bool

Default value

0x0

If true, a strex fail can hit watchpoint.

stzgm_reports_fault_address_from_reg_arg**Type**

int

Default value

0x0

Which faulting address should be reported in FAR_ELx on a failed STZGM: 0: the lowest aligned addr to DCZID-log2-block-size, 1: the addr held in the register argument, 2: if it is a tag-check fault, the addr aligned to DCZID-log2-block-size, otherwise the addr held in the register argument.

supports_multi_threading**Type**

bool

Default value

0x0

Sets the MPIDR.MT bit. Setting this to true hints the the cluster is multi-threading compatible.

sve.clear_constrained_lanes**Type**

int

Default value

0x0

When a constrained vector length increases, previously inaccessible bits are set to zero. Possible values are: 0=never, 1=always, 2=if the register was written to while the vector length was constrained.

sve.combine_movprfx_and_destructive**Type**

bool

Default value

0x0

Attempt to combine the execution of MOVPRFX and the destructively-encoded instruction that follows it.

sve.disable_speculative_accesses

Type

bool

Default value

0x0

All speculative memory accesses behave as though faulting, without accessing memory.

sve.enable_at_reset

Type

bool

Default value

0x0

Start with system registers set up for Scalable Vector Extension use.

sve.ffr_16b_pattern_UNKNOWN

Type

int

Default value

0x0

A specific 16-bit UNKNOWN value that is used by parameter force_UNKNOWN_to_ffr.

sve.force_UNKNOWN_to_ffr

Type

int

Default value

0x0

Governs behavior if WRFFR writes a non-monotonic value to FFR. Possible values are: 0 - Write non-canonical value to FFR, 1 - Overwrite FFR with a specific pattern of 16-bit UNKNOWN value. See ffr_16b_pattern_UNKNOWN, 2 - Clear all bits above first zero 3 - Set all bits after first one.

sve.fp_exception_report_lowest

Type

bool

Default value

0x0

If true, for multiple trapped FP exceptions, report the lowest lane in VECITR. Otherwise, report the highest.

sve.fp_exception_set_tfv**Type**

bool

Default value

0x1

Set ESR_ELx.TFV during FP exception. Trapped exception flags are valid.

sve.fp_exception_set_vecitr**Type**

bool

Default value

0x0

If true, set ESR_ELx.VECITR during FP exception. Otherwise, set RES0.

sve.has_b16b16**Type**

int

Default value

0x0

Whether FEAT_SVE_B16B16 is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if either FEAT_SVE2 or FEAT_SME2 is implemented.

sve.has_bfscale**Type**

int

Default value

0x0

Whether FEAT_SVE_BFSCALE is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if either FEAT_SVE2 or FEAT_SME2 is implemented.

sve.has_sme**Type**

bool

Default value

0x0

Whether SME is implemented (FEAT_SME).

sve.has_sme2**Type**

bool

Default value

0x0

Whether SME2 is implemented (FEAT_SME2).

sve.has_sme_b16b16**Type**

int

Default value

0x0

Whether FEAT_SME_B16B16 is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if FEAT_SME2 is implemented.

sve.has_sme_f16f16**Type**

int

Default value

0x0

Whether FEAT_SME_F16F16 is implemented. Possible values are: 0 - Not implemented, 1 - Implemented if FEAT_SME2 is implemented.

sve.has_sme_f64f64**Type**

int

Default value

0x1

If SME is implemented, whether double-precision FMOPA and FMOPS are implemented.

sve.has_sme_f8f16**Type**

int

Default value

0x1

If SME2 is implemented, whether FEAT_SME_F8F16 is implemented.

sve.has_sme_f8f32**Type**

int

Default value

0x1

If SME2 is implemented, whether FEAT_SME_F8F32 is implemented.

sve.has_sme_fa64**Type**

bool

Default value

0x0

Whether FEAT_SME_FA64 is implemented.

sve.has_sme_i16i64**Type**

int

Default value

0x1

If SME is implemented, whether instructions that accumulate 16-bit integer outer products into 64-bit integer tiles are implemented.

sve.has_sme_lutv2**Type**

bool

Default value

0x0

Whether FEAT_SME_LUTv2 is implemented.

sve.has_sme_priority_control**Type**

bool

Default value

0x1

Whether SME Priority Control is implemented.

sve.has_ssve_aes**Type**

int

Default value

0x0

Indicates support for SVE2 and SME2 AES instructions when the PE is in Streaming SVE mode (FEAT_SSVE_AES).

sve.has_ssve_f8f16mm**Type**

int

Default value

0x0

Implement the FP8 to half-precision matrix multiply instruction when the PE is in Streaming SVE mode (FEAT_SSVE_F8F16MM).

sve.has_ssve_f8f32mm**Type**

int

Default value

0x0

Implement the SVE FP8 to single-precision matrix multiply instruction when the PE is in Streaming SVE mode (FEAT_SSVE_F8F32MM).

sve.has_sve2**Type**

bool

Default value

0x0

Whether SVE2 is implemented (FEAT_SVE2).

sve.has_sve2_aes**Type**

int

Default value

0x2

If SVE2 is implemented, whether AES instructions are implemented. Possible values are: 0 - not implemented, 1 - SVE2 AESE, AESD, AESMC, and AESIMC are implemented (FEAT_SVE_AES),

2 - Same as 1 but in addition SVE2 PMULLB and PMULLT with 64-bit source are implemented,
3 - Same as 2 but SVE2 64-bit source element PMLALB and PMLALT instruction variants are implemented (FEAT_SVE_PMULL128).

sve.has_sve2_bit_perm**Type**

bool

Default value

0x1

If SVE2 is implemented, whether BitPerm instructions are implemented (FEAT_SVE_BitPerm).

sve.has_sve2_sha3**Type**

bool

Default value

0x1

If SVE2 is implemented, whether SHA3 instructions are implemented (FEAT_SVE_SHA3).

sve.has_sve2_sm4**Type**

bool

Default value

0x1

If SVE2 is implemented, whether SM4 instructions are implemented (FEAT_SVE_SM4).

sve.has_sve_bf16**Type**

bool

Default value

0x1

Whether SVE BFloat16 instructions are implemented.

sve.has_sve_extended_bf16**Type**

int

Default value

0x2

Deprecated: to enable FEAT_EBF16, use CPU parameter has_ebf16. Whether Extended BFloat16 instructions are implemented. Possible values are: 0 - Disabled, 1 - Enabled if SME or SVE is implemented, 2 - Enabled if SME is implemented.

sve.has_sve_f16f32mm**Type**

bool

Default value

0x0

Whether the SVE half-precision to single-precision Matrix Multiply instructions are implemented (FEAT_F16F32MM).

sve.has_sve_mm_f32**Type**

bool

Default value

0x1

Whether the SVE FP32 Matrix Multiply instructions are implemented (FEAT_F32MM).

sve.has_sve_mm_f64**Type**

bool

Default value

0x1

Whether the SVE FP64 Matrix Multiply instructions are implemented (FEAT_F64MM).

sve.has_sve_mm_i8**Type**

bool

Default value

0x1

Whether the SVE Int8 Matrix Multiply instructions are implemented (FEAT_I8MM).

sve.movprfx_unpredictable_behavior**Type**

int

Default value

0x0

Defines the behavior of MOVPRFX and the instruction it immediately precedes when the behavior is CONSTRAINED UNPREDICTABLE. Possible values are: 0 - UNDEF execution from MOVPRFX, 1 - MOVPRFX and second half of instruction executes as NOP, 2 - NOP MOVPRFX only, 3 - UNDEF execution from MOVPRFX unless otherwise trapped.

sve.predicated_sp_align_check_behaviour

Type

int

Default value

0x0

Governs behavior of SP alignment checking for predicated memory accesses. Possible values are: 0 - Always perform, 1 - Skip if governing predicate is 0, 2 - Skip for contiguous accesses if governing predicate is 0, 3 - Skip for gather/scatter accesses if governing predicate is 0.

sve.relax_sme_watchpoint_matching_16

Type

bool

Default value

0x0

Whether memory accesses through Z and P registers in Streaming Mode and all accesses through ZA match watchpoints rounded to 16-byte alignment.

sve.relax_sve_watchpoint_matching_16

Type

bool

Default value

0x0

If FEAT_DEBUGv8p9 is implemented, whether memory accesses through Z and P registers outside Streaming Mode match watchpoints rounded to 16-byte alignment.

sve.sm_tag_checked

Type

bool

Default value

0x1

Whether SME, SVE, and SIMD&FP load and store instructions executed when the PE is in Streaming SVE mode perform a Tag Check.

sve.sme2_version**Type**

int

Default value

0x0

The version of SME2 if implemented. Possible values are: 0 - FEAT_SME2, 1 - FEAT_SME2p1, 2 - SME2_2024 (Note: This will change post Alpha).

sve.sme_highest_implemented_priority**Type**

int

Default value

0x0

When SME Priority Control and SME2p2 are implemented, controls the highest implemented priority.

sve.sme_only**Type**

bool

Default value

0x0

If SME is implemented, whether SVE functionality is available only when SM=1.

sve.sme_ssve_fp8_support_level**Type**

int

Default value

0x0

If FEAT_SME2 and FEAT_FP8 are implemented, whether FP8 operations are supported in Streaming Mode where not implemented outside Streaming Mode. Possible values are: 0 - No support above FEAT_FP8, 1 - FEAT_SSVE_FP8FMA, 2 - FEAT_SSVE_FP8DOT4, 3 - FEAT_SSVE_FP8DOT2.

sve.sme_veclens_implemented**Type**

int

Default value

0x7

Which SME vector lengths are implemented. Represented as a bitfield where $\text{bit}[n]=1$ implies SME vector length of $128 \cdot 2^n$ bits is implemented.

sve.smidr_el1_implementer_val**Type**

int

Default value

0x41

The value of SMIDR_EL1.Implementer.

sve.smidr_el1_revision_val**Type**

int

Default value

0x0

The value of SMIDR_EL1.Revision.

sve.sve2_version**Type**

int

Default value

0x0

The version of SVE2 if implemented. Possible values are: 0 - FEAT_SVE2, 1 - FEAT_SVE2p1, 2 - SVE2_2024 (Note: This will change post Alpha).

sve.sve_dabt_far_behaviour**Type**

int

Default value

0x0

Whether the FAR reported on a Data Abort is imprecise. Possible values are: 0 - FAR Precise, 1 - FAR not Precise on abort due to an SVE contiguous vector load/store in Streaming SVE mode, or an SME load/store. , 2 - As per 1, but only for predicated SVE/SME instructions.

sve.sve_wp_far_behaviour**Type**

int

Default value

0x0

FAR reporting behavior on a Watchpoint debug exception. Possible values are: 0 - FAR Precise, 1 - FAR not Precise on abort due to an SVE contiguous vector load/store in Streaming SVE mode, or an SME load/store, 2 - FAR not valid on abort due to an SVE contiguous vector load/store in Streaming SVE mode, or an SME load/store, 3 - As per 1, but only for predicated SVE/SME instructions.

sve.trace_za_tilewise

Type

bool

Default value

0x1

Whether tile-wise accesses to ZA are traced tile-wise rather than array-wise. Note: if false, column-wise accesses cause an event for every vector in the tile.

sve.undef_invalid_combined_movprfx

Type

bool

Default value

0x1

If a combined MOVPRFX is invalid, raise an UNDEF exception. Otherwise, NOP the second half. This parameter is deprecated.

sve.unknown_value

Type

int

Default value

0xdeaddeaddeaddead

Simulated value for a state that has an UNKNOWN value after reset.

sve.vecLEN

Type

int

Default value

0x8

SVE vector length in units of 64 bits.

sve.z_reg_on_load_fault_behaviour

Type

int

Default value

0x0

Governs the behavior of destination Z-registers in case of a load fault. Possible values are: 0 - Register becomes UNKNOWN, 1 - Register is preserved.

sve.za_on_svl_increase_behaviour**Type**

int

Default value

0x0

Controls the state of the previously inaccessible portion of the ZA registers on SVL increase. Possible values are: 0 - Retain values, 1 - Zero ZA.

sve.za_tag_checked**Type**

bool

Default value

0x1

Whether memory accesses due to SME LDR and STR instructions that access the SME ZA array perform a Tag Check.

swp_with_xzr_is_st_atomic**Type**

bool

Default value

0x1

If true, swp with dest as xzr is treated as store atomic.

sync_ext_abort_is_sync_serror**Type**

bool

Default value

0x0

Treat synchronous external aborts as synchronous SErrors (RASv8.9). 0, synchronous external abort. 1, synchronous serror.

system_pmu_id**Type**

int

Default value

0x0

When FEAT_SPMU is implemented, indicates the largest value *s* to select a System PMU <*s*>.

take_ccfail_tsc_trap**Type**

bool

Default value

0x0

When take_ccfail_undef=1 this parameter controls whether or not an SMC instruction that is trapped by HCR_EL2.TSC but fails its condition code check generates a trap to EL2.

take_ccfail_undef**Type**

bool

Default value

0x1

UNDEF exception is taken even if condition code check fails.

tcr_ps_reserved_value_size**Type**

int

Default value

0x0

Physical size treated when TCR.(I)PS is programmed with a reserved value. 0, 48 bits. 1, 52 bits. The parameter value is treated 0 if LPA is not supported.

tcr_txsz_undersize_should_fault**Type**

bool

Default value

0x1

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

tdosa_traps_osdlr_if_no_os_double_lock**Type**

bool

Default value

0x1

MDCR_EL*.TDOSA enables trap on OSDLR_EL1 and DBGOSDLR when OS double-lock is not implemented.

tidcp_traps_el0_undef_imp_def**Type**

bool

Default value

0x1

TIDCP has priority over UNDEF for accesses to IMPLEMENTATION DEFINED functionality from EL0.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_or_ic_invalid_xt**Type**

int

Default value

0x0

Behavior of TLBI and IC instructions that don't take Xt as an argument when Xt != 0b11111. 0: TLB and IC not UNDEF, 1: TLBI UNDEF, IC not UNDEF, 2: TLBI not UNDEF, IC UNDEF, 3: TLBI and IC UNDEF.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

tme_disable-read-write-set-optimizations

Type

bool

Default value

0x0

If true, disables the read/write set related optimizations of the model.

tme_imp-failures-can-retry

Type

bool

Default value

0x0

If true, IMP=1 failures introduced by the parameters: tme_wfe-fails-transactions tme_tcommit-fails-transactions tme_wakeup-from-wfe-always-fails-transactions will also report RTRY=1.

tme_implementation-type

Type

int

Default value

0x0

Implementation type for TME. The following options are available: 0x0: Always fail starting transactions with the IMP cause. 0x1: Fail on forbidden operations (e.g. some system register accesses) and at model's convenience. 0x2: As 0x1 but also enable inter PE memory conflict checking. .

tme_random-memory-access-fail-chance

Type

int

Default value

0x0

If >0, add a pseudorandom chance for every memory access (loads, stores, TCOMMIT) inside a transaction to cause the transaction to fail with IMP.

tme_read-set-size

Type

int

Default value

0x0

Size of the transactional read set in bytes, rounded up to the nearest integer number of transaction granules. 0 == unlimited.

tme_support-only-guaranteed-mem-attr**Type**

bool

Default value

0x0

If true, a transactional access to memory with a type not architecturally guaranteed to be supported will cause a transaction failure with IMP=1.

tme_tcommit-fails-transactions**Type**

bool

Default value

0x0

If true, executing TCOMMIT inside a transaction will cause it to fail with IMP=1.

tme_wakeup-from-wfe-always-fails-transactions**Type**

bool

Default value

0x0

If true, waking up from a WFE will always fail the transaction, even if not required.

tme_wfe-fails-transactions**Type**

bool

Default value

0x0

If true, executing WFE inside a transaction will cause it to fail with IMP=1.

tme_write-set-size**Type**

int

Default value

0x0

Size of the transactional write set in bytes, rounded up to the nearest integer number of transaction granules. 0 == unlimited.

trace_full_simd_reg_with_nep**Type**

bool

Default value

0x0

Whether full simd register is traced even if partial update is done when FPCR.NEP=1.

trace_has_sysreg_access**Type**

bool

Default value

0x1

ETM trace registers support access via system registers.

trace_icc_registers_as_icv_when_redirected**Type**

bool

Default value

0x0

If true, update trace with ICV, instead of ICC when ICV registers are accessed depending on the core state.

trace_physical_registers_when_host_virtualisation_enabled**Type**

int

Default value

0x0

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers).

trap_dc_cmo_to_pou_if_nop**Type**

bool

Default value

0x1

Whether traps to DC CMO operations to PoU are ignored if the same is treated as NOP.

trap_ic_cmo_to_pou_if_nop**Type**

bool

Default value

0x1

Whether traps to IC CMO operations to PoU are ignored if the same is treated as NOP.

trap_reserved_group3_id_regs**Type**

bool

Default value

0x0

Whether setting HCR_EL2.TID3 traps reserved group3 id registers.

trbe_cmod**Type**

int

Default value

0x0

TRBE Customer Modified.

trbe_des**Type**

int

Default value

0x0

Designer, JEP106 identification code.

trbe_external_abort_handling**Type**

int

Default value

0x0

Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer. (0->External abort is reported to TRBE. From Armv9.3, the value 0 is not permitted and will be 1 if Armv9.3 is implemented. 1-> External abort is ignored. 2->The External abort generates an SError and the error is not reported to TRBE.).

trbe_has hardware_translation_table_update**Type**

bool

Default value

0x1

If true, address translation performed by the Trace Buffer Extension manages the Access Flag and dirty state.

trbe_implemented_version**Type**

int

Default value

0x1

Trace Buffer Extension implemented version, 1: FEAT_TRBE implemented (Armv9.0), 2: FEAT_TRBEv1p1 and FEAT_TRBE_EXC are implemented.

trbe_mpam**Type**

int

Default value

0x0

TRBE MPAM support.

trbe_part**Type**

int

Default value

0x0

Part number.

trbe_partid_max**Type**

int

Default value

0x0

Largest permitted TRBDEVID1.PARTID value.

trbe_pmg_max**Type**

int

Default value

0x0

Largest permitted TRBDEVID1.PMG value.

trbe_revand**Type**

int

Default value

0x0

TRBE component minor revision.

trbe_revision**Type**

int

Default value

0x0

TRBE architecture revision.

treat-dcache-cmos-to-occ-as-nop**Type**

bool

Default value

0x0

Implement CMOs to Outer cache level as NOP.

treat-dcache-cmos-to-poc-as-nop**Type**

int

Default value

0x0

Whether dcache maintenance operations to the point of coherency are required for instruction to data coherence. 0 - Clean/Invalidate ops required, 1 - Clean/Invalidate ops not required and cannot generate faults, 2 - Clean/Invalidate ops not required but can generate faults.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

treat-dcache-invalidate-as-clean-invalidate**Type**

bool

Default value

0x0

Treat data cache invalidate operations as clean and invalidate.

treat-icache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

If has_coherent_icache is true, whether instruction cache invalidation operations to PoU which are treated as NOP can generate fault. 0 - cannot generate faults, 1 - can generate faults.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

`treat_forced_normal_as_device_for_excl_atomics`

Type

bool

Default value

0x0

Whether exclusive/atomic access is supported in same manner as access to device if stage1 is Device memory and final memory attribute forced to normal by FWB.

`treat_pld_as_nop`

Type

bool

Default value

0x0

If true, treat PLD as NOP.

`treat_pli_as_nop`

Type

bool

Default value

0x0

If true, treat PLI as NOP.

`treat_wfi_wfe_as_nop`

Type

bool

Default value

0x0

If true, never go into wait state for WFI or WFE instructions.

`truncate_pc_on_illegal_exception_return_to_aarch32`

Type

bool

Default value

0x1

On Illegal ERET to AArch32, truncate PC to 32-bits.

undef_ccsidr2_access_for_unimplemented_aarch32

Type

bool

Default value

0x0

Whether access to CCSIDR2 is undef if AArch32 is implemented or not at EL1.

unification-level

Type

int

Default value

0x1

Level of Unification Inner Shareable for the cache hierarchy.

unification-uniprocessor-level

Type

int

Default value

0x1

Level of Unification Uniprocessor for the cache hierarchy.

unpred_LSE128_overlap

Type

int

Default value

0x1

Constrained unpredictable behaviours for 128-bit LSE overlap. 1 Constraint_UNDEF, 2 Constraint_NOP.

unpred_brb_iall_or_inj_invalid_xt_behave_as_undef

Type

bool

Default value

0x0

If true, BRB IALL/INJ instruction will behave as UNDEFINED if Xt != 0b11111.

unpred_clear_ISV_for_exception_before_software_step**Type**

bool

Default value

0x0

Whether ESR_ELx.ISV bit is cleared/set, when it is constrained unpredictable due to a different exception before a software step exception.

unpred_edscr_ns_set_unknown_bit**Type**

bool

Default value

0x0

Unknown(x) bit in NS field in EDSCR can be configure to 0 or 1.

unpred_edscr_rw_unknown_bits_read_as_1**Type**

bool

Default value

0x0

Unknown(x) bits in RW field in EDSCR are read as 1 instead of 0.

unpred_edscr_status_read_as_no_syndrome**Type**

bool

Default value

0x0

Controls the choice of EDSCR.STATUS bit-values, when it is constrained unpredictable behaviour due to a different exception before a halting step debug event.

unpred_extdbg_unknown_bits**Type**

int

Default value

0x0

Data used to fill only in UNKNOWN bit-fields of external debug registers e.g., EDPFR and EDDFR.

unpred_load_single_reg_overlap_with_wb**Type**

int

Default value

0x0

Constrained unpredictable behaviours for single load with writeback(might impact certain load pair instructions) 0 Constraint_WBSUPPRESS, 1 Constraint_UNDEF, 2 Constraint_NOP.

unpred_mrsmsr_currentlymapped_undef**Type**

bool

Default value

0x0

UNPREDICTABLE register access (accessible from current mode using different instruction) modeled as NOP when false and UNDEF when true.

unpred_mrsmsr_protfailed_undef**Type**

bool

Default value

0x0

UNPREDICTABLE register access (not accessible from current PL and security state) modeled as NOP when false and UNDEF when true.

unpred_mte_stzgm_tag_operation_before_data**Type**

bool

Default value

0x1

Whether Tag operations are performed before data operations for an STGZM instruction.

unpred_mte_tag_read_when_ata_controls_are_zero_or_untagged_attr**Type**

bool

Default value

0x0

Constrained unpredictable for MTE tag read when ATA controls are 0 or untagged attribute. false, Read as zero. true, Permitted to generate an external abort if a read of data from the same address would generate an external abort.

unpred_mte_tag_store_data_cache_instr_to_device_mem_as_alignment_fault

Type

bool

Default value

0x0

Constrained unpredictable choice for MTE instructions which store tags (on DC instructions) to memory locations marked as Device. false, Storing the data, if any, to the locations. true, Generating an Alignment Fault.

unpred_mte_tag_store_to_device_mem_as_alignment_fault

Type

bool

Default value

0x0

Constrained unpredictable choice for STZGM instruction which store tags to memory locations marked as Device. false, Storing the data, if any, to the locations. true, Generating an Alignment Fault.

unpred_nested_virtualization_nv_behaviour

Type

int

Default value

0x0

Constrained unpredictable choices for HCR_EL2.NV=0 and HCR_EL2.NV1=1 with respect to nested virtualization - 0, Behave as defined in the specification as per bit values - 1, Behave as if HCR_EL2.NV=1 and HCR_EL2.NV1=1 for all purpose other than reading back HCR_EL2.NV - 2, Behave as if HCR_EL2.NV=0 and HCR_EL2.NV1=0 for all purpose other than reading back HCR_EL2.NV1 .

unpred_par_attr_returns_mair

Type

bool

Default value

0x0

If true, PAR_EL1.ATTR represents the memory attributes as per the MAIR value instead of the ones in the descriptor.

unpred_sctlr_c_0_taggable_behaviour**Type**

int

Default value

0x2

Controls unpredictable effects when SCTLTR_ELx.C=0 for a stage 1 translation regime on whether memory is treated as taggable. Values: 0=Tagged, 1=Untagged but forced to Tagged when FWB=1 and stage 2 restores WB, 2 = Untagged.

unpred_store_exclusive_base_overlap**Type**

int

Default value

0x0

Constrained unpredictable behaviours for store exclusive when s==n. 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP.

unpred_store_pair_and_single_reg_overlap_with_wb**Type**

int

Default value

0x0

Constrained unpredictable behaviours for pair and single store with writeback(doesn't cover store exclusive) 0 Constraint_NONE, 1 Constraint_UNDEF, 2 Constraint_NOP.

unpred_tlbi_not_in_monitor_mode**Type**

int

Default value

0x0

Constrained unpredictable behaviors for AArch32 TLBI instructions executed in secure privileged mode other than Monitor mode. 0: Preferred behavior (default), 1: UNDEF, 2: NOP, 3: execute as if had been executed in Monitor mode.

unpred_tsize_aborts**Type**

bool

Default value

0x0

Behaviour when TSize is out of range. 0, force into range. 1, translation fault, forces unpred_tsize_pamax_aborts to 1.

unpred_tsize_pamax_aborts

Type

bool

Default value

0x0

Behaviour when stage 2 TSize exceeds the physical address size (or 40bits, from AArch32). 0, force into range. 1, translation fault. Ignored if unpred_tsize_aborts is 1.

unpred_vnchr_el2_ress_mismatch

Type

int

Default value

0x0

Constrained unpredictable choices when bits marked as RESS do not all have the same value for VNCR_EL2 - 0, Generating an EL2 translation regime translation abort on use of the VNCR_EL2 register - 1, Reserved sign extended bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes other than reading back the register - 2, Reserved sign extended bits of VNCR_EL2 are same as bit[52] or bit[48] based on if large VA is supported or not, for all purposes .

unpred_zero_spsr_btype

Type

bool

Default value

0x1

Constrained unpredictable control to make SPSR_ELx.BTYPE 0 instead of PSTATE.BTYPE on synchronous exceptions other than Software Step, PC alignment fault, Instruction Abort, Breakpoint or Address Matching Vector Catch, Illegal Execution State, BRK instruction, Branch Target.

unpredictable_exclusive_abort_memtype

Type

int

Default value

0x0

Cause MMU abort if exclusive access is not supported in certain memory type (0=exclusives allowed in all memory types, 1=exclusives abort in Device memory types, 2=exclusives abort in any type other than WB inner cacheable).

unpredictable_hvc_behaviour

Type

int

Default value

0x0

HVC unpredictable behaviour. 0, UNDEF. 1, NOP.

unpredictable_smc_behaviour

Type

int

Default value

0x0

SMC unpredictable behaviour. 0, UNDEF. 1, NOP.

unpredictable_wfet_and_wfit_behaviour

Type

int

Default value

0x1

WFET and WFIT unpredictable behaviour in debug state. 0, UNDEFINED. 1, NOP.

unsupported_atomic_fault_type

Type

int

Default value

0x0

Type of fault reported on unsupported atomic access. 0 = external abort if any reported by interconnect, 1 = precise unsupported atomic fault, 2 = precise external abort, 3 = imprecise external abort.

unsupported_hw_update_fault_type

Type

int

Default value

0x0

Type of abort reported when hw update to descriptor is done using unsupported memtype (0=No abort, 1=IMPDEF abort caused by memtype, 2=Sync external abort).

use_Xt_as_LDG_STG_input**Type**

bool

Default value

0x1

Use new MTE Instructions formats for LDG/ST(Z)(2)G, which use Xt as an input.

use_architectural_names**Type**

bool

Default value

0x0

Use names SP/LR/PC instead of R13/R14/R15.

use_mte_eac_02_instructions_encoding**Type**

bool

Default value

0x1

Use new MTE Instructions encoding since MTE spec EAC 0.2 in ARMv8.5.

use_mte_eac_08_tfsr_encoding**Type**

bool

Default value

0x1

Use new MTE TFSR_ELx encodings since MTE spec EAC 0.8 in ARMv8.5.

use_rosetta_disass**Type**

int

Default value

0x1

Use Rosetta disassembly library. Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.4 is enabled. - 2, feature is implemented.

use_sif_to_compute_pan**Type**

bool

Default value

0x0

Where FEAT_PAN3 is implemented, whether SCR_EL3.SIF bit is used to determine instruction access permission for the purpose of PAN.

use_stage1_sh_as_input_to_stage2**Type**

bool

Default value

0x0

IMPDEF case of whether to use stage1 shareability or OuterShareable as input to stage2 if stage1 is Device memtype.

use_tlb_contig_hint**Type**

bool

Default value

0x0

Translation table entries with the contiguous hint bit set generate large TLB entries.

user_defined_rom_table_debug_power_config**Type**

string

Default value

""

User defined ROM Table debug power domains for ED,CTI,PMU and TRACE, and DBGPCR configuration. The "version" field and "cores" array are mandatory. The "dbgpcr" array, if provided, must contain unique integers in the range [0, 32) describing which debug power domains have power control implemented. The "rom" and "dbgpcr" fields in objects in the "cores" array are only allowed when 'debug_rom_is_flat' is false. All power domain ID fields ("rom", "ed/pmu", "cti", "etm") must be in the range [0, 32). The "ed/pmu" field is mandatory. Example JSON for a hierarchical debug ROM layout: '{"version": 0, "dbgpcr": [0, 1], "cores":[{"dbgpcr": [1, 31], "rom": 0, "ed/pmu": 0, "cti": 31, "etm": 1}, {"ed/pmu": 0}]}'.

vpu_datapath_width**Type**

int

Default value

0x80

VPU data path width.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

warn_unpredictable_in_v7**Type**

bool

Default value

0x1

If true, behaviour which is unpredictable in V7 yet is predictable in V8 will produce a warning.

watchpoint-log2secondary_restriction**Type**

int

Default value

0x0

log2 size of secondary restriction of FAR/EDWAR possible values on watchpoint hit for load/store operations.

wfe_wakeup_delay**Type**

int

Default value

0x0

Configure WFE wakeup delay in CPU cycles.

wfi_wakeup_delay**Type**

int

Default value

0x0

Configure WFI wakeup delay in CPU cycles.

wnr_is_read_for_s2f_on_s1_atomic_instr_fault**Type**

bool

Default value

0x0

Whether WnR is 0 for stage2 fault on stage1 for atomic instructions.

wnr_is_read_for_s2f_on_s1_dbm_update**Type**

bool

Default value

0x0

Whether WnR is 0 for stage2 fault on stage1 descriptor dbm update.

wp_ignores_dbm_update**Type**

bool

Default value

0x0

If true, dbm update is ignored on watchpoint hit.

wp_num_reporting**Type**

int

Default value

0x0

When reporting of the watchpoint number on Watchpoint Exceptions and Debug Events is performed 0 - When FEAT_Debugv8p9 is implemented or otherwise required 1 - When FEAT_Debugv8p9 or FEAT_SME is implemented.

3.5.3 ARMAEMv8MCT

ARMAEMv8MCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-196: IP revisions support

Revision	Quality level
v8.0M	Full support
v8.1M	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMAEMv8MCT

This model has the following Iris instances:

Table 3-197: ARMAEMv8MCT Iris instances

InstanceName	ComponentName
ARMAEMv8MCT	ARM_AEMv8M
ARMAEMv8MCT.acp_mapper	PVBusMapper
ARMAEMv8MCT.ext_bus	PVBusLogger
ARMAEMv8MCT.ext_bus.mapper	PVBusMapper
ARMAEMv8MCT.l1_incoherent_interconnect	PVCache
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[2]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMAEMv8MCT.l1dcache	PVCache

InstanceName	ComponentName
ARMAEMv8MCT.l1dcache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l1icache	PVCache
ARMAEMv8MCT.l1icache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-198: ARMAEMv8MCT MTI instances

InstanceName	ComponentName
ARMAEMv8MCT	ARM_AEMv8M
ARMAEMv8MCT.acp_mapper	PVBusMapper
ARMAEMv8MCT.ext_bus	PVBusLogger
ARMAEMv8MCT.ext_bus.mapper	PVBusMapper
ARMAEMv8MCT.l1_incoherent_interconnect	PVCache
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[17]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[1]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[2]	PVBusSlave

ARMAEMv8MCT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMAEMv8MCT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMAEMv8MCT.l1dcache	PVCache
ARMAEMv8MCT.l1dcache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l1icache	PVCache
ARMAEMv8MCT.l1icache.upstream[0]	PVBusSlave
ARMAEMv8MCT.l2_flusher	AsyncCacheFlushUnit

ARMAEMv8MCT contains the following CADI targets:

- ARM_AEMv8M

Ports for ARMAEMv8MCT

Table 3-199: Ports

Name	Protocol	Type	Description
ahbd	PVBus	Slave	Debug AHB - core bus slave driven by the DAP.
ahbp_m	PVBus	Master	The core will generate Vendor System data accesses on this port.
ahbs	PVBus	Slave	External master (e.g. DMA) can write TCMs (whether or not enabled in xTCMCR).
auxfault	Value	Slave	This is wired to the Auxiliary Fault Status Register.
bigend	Signal	Slave	Configure big endian data format.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
coproc_bus	CoprocBusProtocol	Slave	Co-Processor Interface
cpuwait	Signal	Slave	When this signal is HIGH out of reset, it forces the processor into a quiescent state that delays its boot-up sequence and instruction execution until this signal is driven LOW.
currpri	Value	Master	Current execution priority.
dap_s	PVBus	Slave	Debug Access Port (DAP).
dbgen	Signal	Slave	Invasive debug enable.
dbgrestart	Signal	Slave	External debug request.
dbgrestarted	Signal	Master	External debug request.
edbgrq	Signal	Slave	External debug request.
etm_reset	Signal	Slave	Separate reset for ETM, if param "has_etm_reset" is true.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE and corresponds to the RTL TXEV and RXEV signals.
fpxxc	Value	Master	Port that sends the value of the FPxxC exception flags (FPIXC, FPIDC, FPOFC, FPUFC, FPDZC, FPIOC). Each flag is present in the same position as in the FPSCR register (e.g. fpxxc[0] = FPIOC).
halted	Signal	Master	External debug request.
idau	PVBus	Master	The core will generate IDAU Bus request.
idau_invalidate_region	Value_64	Slave	64 bit number to invalid IDAU memory range (start_address<<32 end_address)
initpahben	Signal	Slave	Enable P-AHB on the next reset
initvtor_ns	Value	Slave	Reset configuration port - Non-Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset This port remains functional no matter ARMv8-M Security Extensions are included or not When ARMv8-M Security Extensions are not included, all exceptions will use NS vector base address given by this port.
initvtor_s	Value	Slave	Reset configuration port - Secure Vector table offset (VTOR.TBLOFF[31:7]) out of reset It becomes functional when ARMv8-M Security Extensions are included When ARMv8-M Security Extensions are not included, this port will be ignored.
intisr[496]	Signal	Slave	This signal array delivers signals to the NVIC.
intnmi	Signal	Slave	Configure non maskable interrupt.

Name	Protocol	Type	Description
intnum	Value	Master	Exception number of the current execution context (from IPSR[8:0]) When the processor is in Thread mode, INTNUM is 0 When the processor is in Handler mode, INTNUM is the exception number of the currently-executing exception.
io_port_in	PVBus	Slave	I/O port pair. See the documentation for the io_port_out port.
io_port_out	PVBus	Master	I/O port pair. Used if IOP is true. Transactions from io_port_out which do not "match" should be returned via io_port_in. For performance reasons, the I/O port interface is not modelled directly. Instead, a simple PVBus gasket is inserted at the point in the memory system where the I/O port would be. In hardware, a device would be attached to the port which would tell the CPU whether it would like to intercept each transaction, given its address. This can be modelled in a performant manner by connecting a PVBusMapper-based device to io_port_out which intercepts transactions of interest and passes other transactions back to the CPU via io_port_in. Your I/O port device model is also responsible for aborting transactions which would be aborted on hardware (e.g. exclusives) if necessary.
lockdcaic	Signal	Slave	-
locknsmpu	Signal	Slave	Disable writes to the Non-Secure MPU_*_NS registers
locknsvtor	Signal	Slave	Disable writes to VTOR_NS
lockpahb	Signal	Slave	P-AHB related ports Disable writes to PAHBCR
locksau	Signal	Slave	Disable writes to the SAU_* registers
locksmpu	Signal	Slave	Disable writes to the Secure MPU_* registers
locksvtaircr	Signal	Slave	Disable writes to VTOR_S, AIRCR.PRIS, AIRCR.BFHFNMINS
lockup	Signal	Master	Asserted when the processor is in lockup state.
niden	Signal	Slave	Non-invasive debug enable.
poreset	Signal	Slave	Raising this signal will do a power-on reset of the core.
pv_ppbus_m	PVBus	Master	The core will generate External Private Peripheral Bus requests on this port.
pvbus_m	PVBus	Master	The core will generate bus requests on this port.
sleepdeep	Signal	Master	Asserted when the processor is in deep sleep.
sleeping	Signal	Master	Asserted when the processor is in sleep.
spiden	Signal	Slave	Secure invasive debug enable.
spniden	Signal	Slave	Secure non-invasive debug enable.
stcalib[2]	Value	Slave	This is the calibration value for the SysTick timer.
stclk	ClockSignal	Slave	This is the reference clock for the SysTick timer.
sysreset	Signal	Slave	Raising this signal will put the core into reset mode (but does not reset the debug logic).
sysresetreq	Signal	Master	Asserted to indicate that a reset is required.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.

Parameters for ARMAEMv8MCT

AFSR_type

Type

int

Default value

0x1

0:No AFSR, 1:state-only 2:Many bits set from (im)precise aborts on AXI, TCM, etc.

AIRCR.BFHFNMINReset**Type**

bool

Default value

0x0

If true, set the bit after reset (as if by IMP_DEF mechanism). Ignored if SECEXT=false.

AIRCR.BFHFNMINWritable**Type**

bool

Default value

0x1

Is AIRCR.BFHFNMIN bit[13] writeable.

AIRCR.ENDIANNESS**Type**

bool

Default value

0x0

Initialize processor to big endian mode.

AIRCR.PRISWritable**Type**

bool

Default value

0x1

Is AIRCR.PRIS bit[14] writeable.

AIRCR.VECTCLRACTIVEChangesMode**Type**

bool

Default value

0x1

Asserting AIRCR.VECTCLRACTIVE clears IPSR and any active exceptions. The mode is also changed to thread if this flag is true. Ignored for v8-M.

AIRCR_NS.DIT_reset**Type**

bool

Default value

0x1

If true and AIRCR_NS.DIT_writable==0, set the bit after reset (as if by IMP_DEF mechanism).

AIRCR_NS.DIT_writable**Type**

bool

Default value

0x1

Is AIRCR_NS.DIT bit[4] writeable.

AIRCR_S.DIT_reset**Type**

bool

Default value

0x1

If true and AIRCR_S.DIT_writable==0, set the bit after reset (as if by IMP_DEF mechanism).

AIRCR_S.DIT_writable**Type**

bool

Default value

0x1

Is AIRCR_S.DIT bit[4] writeable.

BB_PRESENT**Type**

bool

Default value

0x0

Enable bitbanding.

BEATS_PER_TICK**Type**

int

Default value

0x2

Number of beats from each in-flight vector instruction executed in 1 tick (1,2 or 4).

BF_is_nop**Type**

bool

Default value

0x1

BF instruction executes as NOP, even if we have LO_BRANCH_INFO.

CCR.BP**Type**

bool

Default value

0x1

Reset value of the Configuration and Control Register's branch prediction enable bit.

CCR.BP_writable**Type**

bool

Default value

0x0

Whether it is possible to modify the Configuration and Control Register's branch prediction enable bit.

CDEMAPPEDONCP**Type**

int

Default value

0xff

Bit N specifies whether the instruction for coprocessor N (CP7:CP0) is redirected to the CDE module.

CDERTLID**Type**

int

Default value

0x20

Value of ID_AFR0.CDERTLID.

CFGMEMALIAS**Type**

int

Default value

0x0

Memory address alias bit for the ITCM, DTCM and P-AHB regions. 0=No alias, 1=Alias bit 24, 2=Alias bit 25, 4=Alias bit 26, 8=Alias bit 27, 16=Alias bit 28.

CFGNOCDECP**Type**

int

Default value

0x0

Bit N means external coprocessor N (CP7:CP0) disable for CDE coprocessor.

CFGPAHBSZ**Type**

int

Default value

0x0

Size of the P-AHB peripheral port memory region. 0=P-AHB disabled, 1=64MB, 2=128MB, 3=256MB, 4=512MB.

CPNSPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Non-Secure state.

CPSPRESENT**Type**

int

Default value

0xff

Bit N means external coprocessor N (CP7:CP0) is accessible in Secure state.

CPUID**Type**

int

Default value

0x0

Set SCS CPUID Base Register. If set to zero, a default CPUID is used.

CTI**Type**

bool

Default value

0x0

CTI (Cross Trigger Interface) included.

CTI_irq0_pin**Type**

int

Default value

0x4

CTI interrupt request 0 pin.

CTI_irq1_pin**Type**

int

Default value

0x5

CTI interrupt request 1 pin.

DTGU**Type**

bool

Default value

0x0

DTCM Security Gate Unit included.

DTGUBLKSZ**Type**

int

Default value

0x3

DTCM gate unit block size. Size=pow(2, DTGUBLKSZ + 5) bytes.

DTGUMAXBLKS**Type**

int

Default value

0x0

Maximum number of DTCM gate unit blocks. Number of blocks=pow(2, DTGUMAXBLKS).

DWT_CTRL.NOCYCCNT**Type**

bool

Default value

0x0

DWT cycle-counter not present (v8M_bl/v6M never have one).

DWT_CTRL.NOPRFCNT**Type**

bool

Default value

0x0

DWT performance-counters not present (v8M_bl/v6M never have them).

DWT_CTRL.NUMCOMP**Type**

int

Default value

0x4

Number of watchpoint unit comparators implemented.

DWT_DEVARCH.REVISION**Type**

int

Default value

0x1

0: V2, 1: V2.1.

DWT_FUNCTION0.ID**Type**

int

Default value

0xb

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION0. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION1.ID**Type**

int

Default value

0x1e

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION1. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION10.ID**Type**

int

Default value

0xb

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION10. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION11.ID**Type**

int

Default value

0x1e

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION11. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION12.ID**Type**

int

Default value

0xb

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION12. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION13.ID**Type**

int

Default value

0x1e

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION13. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION14.ID**Type**

int

Default value

0xb

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION14. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION15.ID**Type**

int

Default value

0x1e

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION15. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION2.ID**Type**

int

Default value

0xb

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION2. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION3.ID**Type**

int

Default value

0x1e

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION3. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION4.ID**Type**

int

Default value

0xb

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION4. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION5.ID**Type**

int

Default value

0x1e

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION5. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION6.ID**Type**

int

Default value

0xb

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION6. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION7.ID**Type**

int

Default value

0x1e

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION7. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION8.ID**Type**

int

Default value

0xb

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION8. If 'baseline' is set, invalid ID bits are cleared.

DWT_FUNCTION9.ID**Type**

int

Default value

0x1e

Sets the capabilities of the comparator that is accessible via the register, DWT_FUNCTION9. If 'baseline' is set, invalid ID bits are cleared.

DWT_TRACE**Type**

bool

Default value

0x1

Support for DWT trace, controls the DWT_CTRL.NOTRCPKT bit. false : No DWT trace included, true: DWT trace included.

DWT_VMASK_reset_data**Type**

int

Default value

0x0

DWT_VMASK register reset value.

ERRDEVID.NUM**Type**

int

Default value

0x38

RAS: Number of implemented error record indexes, 0 to 56.

FPB_HAS_LSR**Type**

bool

Default value

0x1

FPB has LAR and LSR for software lock if mainline.

FP_CTRL.NUM_CODE**Type**

int

Default value

0x8

Number of breakpoint unit comparators implemented (limited to 15 in V6M or baseline).

FP_CTRL.NUM_LIT**Type**

int

Default value

0x0

How many Literals FPB supports remapping (ignored if baseline or TZM).

FP_REMAP.RMPSPT**Type**

bool

Default value

0x1

FPB supports remapping (ignored if baseline or SECEXT).

ID_DFR0.Debug_Model_M_profile**Type**

bool

Default value

0x1

Set whether debug extensions are implemented.

ID_ISAR0.CmpBranch**Type**

int

Default value

0x3

Support for Compare and Branch instructions. 1 = Supports CBNZ and CBZ instructions; 3 = Supports non-predicated low overhead looping (WLS, DLS, LE, and LC) and branch future (BF, BFX, BFL, BFLX, and BFCSEL) instructions.

ID_ISAR0.coproc_instrs**Type**

int

Default value

0x4

Supported Coprocessor instructions 0: None 1: CDP, LDC, MCR, MRC, and STC instructions 2: As for 1, and CDP2, LDC2, MCR2, MRC2, and STC2 instructions 3: As for 2, and MCRR and MRRC instructions 4: As for 2, and MCRR and MRRC instructions.

ID_ISAR1.extend_instrs**Type**

int

Default value

0x2

level of support for extend instructions.

ID_ISAR1.interwork_instrs**Type**

int

Default value

0x2

level of support for Interworking instructions.

ID_ISAR2.MultiAccessInt**Type**

int

Default value

0x2

level of support for interruptible multi-access instructions.

ID_ISAR2.multS_instrs**Type**

int

Default value

0x3

level of support for advanced signed Multiply instructions.

ID_ISAR2.multU_instrs**Type**

int

Default value

0x2

level of support for advanced unsigned Multiply instructions.

ID_ISAR3.SIMD_instrs**Type**

int

Default value

0x3

level of support for SIMD instructions.

ID_ISAR3.saturate_instrs**Type**

int

Default value

0x1

level of support for saturate instructions.

ID_ISAR3.synchprim_instrs**Type**

int

Default value

0x1

level of support for synchronization primitives ID_ISAR3.

ID_ISAR4.synchPrim_instrs_frac**Type**

int

Default value

0x3

level of support for synchronization primitives ID_ISAR4.

ID_ISAR4.unpriv_instrs**Type**

int

Default value

0x2

supported unprivileged instructions 0: None 1: LDRBT, LDRT, STRBT, and STRT instructions 2: As for 1, and LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

ID_ISAR4.withshifts_instrs**Type**

int

Default value

0x3

level of support for instructions with shifts.

ID_ISAR5.PACBTI**Type**

int

Default value

0x0

0: PAC/BTI not implemented, 1: PAC implemented using the QARMA5 algorithm with BTI, 2: PAC implemented using an IMP DEF algorithm with BTI, 4: PAC implemented using the QARMA3 algorithm with BTI.

ID_MMFR0.Auxiliary_registers**Type**

bool

Default value

0x1

Auxiliary registers bits in ID_MMFR0, indicate the support for Auxiliary registers.

ID_MMFR0.Outermost_shareability**Type**

int

Default value

0x0

Outermost shareability bits in ID_MMFR0, indicate the outermost shareability domain implemented.

ID_MMFR0.ShareLvl**Type**

int

Default value

0x1

Shareability levels bits in ID_MMFR0, indicate the number of Shareability levels implemented.

INITPAHBEN**Type**

bool

Default value

0x0

The P-AHB enable state at reset.

INITVTOR_NS**Type**

int

Default value

0x0

Non-Secure vector-table offset at reset.

INITVTOR_S**Type**

int

Default value

0x0

Secure vector-table offset at reset.

IOP**Type**

bool

Default value

0x0

Send all d-side transactions to the port, io_port_out. Transactions which do not match should be returned to the port, io_port_in.

IRQDIS0**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+0].

IRQDIS1**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+32].

IRQDIS10**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+320].

IRQDIS11**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+352].

IRQDIS12**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+384].

IRQDIS13**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+416].

IRQDIS14**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+448].

IRQDIS15**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+480].

IRQDIS2**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+64].

IRQDIS3**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+96].

IRQDIS4**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+128].

IRQDIS5**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+160].

IRQDIS6**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+192].

IRQDIS7**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+224].

IRQDIS8**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+256].

IRQDIS9**Type**

int

Default value

0x0

IRQ line disable mask. Bit n of this 32-bit parameter disables IRQ[n+288].

ITGU**Type**

bool

Default value

0x0

ITCM Security Gate Unit included.

ITGUBLKSZ**Type**

int

Default value

0x3

ITCM gate unit block size. Size=pow(2, ITGUBLKSZ + 5) bytes.

ITGUMAXBLKS**Type**

int

Default value

0x0

Maximum number of ITCM gate unit blocks. Number of blocks=pow(2, ITGUMAXBLKS).

ITM**Type**

bool

Default value

0x1

Level of instrumentation trace supported. false : No ITM trace included, true: ITM trace included (unless baseline).

ITM_HAS_LSR**Type**

bool

Default value

0x1

ITM support LAR and LSR for software lock.

LOCKDTGU**Type**

bool

Default value

0x0

Lock down of Data TGU registers write.

LOCKITGU**Type**

bool

Default value

0x0

Lock down of Instruction TGU registers write.

LOCKTCM**Type**

bool

Default value

0x0

Lock down of TCM registers write.

LOCK_NS_MPU**Type**

bool

Default value

0x0

Lock down of Non-Secure MPU registers write.

LOCK_SAU**Type**

bool

Default value

0x0

Lock down of SAU registers write.

LOCK_S_MPU**Type**

bool

Default value

0x0

Lock down of Secure MPU registers write.

LVL_WIDTH**Type**

int

Default value

0x3

Number of bits of interrupt priority (baseline has 2).

MEMORY_REGION_MASK**Type**

int

Default value

0xffffffff

Read/Write Mask for MPU_RBAR, MPU_RLAR, SAU_RBAR, SAU_RLAR. Bits[4:0] of this parameter are ignored.

MPU_TYPE_NS.DREGION**Type**

int

Default value

0x10

Number of regions in the Non-Secure MPU. If Security Extensions are absent, this is the total number of MPU regions.

MPU_TYPE_S.DREGION**Type**

int

Default value

0x10

Number of regions in the Secure MPU. If Security Extensions are absent, this is ignored.

MVE**Type**

int

Default value

0x2

Set whether the model has MVE support. If FPU = 0: 0=MVE not included, 1=Integer subset of MVE included. If FPU = 1: 0=MVE not included, 1=Integer subset of MVE included, 2=Integer and half and single precision floating point MVE included.

MVFR0.Double-precision**Type**

bool

Default value

0x1

Support 8-byte floats.

MVFR1.FP16**Type**

bool

Default value

0x1

FP extension implements half-precision floating-point operations. 0 = Not supported; 1 = Supported.

MVFR1.FPHP**Type**

int

Default value

0x2

FP extension implements half-precision floating-point conversion instructions. 0x1: Half-precision to single-precision, 0x2: As for 0x1 and also half-precision to double-precision.

MVFR1.MVE**Type**

int

Default value

0x2

DEPRECATED: Use parameter MVE instead.

NUM_IRQ**Type**

int

Default value

0x10

Number of user interrupts.

NVIC_ITNS0**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS1**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS10**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS11**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS12**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS13**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS14**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS15**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS2**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS3

Type

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS4

Type

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS5

Type

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS6

Type

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS7**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS8**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

NVIC_ITNS9**Type**

string

Default value

""

Each character fixes a security state target for a given external interrupt. 'N' implies NS; 'S' implies S; anything else is ignored. The largest bit is first, e.g. 'S-NN' sets external interrupts 0 and 1 to non-secure, 2 remains settable via the NVIC_ITNS register and 3 always targets secure.

REGISTER_POP_ORDER**Type**

string

Default value`"R4-R11,R0-R3,R12,R14,RETURN_ADDR,CPSR,S0-S15,FPSCR,PADDING,S16-S31"`

Order in which the registers are popped off the stack during exception return. A comma separated list of register names and ranges.

REGISTER_PUSH_ORDER**Type**

string

Default value

"R0-R3,R12,R14,RETURN_ADDR,CPSR,S0-S15,FPSCR,PADDING,S16-S31"

Order in which the registers are pushed on to the stack during exception handling. A comma separated list of register names and ranges.

SAU_CTRL.ALLNS**Type**

bool

Default value

0x0

At reset, the SAU treats entire memory space as NS when the SAU is disabled if this is set.

SAU_CTRL.ENABLE**Type**

bool

Default value

0x0

Enable SAU at reset.

SAU_REGION0.BADDR**Type**

int

Default value

0x0

Base address of SAU region0 at reset.

SAU_REGION0.ENABLE**Type**

bool

Default value

0x0

Enable SAU region0 at reset.

SAU_REGION0.LADDR**Type**

int

Default value

0x0

Limit address of SAU region0 at reset.

SAU_REGION0.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region0 at reset.

SAU_REGION1.BADDR**Type**

int

Default value

0x0

Base address of SAU region1 at reset.

SAU_REGION1.ENABLE**Type**

bool

Default value

0x0

Enable SAU region1 at reset.

SAU_REGION1.LADDR**Type**

int

Default value

0x0

Limit address of SAU region1 at reset.

SAU_REGION1.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region1 at reset.

SAU_REGION10.BADDR**Type**

int

Default value

0x0

Base address of SAU region10 at reset.

SAU_REGION10.ENABLE**Type**

bool

Default value

0x0

Enable SAU region10 at reset.

SAU_REGION10.LADDR**Type**

int

Default value

0x0

Limit address of SAU region10 at reset.

SAU_REGION10.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region10 at reset.

SAU_REGION100.BADDR**Type**

int

Default value

0x0

Base address of SAU region100 at reset.

SAU_REGION100.ENABLE**Type**

bool

Default value

0x0

Enable SAU region100 at reset.

SAU_REGION100.LADDR**Type**

int

Default value

0x0

Limit address of SAU region100 at reset.

SAU_REGION100.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region100 at reset.

SAU_REGION101.BADDR**Type**

int

Default value

0x0

Base address of SAU region101 at reset.

SAU_REGION101.ENABLE**Type**

bool

Default value

0x0

Enable SAU region101 at reset.

SAU_REGION101.LADDR**Type**

int

Default value

0x0

Limit address of SAU region101 at reset.

SAU_REGION101.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region101 at reset.

SAU_REGION102.BADDR**Type**

int

Default value

0x0

Base address of SAU region102 at reset.

SAU_REGION102.ENABLE**Type**

bool

Default value

0x0

Enable SAU region102 at reset.

SAU_REGION102.LADDR**Type**

int

Default value

0x0

Limit address of SAU region102 at reset.

SAU_REGION102.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region102 at reset.

SAU_REGION103.BADDR**Type**

int

Default value

0x0

Base address of SAU region103 at reset.

SAU_REGION103.ENABLE**Type**

bool

Default value

0x0

Enable SAU region103 at reset.

SAU_REGION103.LADDR**Type**

int

Default value

0x0

Limit address of SAU region103 at reset.

SAU_REGION103.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region103 at reset.

SAU_REGION104.BADDR**Type**

int

Default value

0x0

Base address of SAU region104 at reset.

SAU_REGION104.ENABLE**Type**

bool

Default value

0x0

Enable SAU region104 at reset.

SAU_REGION104.LADDR**Type**

int

Default value

0x0

Limit address of SAU region104 at reset.

SAU_REGION104.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region104 at reset.

SAU_REGION105.BADDR**Type**

int

Default value

0x0

Base address of SAU region105 at reset.

SAU_REGION105.ENABLE**Type**

bool

Default value

0x0

Enable SAU region105 at reset.

SAU_REGION105.LADDR**Type**

int

Default value

0x0

Limit address of SAU region105 at reset.

SAU_REGION105.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region105 at reset.

SAU_REGION106.BADDR**Type**

int

Default value

0x0

Base address of SAU region106 at reset.

SAU_REGION106.ENABLE**Type**

bool

Default value

0x0

Enable SAU region106 at reset.

SAU_REGION106.LADDR**Type**

int

Default value

0x0

Limit address of SAU region106 at reset.

SAU_REGION106.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region106 at reset.

SAU_REGION107.BADDR**Type**

int

Default value

0x0

Base address of SAU region107 at reset.

SAU_REGION107.ENABLE**Type**

bool

Default value

0x0

Enable SAU region107 at reset.

SAU_REGION107.LADDR**Type**

int

Default value

0x0

Limit address of SAU region107 at reset.

SAU_REGION107.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region107 at reset.

SAU_REGION108.BADDR**Type**

int

Default value

0x0

Base address of SAU region108 at reset.

SAU_REGION108.ENABLE**Type**

bool

Default value

0x0

Enable SAU region108 at reset.

SAU_REGION108.LADDR**Type**

int

Default value

0x0

Limit address of SAU region108 at reset.

SAU_REGION108.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region108 at reset.

SAU_REGION109.BADDR**Type**

int

Default value

0x0

Base address of SAU region109 at reset.

SAU_REGION109.ENABLE**Type**

bool

Default value

0x0

Enable SAU region109 at reset.

SAU_REGION109.LADDR**Type**

int

Default value

0x0

Limit address of SAU region109 at reset.

SAU_REGION109.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region109 at reset.

SAU_REGION11.BADDR**Type**

int

Default value

0x0

Base address of SAU region11 at reset.

SAU_REGION11.ENABLE**Type**

bool

Default value

0x0

Enable SAU region11 at reset.

SAU_REGION11.LADDR**Type**

int

Default value

0x0

Limit address of SAU region11 at reset.

SAU_REGION11.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region11 at reset.

SAU_REGION110.BADDR**Type**

int

Default value

0x0

Base address of SAU region110 at reset.

SAU_REGION110.ENABLE**Type**

bool

Default value

0x0

Enable SAU region110 at reset.

SAU_REGION110.LADDR**Type**

int

Default value

0x0

Limit address of SAU region110 at reset.

SAU_REGION110.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region110 at reset.

SAU_REGION111.BADDR**Type**

int

Default value

0x0

Base address of SAU region111 at reset.

SAU_REGION111.ENABLE**Type**

bool

Default value

0x0

Enable SAU region111 at reset.

SAU_REGION111.LADDR**Type**

int

Default value

0x0

Limit address of SAU region111 at reset.

SAU_REGION111.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region111 at reset.

SAU_REGION112.BADDR**Type**

int

Default value

0x0

Base address of SAU region112 at reset.

SAU_REGION112.ENABLE**Type**

bool

Default value

0x0

Enable SAU region112 at reset.

SAU_REGION112.LADDR**Type**

int

Default value

0x0

Limit address of SAU region112 at reset.

SAU_REGION112.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region112 at reset.

SAU_REGION113.BADDR**Type**

int

Default value

0x0

Base address of SAU region113 at reset.

SAU_REGION113.ENABLE**Type**

bool

Default value

0x0

Enable SAU region113 at reset.

SAU_REGION113.LADDR**Type**

int

Default value

0x0

Limit address of SAU region113 at reset.

SAU_REGION113.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region113 at reset.

SAU_REGION114.BADDR**Type**

int

Default value

0x0

Base address of SAU region114 at reset.

SAU_REGION114.ENABLE**Type**

bool

Default value

0x0

Enable SAU region114 at reset.

SAU_REGION114.LADDR**Type**

int

Default value

0x0

Limit address of SAU region114 at reset.

SAU_REGION114.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region114 at reset.

SAU_REGION115.BADDR**Type**

int

Default value

0x0

Base address of SAU region115 at reset.

SAU_REGION115.ENABLE**Type**

bool

Default value

0x0

Enable SAU region115 at reset.

SAU_REGION115.LADDR**Type**

int

Default value

0x0

Limit address of SAU region115 at reset.

SAU_REGION115.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region115 at reset.

SAU_REGION116.BADDR**Type**

int

Default value

0x0

Base address of SAU region116 at reset.

SAU_REGION116.ENABLE**Type**

bool

Default value

0x0

Enable SAU region116 at reset.

SAU_REGION116.LADDR**Type**

int

Default value

0x0

Limit address of SAU region116 at reset.

SAU_REGION116.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region116 at reset.

SAU_REGION117.BADDR**Type**

int

Default value

0x0

Base address of SAU region117 at reset.

SAU_REGION117.ENABLE**Type**

bool

Default value

0x0

Enable SAU region117 at reset.

SAU_REGION117.LADDR**Type**

int

Default value

0x0

Limit address of SAU region117 at reset.

SAU_REGION117.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region117 at reset.

SAU_REGION118.BADDR**Type**

int

Default value

0x0

Base address of SAU region118 at reset.

SAU_REGION118.ENABLE**Type**

bool

Default value

0x0

Enable SAU region118 at reset.

SAU_REGION118.LADDR**Type**

int

Default value

0x0

Limit address of SAU region118 at reset.

SAU_REGION118.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region118 at reset.

SAU_REGION119.BADDR**Type**

int

Default value

0x0

Base address of SAU region119 at reset.

SAU_REGION119.ENABLE**Type**

bool

Default value

0x0

Enable SAU region119 at reset.

SAU_REGION119.LADDR**Type**

int

Default value

0x0

Limit address of SAU region119 at reset.

SAU_REGION119.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region119 at reset.

SAU_REGION12.BADDR**Type**

int

Default value

0x0

Base address of SAU region12 at reset.

SAU_REGION12.ENABLE**Type**

bool

Default value

0x0

Enable SAU region12 at reset.

SAU_REGION12.LADDR**Type**

int

Default value

0x0

Limit address of SAU region12 at reset.

SAU_REGION12.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region12 at reset.

SAU_REGION120.BADDR**Type**

int

Default value

0x0

Base address of SAU region120 at reset.

SAU_REGION120.ENABLE**Type**

bool

Default value

0x0

Enable SAU region120 at reset.

SAU_REGION120.LADDR**Type**

int

Default value

0x0

Limit address of SAU region120 at reset.

SAU_REGION120.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region120 at reset.

SAU_REGION121.BADDR**Type**

int

Default value

0x0

Base address of SAU region121 at reset.

SAU_REGION121.ENABLE**Type**

bool

Default value

0x0

Enable SAU region121 at reset.

SAU_REGION121.LADDR**Type**

int

Default value

0x0

Limit address of SAU region121 at reset.

SAU_REGION121.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region121 at reset.

SAU_REGION122.BADDR**Type**

int

Default value

0x0

Base address of SAU region122 at reset.

SAU_REGION122.ENABLE**Type**

bool

Default value

0x0

Enable SAU region122 at reset.

SAU_REGION122.LADDR**Type**

int

Default value

0x0

Limit address of SAU region122 at reset.

SAU_REGION122.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region122 at reset.

SAU_REGION123.BADDR**Type**

int

Default value

0x0

Base address of SAU region123 at reset.

SAU_REGION123.ENABLE**Type**

bool

Default value

0x0

Enable SAU region123 at reset.

SAU_REGION123.LADDR**Type**

int

Default value

0x0

Limit address of SAU region123 at reset.

SAU_REGION123.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region123 at reset.

SAU_REGION124.BADDR**Type**

int

Default value

0x0

Base address of SAU region124 at reset.

SAU_REGION124.ENABLE**Type**

bool

Default value

0x0

Enable SAU region124 at reset.

SAU_REGION124.LADDR**Type**

int

Default value

0x0

Limit address of SAU region124 at reset.

SAU_REGION124.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region124 at reset.

SAU_REGION125.BADDR**Type**

int

Default value

0x0

Base address of SAU region125 at reset.

SAU_REGION125.ENABLE**Type**

bool

Default value

0x0

Enable SAU region125 at reset.

SAU_REGION125.LADDR**Type**

int

Default value

0x0

Limit address of SAU region125 at reset.

SAU_REGION125.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region125 at reset.

SAU_REGION126.BADDR**Type**

int

Default value

0x0

Base address of SAU region126 at reset.

SAU_REGION126.ENABLE**Type**

bool

Default value

0x0

Enable SAU region126 at reset.

SAU_REGION126.LADDR**Type**

int

Default value

0x0

Limit address of SAU region126 at reset.

SAU_REGION126.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region126 at reset.

SAU_REGION127.BADDR**Type**

int

Default value

0x0

Base address of SAU region127 at reset.

SAU_REGION127.ENABLE**Type**

bool

Default value

0x0

Enable SAU region127 at reset.

SAU_REGION127.LADDR**Type**

int

Default value

0x0

Limit address of SAU region127 at reset.

SAU_REGION127.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region127 at reset.

SAU_REGION128.BADDR**Type**

int

Default value

0x0

Base address of SAU region128 at reset.

SAU_REGION128.ENABLE**Type**

bool

Default value

0x0

Enable SAU region128 at reset.

SAU_REGION128.LADDR**Type**

int

Default value

0x0

Limit address of SAU region128 at reset.

SAU_REGION128.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region128 at reset.

SAU_REGION129.BADDR**Type**

int

Default value

0x0

Base address of SAU region129 at reset.

SAU_REGION129.ENABLE**Type**

bool

Default value

0x0

Enable SAU region129 at reset.

SAU_REGION129.LADDR**Type**

int

Default value

0x0

Limit address of SAU region129 at reset.

SAU_REGION129.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region129 at reset.

SAU_REGION13.BADDR**Type**

int

Default value

0x0

Base address of SAU region13 at reset.

SAU_REGION13.ENABLE**Type**

bool

Default value

0x0

Enable SAU region13 at reset.

SAU_REGION13.LADDR**Type**

int

Default value

0x0

Limit address of SAU region13 at reset.

SAU_REGION13.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region13 at reset.

SAU_REGION130.BADDR**Type**

int

Default value

0x0

Base address of SAU region130 at reset.

SAU_REGION130.ENABLE**Type**

bool

Default value

0x0

Enable SAU region130 at reset.

SAU_REGION130.LADDR**Type**

int

Default value

0x0

Limit address of SAU region130 at reset.

SAU_REGION130.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region130 at reset.

SAU_REGION131.BADDR**Type**

int

Default value

0x0

Base address of SAU region131 at reset.

SAU_REGION131.ENABLE**Type**

bool

Default value

0x0

Enable SAU region131 at reset.

SAU_REGION131.LADDR**Type**

int

Default value

0x0

Limit address of SAU region131 at reset.

SAU_REGION131.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region131 at reset.

SAU_REGION132.BADDR**Type**

int

Default value

0x0

Base address of SAU region132 at reset.

SAU_REGION132.ENABLE**Type**

bool

Default value

0x0

Enable SAU region132 at reset.

SAU_REGION132.LADDR**Type**

int

Default value

0x0

Limit address of SAU region132 at reset.

SAU_REGION132.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region132 at reset.

SAU_REGION133.BADDR**Type**

int

Default value

0x0

Base address of SAU region133 at reset.

SAU_REGION133.ENABLE**Type**

bool

Default value

0x0

Enable SAU region133 at reset.

SAU_REGION133.LADDR**Type**

int

Default value

0x0

Limit address of SAU region133 at reset.

SAU_REGION133.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region133 at reset.

SAU_REGION134.BADDR**Type**

int

Default value

0x0

Base address of SAU region134 at reset.

SAU_REGION134.ENABLE**Type**

bool

Default value

0x0

Enable SAU region134 at reset.

SAU_REGION134.LADDR**Type**

int

Default value

0x0

Limit address of SAU region134 at reset.

SAU_REGION134.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region134 at reset.

SAU_REGION135.BADDR**Type**

int

Default value

0x0

Base address of SAU region135 at reset.

SAU_REGION135.ENABLE**Type**

bool

Default value

0x0

Enable SAU region135 at reset.

SAU_REGION135.LADDR**Type**

int

Default value

0x0

Limit address of SAU region135 at reset.

SAU_REGION135.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region135 at reset.

SAU_REGION136.BADDR**Type**

int

Default value

0x0

Base address of SAU region136 at reset.

SAU_REGION136.ENABLE**Type**

bool

Default value

0x0

Enable SAU region136 at reset.

SAU_REGION136.LADDR**Type**

int

Default value

0x0

Limit address of SAU region136 at reset.

SAU_REGION136.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region136 at reset.

SAU_REGION137.BADDR**Type**

int

Default value

0x0

Base address of SAU region137 at reset.

SAU_REGION137.ENABLE**Type**

bool

Default value

0x0

Enable SAU region137 at reset.

SAU_REGION137.LADDR**Type**

int

Default value

0x0

Limit address of SAU region137 at reset.

SAU_REGION137.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region137 at reset.

SAU_REGION138.BADDR**Type**

int

Default value

0x0

Base address of SAU region138 at reset.

SAU_REGION138.ENABLE**Type**

bool

Default value

0x0

Enable SAU region138 at reset.

SAU_REGION138.LADDR**Type**

int

Default value

0x0

Limit address of SAU region138 at reset.

SAU_REGION138.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region138 at reset.

SAU_REGION139.BADDR**Type**

int

Default value

0x0

Base address of SAU region139 at reset.

SAU_REGION139.ENABLE**Type**

bool

Default value

0x0

Enable SAU region139 at reset.

SAU_REGION139.LADDR**Type**

int

Default value

0x0

Limit address of SAU region139 at reset.

SAU_REGION139.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region139 at reset.

SAU_REGION14.BADDR**Type**

int

Default value

0x0

Base address of SAU region14 at reset.

SAU_REGION14.ENABLE**Type**

bool

Default value

0x0

Enable SAU region14 at reset.

SAU_REGION14.LADDR**Type**

int

Default value

0x0

Limit address of SAU region14 at reset.

SAU_REGION14.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region14 at reset.

SAU_REGION140.BADDR**Type**

int

Default value

0x0

Base address of SAU region140 at reset.

SAU_REGION140.ENABLE**Type**

bool

Default value

0x0

Enable SAU region140 at reset.

SAU_REGION140.LADDR**Type**

int

Default value

0x0

Limit address of SAU region140 at reset.

SAU_REGION140.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region140 at reset.

SAU_REGION141.BADDR**Type**

int

Default value

0x0

Base address of SAU region141 at reset.

SAU_REGION141.ENABLE**Type**

bool

Default value

0x0

Enable SAU region141 at reset.

SAU_REGION141.LADDR**Type**

int

Default value

0x0

Limit address of SAU region141 at reset.

SAU_REGION141.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region141 at reset.

SAU_REGION142.BADDR**Type**

int

Default value

0x0

Base address of SAU region142 at reset.

SAU_REGION142.ENABLE**Type**

bool

Default value

0x0

Enable SAU region142 at reset.

SAU_REGION142.LADDR**Type**

int

Default value

0x0

Limit address of SAU region142 at reset.

SAU_REGION142.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region142 at reset.

SAU_REGION143.BADDR**Type**

int

Default value

0x0

Base address of SAU region143 at reset.

SAU_REGION143.ENABLE**Type**

bool

Default value

0x0

Enable SAU region143 at reset.

SAU_REGION143.LADDR**Type**

int

Default value

0x0

Limit address of SAU region143 at reset.

SAU_REGION143.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region143 at reset.

SAU_REGION144.BADDR**Type**

int

Default value

0x0

Base address of SAU region144 at reset.

SAU_REGION144.ENABLE**Type**

bool

Default value

0x0

Enable SAU region144 at reset.

SAU_REGION144.LADDR**Type**

int

Default value

0x0

Limit address of SAU region144 at reset.

SAU_REGION144.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region144 at reset.

SAU_REGION145.BADDR**Type**

int

Default value

0x0

Base address of SAU region145 at reset.

SAU_REGION145.ENABLE**Type**

bool

Default value

0x0

Enable SAU region145 at reset.

SAU_REGION145.LADDR**Type**

int

Default value

0x0

Limit address of SAU region145 at reset.

SAU_REGION145.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region145 at reset.

SAU_REGION146.BADDR**Type**

int

Default value

0x0

Base address of SAU region146 at reset.

SAU_REGION146.ENABLE**Type**

bool

Default value

0x0

Enable SAU region146 at reset.

SAU_REGION146.LADDR**Type**

int

Default value

0x0

Limit address of SAU region146 at reset.

SAU_REGION146.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region146 at reset.

SAU_REGION147.BADDR**Type**

int

Default value

0x0

Base address of SAU region147 at reset.

SAU_REGION147.ENABLE**Type**

bool

Default value

0x0

Enable SAU region147 at reset.

SAU_REGION147.LADDR**Type**

int

Default value

0x0

Limit address of SAU region147 at reset.

SAU_REGION147.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region147 at reset.

SAU_REGION148.BADDR**Type**

int

Default value

0x0

Base address of SAU region148 at reset.

SAU_REGION148.ENABLE**Type**

bool

Default value

0x0

Enable SAU region148 at reset.

SAU_REGION148.LADDR**Type**

int

Default value

0x0

Limit address of SAU region148 at reset.

SAU_REGION148.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region148 at reset.

SAU_REGION149.BADDR**Type**

int

Default value

0x0

Base address of SAU region149 at reset.

SAU_REGION149.ENABLE**Type**

bool

Default value

0x0

Enable SAU region149 at reset.

SAU_REGION149.LADDR**Type**

int

Default value

0x0

Limit address of SAU region149 at reset.

SAU_REGION149.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region149 at reset.

SAU_REGION15.BADDR**Type**

int

Default value

0x0

Base address of SAU region15 at reset.

SAU_REGION15.ENABLE**Type**

bool

Default value

0x0

Enable SAU region15 at reset.

SAU_REGION15.LADDR**Type**

int

Default value

0x0

Limit address of SAU region15 at reset.

SAU_REGION15.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region15 at reset.

SAU_REGION150.BADDR**Type**

int

Default value

0x0

Base address of SAU region150 at reset.

SAU_REGION150.ENABLE**Type**

bool

Default value

0x0

Enable SAU region150 at reset.

SAU_REGION150.LADDR**Type**

int

Default value

0x0

Limit address of SAU region150 at reset.

SAU_REGION150.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region150 at reset.

SAU_REGION151.BADDR**Type**

int

Default value

0x0

Base address of SAU region151 at reset.

SAU_REGION151.ENABLE**Type**

bool

Default value

0x0

Enable SAU region151 at reset.

SAU_REGION151.LADDR**Type**

int

Default value

0x0

Limit address of SAU region151 at reset.

SAU_REGION151.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region151 at reset.

SAU_REGION152.BADDR**Type**

int

Default value

0x0

Base address of SAU region152 at reset.

SAU_REGION152.ENABLE**Type**

bool

Default value

0x0

Enable SAU region152 at reset.

SAU_REGION152.LADDR**Type**

int

Default value

0x0

Limit address of SAU region152 at reset.

SAU_REGION152.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region152 at reset.

SAU_REGION153.BADDR**Type**

int

Default value

0x0

Base address of SAU region153 at reset.

SAU_REGION153.ENABLE**Type**

bool

Default value

0x0

Enable SAU region153 at reset.

SAU_REGION153.LADDR**Type**

int

Default value

0x0

Limit address of SAU region153 at reset.

SAU_REGION153.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region153 at reset.

SAU_REGION154.BADDR**Type**

int

Default value

0x0

Base address of SAU region154 at reset.

SAU_REGION154.ENABLE**Type**

bool

Default value

0x0

Enable SAU region154 at reset.

SAU_REGION154.LADDR**Type**

int

Default value

0x0

Limit address of SAU region154 at reset.

SAU_REGION154.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region154 at reset.

SAU_REGION155.BADDR**Type**

int

Default value

0x0

Base address of SAU region155 at reset.

SAU_REGION155.ENABLE**Type**

bool

Default value

0x0

Enable SAU region155 at reset.

SAU_REGION155.LADDR**Type**

int

Default value

0x0

Limit address of SAU region155 at reset.

SAU_REGION155.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region155 at reset.

SAU_REGION156.BADDR**Type**

int

Default value

0x0

Base address of SAU region156 at reset.

SAU_REGION156.ENABLE**Type**

bool

Default value

0x0

Enable SAU region156 at reset.

SAU_REGION156.LADDR**Type**

int

Default value

0x0

Limit address of SAU region156 at reset.

SAU_REGION156.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region156 at reset.

SAU_REGION157.BADDR**Type**

int

Default value

0x0

Base address of SAU region157 at reset.

SAU_REGION157.ENABLE**Type**

bool

Default value

0x0

Enable SAU region157 at reset.

SAU_REGION157.LADDR**Type**

int

Default value

0x0

Limit address of SAU region157 at reset.

SAU_REGION157.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region157 at reset.

SAU_REGION158.BADDR**Type**

int

Default value

0x0

Base address of SAU region158 at reset.

SAU_REGION158.ENABLE**Type**

bool

Default value

0x0

Enable SAU region158 at reset.

SAU_REGION158.LADDR**Type**

int

Default value

0x0

Limit address of SAU region158 at reset.

SAU_REGION158.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region158 at reset.

SAU_REGION159.BADDR**Type**

int

Default value

0x0

Base address of SAU region159 at reset.

SAU_REGION159.ENABLE**Type**

bool

Default value

0x0

Enable SAU region159 at reset.

SAU_REGION159.LADDR**Type**

int

Default value

0x0

Limit address of SAU region159 at reset.

SAU_REGION159.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region159 at reset.

SAU_REGION16.BADDR**Type**

int

Default value

0x0

Base address of SAU region16 at reset.

SAU_REGION16.ENABLE**Type**

bool

Default value

0x0

Enable SAU region16 at reset.

SAU_REGION16.LADDR**Type**

int

Default value

0x0

Limit address of SAU region16 at reset.

SAU_REGION16.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region16 at reset.

SAU_REGION160.BADDR**Type**

int

Default value

0x0

Base address of SAU region160 at reset.

SAU_REGION160.ENABLE**Type**

bool

Default value

0x0

Enable SAU region160 at reset.

SAU_REGION160.LADDR**Type**

int

Default value

0x0

Limit address of SAU region160 at reset.

SAU_REGION160.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region160 at reset.

SAU_REGION161.BADDR**Type**

int

Default value

0x0

Base address of SAU region161 at reset.

SAU_REGION161.ENABLE**Type**

bool

Default value

0x0

Enable SAU region161 at reset.

SAU_REGION161.LADDR**Type**

int

Default value

0x0

Limit address of SAU region161 at reset.

SAU_REGION161.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region161 at reset.

SAU_REGION162.BADDR**Type**

int

Default value

0x0

Base address of SAU region162 at reset.

SAU_REGION162.ENABLE**Type**

bool

Default value

0x0

Enable SAU region162 at reset.

SAU_REGION162.LADDR**Type**

int

Default value

0x0

Limit address of SAU region162 at reset.

SAU_REGION162.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region162 at reset.

SAU_REGION163.BADDR**Type**

int

Default value

0x0

Base address of SAU region163 at reset.

SAU_REGION163.ENABLE**Type**

bool

Default value

0x0

Enable SAU region163 at reset.

SAU_REGION163.LADDR**Type**

int

Default value

0x0

Limit address of SAU region163 at reset.

SAU_REGION163.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region163 at reset.

SAU_REGION164.BADDR**Type**

int

Default value

0x0

Base address of SAU region164 at reset.

SAU_REGION164.ENABLE**Type**

bool

Default value

0x0

Enable SAU region164 at reset.

SAU_REGION164.LADDR**Type**

int

Default value

0x0

Limit address of SAU region164 at reset.

SAU_REGION164.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region164 at reset.

SAU_REGION165.BADDR**Type**

int

Default value

0x0

Base address of SAU region165 at reset.

SAU_REGION165.ENABLE**Type**

bool

Default value

0x0

Enable SAU region165 at reset.

SAU_REGION165.LADDR**Type**

int

Default value

0x0

Limit address of SAU region165 at reset.

SAU_REGION165.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region165 at reset.

SAU_REGION166.BADDR**Type**

int

Default value

0x0

Base address of SAU region166 at reset.

SAU_REGION166.ENABLE**Type**

bool

Default value

0x0

Enable SAU region166 at reset.

SAU_REGION166.LADDR**Type**

int

Default value

0x0

Limit address of SAU region166 at reset.

SAU_REGION166.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region166 at reset.

SAU_REGION167.BADDR**Type**

int

Default value

0x0

Base address of SAU region167 at reset.

SAU_REGION167.ENABLE**Type**

bool

Default value

0x0

Enable SAU region167 at reset.

SAU_REGION167.LADDR**Type**

int

Default value

0x0

Limit address of SAU region167 at reset.

SAU_REGION167.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region167 at reset.

SAU_REGION168.BADDR**Type**

int

Default value

0x0

Base address of SAU region168 at reset.

SAU_REGION168.ENABLE**Type**

bool

Default value

0x0

Enable SAU region168 at reset.

SAU_REGION168.LADDR**Type**

int

Default value

0x0

Limit address of SAU region168 at reset.

SAU_REGION168.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region168 at reset.

SAU_REGION169.BADDR**Type**

int

Default value

0x0

Base address of SAU region169 at reset.

SAU_REGION169.ENABLE**Type**

bool

Default value

0x0

Enable SAU region169 at reset.

SAU_REGION169.LADDR**Type**

int

Default value

0x0

Limit address of SAU region169 at reset.

SAU_REGION169.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region169 at reset.

SAU_REGION17.BADDR**Type**

int

Default value

0x0

Base address of SAU region17 at reset.

SAU_REGION17.ENABLE**Type**

bool

Default value

0x0

Enable SAU region17 at reset.

SAU_REGION17.LADDR**Type**

int

Default value

0x0

Limit address of SAU region17 at reset.

SAU_REGION17.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region17 at reset.

SAU_REGION170.BADDR**Type**

int

Default value

0x0

Base address of SAU region170 at reset.

SAU_REGION170.ENABLE**Type**

bool

Default value

0x0

Enable SAU region170 at reset.

SAU_REGION170.LADDR**Type**

int

Default value

0x0

Limit address of SAU region170 at reset.

SAU_REGION170.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region170 at reset.

SAU_REGION171.BADDR**Type**

int

Default value

0x0

Base address of SAU region171 at reset.

SAU_REGION171.ENABLE**Type**

bool

Default value

0x0

Enable SAU region171 at reset.

SAU_REGION171.LADDR**Type**

int

Default value

0x0

Limit address of SAU region171 at reset.

SAU_REGION171.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region171 at reset.

SAU_REGION172.BADDR**Type**

int

Default value

0x0

Base address of SAU region172 at reset.

SAU_REGION172.ENABLE**Type**

bool

Default value

0x0

Enable SAU region172 at reset.

SAU_REGION172.LADDR**Type**

int

Default value

0x0

Limit address of SAU region172 at reset.

SAU_REGION172.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region172 at reset.

SAU_REGION173.BADDR**Type**

int

Default value

0x0

Base address of SAU region173 at reset.

SAU_REGION173.ENABLE**Type**

bool

Default value

0x0

Enable SAU region173 at reset.

SAU_REGION173.LADDR**Type**

int

Default value

0x0

Limit address of SAU region173 at reset.

SAU_REGION173.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region173 at reset.

SAU_REGION174.BADDR**Type**

int

Default value

0x0

Base address of SAU region174 at reset.

SAU_REGION174.ENABLE**Type**

bool

Default value

0x0

Enable SAU region174 at reset.

SAU_REGION174.LADDR**Type**

int

Default value

0x0

Limit address of SAU region174 at reset.

SAU_REGION174.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region174 at reset.

SAU_REGION175.BADDR**Type**

int

Default value

0x0

Base address of SAU region175 at reset.

SAU_REGION175.ENABLE**Type**

bool

Default value

0x0

Enable SAU region175 at reset.

SAU_REGION175.LADDR**Type**

int

Default value

0x0

Limit address of SAU region175 at reset.

SAU_REGION175.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region175 at reset.

SAU_REGION176.BADDR**Type**

int

Default value

0x0

Base address of SAU region176 at reset.

SAU_REGION176.ENABLE**Type**

bool

Default value

0x0

Enable SAU region176 at reset.

SAU_REGION176.LADDR**Type**

int

Default value

0x0

Limit address of SAU region176 at reset.

SAU_REGION176.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region176 at reset.

SAU_REGION177.BADDR**Type**

int

Default value

0x0

Base address of SAU region177 at reset.

SAU_REGION177.ENABLE**Type**

bool

Default value

0x0

Enable SAU region177 at reset.

SAU_REGION177.LADDR**Type**

int

Default value

0x0

Limit address of SAU region177 at reset.

SAU_REGION177.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region177 at reset.

SAU_REGION178.BADDR**Type**

int

Default value

0x0

Base address of SAU region178 at reset.

SAU_REGION178.ENABLE**Type**

bool

Default value

0x0

Enable SAU region178 at reset.

SAU_REGION178.LADDR**Type**

int

Default value

0x0

Limit address of SAU region178 at reset.

SAU_REGION178.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region178 at reset.

SAU_REGION179.BADDR**Type**

int

Default value

0x0

Base address of SAU region179 at reset.

SAU_REGION179.ENABLE**Type**

bool

Default value

0x0

Enable SAU region179 at reset.

SAU_REGION179.LADDR**Type**

int

Default value

0x0

Limit address of SAU region179 at reset.

SAU_REGION179.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region179 at reset.

SAU_REGION18.BADDR**Type**

int

Default value

0x0

Base address of SAU region18 at reset.

SAU_REGION18.ENABLE**Type**

bool

Default value

0x0

Enable SAU region18 at reset.

SAU_REGION18.LADDR**Type**

int

Default value

0x0

Limit address of SAU region18 at reset.

SAU_REGION18.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region18 at reset.

SAU_REGION180.BADDR**Type**

int

Default value

0x0

Base address of SAU region180 at reset.

SAU_REGION180.ENABLE**Type**

bool

Default value

0x0

Enable SAU region180 at reset.

SAU_REGION180.LADDR**Type**

int

Default value

0x0

Limit address of SAU region180 at reset.

SAU_REGION180.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region180 at reset.

SAU_REGION181.BADDR**Type**

int

Default value

0x0

Base address of SAU region181 at reset.

SAU_REGION181.ENABLE**Type**

bool

Default value

0x0

Enable SAU region181 at reset.

SAU_REGION181.LADDR**Type**

int

Default value

0x0

Limit address of SAU region181 at reset.

SAU_REGION181.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region181 at reset.

SAU_REGION182.BADDR**Type**

int

Default value

0x0

Base address of SAU region182 at reset.

SAU_REGION182.ENABLE**Type**

bool

Default value

0x0

Enable SAU region182 at reset.

SAU_REGION182.LADDR**Type**

int

Default value

0x0

Limit address of SAU region182 at reset.

SAU_REGION182.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region182 at reset.

SAU_REGION183.BADDR**Type**

int

Default value

0x0

Base address of SAU region183 at reset.

SAU_REGION183.ENABLE**Type**

bool

Default value

0x0

Enable SAU region183 at reset.

SAU_REGION183.LADDR**Type**

int

Default value

0x0

Limit address of SAU region183 at reset.

SAU_REGION183.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region183 at reset.

SAU_REGION184.BADDR**Type**

int

Default value

0x0

Base address of SAU region184 at reset.

SAU_REGION184.ENABLE**Type**

bool

Default value

0x0

Enable SAU region184 at reset.

SAU_REGION184.LADDR**Type**

int

Default value

0x0

Limit address of SAU region184 at reset.

SAU_REGION184.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region184 at reset.

SAU_REGION185.BADDR**Type**

int

Default value

0x0

Base address of SAU region185 at reset.

SAU_REGION185.ENABLE**Type**

bool

Default value

0x0

Enable SAU region185 at reset.

SAU_REGION185.LADDR**Type**

int

Default value

0x0

Limit address of SAU region185 at reset.

SAU_REGION185.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region185 at reset.

SAU_REGION186.BADDR**Type**

int

Default value

0x0

Base address of SAU region186 at reset.

SAU_REGION186.ENABLE**Type**

bool

Default value

0x0

Enable SAU region186 at reset.

SAU_REGION186.LADDR**Type**

int

Default value

0x0

Limit address of SAU region186 at reset.

SAU_REGION186.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region186 at reset.

SAU_REGION187.BADDR**Type**

int

Default value

0x0

Base address of SAU region187 at reset.

SAU_REGION187.ENABLE**Type**

bool

Default value

0x0

Enable SAU region187 at reset.

SAU_REGION187.LADDR**Type**

int

Default value

0x0

Limit address of SAU region187 at reset.

SAU_REGION187.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region187 at reset.

SAU_REGION188.BADDR**Type**

int

Default value

0x0

Base address of SAU region188 at reset.

SAU_REGION188.ENABLE**Type**

bool

Default value

0x0

Enable SAU region188 at reset.

SAU_REGION188.LADDR**Type**

int

Default value

0x0

Limit address of SAU region188 at reset.

SAU_REGION188.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region188 at reset.

SAU_REGION189.BADDR**Type**

int

Default value

0x0

Base address of SAU region189 at reset.

SAU_REGION189.ENABLE**Type**

bool

Default value

0x0

Enable SAU region189 at reset.

SAU_REGION189.LADDR**Type**

int

Default value

0x0

Limit address of SAU region189 at reset.

SAU_REGION189.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region189 at reset.

SAU_REGION19.BADDR**Type**

int

Default value

0x0

Base address of SAU region19 at reset.

SAU_REGION19.ENABLE**Type**

bool

Default value

0x0

Enable SAU region19 at reset.

SAU_REGION19.LADDR**Type**

int

Default value

0x0

Limit address of SAU region19 at reset.

SAU_REGION19.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region19 at reset.

SAU_REGION190.BADDR**Type**

int

Default value

0x0

Base address of SAU region190 at reset.

SAU_REGION190.ENABLE**Type**

bool

Default value

0x0

Enable SAU region190 at reset.

SAU_REGION190.LADDR**Type**

int

Default value

0x0

Limit address of SAU region190 at reset.

SAU_REGION190.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region190 at reset.

SAU_REGION191.BADDR**Type**

int

Default value

0x0

Base address of SAU region191 at reset.

SAU_REGION191.ENABLE**Type**

bool

Default value

0x0

Enable SAU region191 at reset.

SAU_REGION191.LADDR**Type**

int

Default value

0x0

Limit address of SAU region191 at reset.

SAU_REGION191.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region191 at reset.

SAU_REGION192.BADDR**Type**

int

Default value

0x0

Base address of SAU region192 at reset.

SAU_REGION192.ENABLE**Type**

bool

Default value

0x0

Enable SAU region192 at reset.

SAU_REGION192.LADDR**Type**

int

Default value

0x0

Limit address of SAU region192 at reset.

SAU_REGION192.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region192 at reset.

SAU_REGION193.BADDR**Type**

int

Default value

0x0

Base address of SAU region193 at reset.

SAU_REGION193.ENABLE**Type**

bool

Default value

0x0

Enable SAU region193 at reset.

SAU_REGION193.LADDR**Type**

int

Default value

0x0

Limit address of SAU region193 at reset.

SAU_REGION193.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region193 at reset.

SAU_REGION194.BADDR**Type**

int

Default value

0x0

Base address of SAU region194 at reset.

SAU_REGION194.ENABLE**Type**

bool

Default value

0x0

Enable SAU region194 at reset.

SAU_REGION194.LADDR**Type**

int

Default value

0x0

Limit address of SAU region194 at reset.

SAU_REGION194.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region194 at reset.

SAU_REGION195.BADDR**Type**

int

Default value

0x0

Base address of SAU region195 at reset.

SAU_REGION195.ENABLE**Type**

bool

Default value

0x0

Enable SAU region195 at reset.

SAU_REGION195.LADDR**Type**

int

Default value

0x0

Limit address of SAU region195 at reset.

SAU_REGION195.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region195 at reset.

SAU_REGION196.BADDR**Type**

int

Default value

0x0

Base address of SAU region196 at reset.

SAU_REGION196.ENABLE**Type**

bool

Default value

0x0

Enable SAU region196 at reset.

SAU_REGION196.LADDR**Type**

int

Default value

0x0

Limit address of SAU region196 at reset.

SAU_REGION196.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region196 at reset.

SAU_REGION197.BADDR**Type**

int

Default value

0x0

Base address of SAU region197 at reset.

SAU_REGION197.ENABLE**Type**

bool

Default value

0x0

Enable SAU region197 at reset.

SAU_REGION197.LADDR**Type**

int

Default value

0x0

Limit address of SAU region197 at reset.

SAU_REGION197.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region197 at reset.

SAU_REGION198.BADDR**Type**

int

Default value

0x0

Base address of SAU region198 at reset.

SAU_REGION198.ENABLE**Type**

bool

Default value

0x0

Enable SAU region198 at reset.

SAU_REGION198.LADDR**Type**

int

Default value

0x0

Limit address of SAU region198 at reset.

SAU_REGION198.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region198 at reset.

SAU_REGION199.BADDR**Type**

int

Default value

0x0

Base address of SAU region199 at reset.

SAU_REGION199.ENABLE**Type**

bool

Default value

0x0

Enable SAU region199 at reset.

SAU_REGION199.LADDR**Type**

int

Default value

0x0

Limit address of SAU region199 at reset.

SAU_REGION199.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region199 at reset.

SAU_REGION2.BADDR**Type**

int

Default value

0x0

Base address of SAU region2 at reset.

SAU_REGION2.ENABLE**Type**

bool

Default value

0x0

Enable SAU region2 at reset.

SAU_REGION2.LADDR**Type**

int

Default value

0x0

Limit address of SAU region2 at reset.

SAU_REGION2.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region2 at reset.

SAU_REGION20.BADDR**Type**

int

Default value

0x0

Base address of SAU region20 at reset.

SAU_REGION20.ENABLE**Type**

bool

Default value

0x0

Enable SAU region20 at reset.

SAU_REGION20.LADDR**Type**

int

Default value

0x0

Limit address of SAU region20 at reset.

SAU_REGION20.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region20 at reset.

SAU_REGION200.BADDR**Type**

int

Default value

0x0

Base address of SAU region200 at reset.

SAU_REGION200.ENABLE**Type**

bool

Default value

0x0

Enable SAU region200 at reset.

SAU_REGION200.LADDR**Type**

int

Default value

0x0

Limit address of SAU region200 at reset.

SAU_REGION200.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region200 at reset.

SAU_REGION201.BADDR**Type**

int

Default value

0x0

Base address of SAU region201 at reset.

SAU_REGION201.ENABLE**Type**

bool

Default value

0x0

Enable SAU region201 at reset.

SAU_REGION201.LADDR**Type**

int

Default value

0x0

Limit address of SAU region201 at reset.

SAU_REGION201.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region201 at reset.

SAU_REGION202.BADDR**Type**

int

Default value

0x0

Base address of SAU region202 at reset.

SAU_REGION202.ENABLE**Type**

bool

Default value

0x0

Enable SAU region202 at reset.

SAU_REGION202.LADDR**Type**

int

Default value

0x0

Limit address of SAU region202 at reset.

SAU_REGION202.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region202 at reset.

SAU_REGION203.BADDR**Type**

int

Default value

0x0

Base address of SAU region203 at reset.

SAU_REGION203.ENABLE**Type**

bool

Default value

0x0

Enable SAU region203 at reset.

SAU_REGION203.LADDR**Type**

int

Default value

0x0

Limit address of SAU region203 at reset.

SAU_REGION203.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region203 at reset.

SAU_REGION204.BADDR**Type**

int

Default value

0x0

Base address of SAU region204 at reset.

SAU_REGION204.ENABLE**Type**

bool

Default value

0x0

Enable SAU region204 at reset.

SAU_REGION204.LADDR**Type**

int

Default value

0x0

Limit address of SAU region204 at reset.

SAU_REGION204.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region204 at reset.

SAU_REGION205.BADDR**Type**

int

Default value

0x0

Base address of SAU region205 at reset.

SAU_REGION205.ENABLE**Type**

bool

Default value

0x0

Enable SAU region205 at reset.

SAU_REGION205.LADDR**Type**

int

Default value

0x0

Limit address of SAU region205 at reset.

SAU_REGION205.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region205 at reset.

SAU_REGION206.BADDR**Type**

int

Default value

0x0

Base address of SAU region206 at reset.

SAU_REGION206.ENABLE**Type**

bool

Default value

0x0

Enable SAU region206 at reset.

SAU_REGION206.LADDR**Type**

int

Default value

0x0

Limit address of SAU region206 at reset.

SAU_REGION206.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region206 at reset.

SAU_REGION207.BADDR**Type**

int

Default value

0x0

Base address of SAU region207 at reset.

SAU_REGION207.ENABLE**Type**

bool

Default value

0x0

Enable SAU region207 at reset.

SAU_REGION207.LADDR**Type**

int

Default value

0x0

Limit address of SAU region207 at reset.

SAU_REGION207.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region207 at reset.

SAU_REGION208.BADDR**Type**

int

Default value

0x0

Base address of SAU region208 at reset.

SAU_REGION208.ENABLE**Type**

bool

Default value

0x0

Enable SAU region208 at reset.

SAU_REGION208.LADDR**Type**

int

Default value

0x0

Limit address of SAU region208 at reset.

SAU_REGION208.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region208 at reset.

SAU_REGION209.BADDR**Type**

int

Default value

0x0

Base address of SAU region209 at reset.

SAU_REGION209.ENABLE**Type**

bool

Default value

0x0

Enable SAU region209 at reset.

SAU_REGION209.LADDR**Type**

int

Default value

0x0

Limit address of SAU region209 at reset.

SAU_REGION209.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region209 at reset.

SAU_REGION21.BADDR**Type**

int

Default value

0x0

Base address of SAU region21 at reset.

SAU_REGION21.ENABLE**Type**

bool

Default value

0x0

Enable SAU region21 at reset.

SAU_REGION21.LADDR**Type**

int

Default value

0x0

Limit address of SAU region21 at reset.

SAU_REGION21.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region21 at reset.

SAU_REGION210.BADDR**Type**

int

Default value

0x0

Base address of SAU region210 at reset.

SAU_REGION210.ENABLE**Type**

bool

Default value

0x0

Enable SAU region210 at reset.

SAU_REGION210.LADDR**Type**

int

Default value

0x0

Limit address of SAU region210 at reset.

SAU_REGION210.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region210 at reset.

SAU_REGION211.BADDR**Type**

int

Default value

0x0

Base address of SAU region211 at reset.

SAU_REGION211.ENABLE**Type**

bool

Default value

0x0

Enable SAU region211 at reset.

SAU_REGION211.LADDR**Type**

int

Default value

0x0

Limit address of SAU region211 at reset.

SAU_REGION211.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region211 at reset.

SAU_REGION212.BADDR**Type**

int

Default value

0x0

Base address of SAU region212 at reset.

SAU_REGION212.ENABLE**Type**

bool

Default value

0x0

Enable SAU region212 at reset.

SAU_REGION212.LADDR**Type**

int

Default value

0x0

Limit address of SAU region212 at reset.

SAU_REGION212.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region212 at reset.

SAU_REGION213.BADDR**Type**

int

Default value

0x0

Base address of SAU region213 at reset.

SAU_REGION213.ENABLE**Type**

bool

Default value

0x0

Enable SAU region213 at reset.

SAU_REGION213.LADDR**Type**

int

Default value

0x0

Limit address of SAU region213 at reset.

SAU_REGION213.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region213 at reset.

SAU_REGION214.BADDR**Type**

int

Default value

0x0

Base address of SAU region214 at reset.

SAU_REGION214.ENABLE**Type**

bool

Default value

0x0

Enable SAU region214 at reset.

SAU_REGION214.LADDR**Type**

int

Default value

0x0

Limit address of SAU region214 at reset.

SAU_REGION214.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region214 at reset.

SAU_REGION215.BADDR**Type**

int

Default value

0x0

Base address of SAU region215 at reset.

SAU_REGION215.ENABLE**Type**

bool

Default value

0x0

Enable SAU region215 at reset.

SAU_REGION215.LADDR**Type**

int

Default value

0x0

Limit address of SAU region215 at reset.

SAU_REGION215.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region215 at reset.

SAU_REGION216.BADDR**Type**

int

Default value

0x0

Base address of SAU region216 at reset.

SAU_REGION216.ENABLE**Type**

bool

Default value

0x0

Enable SAU region216 at reset.

SAU_REGION216.LADDR**Type**

int

Default value

0x0

Limit address of SAU region216 at reset.

SAU_REGION216.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region216 at reset.

SAU_REGION217.BADDR**Type**

int

Default value

0x0

Base address of SAU region217 at reset.

SAU_REGION217.ENABLE**Type**

bool

Default value

0x0

Enable SAU region217 at reset.

SAU_REGION217.LADDR**Type**

int

Default value

0x0

Limit address of SAU region217 at reset.

SAU_REGION217.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region217 at reset.

SAU_REGION218.BADDR**Type**

int

Default value

0x0

Base address of SAU region218 at reset.

SAU_REGION218.ENABLE**Type**

bool

Default value

0x0

Enable SAU region218 at reset.

SAU_REGION218.LADDR**Type**

int

Default value

0x0

Limit address of SAU region218 at reset.

SAU_REGION218.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region218 at reset.

SAU_REGION219.BADDR**Type**

int

Default value

0x0

Base address of SAU region219 at reset.

SAU_REGION219.ENABLE**Type**

bool

Default value

0x0

Enable SAU region219 at reset.

SAU_REGION219.LADDR**Type**

int

Default value

0x0

Limit address of SAU region219 at reset.

SAU_REGION219.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region219 at reset.

SAU_REGION22.BADDR**Type**

int

Default value

0x0

Base address of SAU region22 at reset.

SAU_REGION22.ENABLE**Type**

bool

Default value

0x0

Enable SAU region22 at reset.

SAU_REGION22.LADDR**Type**

int

Default value

0x0

Limit address of SAU region22 at reset.

SAU_REGION22.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region22 at reset.

SAU_REGION220.BADDR**Type**

int

Default value

0x0

Base address of SAU region220 at reset.

SAU_REGION220.ENABLE**Type**

bool

Default value

0x0

Enable SAU region220 at reset.

SAU_REGION220.LADDR**Type**

int

Default value

0x0

Limit address of SAU region220 at reset.

SAU_REGION220.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region220 at reset.

SAU_REGION221.BADDR**Type**

int

Default value

0x0

Base address of SAU region221 at reset.

SAU_REGION221.ENABLE**Type**

bool

Default value

0x0

Enable SAU region221 at reset.

SAU_REGION221.LADDR**Type**

int

Default value

0x0

Limit address of SAU region221 at reset.

SAU_REGION221.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region221 at reset.

SAU_REGION222.BADDR**Type**

int

Default value

0x0

Base address of SAU region222 at reset.

SAU_REGION222.ENABLE**Type**

bool

Default value

0x0

Enable SAU region222 at reset.

SAU_REGION222.LADDR**Type**

int

Default value

0x0

Limit address of SAU region222 at reset.

SAU_REGION222.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region222 at reset.

SAU_REGION223.BADDR**Type**

int

Default value

0x0

Base address of SAU region223 at reset.

SAU_REGION223.ENABLE**Type**

bool

Default value

0x0

Enable SAU region223 at reset.

SAU_REGION223.LADDR**Type**

int

Default value

0x0

Limit address of SAU region223 at reset.

SAU_REGION223.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region223 at reset.

SAU_REGION224.BADDR**Type**

int

Default value

0x0

Base address of SAU region224 at reset.

SAU_REGION224.ENABLE**Type**

bool

Default value

0x0

Enable SAU region224 at reset.

SAU_REGION224.LADDR**Type**

int

Default value

0x0

Limit address of SAU region224 at reset.

SAU_REGION224.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region224 at reset.

SAU_REGION225.BADDR**Type**

int

Default value

0x0

Base address of SAU region225 at reset.

SAU_REGION225.ENABLE**Type**

bool

Default value

0x0

Enable SAU region225 at reset.

SAU_REGION225.LADDR**Type**

int

Default value

0x0

Limit address of SAU region225 at reset.

SAU_REGION225.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region225 at reset.

SAU_REGION226.BADDR**Type**

int

Default value

0x0

Base address of SAU region226 at reset.

SAU_REGION226.ENABLE**Type**

bool

Default value

0x0

Enable SAU region226 at reset.

SAU_REGION226.LADDR**Type**

int

Default value

0x0

Limit address of SAU region226 at reset.

SAU_REGION226.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region226 at reset.

SAU_REGION227.BADDR**Type**

int

Default value

0x0

Base address of SAU region227 at reset.

SAU_REGION227.ENABLE**Type**

bool

Default value

0x0

Enable SAU region227 at reset.

SAU_REGION227.LADDR**Type**

int

Default value

0x0

Limit address of SAU region227 at reset.

SAU_REGION227.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region227 at reset.

SAU_REGION228.BADDR**Type**

int

Default value

0x0

Base address of SAU region228 at reset.

SAU_REGION228.ENABLE**Type**

bool

Default value

0x0

Enable SAU region228 at reset.

SAU_REGION228.LADDR**Type**

int

Default value

0x0

Limit address of SAU region228 at reset.

SAU_REGION228.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region228 at reset.

SAU_REGION229.BADDR**Type**

int

Default value

0x0

Base address of SAU region229 at reset.

SAU_REGION229.ENABLE**Type**

bool

Default value

0x0

Enable SAU region229 at reset.

SAU_REGION229.LADDR**Type**

int

Default value

0x0

Limit address of SAU region229 at reset.

SAU_REGION229.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region229 at reset.

SAU_REGION23.BADDR**Type**

int

Default value

0x0

Base address of SAU region23 at reset.

SAU_REGION23.ENABLE**Type**

bool

Default value

0x0

Enable SAU region23 at reset.

SAU_REGION23.LADDR**Type**

int

Default value

0x0

Limit address of SAU region23 at reset.

SAU_REGION23.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region23 at reset.

SAU_REGION230.BADDR**Type**

int

Default value

0x0

Base address of SAU region230 at reset.

SAU_REGION230.ENABLE**Type**

bool

Default value

0x0

Enable SAU region230 at reset.

SAU_REGION230.LADDR**Type**

int

Default value

0x0

Limit address of SAU region230 at reset.

SAU_REGION230.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region230 at reset.

SAU_REGION231.BADDR**Type**

int

Default value

0x0

Base address of SAU region231 at reset.

SAU_REGION231.ENABLE**Type**

bool

Default value

0x0

Enable SAU region231 at reset.

SAU_REGION231.LADDR**Type**

int

Default value

0x0

Limit address of SAU region231 at reset.

SAU_REGION231.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region231 at reset.

SAU_REGION232.BADDR**Type**

int

Default value

0x0

Base address of SAU region232 at reset.

SAU_REGION232.ENABLE**Type**

bool

Default value

0x0

Enable SAU region232 at reset.

SAU_REGION232.LADDR**Type**

int

Default value

0x0

Limit address of SAU region232 at reset.

SAU_REGION232.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region232 at reset.

SAU_REGION233.BADDR**Type**

int

Default value

0x0

Base address of SAU region233 at reset.

SAU_REGION233.ENABLE**Type**

bool

Default value

0x0

Enable SAU region233 at reset.

SAU_REGION233.LADDR**Type**

int

Default value

0x0

Limit address of SAU region233 at reset.

SAU_REGION233.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region233 at reset.

SAU_REGION234.BADDR**Type**

int

Default value

0x0

Base address of SAU region234 at reset.

SAU_REGION234.ENABLE**Type**

bool

Default value

0x0

Enable SAU region234 at reset.

SAU_REGION234.LADDR**Type**

int

Default value

0x0

Limit address of SAU region234 at reset.

SAU_REGION234.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region234 at reset.

SAU_REGION235.BADDR**Type**

int

Default value

0x0

Base address of SAU region235 at reset.

SAU_REGION235.ENABLE**Type**

bool

Default value

0x0

Enable SAU region235 at reset.

SAU_REGION235.LADDR**Type**

int

Default value

0x0

Limit address of SAU region235 at reset.

SAU_REGION235.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region235 at reset.

SAU_REGION236.BADDR**Type**

int

Default value

0x0

Base address of SAU region236 at reset.

SAU_REGION236.ENABLE**Type**

bool

Default value

0x0

Enable SAU region236 at reset.

SAU_REGION236.LADDR**Type**

int

Default value

0x0

Limit address of SAU region236 at reset.

SAU_REGION236.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region236 at reset.

SAU_REGION237.BADDR**Type**

int

Default value

0x0

Base address of SAU region237 at reset.

SAU_REGION237.ENABLE**Type**

bool

Default value

0x0

Enable SAU region237 at reset.

SAU_REGION237.LADDR**Type**

int

Default value

0x0

Limit address of SAU region237 at reset.

SAU_REGION237.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region237 at reset.

SAU_REGION238.BADDR**Type**

int

Default value

0x0

Base address of SAU region238 at reset.

SAU_REGION238.ENABLE**Type**

bool

Default value

0x0

Enable SAU region238 at reset.

SAU_REGION238.LADDR**Type**

int

Default value

0x0

Limit address of SAU region238 at reset.

SAU_REGION238.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region238 at reset.

SAU_REGION239.BADDR**Type**

int

Default value

0x0

Base address of SAU region239 at reset.

SAU_REGION239.ENABLE**Type**

bool

Default value

0x0

Enable SAU region239 at reset.

SAU_REGION239.LADDR**Type**

int

Default value

0x0

Limit address of SAU region239 at reset.

SAU_REGION239.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region239 at reset.

SAU_REGION24.BADDR**Type**

int

Default value

0x0

Base address of SAU region24 at reset.

SAU_REGION24.ENABLE**Type**

bool

Default value

0x0

Enable SAU region24 at reset.

SAU_REGION24.LADDR**Type**

int

Default value

0x0

Limit address of SAU region24 at reset.

SAU_REGION24.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region24 at reset.

SAU_REGION240.BADDR**Type**

int

Default value

0x0

Base address of SAU region240 at reset.

SAU_REGION240.ENABLE**Type**

bool

Default value

0x0

Enable SAU region240 at reset.

SAU_REGION240.LADDR**Type**

int

Default value

0x0

Limit address of SAU region240 at reset.

SAU_REGION240.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region240 at reset.

SAU_REGION241.BADDR**Type**

int

Default value

0x0

Base address of SAU region241 at reset.

SAU_REGION241.ENABLE**Type**

bool

Default value

0x0

Enable SAU region241 at reset.

SAU_REGION241.LADDR**Type**

int

Default value

0x0

Limit address of SAU region241 at reset.

SAU_REGION241.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region241 at reset.

SAU_REGION242.BADDR**Type**

int

Default value

0x0

Base address of SAU region242 at reset.

SAU_REGION242.ENABLE**Type**

bool

Default value

0x0

Enable SAU region242 at reset.

SAU_REGION242.LADDR**Type**

int

Default value

0x0

Limit address of SAU region242 at reset.

SAU_REGION242.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region242 at reset.

SAU_REGION243.BADDR**Type**

int

Default value

0x0

Base address of SAU region243 at reset.

SAU_REGION243.ENABLE**Type**

bool

Default value

0x0

Enable SAU region243 at reset.

SAU_REGION243.LADDR**Type**

int

Default value

0x0

Limit address of SAU region243 at reset.

SAU_REGION243.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region243 at reset.

SAU_REGION244.BADDR**Type**

int

Default value

0x0

Base address of SAU region244 at reset.

SAU_REGION244.ENABLE**Type**

bool

Default value

0x0

Enable SAU region244 at reset.

SAU_REGION244.LADDR**Type**

int

Default value

0x0

Limit address of SAU region244 at reset.

SAU_REGION244.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region244 at reset.

SAU_REGION245.BADDR**Type**

int

Default value

0x0

Base address of SAU region245 at reset.

SAU_REGION245.ENABLE**Type**

bool

Default value

0x0

Enable SAU region245 at reset.

SAU_REGION245.LADDR**Type**

int

Default value

0x0

Limit address of SAU region245 at reset.

SAU_REGION245.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region245 at reset.

SAU_REGION246.BADDR**Type**

int

Default value

0x0

Base address of SAU region246 at reset.

SAU_REGION246.ENABLE**Type**

bool

Default value

0x0

Enable SAU region246 at reset.

SAU_REGION246.LADDR**Type**

int

Default value

0x0

Limit address of SAU region246 at reset.

SAU_REGION246.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region246 at reset.

SAU_REGION247.BADDR**Type**

int

Default value

0x0

Base address of SAU region247 at reset.

SAU_REGION247.ENABLE**Type**

bool

Default value

0x0

Enable SAU region247 at reset.

SAU_REGION247.LADDR**Type**

int

Default value

0x0

Limit address of SAU region247 at reset.

SAU_REGION247.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region247 at reset.

SAU_REGION248.BADDR**Type**

int

Default value

0x0

Base address of SAU region248 at reset.

SAU_REGION248.ENABLE**Type**

bool

Default value

0x0

Enable SAU region248 at reset.

SAU_REGION248.LADDR**Type**

int

Default value

0x0

Limit address of SAU region248 at reset.

SAU_REGION248.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region248 at reset.

SAU_REGION249.BADDR**Type**

int

Default value

0x0

Base address of SAU region249 at reset.

SAU_REGION249.ENABLE**Type**

bool

Default value

0x0

Enable SAU region249 at reset.

SAU_REGION249.LADDR**Type**

int

Default value

0x0

Limit address of SAU region249 at reset.

SAU_REGION249.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region249 at reset.

SAU_REGION25.BADDR**Type**

int

Default value

0x0

Base address of SAU region25 at reset.

SAU_REGION25.ENABLE**Type**

bool

Default value

0x0

Enable SAU region25 at reset.

SAU_REGION25.LADDR**Type**

int

Default value

0x0

Limit address of SAU region25 at reset.

SAU_REGION25.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region25 at reset.

SAU_REGION250.BADDR**Type**

int

Default value

0x0

Base address of SAU region250 at reset.

SAU_REGION250.ENABLE**Type**

bool

Default value

0x0

Enable SAU region250 at reset.

SAU_REGION250.LADDR**Type**

int

Default value

0x0

Limit address of SAU region250 at reset.

SAU_REGION250.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region250 at reset.

SAU_REGION251.BADDR**Type**

int

Default value

0x0

Base address of SAU region251 at reset.

SAU_REGION251.ENABLE**Type**

bool

Default value

0x0

Enable SAU region251 at reset.

SAU_REGION251.LADDR**Type**

int

Default value

0x0

Limit address of SAU region251 at reset.

SAU_REGION251.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region251 at reset.

SAU_REGION252.BADDR**Type**

int

Default value

0x0

Base address of SAU region252 at reset.

SAU_REGION252.ENABLE**Type**

bool

Default value

0x0

Enable SAU region252 at reset.

SAU_REGION252.LADDR**Type**

int

Default value

0x0

Limit address of SAU region252 at reset.

SAU_REGION252.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region252 at reset.

SAU_REGION253.BADDR**Type**

int

Default value

0x0

Base address of SAU region253 at reset.

SAU_REGION253.ENABLE**Type**

bool

Default value

0x0

Enable SAU region253 at reset.

SAU_REGION253.LADDR**Type**

int

Default value

0x0

Limit address of SAU region253 at reset.

SAU_REGION253.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region253 at reset.

SAU_REGION254.BADDR**Type**

int

Default value

0x0

Base address of SAU region254 at reset.

SAU_REGION254.ENABLE**Type**

bool

Default value

0x0

Enable SAU region254 at reset.

SAU_REGION254.LADDR**Type**

int

Default value

0x0

Limit address of SAU region254 at reset.

SAU_REGION254.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region254 at reset.

SAU_REGION255.BADDR**Type**

int

Default value

0x0

Base address of SAU region255 at reset.

SAU_REGION255.ENABLE**Type**

bool

Default value

0x0

Enable SAU region255 at reset.

SAU_REGION255.LADDR**Type**

int

Default value

0x0

Limit address of SAU region255 at reset.

SAU_REGION255.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region255 at reset.

SAU_REGION26.BADDR**Type**

int

Default value

0x0

Base address of SAU region26 at reset.

SAU_REGION26.ENABLE**Type**

bool

Default value

0x0

Enable SAU region26 at reset.

SAU_REGION26.LADDR**Type**

int

Default value

0x0

Limit address of SAU region26 at reset.

SAU_REGION26.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region26 at reset.

SAU_REGION27.BADDR**Type**

int

Default value

0x0

Base address of SAU region27 at reset.

SAU_REGION27.ENABLE**Type**

bool

Default value

0x0

Enable SAU region27 at reset.

SAU_REGION27.LADDR**Type**

int

Default value

0x0

Limit address of SAU region27 at reset.

SAU_REGION27.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region27 at reset.

SAU_REGION28.BADDR**Type**

int

Default value

0x0

Base address of SAU region28 at reset.

SAU_REGION28.ENABLE**Type**

bool

Default value

0x0

Enable SAU region28 at reset.

SAU_REGION28.LADDR**Type**

int

Default value

0x0

Limit address of SAU region28 at reset.

SAU_REGION28.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region28 at reset.

SAU_REGION29.BADDR**Type**

int

Default value

0x0

Base address of SAU region29 at reset.

SAU_REGION29.ENABLE**Type**

bool

Default value

0x0

Enable SAU region29 at reset.

SAU_REGION29.LADDR**Type**

int

Default value

0x0

Limit address of SAU region29 at reset.

SAU_REGION29.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region29 at reset.

SAU_REGION3.BADDR**Type**

int

Default value

0x0

Base address of SAU region3 at reset.

SAU_REGION3.ENABLE**Type**

bool

Default value

0x0

Enable SAU region3 at reset.

SAU_REGION3.LADDR**Type**

int

Default value

0x0

Limit address of SAU region3 at reset.

SAU_REGION3.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region3 at reset.

SAU_REGION30.BADDR**Type**

int

Default value

0x0

Base address of SAU region30 at reset.

SAU_REGION30.ENABLE**Type**

bool

Default value

0x0

Enable SAU region30 at reset.

SAU_REGION30.LADDR**Type**

int

Default value

0x0

Limit address of SAU region30 at reset.

SAU_REGION30.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region30 at reset.

SAU_REGION31.BADDR**Type**

int

Default value

0x0

Base address of SAU region31 at reset.

SAU_REGION31.ENABLE**Type**

bool

Default value

0x0

Enable SAU region31 at reset.

SAU_REGION31.LADDR**Type**

int

Default value

0x0

Limit address of SAU region31 at reset.

SAU_REGION31.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region31 at reset.

SAU_REGION32.BADDR**Type**

int

Default value

0x0

Base address of SAU region32 at reset.

SAU_REGION32.ENABLE**Type**

bool

Default value

0x0

Enable SAU region32 at reset.

SAU_REGION32.LADDR**Type**

int

Default value

0x0

Limit address of SAU region32 at reset.

SAU_REGION32.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region32 at reset.

SAU_REGION33.BADDR**Type**

int

Default value

0x0

Base address of SAU region33 at reset.

SAU_REGION33.ENABLE**Type**

bool

Default value

0x0

Enable SAU region33 at reset.

SAU_REGION33.LADDR**Type**

int

Default value

0x0

Limit address of SAU region33 at reset.

SAU_REGION33.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region33 at reset.

SAU_REGION34.BADDR**Type**

int

Default value

0x0

Base address of SAU region34 at reset.

SAU_REGION34.ENABLE**Type**

bool

Default value

0x0

Enable SAU region34 at reset.

SAU_REGION34.LADDR**Type**

int

Default value

0x0

Limit address of SAU region34 at reset.

SAU_REGION34.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region34 at reset.

SAU_REGION35.BADDR**Type**

int

Default value

0x0

Base address of SAU region35 at reset.

SAU_REGION35.ENABLE**Type**

bool

Default value

0x0

Enable SAU region35 at reset.

SAU_REGION35.LADDR**Type**

int

Default value

0x0

Limit address of SAU region35 at reset.

SAU_REGION35.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region35 at reset.

SAU_REGION36.BADDR**Type**

int

Default value

0x0

Base address of SAU region36 at reset.

SAU_REGION36.ENABLE**Type**

bool

Default value

0x0

Enable SAU region36 at reset.

SAU_REGION36.LADDR**Type**

int

Default value

0x0

Limit address of SAU region36 at reset.

SAU_REGION36.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region36 at reset.

SAU_REGION37.BADDR**Type**

int

Default value

0x0

Base address of SAU region37 at reset.

SAU_REGION37.ENABLE**Type**

bool

Default value

0x0

Enable SAU region37 at reset.

SAU_REGION37.LADDR**Type**

int

Default value

0x0

Limit address of SAU region37 at reset.

SAU_REGION37.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region37 at reset.

SAU_REGION38.BADDR**Type**

int

Default value

0x0

Base address of SAU region38 at reset.

SAU_REGION38.ENABLE**Type**

bool

Default value

0x0

Enable SAU region38 at reset.

SAU_REGION38.LADDR**Type**

int

Default value

0x0

Limit address of SAU region38 at reset.

SAU_REGION38.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region38 at reset.

SAU_REGION39.BADDR**Type**

int

Default value

0x0

Base address of SAU region39 at reset.

SAU_REGION39.ENABLE**Type**

bool

Default value

0x0

Enable SAU region39 at reset.

SAU_REGION39.LADDR**Type**

int

Default value

0x0

Limit address of SAU region39 at reset.

SAU_REGION39.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region39 at reset.

SAU_REGION4.BADDR**Type**

int

Default value

0x0

Base address of SAU region4 at reset.

SAU_REGION4.ENABLE**Type**

bool

Default value

0x0

Enable SAU region4 at reset.

SAU_REGION4.LADDR**Type**

int

Default value

0x0

Limit address of SAU region4 at reset.

SAU_REGION4.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region4 at reset.

SAU_REGION40.BADDR**Type**

int

Default value

0x0

Base address of SAU region40 at reset.

SAU_REGION40.ENABLE**Type**

bool

Default value

0x0

Enable SAU region40 at reset.

SAU_REGION40.LADDR**Type**

int

Default value

0x0

Limit address of SAU region40 at reset.

SAU_REGION40.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region40 at reset.

SAU_REGION41.BADDR**Type**

int

Default value

0x0

Base address of SAU region41 at reset.

SAU_REGION41.ENABLE**Type**

bool

Default value

0x0

Enable SAU region41 at reset.

SAU_REGION41.LADDR**Type**

int

Default value

0x0

Limit address of SAU region41 at reset.

SAU_REGION41.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region41 at reset.

SAU_REGION42.BADDR**Type**

int

Default value

0x0

Base address of SAU region42 at reset.

SAU_REGION42.ENABLE**Type**

bool

Default value

0x0

Enable SAU region42 at reset.

SAU_REGION42.LADDR**Type**

int

Default value

0x0

Limit address of SAU region42 at reset.

SAU_REGION42.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region42 at reset.

SAU_REGION43.BADDR**Type**

int

Default value

0x0

Base address of SAU region43 at reset.

SAU_REGION43.ENABLE**Type**

bool

Default value

0x0

Enable SAU region43 at reset.

SAU_REGION43.LADDR**Type**

int

Default value

0x0

Limit address of SAU region43 at reset.

SAU_REGION43.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region43 at reset.

SAU_REGION44.BADDR**Type**

int

Default value

0x0

Base address of SAU region44 at reset.

SAU_REGION44.ENABLE**Type**

bool

Default value

0x0

Enable SAU region44 at reset.

SAU_REGION44.LADDR**Type**

int

Default value

0x0

Limit address of SAU region44 at reset.

SAU_REGION44.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region44 at reset.

SAU_REGION45.BADDR**Type**

int

Default value

0x0

Base address of SAU region45 at reset.

SAU_REGION45.ENABLE**Type**

bool

Default value

0x0

Enable SAU region45 at reset.

SAU_REGION45.LADDR**Type**

int

Default value

0x0

Limit address of SAU region45 at reset.

SAU_REGION45.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region45 at reset.

SAU_REGION46.BADDR**Type**

int

Default value

0x0

Base address of SAU region46 at reset.

SAU_REGION46.ENABLE**Type**

bool

Default value

0x0

Enable SAU region46 at reset.

SAU_REGION46.LADDR**Type**

int

Default value

0x0

Limit address of SAU region46 at reset.

SAU_REGION46.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region46 at reset.

SAU_REGION47.BADDR**Type**

int

Default value

0x0

Base address of SAU region47 at reset.

SAU_REGION47.ENABLE**Type**

bool

Default value

0x0

Enable SAU region47 at reset.

SAU_REGION47.LADDR**Type**

int

Default value

0x0

Limit address of SAU region47 at reset.

SAU_REGION47.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region47 at reset.

SAU_REGION48.BADDR**Type**

int

Default value

0x0

Base address of SAU region48 at reset.

SAU_REGION48.ENABLE**Type**

bool

Default value

0x0

Enable SAU region48 at reset.

SAU_REGION48.LADDR**Type**

int

Default value

0x0

Limit address of SAU region48 at reset.

SAU_REGION48.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region48 at reset.

SAU_REGION49.BADDR**Type**

int

Default value

0x0

Base address of SAU region49 at reset.

SAU_REGION49.ENABLE**Type**

bool

Default value

0x0

Enable SAU region49 at reset.

SAU_REGION49.LADDR**Type**

int

Default value

0x0

Limit address of SAU region49 at reset.

SAU_REGION49.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region49 at reset.

SAU_REGION5.BADDR**Type**

int

Default value

0x0

Base address of SAU region5 at reset.

SAU_REGION5.ENABLE**Type**

bool

Default value

0x0

Enable SAU region5 at reset.

SAU_REGION5.LADDR**Type**

int

Default value

0x0

Limit address of SAU region5 at reset.

SAU_REGION5.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region5 at reset.

SAU_REGION50.BADDR**Type**

int

Default value

0x0

Base address of SAU region50 at reset.

SAU_REGION50.ENABLE**Type**

bool

Default value

0x0

Enable SAU region50 at reset.

SAU_REGION50.LADDR**Type**

int

Default value

0x0

Limit address of SAU region50 at reset.

SAU_REGION50.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region50 at reset.

SAU_REGION51.BADDR**Type**

int

Default value

0x0

Base address of SAU region51 at reset.

SAU_REGION51.ENABLE**Type**

bool

Default value

0x0

Enable SAU region51 at reset.

SAU_REGION51.LADDR**Type**

int

Default value

0x0

Limit address of SAU region51 at reset.

SAU_REGION51.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region51 at reset.

SAU_REGION52.BADDR**Type**

int

Default value

0x0

Base address of SAU region52 at reset.

SAU_REGION52.ENABLE**Type**

bool

Default value

0x0

Enable SAU region52 at reset.

SAU_REGION52.LADDR**Type**

int

Default value

0x0

Limit address of SAU region52 at reset.

SAU_REGION52.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region52 at reset.

SAU_REGION53.BADDR**Type**

int

Default value

0x0

Base address of SAU region53 at reset.

SAU_REGION53.ENABLE**Type**

bool

Default value

0x0

Enable SAU region53 at reset.

SAU_REGION53.LADDR**Type**

int

Default value

0x0

Limit address of SAU region53 at reset.

SAU_REGION53.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region53 at reset.

SAU_REGION54.BADDR**Type**

int

Default value

0x0

Base address of SAU region54 at reset.

SAU_REGION54.ENABLE**Type**

bool

Default value

0x0

Enable SAU region54 at reset.

SAU_REGION54.LADDR**Type**

int

Default value

0x0

Limit address of SAU region54 at reset.

SAU_REGION54.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region54 at reset.

SAU_REGION55.BADDR**Type**

int

Default value

0x0

Base address of SAU region55 at reset.

SAU_REGION55.ENABLE**Type**

bool

Default value

0x0

Enable SAU region55 at reset.

SAU_REGION55.LADDR**Type**

int

Default value

0x0

Limit address of SAU region55 at reset.

SAU_REGION55.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region55 at reset.

SAU_REGION56.BADDR**Type**

int

Default value

0x0

Base address of SAU region56 at reset.

SAU_REGION56.ENABLE**Type**

bool

Default value

0x0

Enable SAU region56 at reset.

SAU_REGION56.LADDR**Type**

int

Default value

0x0

Limit address of SAU region56 at reset.

SAU_REGION56.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region56 at reset.

SAU_REGION57.BADDR**Type**

int

Default value

0x0

Base address of SAU region57 at reset.

SAU_REGION57.ENABLE**Type**

bool

Default value

0x0

Enable SAU region57 at reset.

SAU_REGION57.LADDR**Type**

int

Default value

0x0

Limit address of SAU region57 at reset.

SAU_REGION57.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region57 at reset.

SAU_REGION58.BADDR**Type**

int

Default value

0x0

Base address of SAU region58 at reset.

SAU_REGION58.ENABLE**Type**

bool

Default value

0x0

Enable SAU region58 at reset.

SAU_REGION58.LADDR**Type**

int

Default value

0x0

Limit address of SAU region58 at reset.

SAU_REGION58.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region58 at reset.

SAU_REGION59.BADDR**Type**

int

Default value

0x0

Base address of SAU region59 at reset.

SAU_REGION59.ENABLE**Type**

bool

Default value

0x0

Enable SAU region59 at reset.

SAU_REGION59.LADDR**Type**

int

Default value

0x0

Limit address of SAU region59 at reset.

SAU_REGION59.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region59 at reset.

SAU_REGION6.BADDR**Type**

int

Default value

0x0

Base address of SAU region6 at reset.

SAU_REGION6.ENABLE**Type**

bool

Default value

0x0

Enable SAU region6 at reset.

SAU_REGION6.LADDR**Type**

int

Default value

0x0

Limit address of SAU region6 at reset.

SAU_REGION6.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region6 at reset.

SAU_REGION60.BADDR**Type**

int

Default value

0x0

Base address of SAU region60 at reset.

SAU_REGION60.ENABLE**Type**

bool

Default value

0x0

Enable SAU region60 at reset.

SAU_REGION60.LADDR**Type**

int

Default value

0x0

Limit address of SAU region60 at reset.

SAU_REGION60.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region60 at reset.

SAU_REGION61.BADDR**Type**

int

Default value

0x0

Base address of SAU region61 at reset.

SAU_REGION61.ENABLE**Type**

bool

Default value

0x0

Enable SAU region61 at reset.

SAU_REGION61.LADDR**Type**

int

Default value

0x0

Limit address of SAU region61 at reset.

SAU_REGION61.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region61 at reset.

SAU_REGION62.BADDR**Type**

int

Default value

0x0

Base address of SAU region62 at reset.

SAU_REGION62.ENABLE**Type**

bool

Default value

0x0

Enable SAU region62 at reset.

SAU_REGION62.LADDR**Type**

int

Default value

0x0

Limit address of SAU region62 at reset.

SAU_REGION62.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region62 at reset.

SAU_REGION63.BADDR**Type**

int

Default value

0x0

Base address of SAU region63 at reset.

SAU_REGION63.ENABLE**Type**

bool

Default value

0x0

Enable SAU region63 at reset.

SAU_REGION63.LADDR**Type**

int

Default value

0x0

Limit address of SAU region63 at reset.

SAU_REGION63.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region63 at reset.

SAU_REGION64.BADDR**Type**

int

Default value

0x0

Base address of SAU region64 at reset.

SAU_REGION64.ENABLE**Type**

bool

Default value

0x0

Enable SAU region64 at reset.

SAU_REGION64.LADDR**Type**

int

Default value

0x0

Limit address of SAU region64 at reset.

SAU_REGION64.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region64 at reset.

SAU_REGION65.BADDR**Type**

int

Default value

0x0

Base address of SAU region65 at reset.

SAU_REGION65.ENABLE**Type**

bool

Default value

0x0

Enable SAU region65 at reset.

SAU_REGION65.LADDR**Type**

int

Default value

0x0

Limit address of SAU region65 at reset.

SAU_REGION65.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region65 at reset.

SAU_REGION66.BADDR**Type**

int

Default value

0x0

Base address of SAU region66 at reset.

SAU_REGION66.ENABLE**Type**

bool

Default value

0x0

Enable SAU region66 at reset.

SAU_REGION66.LADDR**Type**

int

Default value

0x0

Limit address of SAU region66 at reset.

SAU_REGION66.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region66 at reset.

SAU_REGION67.BADDR**Type**

int

Default value

0x0

Base address of SAU region67 at reset.

SAU_REGION67.ENABLE**Type**

bool

Default value

0x0

Enable SAU region67 at reset.

SAU_REGION67.LADDR**Type**

int

Default value

0x0

Limit address of SAU region67 at reset.

SAU_REGION67.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region67 at reset.

SAU_REGION68.BADDR**Type**

int

Default value

0x0

Base address of SAU region68 at reset.

SAU_REGION68.ENABLE**Type**

bool

Default value

0x0

Enable SAU region68 at reset.

SAU_REGION68.LADDR**Type**

int

Default value

0x0

Limit address of SAU region68 at reset.

SAU_REGION68.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region68 at reset.

SAU_REGION69.BADDR**Type**

int

Default value

0x0

Base address of SAU region69 at reset.

SAU_REGION69.ENABLE**Type**

bool

Default value

0x0

Enable SAU region69 at reset.

SAU_REGION69.LADDR**Type**

int

Default value

0x0

Limit address of SAU region69 at reset.

SAU_REGION69.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region69 at reset.

SAU_REGION7.BADDR**Type**

int

Default value

0x0

Base address of SAU region7 at reset.

SAU_REGION7.ENABLE**Type**

bool

Default value

0x0

Enable SAU region7 at reset.

SAU_REGION7.LADDR**Type**

int

Default value

0x0

Limit address of SAU region7 at reset.

SAU_REGION7.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region7 at reset.

SAU_REGION70.BADDR**Type**

int

Default value

0x0

Base address of SAU region70 at reset.

SAU_REGION70.ENABLE**Type**

bool

Default value

0x0

Enable SAU region70 at reset.

SAU_REGION70.LADDR**Type**

int

Default value

0x0

Limit address of SAU region70 at reset.

SAU_REGION70.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region70 at reset.

SAU_REGION71.BADDR**Type**

int

Default value

0x0

Base address of SAU region71 at reset.

SAU_REGION71.ENABLE**Type**

bool

Default value

0x0

Enable SAU region71 at reset.

SAU_REGION71.LADDR**Type**

int

Default value

0x0

Limit address of SAU region71 at reset.

SAU_REGION71.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region71 at reset.

SAU_REGION72.BADDR**Type**

int

Default value

0x0

Base address of SAU region72 at reset.

SAU_REGION72.ENABLE**Type**

bool

Default value

0x0

Enable SAU region72 at reset.

SAU_REGION72.LADDR**Type**

int

Default value

0x0

Limit address of SAU region72 at reset.

SAU_REGION72.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region72 at reset.

SAU_REGION73.BADDR**Type**

int

Default value

0x0

Base address of SAU region73 at reset.

SAU_REGION73.ENABLE**Type**

bool

Default value

0x0

Enable SAU region73 at reset.

SAU_REGION73.LADDR**Type**

int

Default value

0x0

Limit address of SAU region73 at reset.

SAU_REGION73.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region73 at reset.

SAU_REGION74.BADDR**Type**

int

Default value

0x0

Base address of SAU region74 at reset.

SAU_REGION74.ENABLE**Type**

bool

Default value

0x0

Enable SAU region74 at reset.

SAU_REGION74.LADDR**Type**

int

Default value

0x0

Limit address of SAU region74 at reset.

SAU_REGION74.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region74 at reset.

SAU_REGION75.BADDR**Type**

int

Default value

0x0

Base address of SAU region75 at reset.

SAU_REGION75.ENABLE**Type**

bool

Default value

0x0

Enable SAU region75 at reset.

SAU_REGION75.LADDR**Type**

int

Default value

0x0

Limit address of SAU region75 at reset.

SAU_REGION75.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region75 at reset.

SAU_REGION76.BADDR**Type**

int

Default value

0x0

Base address of SAU region76 at reset.

SAU_REGION76.ENABLE**Type**

bool

Default value

0x0

Enable SAU region76 at reset.

SAU_REGION76.LADDR**Type**

int

Default value

0x0

Limit address of SAU region76 at reset.

SAU_REGION76.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region76 at reset.

SAU_REGION77.BADDR**Type**

int

Default value

0x0

Base address of SAU region77 at reset.

SAU_REGION77.ENABLE**Type**

bool

Default value

0x0

Enable SAU region77 at reset.

SAU_REGION77.LADDR**Type**

int

Default value

0x0

Limit address of SAU region77 at reset.

SAU_REGION77.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region77 at reset.

SAU_REGION78.BADDR**Type**

int

Default value

0x0

Base address of SAU region78 at reset.

SAU_REGION78.ENABLE**Type**

bool

Default value

0x0

Enable SAU region78 at reset.

SAU_REGION78.LADDR**Type**

int

Default value

0x0

Limit address of SAU region78 at reset.

SAU_REGION78.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region78 at reset.

SAU_REGION79.BADDR**Type**

int

Default value

0x0

Base address of SAU region79 at reset.

SAU_REGION79.ENABLE**Type**

bool

Default value

0x0

Enable SAU region79 at reset.

SAU_REGION79.LADDR**Type**

int

Default value

0x0

Limit address of SAU region79 at reset.

SAU_REGION79.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region79 at reset.

SAU_REGION8.BADDR**Type**

int

Default value

0x0

Base address of SAU region8 at reset.

SAU_REGION8.ENABLE**Type**

bool

Default value

0x0

Enable SAU region8 at reset.

SAU_REGION8.LADDR**Type**

int

Default value

0x0

Limit address of SAU region8 at reset.

SAU_REGION8.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region8 at reset.

SAU_REGION80.BADDR**Type**

int

Default value

0x0

Base address of SAU region80 at reset.

SAU_REGION80.ENABLE**Type**

bool

Default value

0x0

Enable SAU region80 at reset.

SAU_REGION80.LADDR**Type**

int

Default value

0x0

Limit address of SAU region80 at reset.

SAU_REGION80.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region80 at reset.

SAU_REGION81.BADDR**Type**

int

Default value

0x0

Base address of SAU region81 at reset.

SAU_REGION81.ENABLE**Type**

bool

Default value

0x0

Enable SAU region81 at reset.

SAU_REGION81.LADDR**Type**

int

Default value

0x0

Limit address of SAU region81 at reset.

SAU_REGION81.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region81 at reset.

SAU_REGION82.BADDR**Type**

int

Default value

0x0

Base address of SAU region82 at reset.

SAU_REGION82.ENABLE**Type**

bool

Default value

0x0

Enable SAU region82 at reset.

SAU_REGION82.LADDR**Type**

int

Default value

0x0

Limit address of SAU region82 at reset.

SAU_REGION82.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region82 at reset.

SAU_REGION83.BADDR**Type**

int

Default value

0x0

Base address of SAU region83 at reset.

SAU_REGION83.ENABLE**Type**

bool

Default value

0x0

Enable SAU region83 at reset.

SAU_REGION83.LADDR**Type**

int

Default value

0x0

Limit address of SAU region83 at reset.

SAU_REGION83.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region83 at reset.

SAU_REGION84.BADDR**Type**

int

Default value

0x0

Base address of SAU region84 at reset.

SAU_REGION84.ENABLE**Type**

bool

Default value

0x0

Enable SAU region84 at reset.

SAU_REGION84.LADDR**Type**

int

Default value

0x0

Limit address of SAU region84 at reset.

SAU_REGION84.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region84 at reset.

SAU_REGION85.BADDR**Type**

int

Default value

0x0

Base address of SAU region85 at reset.

SAU_REGION85.ENABLE**Type**

bool

Default value

0x0

Enable SAU region85 at reset.

SAU_REGION85.LADDR**Type**

int

Default value

0x0

Limit address of SAU region85 at reset.

SAU_REGION85.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region85 at reset.

SAU_REGION86.BADDR**Type**

int

Default value

0x0

Base address of SAU region86 at reset.

SAU_REGION86.ENABLE**Type**

bool

Default value

0x0

Enable SAU region86 at reset.

SAU_REGION86.LADDR**Type**

int

Default value

0x0

Limit address of SAU region86 at reset.

SAU_REGION86.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region86 at reset.

SAU_REGION87.BADDR**Type**

int

Default value

0x0

Base address of SAU region87 at reset.

SAU_REGION87.ENABLE**Type**

bool

Default value

0x0

Enable SAU region87 at reset.

SAU_REGION87.LADDR**Type**

int

Default value

0x0

Limit address of SAU region87 at reset.

SAU_REGION87.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region87 at reset.

SAU_REGION88.BADDR**Type**

int

Default value

0x0

Base address of SAU region88 at reset.

SAU_REGION88.ENABLE**Type**

bool

Default value

0x0

Enable SAU region88 at reset.

SAU_REGION88.LADDR**Type**

int

Default value

0x0

Limit address of SAU region88 at reset.

SAU_REGION88.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region88 at reset.

SAU_REGION89.BADDR**Type**

int

Default value

0x0

Base address of SAU region89 at reset.

SAU_REGION89.ENABLE**Type**

bool

Default value

0x0

Enable SAU region89 at reset.

SAU_REGION89.LADDR**Type**

int

Default value

0x0

Limit address of SAU region89 at reset.

SAU_REGION89.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region89 at reset.

SAU_REGION9.BADDR**Type**

int

Default value

0x0

Base address of SAU region9 at reset.

SAU_REGION9.ENABLE**Type**

bool

Default value

0x0

Enable SAU region9 at reset.

SAU_REGION9.LADDR**Type**

int

Default value

0x0

Limit address of SAU region9 at reset.

SAU_REGION9.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region9 at reset.

SAU_REGION90.BADDR**Type**

int

Default value

0x0

Base address of SAU region90 at reset.

SAU_REGION90.ENABLE**Type**

bool

Default value

0x0

Enable SAU region90 at reset.

SAU_REGION90.LADDR**Type**

int

Default value

0x0

Limit address of SAU region90 at reset.

SAU_REGION90.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region90 at reset.

SAU_REGION91.BADDR**Type**

int

Default value

0x0

Base address of SAU region91 at reset.

SAU_REGION91.ENABLE**Type**

bool

Default value

0x0

Enable SAU region91 at reset.

SAU_REGION91.LADDR**Type**

int

Default value

0x0

Limit address of SAU region91 at reset.

SAU_REGION91.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region91 at reset.

SAU_REGION92.BADDR**Type**

int

Default value

0x0

Base address of SAU region92 at reset.

SAU_REGION92.ENABLE**Type**

bool

Default value

0x0

Enable SAU region92 at reset.

SAU_REGION92.LADDR**Type**

int

Default value

0x0

Limit address of SAU region92 at reset.

SAU_REGION92.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region92 at reset.

SAU_REGION93.BADDR**Type**

int

Default value

0x0

Base address of SAU region93 at reset.

SAU_REGION93.ENABLE**Type**

bool

Default value

0x0

Enable SAU region93 at reset.

SAU_REGION93.LADDR**Type**

int

Default value

0x0

Limit address of SAU region93 at reset.

SAU_REGION93.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region93 at reset.

SAU_REGION94.BADDR**Type**

int

Default value

0x0

Base address of SAU region94 at reset.

SAU_REGION94.ENABLE**Type**

bool

Default value

0x0

Enable SAU region94 at reset.

SAU_REGION94.LADDR**Type**

int

Default value

0x0

Limit address of SAU region94 at reset.

SAU_REGION94.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region94 at reset.

SAU_REGION95.BADDR**Type**

int

Default value

0x0

Base address of SAU region95 at reset.

SAU_REGION95.ENABLE**Type**

bool

Default value

0x0

Enable SAU region95 at reset.

SAU_REGION95.LADDR**Type**

int

Default value

0x0

Limit address of SAU region95 at reset.

SAU_REGION95.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region95 at reset.

SAU_REGION96.BADDR**Type**

int

Default value

0x0

Base address of SAU region96 at reset.

SAU_REGION96.ENABLE**Type**

bool

Default value

0x0

Enable SAU region96 at reset.

SAU_REGION96.LADDR**Type**

int

Default value

0x0

Limit address of SAU region96 at reset.

SAU_REGION96.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region96 at reset.

SAU_REGION97.BADDR**Type**

int

Default value

0x0

Base address of SAU region97 at reset.

SAU_REGION97.ENABLE**Type**

bool

Default value

0x0

Enable SAU region97 at reset.

SAU_REGION97.LADDR**Type**

int

Default value

0x0

Limit address of SAU region97 at reset.

SAU_REGION97.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region97 at reset.

SAU_REGION98.BADDR**Type**

int

Default value

0x0

Base address of SAU region98 at reset.

SAU_REGION98.ENABLE**Type**

bool

Default value

0x0

Enable SAU region98 at reset.

SAU_REGION98.LADDR**Type**

int

Default value

0x0

Limit address of SAU region98 at reset.

SAU_REGION98.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region98 at reset.

SAU_REGION99.BADDR**Type**

int

Default value

0x0

Base address of SAU region99 at reset.

SAU_REGION99.ENABLE**Type**

bool

Default value

0x0

Enable SAU region99 at reset.

SAU_REGION99.LADDR**Type**

int

Default value

0x0

Limit address of SAU region99 at reset.

SAU_REGION99.NSC**Type**

bool

Default value

0x0

Set NSC for SAU region99 at reset.

SAU_TYPE.SREGION**Type**

int

Default value

0x10

Number of SAU regions (0 => no SAU).

SECEXT**Type**

bool

Default value

0x1

Whether the ARMv8-M Security Extensions are included.

SYST**Type**

int

Default value

0x2

Include SysTick timer functionality (0=Absent, 1=Secure only, 2=Secure and NS).

SYST_CALIB_NS_reset**Type**

int

Default value

0x0

SYST_CALIB_NS reset value.

SYST_CALIB_reset**Type**

int

Default value

0x0

SYST_CALIB reset value.

VTOR_NS**Type**

bool

Default value

0x1

NonSecure Vector Table Offset Register is writeable.

VTOR_NS_MASK**Type**

int

Default value

0xffffffff80

Non-Secure VTOR write mask.

VTOR_S**Type**

bool

Default value

0x1

Secure Vector Table Offset Register is writeable.

VTOR_S_MASK**Type**

int

Default value

0xffffffff80

Secure VTOR write mask.

WIC**Type**

bool

Default value

0x1

Include support for WIC-mode deep sleep.

abort_unaligned_nonNormal**Type**

bool

Default value

0x1

If true, UNPREDICTABLE accesses of device and strongly ordered memory abort; if false they are allowed.

aircr_iesb_is_writable**Type**

bool

Default value

0x1

IS the AIRCR.IESB bit [5] writable?.

aircr_iesb_reset**Type**

bool

Default value

0x0

Set the AIRCR.IESB bit [5] after reset.

allow_dap_writes_while_core_running**Type**

bool

Default value

0x1

Debug writes are respected even while the core is running, i.e. the core does not have to be halted.

allow_debug_monitor_with_in_flight_inst**Type**

bool

Default value

0x0

Allow handling Debug Monitor exception with in-flight instructions.

allow_stack_accesses_to_ppb_space**Type**

bool

Default value

0x0

Allow stack accesses to PPB space.

always_undefinstr_over_nocp**Type**

bool

Default value

0x0

Only v8.0M. Always fault with UNDEFINSTR for undefined instructions that fall in CP space (don't check coprocessor status).

apply_prigroup_to_pending_tree**Type**

bool

Default value

0x0

DEPRECATED: please use sep_sec_state_then_apply_prigroup_to_pending. Original description: Apply AIRCR.PRIGROUP to the pending and active trees (instead of just the active tree) when selecting the highest priority pending exception.

baseline**Type**

bool

Default value

0x1

Use the baseline profile (if false, use mainline).

bp_on_2nd_halfword**Type**

bool

Default value

0x1

Respect DWT/BPU breakpoint-hit on 2nd halfword of 32-bit instruction.

callee_register_push_low_to_high**Type**

bool

Default value

0x1

If true, push callee registers in order from R4 to R11. If false, push R11 to R4.

cde_fp_check_on_unsupported**Type**

bool

Default value

0x0

Run FP checks on both supported and unsupported CDE instructions.

cde_impl_name**Type**

string

Default value

""

Name of the CDE implementation for this core (implementation contributed by MTI plugin).

clear_non_secure_EXC_RETURN.ES_on_tailchain**Type**

bool

Default value

0x1

Clear EXC_RETURN.ES in LR value on entry to a tail-chained exception when returning from Non-secure state.

condition_flags_reset**Type**

int

Default value

0x0

Reset Value of condition flags in APSR.

cpi_div**Type**

int

Default value

0x1

divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

multiplier for calculating CPI (Cycles Per Instruction).

cpu_can_access_debug_regs**Type**

bool

Default value

0x1

The DWT, BPU, ROM table, DCB, and the SHCSR and DFSR registers access from the processor.

dbg_coproc_load_store_enable**Type**

int

Default value

0x0

Enable LDCX and STCX instructions.

dcache-invalidate-ns-cleans-s**Type**

bool

Default value

0x0

Whether V8M DCI* in non-secure should clean-and-invalidate secure cache contents.

dcache-size**Type**

int

Default value

0x8000

L1 D-cache size in bytes.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

delay_faultmask_update**Type**

bool

Default value

0x0

Delay FAULTMASK update to context sync.

delay_sysreg_update**Type**

bool

Default value

0x0

Delay some system register updates (e.g. SHCSR) to context sync.

do_exclusive_monitor_check_first**Type**

bool

Default value

0x0

In exclusive stores, check local exclusive monitor before detecting other memory aborts.

drop_mem_fault**Type**

bool

Default value

0x0

Whether to drop mem_fault in favour of subsequently generated NOCP/secure fault in PushStack.

dtcm_enable**Type**

bool

Default value

0x0

Enable DTCM at reset.

dtcm_size**Type**

int

Default value

0x100

DTCM size in KB.

dwt_unaligned_word_access_as_half_word**Type**

bool

Default value

0x1

DWT Treat unaligned word access as half word or bytes.

enable_helium_extension**Type**

bool

Default value

0x0

Enable Helium extension.

exercise_strex_fail**Type**

bool

Default value

0x0

Reject a pseudo-random majority of exclusive store instructions.

has_ahbp**Type**

bool

Default value

0x1

Are Vendor-Sys accesses sent to a separate bus (AHBP on CM7).

has_arm_v8-1m**Type**

bool

Default value

0x0

Enable v8.1M architecture version and features.

has_cde**Type**

bool

Default value

0x0

Enables Custom Datapath Extensions.

has_core_dside_bus_gasket**Type**

bool

Default value

0x0

STL gasket enabled.

has_lob_cache**Type**

bool

Default value

0x1

Support for LOB cache (only if support for LO instructions is enabled as well).

has_m55_tcmcr**Type**

bool

Default value

0x0

If true, enables the CortexM55 TCM Control Registers (ITCMCR and DTCMCR), If false, CortexM55 TCM Control Registers are disabled.

has_pmu**Type**

bool

Default value

0x0

Availability of optional PMU.

has_separate_etm_reset**Type**

bool

Default value

0x0

If true, signal 'etmreset' resets the core, else the core power-on-reset does.

has_unpriviledged_debug**Type**

bool

Default value

0x1

Unprivileged Debug Extension supported for Mainline Extension.

has_writebuffer**Type**

bool

Default value

0x0

Implement write accesses buffering before L1 cache. May affect ext_abort behaviour.

icache-size**Type**

int

Default value

0x8000

L1 I-cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

ignore_RNR_top_nibble**Type**

bool

Default value

0x0

If set, only the bottom four bits of MPU_RNR.REGION are used.

ignore_demcr_sdme_for_nonhalting_bkpt**Type**

bool

Default value

0x0

Ignore the SDME bit of the DEMCR register when escalating a Debug Monitor exception to a HardFault.

ignore_out_of_range_RNR_write**Type**

bool

Default value

0x0

If an MPU_RNR.REGION write is out of range, ignore it ; if false, MPU_RNR values wrap.

ignore_unpred_SBZSBO**Type**

bool

Default value

0x0

Use smaller decoder does not UNDEF some unpredictable SBZ/SBO fields.

ignore_unpred_ZeroRegistersInList**Type**

bool

Default value

0x0

VLDM,VSTM,STM,LDM with no registers NOP instead of UNDEF.

itcm_enable**Type**

bool

Default value

0x0

Enable ITCM at reset.

itcm_size**Type**

int

Default value

0x100

ITCM size in KB.

late_arrival**Type**

bool

Default value

0x1

Enable late arrival support.

master_id**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

mve_has_atomic_ticks**Type**

bool

Default value

0x0

Enable atomic ticks behaviour for vector instructions flagged as such (e.g. VLDR).

num_pmu_counters**Type**

int

Default value

0x1f

Number of available PMU counters.

number_of_itm_stimulus_ports**Type**

int

Default value

0x20

The number of ITM stimulus ports.

pend_overriden_exception_on_stack_push**Type**

bool

Default value

0x0

Mark any overridden exceptions on stack push as pending (instead of dropping them).

preserve_unknown_caller_save_regs_at_S_to_S**Type**

bool

Default value

0x1

preserve unknown caller registers when they become UNKNOWN at secure to secure.

ras_ERRFR0**Type**

string

Default value

"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR1**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR10**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR11**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR12**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR13**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ
e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR14**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ
e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR15**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ
e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR16**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ
e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR17**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR18**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR19**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR2**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR20**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR21**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR22**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR23**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR24**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ
e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR25**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ
e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR26**Type**

string

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ
e.g. {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}.

ras_ERRFR27**Type**

string

Default value

```

Default value

```
"{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}"
```

A JSON object or array of objects for each field of ERRFR. Records not described default to RAZ
e.g. '{"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x2, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x1, "CI":0x2}'.

ras_cei_pin**Type**

int

Default value

0x2

RAS: Critical error interrupt pin.

ras_cei_support**Type**

bool

Default value

0x1

RAS: Whether Critical Error Interrupt is supported.

ras_eri_pin**Type**

int

Default value

0x1

RAS: Error recovery interrupt pin.

ras_eri_support**Type**

bool

Default value

0x1

RAS: Whether Error Recovery Interrupt is supported.

ras_error_record**Type**

int

Default value

0xffffffffffffffff

56 bit value that specifies which nodes out of 0-55 are implemented (ERRDEVID is derived from this parameter).

ras_fhi_pin**Type**

int

Default value

0x0

RAS: Fault handling interrupt pin.

ras_fhi_support**Type**

bool

Default value

0x1

RAS: Whether Fault Handling Interrupt is supported.

rd_ns_bus_err_behave**Type**

int

Default value

0x1

External read aborts in nonsecure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

rd_s_bus_err_behave**Type**

int

Default value

0x1

External read aborts in secure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

register_reset_data**Type**

int

Default value

0x0

Data used to fill register bits when they become UNKNOWN at reset.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the CUID register. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0x20700000

Virtual address of top of heap.

semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

semihosting-stack_base**Type**

int

Default value

0x20800000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0x20700000

Virtual address of stack limit.

sep_sec_state_then_apply_prigroup_to_pending**Type**

bool

Default value

0x0

Use separate comparison trees for Secure and Non-Secure pending exceptions and apply AIRCR.PRIGROUP to the output of each before they are compared to determine the overall highest priority.

sequential_security_transitions**Type**

int

Default value

0x1

Allow transition of security state in sequential instruction fetches that cross from non-secure to secure memory with SG instruction 0: never, 1: always, 2: 32-bit instrs, 3: ISB.

share_fault_address_reg**Type**

bool

Default value

0x0

If true, Fault Address Register is shared.

stack_limit_check**Type**

int

Default value

0x7

Implementation defined stack limit checks for instructions. Bit 0: Load-exclusive, Bit 1: Load-acquire, Bit 2: VLDM. Any instruction that can't be configured does stack limit check by default.

stack_limit_check_optimization**Type**

bool

Default value

0x1

Stack limit check optimization (0: limit check done for each word on the stack, 1: limit check done only on stack pointer).

stacking_writes_are_precise

Type

bool

Default value

0x1

Faults on stack writes are precise.

supports_unprivileged

Type

bool

Default value

0x1

Enable support for Unprivileged/Privileged Extension.

tail_chain

Type

bool

Default value

0x1

Enable tail-chaining optimisation.

trace_style

Type

int

Default value

0x2

MVE instruction trace style: Add 16 for [**-] beat trace. Add 32 for tracing IMPLIED LOB instructions. Add 64 to change opcode of implied BF to 0xBF00.

unknown_regs_at_exception_value

Type

int

Default value

0x0

Data used to fill registers when they become UNKNOWN at exception and exception-return.

unpred_WriteBackandBaseInList_stores_old_base_value**Type**

bool

Default value

0x0

allow STM with write back to base register in register list.

unpred_mon_step_write**Type**

int

Default value

0x0

Behavior on unpredictable updates to MON_STEP bit of DEMCR. 0: ignore write, 1: set one, 2: set zero.

unpred_msr_psr_with_one_mask_and_nodsp_is_nop**Type**

bool

Default value

0x1

If true, MSR to *PSR with a one mask and no DSP does nothing.

unpred_msr_psr_with_zero_mask_is_nop**Type**

bool

Default value

0x0

If true, MSR to *PSR with a zero mask does nothing.

unstack_R_regs_before_fp_cp_check**Type**

bool

Default value

0x0

In exception return unstack normal register before checking fp coprocessor is enable to unstack FP register.

vector_fetch_as_wpt_event**Type**

bool

Default value

0x0

Watchpoint on exception vector fetch.

vector_fetch_busfault_sets_HFSR_FORCED**Type**

bool

Default value

0x0

Only v8.0M. Set HFSR.FORCED when a vector table read generates a HardFault.

vector_fetch_on_iside**Type**

bool

Default value

0x1

Perform vector fetch on I-side.

vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

wr_ns_bus_err_behave

Type
int

Default value
0x3

External write aborts in nonsecure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

wr_s_bus_err_behave

Type
int

Default value
0x3

External write aborts in secure domain 0:ignored, 1:precise, 2:imprecise, 3=imprecise except SO.

write_unknown_regs_at_exception

Type
bool

Default value
0x0

Do we write registers when they become UNKNOWN at exception or exception-return.

3.5.4 ARMCortexA5CT

ARMCortexA5CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-200: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA5CT

This model has the following Iris instances:

Table 3-201: ARMCortexA5CT Iris instances

InstanceName	ComponentName
ARMCortexA5CT	Cluster_ARM_Cortex-A5UP

InstanceName	ComponentName
ARMCortexA5CT.acp_mapper	PVBusMapper
ARMCortexA5CT.cpu0	ARM_Cortex-A5UP
ARMCortexA5CT.cpu0.UTLB	TLB
ARMCortexA5CT.cpu0.l1dcache	PVCache
ARMCortexA5CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA5CT.cpu0.l1licache	PVCache
ARMCortexA5CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA5CT.cpu0.utlb	TlbCadi
ARMCortexA5CT.ext_bus	PVBusLogger
ARMCortexA5CT.ext_bus.mapper	PVBusMapper
ARMCortexA5CT.l1_incoherent_interconnect	PVCache
ARMCortexA5CT.l1_incoherent_interconnect.upstream[0]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[10]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[11]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[12]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[13]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[14]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[15]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[16]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[17]	PVBusSlave

ARMCortexA5CT.l1_incoherent_interconnect.upstream[3]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[4]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[5]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[6]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[7]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexA5CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA5CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA5CT contains the following CADI targets:

- ARM_Cortex-A5UP
- Cluster_ARM_Cortex-A5UP
- PVCache
- TlbCadi

About ARMCortexA5CT

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv3-D32 are supported.

vfp present and ase not present

VFPv3-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv3-D32 support.

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.

Ports for ARMCortexA5CT**Table 3-203: Ports**

Name	Protocol	Type	Description
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgnmfi[1]	Signal	Slave	This signal disables FIQ mask in CPSR.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cp15sdisable[1]	Signal	Slave	This signal disables write access to some system control processor registers.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq[1]	Signal	Slave	This signal drives the CPU's interrupt handling.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[1]	Signal	Slave	This signal provides default exception handling state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	Signal	Slave	This signal controls the location of the exception vectors at reset.

Parameters for ARMCortexA5CT

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

cpi_div

Type

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul

Type

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND

Type

bool

Default value

0x0

Initialize to BE8 endianness.

cpuX.CFGNMFI

Type

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.POWERCTLI**Type**

int

Default value

0x0

Default power control state for processor.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether model has NEON support.

cpuX.dcache-size**Type**

int

Default value

0x8000

Set D-cache size in bytes.

cpuX.icache-size**Type**

int

Default value

0x8000

Set I-cache size in bytes.

cpuX.min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`device-accurate-tlb`**Type**

bool

Default value

0x0

Specify whether all TLBs are modeled.

`icache-hit_latency`**Type**

int

Default value

0x0

I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`icache-maintenance_latency`**Type**

int

Default value

0x0

I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

icache-miss_latency**Type**

int

Default value

0x0

I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

3.5.5 ARMCortexA5MPx1CT

ARMCortexA5MPx1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-204: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA5MPx1CT

This model has the following Iris instances:

Table 3-205: ARMCortexA5MPx1CT Iris instances

InstanceName	ComponentName
ARMCortexA5MPx1CT	Cluster_ARM_Cortex-A5MP
ARMCortexA5MPx1CT.acp_mapper	PVBusMapper
ARMCortexA5MPx1CT.cpu0	ARM_Cortex-A5MP

InstanceName	ComponentName
ARMCortexA5MPx1CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA5MPx1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA5MPx1CT contains the following CADI targets:

- ARM_Cortex-A5MP
- Cluster_ARM_Cortex-A5MP
- PVCache
- TlbCadi

About ARMCortexA5MPx1CT

- The following components also exist:
 - ARMCortexA5MPx2CT.
 - ARMCortexA5MPx4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv3-D32 are supported.

vfp present and ase not present

VFPv3-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv3-D32 support.

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- If you are using the `ARMCortexA5MPxnCT` component in a VE platform model, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- There is a single memory port combining instruction, data, DMA and peripheral access.
- The GIC does not respect the `CFGSDISABLE` signal. This leads to some registers being accessible when they must not be.

- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of *Wait For Interrupt* (WFI) to wake up.
- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require an L2 cache you can add a PL310 Level 2 Cache Controller component.

Ports for ARMCortexA5MPx1CT

Table 3-207: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
cfgend[1]	Signal	Slave	This signal is for EE bit initialisation.
cfgnmfi[1]	Signal	Slave	This signal disables FIQ mask in CPSR.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cp15sdisable[1]	Signal	Slave	This signal disables write access to some system control processor registers.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
filteren	Signal	Slave	This signal enables filtering of address ranges between master bus ports.
filterend	Value	Slave	This port sets end of region mapped to pvbus_m1.
filterstart	Value	Slave	This port sets start of region mapped to pvbus_m1.
fiq[1]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[1]	Signal	Master	This signal exports internal VGIC FIQ signal to the CPU.
ints[224]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq[1]	Signal	Slave	This signal drives the CPU's interrupt handling.
irqout[1]	Signal	Master	This signal exports internal VGIC IRQ signal to the CPU.
periphbase	Value	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down at least by factor of two.
periphreset	Signal	Slave	This signal resets timer and interrupt controller.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	AXI master 0 bus master channel.
pvbus_m1	PVBus	Master	AXI master 1 bus master channel.
pwrctl1[1]	Value	Slave	This port sets reset value for scu CPU status register.
pwrctl0[1]	Value	Master	This port sends scu CPU status register bits.

Name	Protocol	Type	Description
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
scureset	Signal	Slave	This signal resets SCU.
smpnamp[1]	Signal	Master	This signals AMP or SMP mode for each Cortex-A5 processor.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[1]	Signal	Slave	This signal provides default exception handling state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
wdreset[1]	Signal	Slave	This signal resets individual watchdog.
wdresetreq[1]	Signal	Master	This signal resets rest of the CA5MP system.

Parameters for ARM Cortex A5MPx1CT

CFGSDISABLE

Type

bool

Default value

0x0

Disable some accesses to GIC registers.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

FILTEREN

Type

bool

Default value

0x0

Enable filtering of accesses through pvbus_m0.

FILTEREND**Type**

int

Default value

0x0

End of region filtered to pvbus_m0.

FILTERSTART**Type**

int

Default value

0x0

Base of region filtered to pvbus_m0.

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

cpuX.CFGNMFI**Type**

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.POWERCTLI**Type**

int

Default value

0x0

Default power control state for processor.

cpuX.SMPnAMP**Type**

bool

Default value

0x0

Set whether the processor is part of a coherent domain.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether model has NEON support.

cpuX.dcache-size**Type**

int

Default value

0x8000

Set D-cache size in bytes.

cpuX.icache-size**Type**

int

Default value

0x8000

Set I-cache size in bytes.

cpuX.min_sync_level**Type**

int

Default value

0x0

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_latency`

Type

int

Default value

0x0

D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

dcache-write_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

device-accurate-tlb**Type**

bool

Default value

0x0

Specify whether all TLBs are modeled.

dic-spi_count**Type**

int

Default value

0x40

Number of shared peripheral interrupts implemented.

icache-hit_latency**Type**

int

Default value

0x0

I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

3.5.6 ARMCortexA7x1CT

ARMCortexA7x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-208: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA7x1CT

This model has the following Iris instances:

Table 3-209: ARMCortexA7x1CT Iris instances

InstanceName	ComponentName
ARMCortexA7x1CT	Cluster_ARM_Cortex-A7

ARMCortexA7x1CT contains the following CADI targets:

- ARM_Cortex-A7
- Cluster_ARM_Cortex-A7
- PVCache
- TlbCadi

About ARMCortexA7x1CT

- The following components also exist:
 - ARMCortexA7x2CT.
 - ARMCortexA7x3CT.
 - ARMCortexA7x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv4-D32 are supported.

vfp present and ase not present

VFPv4-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to true so model has Neon and VFPv4-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv4-D32 support.

- If you are using the ARMCortexA7x_nCT component in a VE platform model, the `PERIPBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

ACE limitation

AXI Coherency Extensions (ACE) are extensions to AXI4 that support system-level cache coherency between multiple clusters. The ACE cache models in the Arm® Cortex®-A15 and Cortex-A7, and the ACE support in the CCI-400 have the limitation that they only process one transaction at a time. Normally, the simulation processes each transaction to completion before allowing any master to generate another transaction. However, in the following situation the simulation might fail. If a SystemC bus slave calls `wait()` while it is processing a transaction, this call might allow another master to issue another transaction that passes through the CCI-400 or the

Cortex-A15 or Cortex-A7 caches. This situation could happen if a SystemC bus master running in another thread is connected to one of the ACE-lite ports on the CCI-400.

Differences between the CT model and RTL implementations

This model has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the CFGSDISABLE signal. This leads to some registers wrongly being accessible.
- The Broadcast Translation Lookaside Buffer (TLB) or cache operations in this model do not cause other cores in the cluster that are asleep because of Wait For Interrupt (WFI) to wake up.
- The model ignores the RR bit in the SCTLR.
- The model implements the Power Control Register in the system control coprocessor but writing to it does not change the behavior of the model.
- The model does not implement ETM registers.
- The model does not support the Cortex®-A7 mechanism to read the internal memory that the Cache and TLB structures use through the implementation defined region of the system coprocessor interface.
- The model does not upgrade DCIMVAC operations to DCCIMVAC.

Ports for ARMCortexA7x1CT

Table 3-211: Ports

Name	Protocol	Type	Description
axierrirq	Signal	Master	Imprecise aborts from the L2 are signaled by pulsing this pin, typically they are connect to an interrupt controller.
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	Signal	Slave	This signal controls the SCTLR.EE bit.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Outputs of the generic timers.
CNTPNSIRQ[4]	Signal	Master	Outputs of the generic timers.
CNTPSIRQ[4]	Signal	Master	Outputs of the generic timers.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Outputs of the generic timers.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some secure system control processor registers.
cpuporeset[4]	Signal	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.

Name	Protocol	Type	Description
fiq[4]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[4]	Signal	Master	This signal exports internal VGIC FIQ signal to the CPU..
irq[4]	Signal	Slave	This signal drives the CPU's interrupt handling.
irqout[4]	Signal	Master	This signal exports internal VGIC IRQ signal to the CPU.
irqs[480]	Signal	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	Signal	Slave	This signal resets the shared L2 memory system, interrupt controller and timer logic.
periphbase	Value_64	Slave	This port sets the base address of the private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
teinit[4]	Signal	Slave	This signal enables Thumb exceptions (controls the SCTLR.TE bit).
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	Signal	Slave	Virtual FIQ inputs. Note that the fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[4]	Signal	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ inputs. Note that the irq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Parameters for ARMCortexA7x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CFGSDISABLE**Type**

bool

Default value

0x0

Disable some accesses to GIC registers.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

`cpuX.CP15SDISABLE`**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

`cpuX.DBGROMADDR`**Type**

int

Default value

0x12000003

This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address.

`cpuX.DBGROMADDRV`**Type**

bool

Default value

0x1

If true this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

cpuX.DBGSELFADDR**Type**

int

Default value

0x10003

This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address.

cpuX.DBGSELFADDRV**Type**

bool

Default value

0x1

If true this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether CT model has been built with NEON support.

cpuX.l1_dcach**Type**

int

Default value

0x8000

Size of L1 D-cache.

cpuX.l1_icach**Type**

int

Default value

0x8000

Size of L1 I-cache.

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether CT model has been built with VFP support.

dic-spi_count**Type**

int

Default value

0x40

Number of shared peripheral interrupts implemented.

disable_periph_decoder**Type**

bool

Default value

0x0

Disable memory mapped access to gic system registers.

internal_vgic**Type**

bool

Default value

0x1

Configures whether the model of the processor contains a VGIC.

l1_dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l1_dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l1_dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l1_dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_dcache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l1_dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `l1_dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l1_dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l1_dcache-state_modelled`

Type

bool

Default value

0x0

Set whether L1 D-cache has stateful implementation.

`l1_dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

l1_dcachelwrite_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed.

l1_dcachelwrite_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

l1_icachelhit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l1_icachelmaintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l1_icachelmiss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l1_icachelread_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l1_icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `l1_icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l1_icache-state_modelled`

Type

bool

Default value

0x0

Set whether L1 I-cache has stateful implementation.

`l2_cache-hit_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l2_cache-maintenance_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l2_cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2_cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l2_cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2_cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l2_cache-size**Type**

int

Default value

0x80000

Set L2 cache size in bytes.

l2_cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l2_cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l2_cache-state_modelled**Type**

bool

Default value

0x0

Set whether L2 cache has stateful implementation.

l2_cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2_cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

3.5.7 ARMCortexA8CT

ARMCortexA8CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-212: IP revisions support

Revision	Quality level
r2p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA8CT

This model has the following Iris instances:

Table 3-213: ARMCortexA8CT Iris instances

InstanceName	ComponentName
ARMCortexA8CT	ARM_Cortex-A8
ARMCortexA8CT.DTLB	TLB
ARMCortexA8CT.ITLB	TLB
ARMCortexA8CT.acp_mapper	PVBusMapper
ARMCortexA8CT.cpu0.dtlb	TlbCadi
ARMCortexA8CT.cpu0.itlb	TlbCadi
ARMCortexA8CT.cpu0.l1dcache	PVCache
ARMCortexA8CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA8CT.cpu0.l1icache	PVCache
ARMCortexA8CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA8CT.ext_bus	PVBusLogger
ARMCortexA8CT.ext_bus.mapper	PVBusMapper
ARMCortexA8CT.l2_cache	PVCache
ARMCortexA8CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[4]	PVBusSlave

InstanceName	ComponentName
ARMCortexA8CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[6]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA8CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-214: ARMCortexA8CT MTI instances

InstanceName	ComponentName
ARMCortexA8CT	ARM_Cortex-A8
ARMCortexA8CT.DTLB	TLB
ARMCortexA8CT.ITLB	TLB

ARMCortexA8CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA8CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA8CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA8CT contains the following CADI targets:

- ARM_Cortex-A8
- PVCache
- TlbCadi

About ARMCortexA8CT

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- If the `l1_dcache-state_modelled` parameter is `true`, then `l2_cache-state_modelled` must also be `true`.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.
- This component provides the registers that the Technical Reference Manual (TRM) specifies, except for the coprocessor 14 registers, the integration and test registers, and the PLE model, which is register-based and has no implemented behavior.

These TLB registers do not have working implementations:

- D-TLB ATTR read/write.
- D-TLB CAM read/write.
- D-TLB PA read/write.
- Normal memory remap register.
- Primary memory remap register.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- There is a single memory port combining instruction, data, DMA and peripheral access.
- The L2 cache write allocate policy is not configurable. It defaults to write-allocate. Writes to the configuration register succeed but are ignored, meaning that data can be unexpectedly stored in the L2 cache.
- Unaligned accesses with the MMU disabled on the processor do not cause data aborts.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA8CT

Table 3-215: Ports

Name	Protocol	Type	Description
cfgend0	Signal	Slave	Configure BE8 mode after a reset.
cfgnmfi	Signal	Slave	Configure FIQs as non-maskable after a reset.
cfgte	Signal	Slave	Configure exceptions to be taken in thumb mode after a reset.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
dmaexterrirq	Signal	Master	L1 PLE error interrupt.
dmairq	Signal	Master	Interrupt signal from L1 PLE.
dmairq	Signal	Master	Secure interrupt signal from L1 PLE.
fiq	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq	Signal	Slave	This signal drives the CPU's interrupt handling.
pmuirq	Signal	Master	Interrupt signal from performance monitoring unit.
pvbush_m	PVBus	Master	The core will generate bus requests on this port.
reset	Signal	Slave	Raising this signal will put the core into reset mode.
ticks	InstructionCount	Master	Port allowing the number of instructions since startup to be read from the CPU.
vinithi	Signal	Slave	Configure high vectors after a reset.

Parameters for ARMCortexA8CT

CFGEND0

Type

bool

Default value

0x0

Initialize to BE8 endianness.

CFGNMFI

Type

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

CFGTE

Type

bool

Default value

0x0

Initialize to take exceptions in T32 state. Model starts in T32 state.

CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

`cpi_div`**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`device-accurate-tlb`**Type**

bool

Default value

0x0

Specify whether all TLBs are modeled.

implements_vfp**Type**

bool

Default value

0x1

Set whether the model has been built with VFP and NEON support.

l1_dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l1_dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l1_dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l1_dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l1_dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `l1_dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l1_dcache-size`

Type

int

Default value

0x8000

Set L1 D-cache size in bytes.

`l1_dcache-state_modelled`

Type

bool

Default value

0x0

Include Level 1 data cache state model.

`l1_dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

l1_dcachelwrite_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed.

l1_dcachelwrite_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

l1_icachelhit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l1_icachelmiss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l1_icachelread_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_icachelread_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l1_icachelread_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `l1_icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l1_icache-size`**Type**

int

Default value

0x8000

Set L1 I-cache size in bytes.

`l1_icache-state_modelled`**Type**

bool

Default value

0x0

Include Level 1 instruction cache state model.

`l2_cache-hit_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l2_cache-maintenance_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l2_cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2_cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l2_cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2_cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l2_cache-size**Type**

int

Default value

0x40000

Set L2 cache size in bytes.

l2_cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l2_cache-state_modelled`**Type**

bool

Default value

0x0

Include unified Level 2 cache state model.

`l2_cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2_cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l2_cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2_cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`master_id`**Type**

int

Default value

0x0

Master ID presented in bus transactions.

min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

siliconID**Type**

int

Default value

0x41000000

Value as read by the system coprocessor siliconID register.

vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

3.5.8 ARMCortexA9MPx1CT

ARMCortexA9MPx1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-216: IP revisions support

Revision	Quality level
r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA9MPx1CT

This model has the following Iris instances:

Table 3-217: ARMCortexA9MPx1CT Iris instances

InstanceName	ComponentName
ARMCortexA9MPx1CT	Cluster_ARM_Cortex-A9MP

ARMCortexA9MPx1CT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA9MPx1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA9MPx1CT contains the following CADI targets:

- ARM_Cortex-A9MP
- Cluster_ARM_Cortex-A9MP
- PVCache
- TlbCadi

About ARMCortexA9MPx1CT

- The following components also exist:
 - ARMCortexA9MPx2CT.
 - ARMCortexA9MPx4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv3-D32 are supported.

vfp present and ase not present

VFPv3-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to true so model has Neon and VFPv3-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv3-D32 support.

- If you are using the ARMCortexA9MPx_nCT component in a VE platform model, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.
- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-

accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.

- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require L2 cache, you can add a PL310 Level 2 Cache Controller component.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the CFGSDISABLE signal. This leads to some registers being accessible when they must not be.
- The SCU enable bit is ignored. The SCU is always enabled.
- The SCU ignores the invalidate all register.
- The Broadcast TLB or cache operations in this model do not cause other cores in the cluster that are asleep because of WFI to wake up.
- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- When modeling the SCU, coherency operations are represented by a memory write followed by a read to refill from memory, rather than using cache-to-cache transfers.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- The following TLB registers do not have working implementations:
 - Main TLB Attr.
 - Main TLB PA.
 - Main TLB VA.
 - Normal memory remap register.
 - Primary memory remap register.
 - Read Main TLB Entry.
 - Write Main TLB Entry.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

- Parity error support is hardware-specific so is not modeled.

Ports for ARMCortexA9MPx1CT

Table 3-219: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>cfgend[4]</code>	Signal	Slave	This signal is for EE bit initialisation.

Name	Protocol	Type	Description
cfgnmfi[4]	Signal	Slave	This signal disables FIQ mask in CPSR.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
filteren	Signal	Slave	This signal enables filtering of address ranges between master bus ports.
filterend	Value	Slave	This port sets end of region mapped to pvbus_m1.
filterstart	Value	Slave	This port sets start of region mapped to pvbus_m1.
fiq[4]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[4]	Signal	Master	This signal exports internal VGIC FIQ signal to the CPU..
ints[224]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq[4]	Signal	Slave	This signal drives the CPU's interrupt handling.
irqout[4]	Signal	Master	This signal exports internal VGIC IRQ signal to the CPU.
periphbase	Value	Slave	This port sets the base address of private peripheral region.
periphclk_in	ClockSignal	Slave	The timer and the watchdog take need a clk that is scaled down at least by factor of two.
periphreset	Signal	Slave	This signal resets timer and interrupt controller.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	AXI master 0 bus master channel.
pvbus_m1	PVBus	Master	AXI master 1 bus master channel.
pwrctlhi[4]	Value	Slave	This port sets reset value for scu CPU status register.
pwrctllo[4]	Value	Master	This port sends scu CPU status register bits.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
scureset	Signal	Slave	This signal resets SCU.
smpnamp[4]	Signal	Master	This signals AMP or SMP mode for each Cortex-A9 processor.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[4]	Signal	Slave	This signal provides default exception handling state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
wdreset[4]	Signal	Slave	This signal resets individual watchdog.
wdresetreq[4]	Signal	Master	This signal resets rest of the CA9MP system.

Parameters for ARMCortexA9MPx1CT

CFGSDISABLE

Type

bool

Default value

0x0

Disable some accesses to GIC registers.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

FILTEREN

Type

bool

Default value

0x0

Enable filtering of accesses through pvbus_m0.

FILTEREND

Type

int

Default value

0x0

End of region filtered to pvbus_m0.

FILTERSTART

Type

int

Default value

0x0

Base of region filtered to pvbus_m0.

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

cpuX.CFGNMFI**Type**

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.POWERCTLI**Type**

int

Default value

0x0

Default power control state for processor.

cpuX.SMPnAMP**Type**

bool

Default value

0x0

Set whether the processor is part of a coherent domain.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether model has NEON support.

cpuX.dcache-size**Type**

int

Default value

0x8000

Set D-cache size in bytes.

cpuX.icache-size**Type**

int

Default value

0x8000

Set I-cache size in bytes.

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

D-cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

D-cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`device-accurate-tlb`**Type**

bool

Default value

0x0

Specify whether all TLBs are modeled.

dic-spi_count**Type**

int

Default value

0x40

Number of shared peripheral interrupts implemented.

icache-hit_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

icache-read_latency

Type
int

Default value
0x0

I-cache timing annotation latency for read accesses given in ticks per byte accessed.`icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-state_modelled

Type
bool

Default value
0x0

Set whether I-cache has stateful implementation.

3.5.9 ARMCortexA9UPCT

ARMCortexA9UPCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-220: IP revisions support

Revision	Quality level
r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA9UPCT

This model has the following Iris instances:

Table 3-221: ARMCortexA9UPCT Iris instances

InstanceName	ComponentName
ARMCortexA9UPCT	Cluster_ARM_Cortex-A9UP

ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[8]	PVBusSlave
ARMCortexA9UPCT.l1_incoherent_interconnect.upstream[9]	PVBusSlave
ARMCortexA9UPCT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA9UPCT contains the following CADI targets:

- ARM_Cortex-A9UP
- Cluster_ARM_Cortex-A9UP
- PVCache
- TlbCadi

About ARMCortexA9UPCT

- The ase-present and vfp-present parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv3-D32 are supported.

vfp present and ase not present

VFPv3-D16 is supported.

vfp not present and ase present

Illegal. Forces vfp-present to true so model has Neon and VFPv3-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv3-D32 support.

- Specify `false` for the `device-accurate-tlb` parameter to enable modeling a different number of TLBs if this improves simulation performance. In this case, the simulation is architecturally-accurate, but not device-accurate. Architectural accuracy is almost always sufficient. Specify `true` if device accuracy is required.
- When you use the `semihosting-cmd_line` parameter to set the command line that is available to semihosting SVC calls, the value of `argv[0]` is set to the first command-line argument, not to the name of an image.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The RR bit in the SCTLR is ignored.
- The Power Control Register in the system control coprocessor is implemented but writing to it does not change the behavior of the model.
- The model cannot be configured with a 128-entry TLB.
- This component implements L1 cache as architecturally defined, but does not implement L2 cache. If you require L2 cache you can add a PL310 Level 2 Cache Controller component.
- Parity error support is hardware-specific so is not modeled.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.

These TLB registers do not have working implementations:

- Normal memory remap register.
- Primary memory remap register.
- Read Main TLB Entry.
- Write Main TLB Entry.
- Main TLB VA.
- Main TLB PA.
- Main TLB Attr.

In addition, the simulation does not distinguish peripheral accesses from data accesses, so it ignores configuration of the peripheral port memory remap register.

Ports for ARMCortexA9UPCT

Table 3-223: Ports

Name	Protocol	Type	Description
<code>cfgend[1]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgnmfi[1]</code>	Signal	Slave	This signal disables FIQ mask in CPSR.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.

Name	Protocol	Type	Description
cp15sdisable[1]	Signal	Slave	This signal disables write access to some system control processor registers.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[1]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
irq[1]	Signal	Slave	This signal drives the CPU's interrupt handling.
pmuirq[1]	Signal	Master	Interrupt signal from performance monitoring unit.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[1]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[1]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[1]	Signal	Master	This signal indicates if a core is in WFI state.
teinit[1]	Signal	Slave	This signal provides default exception handling state.
ticks[1]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vinithi[1]	Signal	Slave	This signal controls the location of the exception vectors at reset.

Parameters for ARMCortexA9UPCT

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

cpi_div

Type

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul

Type

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

cpuX.CFGNMFI**Type**

bool

Default value

0x0

Enable nonmaskable FIQ interrupts on startup.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.POWERCTLI**Type**

int

Default value

0x0

Default power control state for processor.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether model has NEON support.

cpuX.dcache-size**Type**

int

Default value

0x8000

Set D-cache size in bytes.

cpuX.icache-size**Type**

int

Default value

0x8000

Set I-cache size in bytes.

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

D-cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

D-cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`

Type

int

Default value

0x0

D-cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`device-accurate-tlb`

Type

bool

Default value

0x0

Specify whether all TLBs are modeled.

icache-hit_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

I-cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

3.5.10 ARMCortexA15x1CT

ARMCortexA15x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-224: IP revisions support

Revision	Quality level
r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA15x1CT

This model has the following Iris instances:

Table 3-225: ARMCortexA15x1CT Iris instances

InstanceName	ComponentName
ARMCortexA15x1CT	Cluster_ARM_Cortex-A15
ARMCortexA15x1CT.Cortex-A15_GIC	GICv2
ARMCortexA15x1CT.acp_mapper	PVBusMapper
ARMCortexA15x1CT.cpu0	ARM_Cortex-A15
ARMCortexA15x1CT.cpu0.DTLB	TLB
ARMCortexA15x1CT.cpu0.ITLB	TLB
ARMCortexA15x1CT.cpu0.dtlb	TlbCadi
ARMCortexA15x1CT.cpu0.itlb	TlbCadi
ARMCortexA15x1CT.cpu0.l1dcache	PVCache

ARMCortexA15x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA15x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA15x1CT contains the following CADI targets:

- ARM_Cortex-A15
- Cluster_ARM_Cortex-A15
- PVCache
- TlbCadi

About ARMCortexA15x1CT

- The following components also exist:
 - ARMCortexA15x2CT.
 - ARMCortexA15x3CT.
 - ARMCortexA15x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

Neon™ and VFPv4-D32 are supported.

vfp present and ase not present

VFPv4-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to `true` so model has Neon and VFPv4-D32 support.

vfp not present and ase not present

Model has neither Neon nor VFPv4-D32 support.

- If you are using the ARMCortexA15x_nCT component on a VE model platform, the `PERIPHBASE` parameter is set automatically to `0x2C000000` and is not visible in the parameter list.

ACE limitation

AXI Coherency Extensions (ACE) are extensions to AXI4 that support system-level cache coherency between multiple clusters. The ACE cache models in the Arm® Cortex®-A15 and Cortex-A7, and the ACE support in the CCI-400 have the limitation that they only process one transaction at a time. Normally, the simulation processes each transaction to completion before allowing any master to generate another transaction. However, in the following situation the simulation might fail. If a SystemC bus slave calls `wait()` while it is processing a transaction, this call might allow another master to issue another transaction that passes through the CCI-400 or the Cortex-A15 or Cortex-A7 caches. This situation could happen if a SystemC bus master running in another thread is connected to one of the ACE-lite ports on the CCI-400.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The GIC does not respect the `CFGSDISABLE` signal. This leads to some registers wrongly being accessible.
- The Broadcast *Translation Lookaside Buffer* (TLB) or cache operations in the model do not cause other cores in the cluster that are asleep because of *Wait For Interrupt* (WFI) to wake up.
- It ignores the RR bit in the SCTLR.
- It implements the Power Control Register in the system control coprocessor but writing to it does not change the behavior of the model.
- When modeling the SCU, coherency operations are by memory writes then reads to refill from memory, rather than cache-to-cache transfers.
- It does not implement ETM registers.
- It implements TLB bitmap registers as RAZ/WI.
- It does not support the Cortex®-A15 mechanism to read the internal memory that the Cache and TLB structures use through the implementation defined region of the system coprocessor interface. This includes the RAM Index Register, IL1DATA Registers, DL1DATA Registers, and associated functionality.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA15x1CT

Table 3-227: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
<code>broadcastinner</code>	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
<code>broadcastouter</code>	Signal	Slave	Enable broadcasting of Outer Shareable transactions.

Name	Protocol	Type	Description
cfgend[4]	Signal	Slave	This signal controls the SCTL.R.EE bit.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Outputs of the generic timers.
CNTPNSIRQ[4]	Signal	Master	Outputs of the generic timers.
CNTPSIRQ[4]	Signal	Master	Outputs of the generic timers.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Outputs of the generic timers.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some secure system control processor registers.
cpuporeset[4]	Signal	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
fiqout[4]	Signal	Master	This signal exports internal VGIC FIQ signal to the CPU..
irq[4]	Signal	Slave	This signal drives the CPU's interrupt handling.
irqout[4]	Signal	Master	This signal exports internal VGIC IRQ signal to the CPU.
irqs[224]	Signal	Slave	These signals drive the CPU's interrupt controller interrupt lines.
l2reset	Signal	Slave	This signal resets the shared L2 memory system, interrupt controller and timer logic.
periphbase	Value_64	Slave	This port sets the base address of the private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
teinit[4]	Signal	Slave	This signal enables Thumb exceptions (controls the SCTL.R.TE bit).
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	Signal	Slave	Virtual FIQ inputs. Note that the fiq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
vinithi[4]	Signal	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ inputs. Note that the irq pins are wired directly to the core if there is no internal VGIC. If there is an internal VGIC then these are ignored.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Parameters for ARMCortexA15x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CFGSDISABLE

Type

bool

Default value

0x0

Disable some accesses to GIC registers.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

IMINLN**Type**

bool

Default value

0x1

Instruction cache minimum line size: false=32 bytes, true=64 bytes.

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.DBGROMADDR**Type**

int

Default value

0x12000003

This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address.

cpuX.DBGROMADDRV**Type**

bool

Default value

0x1

If true, this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

cpuX.DBGSELFADDR**Type**

int

Default value

0x10003

This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address.

cpuX.DBGSELFADDRV**Type**

bool

Default value

0x1

If true, this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether CT model has been built with NEON support.

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether CT model has been built with VFP support.

dic-spi_count**Type**

int

Default value

0x40

Number of shared peripheral interrupts implemented.

disable_periph_decoder**Type**

bool

Default value

0x0

Disable memory mapped access to gic system registers.

internal_vgic**Type**

bool

Default value

0x1

Configures whether the model of the processor contains a Virtualized Generic Interrupt Controller (VGIC).

l1_dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l1_dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l1_dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l1_dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

l1_dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `l1_dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l1_dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

l1_dcache-state_modelled**Type**

bool

Default value

0x0

Set whether L1 D-cache has stateful implementation.

l1_dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l1_dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `l1_dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`l1_icache-hit_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l1_icache-maintenance_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l1_icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

l1_ichache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_ichache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l1_ichache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. l1_ichache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l1_ichache-state_modelled**Type**

bool

Default value

0x0

Set whether L1 I-cache has stateful implementation.

l2-data-slice**Type**

int

Default value

0x0

L2 data RAM slice.

l2-tag-slice**Type**

int

Default value

0x0

L2 tag RAM slice.

l2_cache-hit_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2_cache-maintenance_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2_cache-miss_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2_cache-read_access_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l2_cache-read_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2_cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2_cache-size`**Type**

int

Default value

0x80000

Set L2 cache size in bytes.

`l2_cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l2_cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l2_cache-state_modelled`**Type**

bool

Default value

0x0

Set whether L2 cache has stateful implementation.

l2_cache-write_access_latency

Type
int

Default value
0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2_cache-write_latency

Type
int

Default value
0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

3.5.11 ARMCortexA17x1CT

ARMCortexA17x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-228: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA17x1CT

This model has the following Iris instances:

Table 3-229: ARMCortexA17x1CT Iris instances

InstanceName	ComponentName
ARMCortexA17x1CT	Cluster_ARM_Cortex-A17
ARMCortexA17x1CT.acp_mapper	PVBusMapper
ARMCortexA17x1CT.cpu0	ARM_Cortex-A17
ARMCortexA17x1CT.cpu0.DTLB	TLB
ARMCortexA17x1CT.cpu0.ITLB	TLB
ARMCortexA17x1CT.cpu0.dtlb	TlbCadi

InstanceName	ComponentName
ARMCortexA17x1CT.cpu0.itlb	TlbCadi
ARMCortexA17x1CT.cpu0.l1dcache	PVCache
ARMCortexA17x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA17x1CT.cpu0.l1licache	PVCache
ARMCortexA17x1CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA17x1CT.ext_bus	PVBusLogger
ARMCortexA17x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA17x1CT.l2_cache	PVCache
ARMCortexA17x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[4]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[6]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA17x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA17x1CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-230: ARMCortexA17x1CT MTI instances

InstanceName	ComponentName
ARMCortexA17x1CT.acp_mapper	PVBusMapper
ARMCortexA17x1CT.cpu0	ARM_Cortex-A17

ARMCortexA17x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA17x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA17x1CT contains the following CADI targets:

- ARM_Cortex-A17
- Cluster_ARM_Cortex-A17
- PVCache
- TlbCadi

About ARMCortexA17x1CT

- The following components also exist:
 - ARMCortexA17x2CT.
 - ARMCortexA17x3CT.
 - ARMCortexA17x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The `ase-present` and `vfp-present` parameters configure the synthesis options:

vfp present and ase present

NEON and VFPv4-D32 are supported.

vfp present and ase not present

VFPv4-D16 is supported.

vfp not present and ase present

Illegal. Forces `vfp-present` to `true` so model has NEON and VFPv4-D32 support.

vfp not present and ase not present

Model has neither NEON nor VFPv4-D32 support.

- This model exposes the `BROADCASTCACHEMAINT`, `BROADCASTINNER`, and `BROADCASTOUTER` parameters at the CPU level, rather than at the cluster level. To achieve correct behavior, set the same value for all CPUs in the cluster.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to `false` in production systems.
- ECC support is hardware-specific so is not modeled.

Ports for ARMCortexA17x1CT**Table 3-231: Ports**

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
<code>broadcastinner</code>	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
<code>broadcastouter</code>	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
<code>CFGADDRFILTEENDNS</code>	Value_64	Slave	NS end address (only bits 39:20 are used).
<code>CFGADDRFILTEENDS</code>	Value_64	Slave	S end address (only bits 39:20 are used).
<code>CFGADDRFILTEENNS</code>	Signal	Slave	Enable periph port filtering for NS accesses.
<code>CFGADDRFILTEENS</code>	Signal	Slave	Enable periph port filtering for S accesses.
<code>CFGADDRFILTESTARTNS</code>	Value_64	Slave	NS start address (only bits 39:20 are used).
<code>CFGADDRFILTESTARTS</code>	Value_64	Slave	S start address (only bits 39:20 are used).
<code>cfgend[4]</code>	Signal	Slave	This signal controls the SCTLR.EE bit.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clusterid</code>	Value	Slave	This port sets the value in the CLUSTERID field (bits[11:8]) of the MPIDR.
<code>CNTHPIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>CNTPSIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[4]</code>	Signal	Master	Outputs of the generic timers.
<code>cp15sdisable[4]</code>	Signal	Slave	This signal disables write access to some secure system control processor registers.
<code>cpuporeset[4]</code>	Signal	Slave	Signal initializes all processor logic including NEON, VFP, Debug, PTM, breakpoint and watchpoint.
<code>event</code>	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
<code>fiq[4]</code>	Signal	Slave	This signal drives the CPU's fast-interrupt handling.
<code>irq[4]</code>	Signal	Slave	This signal drives the CPU's interrupt handling.
<code>l2flushdone</code>	Signal	Master	Flush of L2 memory system complete.

Name	Protocol	Type	Description
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	This signal resets the shared L2 memory system and timer logic.
peripheral_m	PVBus	Master	The core's peripheral port. Controlled by filter registers.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Signal initializes the shared Debug APB, CTI and CTM logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
teinit[4]	Signal	Slave	This signal enables Thumb exceptions (controls the SCTLR.TE bit).
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vfiq[4]	Signal	Slave	Virtual FIQ inputs.
vinithi[4]	Signal	Slave	This signal controls the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ inputs.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Parameters for ARMCortexA17x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CFGADDRFILTEENDNS**Type**

int

Default value

0x0

Peripheral port NS end address.

CFGADDRFILTEENDS**Type**

int

Default value

0x0

Peripheral port S end address.

CFGADDRFILTEENNS**Type**

bool

Default value

0x0

Peripheral port NS address filtering enabled.

CFGADDRFILTEENS**Type**

bool

Default value

0x0

Peripheral port S address filtering enabled.

CFGADDRFILTSTARTNS**Type**

int

Default value

0x0

Peripheral port NS start address.

CFGADDRFILTSTARTS**Type**

int

Default value

0x0

Peripheral port S start address.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

IMINLN**Type**

bool

Default value

0x1

Instruction cache minimum line size: false=32 bytes, true=64 bytes.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Initialize to BE8 endianness.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.DBGROMADDR**Type**

int

Default value

0x12000003

This value is used to initialize the CP15 DBGDRAR register. Bits[39:12] of this register specify the ROM table physical address.

cpuX.DBGROMADDRV**Type**

bool

Default value

0x1

If true, this sets bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

cpuX.DBGSELFADDR**Type**

int

Default value

0x10003

This value is used to initialize the CP15 DBGDSAR register. Bits[39:17] of this register specify the ROM table physical address.

cpuX.DBGSELFADDRV**Type**

bool

Default value

0x1

If true, this sets bits[1:0] of the CP15 DBGDSAR to indicate that the address is valid.

cpuX.TEINIT**Type**

bool

Default value

0x0

T32 exception enable. The default has exceptions including reset handled in A32 state.

cpuX.VINITHI**Type**

bool

Default value

0x0

Initialize with high vectors enabled.

cpuX.ase-present**Type**

bool

Default value

0x1

Set whether CT model has been built with NEON support.

cpuX.l1_icache-size**Type**

int

Default value

0x8000

Size of L1 I-cache.

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-ARM_HLT**Type**

int

Default value

0xf000

ARM HLT number for semihosting.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

ARM SVC number for semihosting.

cpuX.semihosting-Thumb_HLT**Type**

int

Default value

0x3c

Thumb HLT number for semihosting.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

Thumb SVC number for semihosting.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting SVC calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC traps. Applications that do not use semihosting must set this parameter to false.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-hlt-enable**Type**

bool

Default value

0x0

Enable semihosting HLT traps. Applications that use HLT semihosting must set this parameter to true and the semihosting-enable parameter to true.

cpuX.semihosting-prefix**Type**

bool

Default value

0x0

Prefix semihosting output with target instance name.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable coprocessor access and VFP at reset.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether CT model has been built with VFP support.

l1_dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l1_dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l1_dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l1_dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

l1_dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `l1_dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l1_dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

l1_dcache-state_modelled**Type**

bool

Default value

0x0

Set whether L1 D-cache has stateful implementation.

l1_dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l1_dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l1_dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `l1_dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`l1_icache-hit_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l1_icache-maintenance_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l1_icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

l1_ichache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l1_ichache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l1_ichache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. l1_ichache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l1_ichache-state_modelled**Type**

bool

Default value

0x0

Set whether L1 I-cache has stateful implementation.

l2-data-slice**Type**

int

Default value

0x0

L2 data RAM slice.

l2-tag-slice**Type**

int

Default value

0x0

L2 tag RAM slice.

l2_cache-hit_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2_cache-maintenance_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2_cache-miss_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2_cache-read_access_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l2_cache-read_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2_cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2_cache-size`**Type**

int

Default value

0x40000

Set L2 cache size in bytes.

`l2_cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l2_cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l2_cache-state_modelled`**Type**

bool

Default value

0x0

Set whether L2 cache has stateful implementation.

l2_cache-write_access_latency

Type
int

Default value
0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2_cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2_cache-write_latency

Type
int

Default value
0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2_cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

3.5.12 **ARMCortexA32x1CT**

ARMCortexA32x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-232: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA32x1CT

This model has the following Iris instances:

Table 3-233: ARMCortexA32x1CT Iris instances

InstanceName	ComponentName
ARMCortexA32x1CT	Cluster_ARM_Cortex-A32
ARMCortexA32x1CT.AMU	PVBusLogger
ARMCortexA32x1CT.AMU.mapper	PVBusMapper
ARMCortexA32x1CT.DAP	PVBusLogger
ARMCortexA32x1CT.DAP.mapper	PVBusMapper
ARMCortexA32x1CT.DSU	DSU

InstanceName	ComponentName
ARMCortexA32x1CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA32x1CT.MMAP	PVBusLogger

ARMCortexA32x1CT contains the following CADI targets:

- ARM_Cortex-A32
- Cluster_ARM_Cortex-A32
- PVCache
- TlbCadi

About ARMCortexA32x1CT

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for the Arm® Cortex®-A32 processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBusDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA32x1CT

Table 3-235: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastinner</code>	Signal	Slave	ACE defined pins.

Name	Protocol	Type	Description
broadcastouter	Signal	Slave	ACE defined pins.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cp15sdisable2[4]	Signal	Slave	-
cpuporeset[4]	Signal	Slave	CPU power on reset.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port
ctidbgirq[4]	Signal	Master	Cross trigger matrix port.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.

Name	Protocol	Type	Description
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Level2 reset.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Debug reset.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt
reset[4]	Signal	Slave	Reset.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state
standbywfi12	Signal	Master	This signal indicated all cores and L2 are idles and in low power state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA32x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x22000000

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x1

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CP15SDISABLE2**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`icache-maintenance_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l2cache-miss_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`l2cache-read_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type
int

Default value
0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.13 ARMCortexA34x1CT

ARMCortexA34x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-236: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA34x1CT

This model has the following Iris instances:

Table 3-237: ARMCortexA34x1CT Iris instances

InstanceName	ComponentName
ARMCortexA34x1CT	Cluster_ARM_Cortex-A34
ARMCortexA34x1CT.AMU	PVBusLogger

ARMCortexA34x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA34x1CT contains the following CADI targets:

- ARM_Cortex-A34
- Cluster_ARM_Cortex-A34
- PVCache
- TlbCadi

About ARMCortexA34x1CT

The model has the following features:

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for this processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBusDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA34x1CT

Table 3-239: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastinner	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
cfgend[4]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commr[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.

Name	Protocol	Type	Description
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	This signal resets the shared L2 memory system, interrupt controller and timer logic.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 memory system are in a WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.

Name	Protocol	Type	Description
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A34x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x1

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CP15SDISABLE2**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-size`**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

`dcache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l2cache-hit_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2cache-maintenance_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2cache-miss_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2cache-read_access_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.14 ARM Cortex A35x1CT

ARM Cortex A35x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-240: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM Cortex A35x1CT

This model has the following Iris instances:

Table 3-241: ARM Cortex A35x1CT Iris instances

InstanceName	ComponentName
ARM Cortex A35x1CT	Cluster_ARM_Cortex-A35
ARM Cortex A35x1CT.AMU	PVBusLogger
ARM Cortex A35x1CT.AMU.mapper	PVBusMapper

ARMCortexA35x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA35x1CT contains the following CADI targets:

- ARM_Cortex-A35
- Cluster_ARM_Cortex-A35
- PVCache
- TlbCadi

About ARMCortexA35x1CT

The model has the following features:

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for this processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBUSDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.
- ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA35x1CT

Table 3-243: Ports

Name	Protocol	Type	Description
aa64naa32[4]	Signal	Slave	Register width after reset.
acp_s	PVBUS	Slave	AXI ACP slave port.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastinner	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the <code>clrexmonreq</code> signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor

Name	Protocol	Type	Description
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cp15sdisable2[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	CPU power on reset.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross trigger matrix port.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdsn[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Level2 reset.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.

Name	Protocol	Type	Description
presetdbg	Signal	Slave	Debug reset.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt
reset[4]	Signal	Slave	Reset.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state
standbywfil2	Signal	Master	This signal indicated all cores and L2 are idles and in low power state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA35x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER**Type**

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x1

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.AA64nAA32`**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

`cpuX.CFGTE`**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

`cpuX.CP15SDISABLE`**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CP15SDISABLE2**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers (FEAT_CP15SDISABLE2).

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`enable_simulation_performance_optimizations`**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

`icache-state_modelled`**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l2cache-hit_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

ptw_latency

Type
int

Default value
0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type
int

Default value
0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.15 ARMCortexA53x1CT

ARMCortexA53x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-244: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM Cortex-A53x1CT

This model has the following Iris instances:

Table 3-245: ARM Cortex-A53x1CT Iris instances

InstanceName	ComponentName
ARM Cortex-A53x1CT	Cluster_ARM_Cortex-A53
ARM Cortex-A53x1CT.AMU	PVBusLogger
ARM Cortex-A53x1CT.AMU.mapper	PVBusMapper
ARM Cortex-A53x1CT.DAP	PVBusLogger
ARM Cortex-A53x1CT.DAP.mapper	PVBusMapper

ARMCortexA53x1CT contains the following CADI targets:

- ARM_Cortex-A53
- Cluster_ARM_Cortex-A53
- PVCache
- TlbCadi

About ARMCortexA53x1CT

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBusDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.

Differences between the CT model and RTL implementations

This component has the following differences from the corresponding revision of the RTL implementation:

- The value of the AArch64 `PMCEID0_ELO` register, and the AArch32 alias of this register, differs in the model from the TRM value. The model value reflects the model counters.
- The mechanisms for setting the affinity fields of the `MPIDR`. The RTL has two ports:
 - `CLUSTERIDAFF1[7:0]`.
 - `CLUSTERIDAFF2[7:0]`. `AFF1` sets the value of `MPIDR` bits[15:8] and `AFF2` sets the value of `MPIDR` bits[23:16]. In contrast, the model has a single `CLUSTER_ID` port. This difference allows the setting of bits[23:8] of the `MPIDR` using bits[15:0] of the `CLUSTER_ID` value.
- The memory mapped debug registers have a view for cores and a view for external debug agents. In the model, these views require two PVBus ports. In hardware, the system designer decides how the implementation differentiates the views.

- In the model, a single peer event port combines the functionality of the `eventi` and `evento` signals in the RTL.
- The Generic Timers are Programmer's View (PV) level abstractions: a model-specific protocol connects the `cntvalueb` port to the `MemoryMappedCounterModule`.
- The GIC CPU Interface is a PV level abstraction: a model-specific protocol connects the GIC CPU Interface to the GIC Distributor.
- The CoreSight Cross Trigger Interface (CTI) is a PV level abstraction: the interface is a model specific one.
- The model has no mechanism to read the internal memory that the Cache and TLB structures use, through the implementation defined region of the system coprocessor interface. This memory includes the RAM Index Register, `IL1DATA` Registers, `DL1DATA` Registers, and associated functionality.
- The model does not implement:
 - ETM registers.
 - The `PMUEVENT` bus.
 - The `WARMRESETREQ` signal. However, the warm reset code sequence (see the section Code sequence to request a Warm reset as a result of `RMR_ELx.RR` in the [Arm Architecture Reference Manual for A-profile architecture](#)) makes the model simulate a warm reset of the core.
 - The `PMUSNAPSHOTREQ` and `PMUSNAPSHOTACK` signals.
 - The `EXTERRIRQ` and `INTERRIRQ` signals.
 - Processor dynamic-retention signals.
 - The `SYSBARDISABLE` signal.
 - The `DBGPWRDUP`, `DBGPWRUPREQ`, `DBGNOPWRDWN`, and `DBGIRSTREQ` debug power management signals.
 - The RTL synthesis option to remove FP and ASE.
 - The RTL synthesis option for a Cortex-A15 style debug memory map.
 - Although Neon support is optional for the Cortex-A53 processor, this model does not implement the `ase-present` parameter. This means it is not possible to configure the model to not support Neon.
 - ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA53x1CT

Table 3-247: Ports

Name	Protocol	Type	Description
<code>aa64naa32[4]</code>	Signal	Slave	Register width after reset.
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
<code>broadcastinner</code>	Signal	Slave	Enable broadcasting of Inner Shareable transactions.

Name	Protocol	Type	Description
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	Timer signals to SoC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SoC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SoC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SoC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgll1rstdisable	Signal	Slave	Control ram clear on reset
dbgnopwrdown[4]	Signal	Master	This signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	This signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.

Name	Protocol	Type	Description
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Reset the shared L2 memory system controller.
l2rstdisable	Signal	Slave	-
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfi12	Signal	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtual FIQ.

Name	Protocol	Type	Description
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Processor Virtual System Error Interrupt request.

Parameters for ARM Cortex A53x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x1

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.AA64nAA32**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-size`**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

`dcache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l2cache-hit_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2cache-maintenance_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2cache-miss_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2cache-read_access_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

patch_level**Type**

int

Default value

0x1

Patch level of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Revision field in MIDR/MIDR_EL1. Corresponds to the patch number Y in rXpY.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.16 ARMCortexA55CT

ARMCortexA55CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-248: IP revisions support

Revision	Quality level
r1p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA55CT

This model has the following Iris instances:

Table 3-249: ARMCortexA55CT Iris instances

InstanceName	ComponentName
ARMCortexA55CT	Cluster_ARM_Cortex-A55
ARMCortexA55CT.AMU	PVBusLogger
ARMCortexA55CT.AMU.mapper	PVBusMapper
ARMCortexA55CT.DAP	PVBusLogger

ARMCortexA55CT.ext_bus.mapper	PVBusMapper
ARMCortexA55CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexA55CT contains the following CADI targets:

- ARM_Cortex-A55
- Cluster_ARM_Cortex-A55
- PVCache
- TlbCadi

About ARMCortexA55CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.

- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGWRUP and DBGRSTREQ are not implemented, but DBGWRUPREQ and DBGNOFWRDWN are implemented.
- Cache stashing capability.
- Dual ACE masters.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpuN.`, where N identifies the core (0-7).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA55CT

Table 3-251: Ports

Name	Protocol	Type	Description
aa64naa32[8]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port.
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.

Name	Protocol	Type	Description
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[8]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[8]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[8]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[8]	Signal	Master	Timer signals to SOC.
commirq[8]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[8]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[8]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	Signal	Slave	Disable cryptography extensions after reset.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[8]	Signal	Master	No power-down request.
dbgpwrupreq[8]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.

Name	Protocol	Type	Description
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[8]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	Signal	Slave	Virtualised FIQ.
vinithi[8]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA55CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.AA64nAA32`**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

`cpuX.CFGTE`**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

`cpuX.CP15SDISABLE`**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x40000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`enable_simulation_performance_optimizations`**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`icache-maintenance_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-miss_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

l3cache-read_access_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

l3cache-read_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l3cache-size

Type

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.17 ARM CortexA55CT_CortexA75CT

ARM CortexA55CT_CortexA75CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-252: IP revisions support

Revision	Quality level
CortexA55 r1p0	Full support
CortexA75 r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexA55CT_CortexA75CT

This model has the following Iris instances:

Table 3-253: ARM CortexA55CT_CortexA75CT Iris instances

InstanceName	ComponentName
ARM CortexA55CT_CortexA75CT	Cluster_ARM_Cortex-A55_Cortex-A75
ARM CortexA55CT_CortexA75CT.AMU	PVBusLogger
ARM CortexA55CT_CortexA75CT.AMU.mapper	PVBusMapper
ARM CortexA55CT_CortexA75CT.DAP	PVBusLogger
ARM CortexA55CT_CortexA75CT.DAP.mapper	PVBusMapper
ARM CortexA55CT_CortexA75CT.DSU	DSU
ARM CortexA55CT_CortexA75CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARM CortexA55CT_CortexA75CT.DSU.mpam_busslave	PVBusSlave
ARM CortexA55CT_CortexA75CT.DSU.shared_cache	PVCache
ARM CortexA55CT_CortexA75CT.DSU.shared_cache.upstream[0]	PVBusSlave

ARMCortexA55CT_CortexA75CT.subcluster1.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA75CT.subcluster1.cpu0.l1icache	PVCache
ARMCortexA55CT_CortexA75CT.subcluster1.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA75CT.subcluster1.cpu0.l2cache	PVCache
ARMCortexA55CT_CortexA75CT.subcluster1.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA75CT.subcluster1.cpu0.l2cache.upstream[1]	PVBusSlave

ARMCortexA55CT_CortexA75CT contains the following CADI targets:

- ARM_Cortex-A55

- ARM_Cortex-A75
- Cluster_ARM_Cortex-A55_Cortex-A75
- PVCache
- Subcluster_ARM_Cortex-A55
- Subcluster_ARM_Cortex-A75
- TlbCadi

About ARMCortexA55CT_CortexA75CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-7 (ARMCortexA55CT).

subcluster1.NUM_CORES

Possible values are 1-4 (ARMCortexA75CT).

The total number of cores in the cluster cannot exceed 8.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- port_name[0-6] for cores in subcluster0.
- port_name[7-10] for cores in subcluster1.

All instances in the Master cross trigger matrix port array, `cti[11]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu6` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu3` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [ARMCortexA55CT](#)
- [ARMCortexA75CT](#)

See also [Arm DynamIQ Shared Unit Technical Reference Manual](#).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA55CT_CortexA75CT

Table 3-255: Ports

Name	Protocol	Type	Description
aa64naa32[11]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port
AENDMP	Value_64	Slave	DynamlQ port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	DynamlQ port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[11]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[11]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[11]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[11]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[11]	Signal	Master	Timer signals to SOC.
commirq[11]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[11]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[11]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[11]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[11]	Signal	Slave	Disable cryptography extensions after reset.
cti[11]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[11]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.

Name	Protocol	Type	Description
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[11]	Signal	Master	No power-down request.
dbgpwrupreq[11]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[11]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[11]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[11]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[11]	PChannel	Slave	PChannels for cores
pmuirq[11]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[11]	Signal	Slave	Per core RAM Error Interrupt.
reset[11]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[11]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[11]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[11]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[11]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[11]	Signal	Slave	Virtualised FIQ.

Name	Protocol	Type	Description
vinithi[11]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[11]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[11]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA55CT_CortexA75CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.AA64nAA32**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster0.cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x40000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`subcluster0.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster0.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

subcluster0.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster0.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.CCSIDR-L1D_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

subcluster1.CCSIDR-L1I_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

subcluster1.CCSIDR-L2_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.AA64nAA32**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster1.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster1.icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`subcluster1.ptw_latency`

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlb_latency

Type
int

Default value
0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.18 ARMCortexA55CT_CortexA76CT

ARMCortexA55CT_CortexA76CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-256: IP revisions support

Revision	Quality level
CortexA55 r1p0	Full support
CortexA76 r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA55CT_CortexA76CT

This model has the following Iris instances:

Table 3-257: ARMCortexA55CT_CortexA76CT Iris instances

InstanceName	ComponentName
ARMCortexA55CT_CortexA76CT	Cluster_ARM_Cortex-A55_Cortex-A76
ARMCortexA55CT_CortexA76CT.AMU	PVBusLogger
ARMCortexA55CT_CortexA76CT.AMU.mapper	PVBusMapper
ARMCortexA55CT_CortexA76CT.DAP	PVBusLogger
ARMCortexA55CT_CortexA76CT.DAP.mapper	PVBusMapper
ARMCortexA55CT_CortexA76CT.DSU	DSU
ARMCortexA55CT_CortexA76CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA55CT_CortexA76CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA55CT_CortexA76CT.DSU.shared_cache	PVCache
ARMCortexA55CT_CortexA76CT.DSU.shared_cache.upstream[0]	PVBusSlave

ARMCortexA55CT_CortexA76CT.subcluster1.cpu0.l1icache	PVCache
ARMCortexA55CT_CortexA76CT.subcluster1.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA76CT.subcluster1.cpu0.l2cache	PVCache
ARMCortexA55CT_CortexA76CT.subcluster1.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexA55CT_CortexA76CT.subcluster1.cpu0.l2cache.upstream[1]	PVBusSlave

ARMCortexA55CT_CortexA76CT contains the following CADI targets:

- ARM_Cortex-A55
- ARM_Cortex-A76
- Cluster_ARM_Cortex-A55_Cortex-A76
- PVCache
- Subcluster_ARM_Cortex-A55
- Subcluster_ARM_Cortex-A76
- TlbCadi

About ARMCortexA55CT_CortexA76CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-7 (ARMCortexA55CT).

subcluster1.NUM_CORES

Possible values are 1-4 (ARMCortexA76CT).

The total number of cores in the cluster cannot exceed 8.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- port_name[0-6] for cores in subcluster0.
- port_name[7-10] for cores in subcluster1.

All instances in the Master cross trigger matrix port array, `cti[11]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu6` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu3` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [ARMCortexA55CT](#)
- [ARMCortexA76CT](#)

Ports for ARMCortexA55CT_CortexA76CT

Table 3-259: Ports

Name	Protocol	Type	Description
<code>aa64naa32[11]</code>	Signal	Slave	Register width after reset.
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port
<code>AENDMP</code>	Value_64	Slave	DynamlQ port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	DynamlQ port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[11]</code>	Signal	Slave	This signal if for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[11]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[11]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[11]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[11]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[11]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[11]</code>	Signal	Master	Timer signals to SOC.
<code>commirq[11]</code>	Signal	Master	Interrupt signal from debug communications channel.

Name	Protocol	Type	Description
core_clk_in[11]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[11]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[11]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[11]	Signal	Slave	Disable cryptography extensions after reset.
cti[11]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[11]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[11]	Signal	Master	No power-down request.
dbgprupreq[11]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[11]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[11]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[11]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[11]	PChannel	Slave	PChannels for cores
pmbirq[11]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[11]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[11]	Signal	Slave	Per core RAM Error Interrupt.
reset[11]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[11]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain

Name	Protocol	Type	Description
sei[11]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[11]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[11]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[11]	Signal	Slave	Virtualised FIQ.
vinithi[11]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[11]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[11]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA55CT_CortexA76CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_issue_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-write_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l3cache-write_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`pchannel_treat_simreset_as_poreset`**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.AA64nAA32**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster0.cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x40000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.max_code_cache_mb`**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

subcluster0.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster0.force_zero_PSTATE_PAN`**Type**

bool

Default value

0x0

Non-architecture parameter to force `PSTATE.PAN` to be 0.0: No effect. 1: `PSTATE.PAN` is always treated as 0. The parameter optimizes the performance of updating `PSTATE.PAN`.

`subcluster0.has_dot_product`**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

`subcluster0.icache-hit_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster0.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-size`**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

`subcluster0.ptw_latency`**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

`subcluster0.tlb_latency`**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

`subcluster0.tlbi_stall_enabled`**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-size`**Type**

int

Default value

0x80000

L2 Cache size in bytes.

`subcluster1.cpuX.l2cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-read_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

subcluster1.ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

subcluster1.ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

subcluster1.ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

subcluster1.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

subcluster1.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.19 ARMCortexA55CT_CortexA78CT

ARMCortexA55CT_CortexA78CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-260: IP revisions support

Revision	Quality level
CortexA55 r1p0	Full support
CortexA78 r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA55CT_CortexA78CT

This model has the following Iris instances:

Table 3-261: ARMCortexA55CT_CortexA78CT Iris instances

InstanceName	ComponentName
ARMCortexA55CT_CortexA78CT	Cluster_ARM_Cortex-A55_Cortex-A78

ARMCortexA55CT_CortexA78CT contains the following CADI targets:

- ARM_Cortex-A55
- ARM_Cortex-A78
- Cluster_ARM_Cortex-A55_Cortex-A78
- PVCache
- Subcluster_ARM_Cortex-A55
- Subcluster_ARM_Cortex-A78
- TlbCadi

About ARMCortexA55CT_CortexA78CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-7 (ARMCortexA55CT).

subcluster1.NUM_CORES

Possible values are 1-4 (ARMCortexA78CT).

The total number of cores in the cluster cannot exceed 8.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- port_name[0-6] for cores in subcluster0.
- port_name[7-10] for cores in subcluster1.

All instances in the Master cross trigger matrix port array, `cti[11]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- subcluster0.cpu0 to subcluster0.cpu6 identify cores in subcluster0.
- subcluster1.cpu0 to subcluster1.cpu3 identify cores in subcluster1.

For information about the cores in this model, see:

- [ARMCortexA55CT](#)
- [ARMCortexA78CT](#)

Ports for ARMCortexA55CT_CortexA78CT

Table 3-263: Ports

Name	Protocol	Type	Description
aa64naa32[11]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port
AENDMP	Value_64	Slave	DynamiQ port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	DynamiQ port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[11]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.

Name	Protocol	Type	Description
cfgte[11]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:14] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[11]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[11]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[11]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[11]	Signal	Master	Timer signals to SOC.
commirq[11]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[11]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[11]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[11]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[11]	Signal	Slave	Disable cryptography extensions after reset.
cti[11]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[11]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[11]	Signal	Master	No power-down request.
dbgpwrupreq[11]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[11]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[11]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[11]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[11]	PChannel	Slave	PChannels for cores

Name	Protocol	Type	Description
pmbirq[11]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[11]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[11]	Signal	Slave	Per core RAM Error Interrupt.
reset[11]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[11]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[11]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[11]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[11]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[11]	Signal	Slave	Virtualised FIQ.
vinithi[11]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[11]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[11]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA55CT_CortexA78CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamlQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l3cache-size`**Type**

int

Default value

0x80000

L3 Cache size in bytes.

`l3cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_issue_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-write_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.AA64nAA32**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster0.cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTL.R.V.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x40000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

subcluster0.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster0.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster0.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTL.R.V.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster1.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster1.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

subcluster1.ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

subcluster1.ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

subcluster1.ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

subcluster1.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster1.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster1.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster1.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled

Type

bool

Default value

0x0

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat-dcache-cmos-to-pou-as-nop

Type

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

subcluster1.walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.20 ARMCortexA57x1CT

ARMCortexA57x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-264: IP revisions support

Revision	Quality level
r1p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM Cortex-A57x1CT

This model has the following Iris instances:

Table 3-265: ARM Cortex-A57x1CT Iris instances

InstanceName	ComponentName
ARM Cortex-A57x1CT	Cluster_ARM_Cortex-A57
ARM Cortex-A57x1CT.AMU	PVBusLogger
ARM Cortex-A57x1CT.AMU.mapper	PVBusMapper
ARM Cortex-A57x1CT.DAP	PVBusLogger
ARM Cortex-A57x1CT.DAP.mapper	PVBusMapper
ARM Cortex-A57x1CT.DSU	DSU

ARMCortexA57x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA57x1CT contains the following CADI targets:

- ARM_Cortex-A57
- Cluster_ARM_Cortex-A57
- PVCache
- TlbCadi

About ARMCortexA57x1CT

The following components also exist:

- ARMCortexA57x2CT.
- ARMCortexA57x3CT.
- ARMCortexA57x4CT.

The per-core parameters are preceded by cpun., where n identifies the core (0-3).

The cache latency parameters are only effective when you enable cache-state modeling. Timing annotation for transactions downstream of the cache and TLB models propagates through the models. This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBusDecoder to direct traffic to the correct port, dev_debug_s or memorymapped_debug_s.

Differences between the model and the RTL

This component has the following differences from the corresponding revision of the RTL implementation:

- The value of the AArch64 PMCEID0_ELO register, and the AArch32 alias of this register, differs in the model from the TRM value. The model value reflects the model counters.

- The mechanisms for setting the affinity fields of the MPIDR. The RTL has two ports:
 - CLUSTERIDAFF1[7:0].
 - CLUSTERIDAFF2[7:0]. AFF1 sets the value of MPIDR bits[15:8] and AFF2 sets the value of MPIDR bits[23:16]. In contrast, the model has a single CLUSTER_ID port. This difference allows the setting of bits[23:8] of the MPIDR using bits[15:0] of the CLUSTER_ID value.
- The memory mapped debug registers have a view for cores and a view for external debug agents. In the model, these views require two PVBUS ports. In hardware, the system designer decides how the implementation differentiates the views.
- In the model, a single peer event port combines the functionality of the eventi and evento signals in the RTL.
- The Generic Timers are Programmer's View (PV) level abstractions: a model-specific protocol connects the cntvalueb port to the MemoryMappedCounterModule.
- The GIC CPU Interface is a PV level abstraction: a model-specific protocol connects the GIC CPU Interface to the GIC Distributor.
- The CoreSight Cross Trigger Interface (CTI) is a PV level abstraction: the interface is a model-specific one.
- The model has no mechanism to read the internal memory that the Cache and TLB structures use, through the implementation defined region of the system coprocessor interface. This memory includes the RAM Index Register, IL1DATA Registers, DL1DATA Registers, and associated functionality.
- The model does not implement:
 - ETM registers.
 - The PMUEVENT bus.
 - The WARMRESETREQ signal. However, the warm reset code sequence (see the section Code sequence to request a Warm reset as a result of RMR_ELx.RR in the Arm Architecture Reference Manual for A-profile architecture) makes the model simulate a warm reset of the core.
 - The PMUSNAPSHOTREQ and PMUSNAPSHOTACK signals.
 - The EXTERRIRQ and INTERRIRQ signals.
 - Processor dynamic-retention signals.
 - The SYSBARDISABLE signal.
 - The DBGPWRDUP, DBGPWRUPREQ, DBGNOPWRDWN, and DBGRSTREQ debug power management signals.
 - ECC and parity schemes are hardware-specific so are not supported.

Ports for ARMCortexA57x1CT

Table 3-267: Ports

Name	Protocol	Type	Description
aa64naa32[4]	Signal	Slave	Register width after reset.
acp_s	PVBUS	Slave	AXI ACP slave port.

Name	Protocol	Type	Description
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	The per-EL counter signal.
CNTPNSIRQ[4]	Signal	Master	The per-EL counter signal.
CNTPSIRQ[4]	Signal	Master	The per-EL counter signal.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	The per-EL counter signal.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	These signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Reset the shared L2 memory system controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.

Name	Protocol	Type	Description
vfiq[4]	Signal	Slave	Virtual FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Processor Virtual System Error Interrupt request.

Parameters for ARM Cortex A57x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x22000000

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x1

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.AA64nAA32**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`enable_simulation_performance_optimizations`**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-state_modelled`**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l2cache-hit_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l2cache-maintenance_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l2cache-miss_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`l2cache-read_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type
int

Default value
0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.21 ARMCortexA65AECT

ARMCortexA65AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-268: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA65AECT

This model has the following Iris instances:

Table 3-269: ARMCortexA65AECT Iris instances

InstanceName	ComponentName
ARMCortexA65AECT	Cluster_ARM_Cortex-A65AE
ARMCortexA65AECT.AMU	PVBusLogger
ARMCortexA65AECT.AMU.mapper	PVBusMapper

ARMCortexA65AECT contains the following CADI targets:

- ARM_Cortex-A65AE
- Cluster_ARM_Cortex-A65AE
- PVCache
- TlbCadi

About ARMCortexA65AECT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:

- Automatic CPU retention mode.
- Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGIRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.
- Split/Lock is supported but with the limitations described in the AE-specific features implemented section.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where `n` identifies the core (0-7).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA65AECT

Table 3-271: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port

Name	Protocol	Type	Description
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[16]	Signal	Slave	This signal if for EE bit initialisation.
cfgte[16]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[16]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[16]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[16]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[16]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[16]	Signal	Master	Timer signals to SOC.
commirq[16]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	Signal	Slave	Disable cryptography extensions after reset.
cti[16]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[16]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[16]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[16]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.

Name	Protocol	Type	Description
gicv3_redistributor_s[16]	GICv3Comms	Slave	GICv3 AXI-stream port per thread.
irq[16]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmuirq[16]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	Signal	Slave	Virtualised FIQ.
vinithi[16]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA65AECT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE

Type

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES

Type

int

Default value

0x2

Number of cores per cluster.

cluster_patch_level

Type

int

Default value

0x0

Cosmetic change to patch number in CLUSTERIDR. Corresponds to the Y in rXpY.

cluster_revision_number

Type

int

Default value

0x0

Cosmetic change to revision number in CLUSTERIDR, Corresponds to the X in rXpY.

`cpi_div`**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.CRYPTODISABLE`**Type**

bool

Default value

0x0

Disable cryptographic features.

`cpuX.enable_single_thread_at_reset`**Type**

bool

Default value

0x0

Enable single thread after reset and keep other thread in reset.

`cpuX.enable_trace_special_hlt_imm16`**Type**

bool

Default value

0x0

Enable usage of parameter `trace_special_hlt_imm16`.

`cpuX.l2cache-hit_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-maintenance_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-miss_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-read_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-size`**Type**

int

Default value

0x40000

L2 Cache size in bytes.

`cpuX.l2cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.threadY.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.threadY.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.threadY.MPIDR-override**Type**

int

Default value

0x0

Override MPIDR value. A nonzero value will override the MT,cluster,cpu,thread ID bits in MPIDR.

cpuX.threadY.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.threadY.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTL.R.V.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_lock_step**Type**

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x400000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-write_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l3cache-write_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`pchannel_treat_simreset_as_poreset`**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

`periph_address_end`**Type**

int

Default value

0x0

End address for peripheral port address range exclusive (corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.22 **ARMCortexA65AECT_CortexA76AECT**

ARMCortexA65AECT_CortexA76AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-272: IP revisions support

Revision	Quality level
CortexA65AE r0p0	Full support
CortexA76AE r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA65AECT_CortexA76AECT

This model has the following Iris instances:

Table 3-273: ARMCortexA65AECT_CortexA76AECT Iris instances

InstanceName	ComponentName
ARMCortexA65AECT_CortexA76AECT	Cluster_ARM_Cortex-A65AE_Cortex-A76AE
ARMCortexA65AECT_CortexA76AECT.AMU	PVBusLogger
ARMCortexA65AECT_CortexA76AECT.AMU.mapper	PVBusMapper
ARMCortexA65AECT_CortexA76AECT.DAP	PVBusLogger
ARMCortexA65AECT_CortexA76AECT.DAP.mapper	PVBusMapper
ARMCortexA65AECT_CortexA76AECT.DSU	DSU
ARMCortexA65AECT_CortexA76AECT.DSU.13_flusher	AsyncCacheFlushUnit

InstanceName	ComponentName
ARMCortexA65AECT_CortexA76AECT.DSU.mpam_busslave	PVBusSlave
ARMCortexA65AECT_CortexA76AECT.DSU.shared_cache	PVCache
ARMCortexA65AECT_CortexA76AECT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMCortexA65AECT_CortexA76AECT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMCortexA65AECT_CortexA76AECT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMCortexA65AECT_CortexA76AECT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMCortexA65AECT_CortexA76AECT.DSU.shared_cache.upstream[4]	PVBusSlave

ARMCortexA65AECT_CortexA76AECT contains the following CADI targets:

- ARM_Cortex-A65AE
- ARM_Cortex-A76AE
- Cluster_ARM_Cortex-A65AE_Cortex-A76AE
- PVCache
- Subcluster_ARM_Cortex-A65AE
- Subcluster_ARM_Cortex-A76AE
- TlbCadi

About ARMCortexA65AECT_CortexA76AECT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 2-6 (ARMCortexA65AECT).

subcluster1.NUM_CORES

Possible values are 2-4 (ARMCortexA76AECT).

The total number of cores in the cluster cannot exceed 8.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- port_name[0-11] for cores in subcluster0.
 - port_name[0] is a port for subcluster0.cpu0.thread0
 - port_name[1] is a port for subcluster0.cpu0.thread1
 - port_name[2] is a port for subcluster0.cpu1.thread0
- port_name[12-15] for cores in subcluster1.

All instances in the Master cross trigger matrix port array, `cti[16]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- subcluster0.cpu0 to subcluster0.cpu5 identify cores in subcluster0.
- subcluster1.cpu0 to subcluster1.cpu3 identify cores in subcluster1.

For information about the cores in this model, see:

- [ARMCortexA65AECT](#)
- [ARMCortexA76AECT](#)

Ports for ARMCortexA65AECT_CortexA76AECT

Table 3-275: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port
AENDMP	Value_64	Slave	DynamlQ port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	DynamlQ port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[16]	Signal	Slave	This signal is for EE bit initialisation.
cfgte[16]	Signal	Slave	This signal provides default exception handling state.

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[16]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[16]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[16]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[16]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[16]	Signal	Master	Timer signals to SOC.
commirq[16]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[10]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[10]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	Signal	Slave	Disable cryptography extensions after reset.
cti[16]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[16]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[16]	Signal	Master	No power-down request.
dbgprupreq[16]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[16]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[10]	PChannel	Slave	PChannels for cores
pmbirq[16]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[16]	Signal	Master	Interrupt signal from performance monitoring unit.

Name	Protocol	Type	Description
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbush_m0	PVBus	Master	The core will generate bus requests on this port.
pvbush_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	Signal	Slave	Per core RAM Error Interrupt.
reset[10]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[16]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	Signal	Slave	Virtualised FIQ.
vinithi[16]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L3 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA65AECT_CortexA76AECT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the

simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE

Type

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

dcache-state_modelled

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode

Type

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics

Type

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_lock_step

Type

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l3cache-maintenance_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-miss_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`l3cache-read_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l3cache-read_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l3cache-size

Type

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

l3cache-snoop_issue_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-write_access_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

l3cache-write_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

subcluster0.NUM_CORES**Type**

int

Default value

0x2

Number of cores per cluster.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.enable_single_thread_at_reset**Type**

bool

Default value

0x0

Enable single thread after reset and keep other thread in reset.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-maintenance_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-miss_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-read_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x40000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT

Type

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC

Type

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line

Type

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd

Type

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable

Type

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.threadY.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.threadY.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster0.cpuX.threadY.MPIDR-override**Type**

int

Default value

0x0

Override MPIDR value. A nonzero value will override the MT,cluster,cpu,thread ID bits in MPIDR.

subcluster0.cpuX.threadY.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.threadY.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster0.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster0.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster0.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster0.icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

`subcluster0.ptw_latency`

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

`subcluster0.reported_patch_level`

Type

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

subcluster0.reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.NUM_CORES**Type**

int

Default value

0x2

Number of cores per cluster.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster1.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.max_code_cache_mb`**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster1.ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

subcluster1.ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

subcluster1.ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

subcluster1.ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster1.has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster1.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster1.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.reported_patch_level**Type**

int

Default value`0xffffffffffffffff`

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

`subcluster1.reported_revision_number`**Type**`int`**Default value**`0xffffffffffffffff`

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

`subcluster1.tlb_latency`**Type**`int`**Default value**`0x0`

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

`subcluster1.tlbi_stall_enabled`**Type**`bool`**Default value**`0x0`

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

`subcluster1.treat-dcache-cmos-to-pou-as-nop`**Type**`int`**Default value**`0x0`

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.23 ARM CortexA65CT

ARM CortexA65CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-276: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexA65CT

This model has the following Iris instances:

Table 3-277: ARM CortexA65CT Iris instances

InstanceName	ComponentName
ARM CortexA65CT	Cluster_ARM_Cortex-A65
ARM CortexA65CT.AMU	PVBusLogger
ARM CortexA65CT.AMU.mapper	PVBusMapper
ARM CortexA65CT.DAP	PVBusLogger
ARM CortexA65CT.DAP.mapper	PVBusMapper
ARM CortexA65CT.DSU	DSU
ARM CortexA65CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARM CortexA65CT.DSU.mpam_busslave	PVBusSlave
ARM CortexA65CT.DSU.shared_cache	PVCache
ARM CortexA65CT.DSU.shared_cache.upstream[0]	PVBusSlave

ARMCortexA65CT.ext_bus	PVBusLogger
ARMCortexA65CT.ext_bus.mapper	PVBusMapper
ARMCortexA65CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

ARMCortexA65CT contains the following CADI targets:

- ARM_Cortex-A65
- Cluster_ARM_Cortex-A65
- PVCache
- TlbCadi

About ARMCortexA65CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).

- Latency configuration.
- Snoop filtering.
- Debug power management signals `DBGPWRDUP` and `DBGIRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not yet supported but signals are implemented.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where `n` identifies the core (0-3).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA65CT

Table 3-279: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[16]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgte[16]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[16]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.

Name	Protocol	Type	Description
CNTVIRQ[16]	Signal	Master	Timer signals to SOC.
commirq[16]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[16]	Signal	Slave	Disable cryptography extensions after reset.
cti[16]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[16]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[16]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[16]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[16]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[16]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[16]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmuirq[16]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[16]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[16]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain

Name	Protocol	Type	Description
sei[16]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[16]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[16]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[16]	Signal	Slave	Virtualised FIQ.
vinithi[16]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[16]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[16]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA65CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

cluster_patch_level**Type**

int

Default value

0x0

Cosmetic change to patch number in CLUSTERIDR. Corresponds to the Y in rXpY.

cluster_revision_number**Type**

int

Default value

0x0

Cosmetic change to revision number in CLUSTERIDR, Corresponds to the X in rXpY.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.enable_single_thread_at_reset**Type**

bool

Default value

0x0

Enable single thread after reset and keep other thread in reset.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x40000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.threadY.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.threadY.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.threadY.MPIDR-override**Type**

int

Default value

0x0

Override MPIDR value. A nonzero value will override the MT,cluster,cpu,thread ID bits in MPIDR.

cpuX.threadY.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.threadY.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x400000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.24 ARMCortexA72x1CT

ARMCortexA72x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-280: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA72x1CT

This model has the following Iris instances:

Table 3-281: ARMCortexA72x1CT Iris instances

InstanceName	ComponentName
ARMCortexA72x1CT	Cluster_ARM_Cortex-A72
ARMCortexA72x1CT.AMU	PVBUSLogger
ARMCortexA72x1CT.AMU.mapper	PVBUSMapper
ARMCortexA72x1CT.DAP	PVBUSLogger
ARMCortexA72x1CT.DAP.mapper	PVBUSMapper
ARMCortexA72x1CT.DSU	DSU
ARMCortexA72x1CT.DSU.mpam_busslave	PVBUSSlave
ARMCortexA72x1CT.MMAP	PVBUSLogger

InstanceName	ComponentName
ARMCortexA72x1CT.MMAP.mapper	PVBusMapper
ARMCortexA72x1CT.RAS	PVBusLogger
ARMCortexA72x1CT.RAS.mapper	PVBusMapper
ARMCortexA72x1CT.acp_mapper	PVBusMapper
ARMCortexA72x1CT.cpu0	ARM_Cortex-A72
ARMCortexA72x1CT.cpu0.UTLB	TLB
ARMCortexA72x1CT.cpu0.dtlb	TlbCadi
ARMCortexA72x1CT.cpu0.l1dcache	PVCache
ARMCortexA72x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA72x1CT.cpu0.l1licache	PVCache

ARMCortexA72x1CT contains the following CADI targets:

- ARM_Cortex-A72
- Cluster_ARM_Cortex-A72
- PVCache
- TlbCadi

About ARMCortexA72x1CT

- The following components also exist:
 - ARMCortexA72x2CT.
 - ARMCortexA72x3CT.
 - ARMCortexA72x4CT.

The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

- The cache latency cluster parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the cache and TLB models.
- ECC and parity schemes are hardware-specific so are not supported.
- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA72x1CT

Table 3-283: Ports

Name	Protocol	Type	Description
aa64naa32[4]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port.
broadcastcachemaint	Signal	Slave	Enable broadcasting of cache maintenance operations to downstream caches.
broadcastinner	Signal	Slave	Enable broadcasting of Inner Shareable transactions.
broadcastouter	Signal	Slave	Enable broadcasting of Outer Shareable transactions.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
clrexmonack	Signal	Master	Acknowledge handshake signal for the <code>clrexmonreq</code> signal

Name	Protocol	Type	Description
clrexmonreq	Signal	Slave	Signals the clearing of an external global exclusive monitor
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
CNTHPIRQ[4]	Signal	Master	The per-EL counter signal.
CNTPNSIRQ[4]	Signal	Master	The per-EL counter signal.
CNTPSIRQ[4]	Signal	Master	The per-EL counter signal.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module
CNTVIRQ[4]	Signal	Master	The per-EL counter signal.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	These signals relate to core power down.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Reset the shared L2 memory system controller.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state.
standbywfil2	Signal	Master	Indicate that all the individual processors and the L2 systems are in a WFI state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtual FIQ
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Processor Virtual System Error Interrupt request.

Parameters for ARMCortexA72x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER**Type**

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x22000000

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x1

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.AA64nAA32**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`enable_simulation_performance_optimizations`**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

`icache-hit_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`icache-maintenance_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l2cache-write_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.25 ARMCortexA73x1CT

ARMCortexA73x1CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-284: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA73x1CT

This model has the following Iris instances:

Table 3-285: ARMCortexA73x1CT Iris instances

InstanceName	ComponentName
ARMCortexA73x1CT	Cluster_ARM_Cortex-A73

ARMCortexA73x1CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Table 3-286: ARMCortexA73x1CT MTI instances

InstanceName	ComponentName
ARMCortexA73x1CT	ARMv8Cluster
ARMCortexA73x1CT.AMU	PVBusLogger
ARMCortexA73x1CT.AMU.mapper	PVBusMapper
ARMCortexA73x1CT.DAP	PVBusLogger
ARMCortexA73x1CT.DAP.mapper	PVBusMapper
ARMCortexA73x1CT.DSU	DSU
ARMCortexA73x1CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA73x1CT.MMAP	PVBusLogger
ARMCortexA73x1CT.MMAP.mapper	PVBusMapper
ARMCortexA73x1CT.RAS	PVBusLogger
ARMCortexA73x1CT.RAS.mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexA73x1CT.acp_mapper	PVBusMapper
ARMCortexA73x1CT.cpu0	ARM_Cortex-A73
ARMCortexA73x1CT.cpu0.UTLB	TLB
ARMCortexA73x1CT.cpu0.l1dcache	PVCache
ARMCortexA73x1CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA73x1CT.cpu0.l1licache	PVCache
ARMCortexA73x1CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA73x1CT.ext_bus	PVBusLogger
ARMCortexA73x1CT.ext_bus.mapper	PVBusMapper
ARMCortexA73x1CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA73x1CT.l2_cache	PVCache
ARMCortexA73x1CT.l2_cache.upstream[0]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[10]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[11]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[12]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[13]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[14]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[15]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[16]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[1]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[2]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[3]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[4]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[5]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[6]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[7]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[8]	PVBusSlave
ARMCortexA73x1CT.l2_cache.upstream[9]	PVBusSlave
ARMCortexA73x1CT.l2_flusher	AsyncCacheFlushUnit

ARMCortexA73x1CT contains the following CADI targets:

- ARM_Cortex-A73
- Cluster_ARM_Cortex-A73
- PVCache
- TlbCadi

About ARMCortexA73x1CT

- The following components also exist:
 - ARMCortexA73x2CT.

- ARMCortexA73x3CT.
- ARMCortexA73x4CT.
- The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).
- This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The `semihosting-cwd` parameter sets the CWD that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- ECC support is hardware-specific so is not modeled.

Ports for ARMCortexA73x1CT

Table 3-287: Ports

Name	Protocol	Type	Description
<code>aa64naa32[4]</code>	Signal	Slave	Register width after reset.
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastinner</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal if for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the core executes instructions.
<code>clrexmonack</code>	Signal	Master	Acknowledge handshake signal for the <code>clrexmonreq</code> signal
<code>clrexmonreq</code>	Signal	Slave	Signals the clearing of an external global exclusive monitor
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.

Name	Protocol	Type	Description
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
commrx[4]	Signal	Master	Receive portion of Data Transfer Register full.
commtx[4]	Signal	Master	Transmit portion of Data Transfer Register empty.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	CPU power on reset.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross trigger matrix port.
dbgack[4]	Signal	Master	External debug interface.
dbgen[4]	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Processor powerup request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
l2flushdone	Signal	Master	Flush of L2 memory system complete.
l2flushreq	Signal	Slave	Request flush of L2 memory system.
l2reset	Signal	Slave	Level2 reset.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden[4]	Signal	Slave	External debug interface.
periphbase	Value_64	Slave	This port sets the base address of private peripheral region.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Debug reset.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt
reset[4]	Signal	Slave	Reset.
romaddr	Value_64	Slave	Debug ROM base address.
romaddrv	Signal	Slave	Debug ROM base address valid.

Name	Protocol	Type	Description
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sei[4]	Signal	Slave	Per core System Error physical pins.
smpen[4]	Signal	Master	This signals AMP or SMP mode for each core.
spiden[4]	Signal	Slave	External debug interface.
spniden[4]	Signal	Slave	External debug interface.
standbywfe[4]	Signal	Master	This signal indicates if a core is in WFE state.
standbywfi[4]	Signal	Master	This signal indicates if a core is in WFI state
standbywfil2	Signal	Master	This signal indicates all cores and L2 are idle and in low power state.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA73x1CT

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTINNER

Type

bool

Default value

0x1

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

CCSIDR-L1D_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

CCSIDR-L1I_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

CCSIDR-L2_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x1

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

PERIPHBASE**Type**

int

Default value

0x13080000

Base address of peripheral memory space.

`cpi_div`**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.AA64nAA32`**Type**

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

`cpuX.CFGTE`**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.SMPEN**Type**

bool

Default value

0x0

Enable broadcast messages necessary for correct SMP operation at reset.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTL.R.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l2cache-miss_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`l2cache-read_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`l2cache-read_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l2cache-size`**Type**

int

Default value

0x80000

L2 Cache size in bytes.

l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.26 ARMCortexA75CT

ARMCortexA75CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-288: IP revisions support

Revision	Quality level
r3p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA75CT

This model has the following Iris instances:

Table 3-289: ARMCortexA75CT Iris instances

InstanceName	ComponentName
ARMCortexA75CT	Cluster_ARM_Cortex-A75
ARMCortexA75CT.AMU	PVBusLogger
ARMCortexA75CT.AMU.mapper	PVBusMapper
ARMCortexA75CT.DAP	PVBusLogger
ARMCortexA75CT.DAP.mapper	PVBusMapper
ARMCortexA75CT.DSU	DSU
ARMCortexA75CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA75CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA75CT.DSU.shared_cache	PVCache
ARMCortexA75CT.DSU.shared_cache.upstream[0]	PVBusSlave

ARMCortexA75CT contains the following CADI targets:

- ARM_Cortex-A75
- Cluster_ARM_Cortex-A75
- PVCache
- TlbCadi

About ARMCortexA75CT

The model supports the following features:

- DynamIQ™ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGWRUP and DBGWRSTREQ are not implemented, but DBGWRUPREQ and DBGWRNOPWRDWN are implemented.
- Cache stashing capability.
- Dual ACE masters.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The per-core parameters are preceded by `cpun.`, where *n* identifies the core (0-3).

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA75CT

Table 3-291: Ports

Name	Protocol	Type	Description
aa64naa32[4]	Signal	Slave	Register width after reset.
acp_s	PVBus	Slave	AXI ACP slave port
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[4]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
edbgrq[4]	Signal	Slave	External debug interface.

Name	Protocol	Type	Description
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Individual processor RAM Error Interrupt signal input.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtual FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtual IRQ.

Name	Protocol	Type	Description
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A75CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CCSIDR-L1D_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1D (this is cosmetic and does not affect cache behaviour).

CCSIDR-L1I_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L1I (this is cosmetic and does not affect cache behaviour).

CCSIDR-L2_override**Type**

int

Default value

0x0

If nonzero, override the value presented in CCSIDR for L2 (this is cosmetic and does not affect cache behaviour).

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the

simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE

Type

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES

Type

int

Default value

0x1

Number of cores per cluster.

cpi_div

Type

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul

Type

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.AA64nAA32

Type

bool

Default value

0x1

Register width configuration at reset. 0, AArch32. 1, AArch64.

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CP15SDISABLE**Type**

bool

Default value

0x0

Initialize to disable access to some CP15 registers.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.27 **ARMCortexA76AECT**

ARMCortexA76AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-292: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA76AECT

This model has the following Iris instances:

Table 3-293: ARMCortexA76AECT Iris instances

InstanceName	ComponentName
ARMCortexA76AECT	Cluster_ARM_Cortex-A76AE
ARMCortexA76AECT.AMU	PVBusLogger
ARMCortexA76AECT.AMU.mapper	PVBusMapper
ARMCortexA76AECT.DAP	PVBusLogger
ARMCortexA76AECT.DAP.mapper	PVBusMapper
ARMCortexA76AECT.DSU	DSU
ARMCortexA76AECT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA76AECT.DSU.mpam_busslave	PVBusSlave

InstanceName	ComponentName
ARMCortexA76AECT.DSU.shared_cache	PVCache
ARMCortexA76AECT.DSU.shared_cache.upstream[0]	PVBusSlave

ARMCortexA76AECT contains the following CADI targets:

- ARM_Cortex-A76AE
- Cluster_ARM_Cortex-A76AE
- PVCache
- TlbCadi

About ARMCortexA76AECT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOFWRDWN are implemented.
- Cache stashing capability.
- Split/Lock is supported but with the limitations described in the AE-specific features implemented section.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where `n` identifies the core (0-3).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA76AECT

Table 3-295: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal if for EE bit initialisation.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.

Name	Protocol	Type	Description
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.

Name	Protocol	Type	Description
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA76AECT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x2

Number of cores per cluster.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`default_opmode`**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

`diagnostics`**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

`enable_lock_step`**Type**

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l3cache-maintenance_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive (corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.28 ARMCortexA76CT

ARMCortexA76CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-296: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA76CT

This model has the following Iris instances:

Table 3-297: ARMCortexA76CT Iris instances

InstanceName	ComponentName
ARMCortexA76CT	Cluster_ARM_Cortex-A76
ARMCortexA76CT.AMU	PVBusLogger
ARMCortexA76CT.AMU.mapper	PVBusMapper
ARMCortexA76CT.DAP	PVBusLogger
ARMCortexA76CT.DAP.mapper	PVBusMapper
ARMCortexA76CT.DSU	DSU
ARMCortexA76CT.DSU.l3_flusher	AsyncCacheFlushUnit

ARMCortexA76CT contains the following CADI targets:

- ARM_Cortex-A76
- Cluster_ARM_Cortex-A76
- PVCache
- TlbCadi

About ARMCortexA76CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOFWRDWN are implemented.
- Cache stashing capability.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where `n` identifies the core (0-3).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA76CT

Table 3-299: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[4]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cp15sdisable[4]	Signal	Slave	This signal disables write access to some system control processor registers.
cpuporeset[4]	Signal	Slave	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	These signals relate to core power down.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.

Name	Protocol	Type	Description
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core virtual System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Name	Protocol	Type	Description
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A76CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

`cpuX.CFGTE`**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

`cpuX.CRYPTODISABLE`**Type**

bool

Default value

0x0

Disable cryptographic features.

`cpuX.RVBARADDR`**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop

Type
int

Default value
0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.29 **ARMCortexA77CT**

ARMCortexA77CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-300: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA77CT

This model has the following Iris instances:

Table 3-301: ARMCortexA77CT Iris instances

InstanceName	ComponentName
ARMCortexA77CT	Cluster_ARM_Cortex-A77
ARMCortexA77CT.AMU	PVBusLogger

ARMCortexA77CT contains the following CADI targets:

- ARM_Cortex-A77
- Cluster_ARM_Cortex-A77
- PVCache
- TlbCadi

About ARMCortexA77CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.

- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGWRDUP and DBGRSTREQ are not implemented, but DBGWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. The per-core parameters are preceded by `cpun.`, where `n` identifies the core (0-3).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARM Cortex-A77CT

Table 3-303: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[4]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.

Name	Protocol	Type	Description
cfgte[4]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[4]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[4]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[4]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[4]	Signal	Master	Timer signals to SOC.
commirq[4]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from statistical profiling unit.

Name	Protocol	Type	Description
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A77CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter `trace_special_hlt_imm16`.

`cpuX.l2cache-hit_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-maintenance_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-miss_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-read_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-size`**Type**

int

Default value

0x80000

L2 Cache size in bytes.

`cpuX.l2cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`dcache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

`dcache-read_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations

Type

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync

Type

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-state_modelled`**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l3cache-maintenance_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-miss_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-write_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l3cache-write_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`pchannel_treat_simreset_as_poreset`**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

`periph_address_end`**Type**

int

Default value

0x0

End address for peripheral port address range exclusive (corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.30 ARM CortexA78AECT

ARM CortexA78AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-304: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexA78AECT

This model has the following Iris instances:

Table 3-305: ARM CortexA78AECT Iris instances

InstanceName	ComponentName
ARM CortexA78AECT	Cluster_ARM_Cortex-A78AE

ARMCortexA78AECT contains the following CADI targets:

- ARM_Cortex-A78AE
- Cluster_ARM_Cortex-A78AE
- PVCache
- TlbCadi

About ARMCortexA78AECT

The model supports the following features:

- DynamlQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamlQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGWRUP and DBGSRREQ are not implemented, but DBGWRUPREQ and DBGNOPWRDWN are implemented.
- Cache stashing capability.
- Split/Lock is supported but with the limitations described in the AE-specific features implemented section.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where `n` identifies the core (0-3).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA78AECT

Table 3-307: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal if for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>commirq[4]</code>	Signal	Master	Interrupt signal from debug communications channel.
<code>core_clk_in[4]</code>	ClockSignal	Slave	The clock signal connected to the <code>core_clk_in</code> port is used to determine the rate at which each core executes instructions.
<code>cpuporeset[4]</code>	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
<code>cryptodisable[4]</code>	Signal	Slave	Disable cryptography extensions after reset.
<code>cti[4]</code>	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.

Name	Protocol	Type	Description
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.

Name	Protocol	Type	Description
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A78AECT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x2

Number of cores per cluster.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTL.R.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`cpuX.max_code_cache_mb`**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_lock_step**Type**

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

has_statistical_profiling**Type**

bool

Default value

0x1

Whether Statistical Based Profiling is implemented (FEAT_SPE).

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-state_modelled`**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`l3cache-maintenance_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-miss_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-write_access_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`l3cache-write_latency`**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`pchannel_treat_simreset_as_poreset`**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

`periph_address_end`**Type**

int

Default value

0x0

End address for peripheral port address range exclusive (corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive (corresponds to ASTARTMP input signal).

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.31 ARMCortexA78CCT

ARMCortexA78CCT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-308: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA78CCT

This model has the following Iris instances:

ARMCortexA78CCT contains the following CADI targets:

- ARM_Cortex-A78C
- Cluster_ARM_Cortex-A78C
- PVCache
- TlbCadi

About ARMCortexA78CCT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Debug power management signals DBGPWRDUP and DBGRSTREQ are not implemented, but DBGPWRUPREQ and DBGNOFWRDWN are implemented.
- Cache stashing capability.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where `n` identifies the core (0-7).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA78CCT

Table 3-311: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AENDMP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
ASTARTMP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[8]	Signal	Slave	This signal if for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
cfgte[8]	Signal	Slave	This signal provides default exception handling state.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[8]	Signal	Master	Timer signals to SOC.
CNTHVIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPNSIRQ[8]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[8]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[8]	Signal	Master	Timer signals to SOC.
commirq[8]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[8]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[8]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[8]	Signal	Slave	Disable cryptography extensions after reset.
cti[8]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[8]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[8]	Signal	Master	No power-down request.
dbgpwrupreq[8]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[8]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.

Name	Protocol	Type	Description
gicv3_redistributor_s[8]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[8]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[8]	PChannel	Slave	PChannels for cores
pmbirq[8]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[8]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[8]	Signal	Slave	Per core RAM Error Interrupt.
reset[8]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[8]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[8]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[8]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[8]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[8]	Signal	Slave	Virtualised FIQ.
vinithi[8]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[8]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[8]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA78CCT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE

Type

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES

Type

int

Default value

0x1

Number of cores per cluster.

cpi_div

Type

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul

Type

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`cpuX.l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether l-cache has stateful implementation.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.32 ARM CortexA78CT

ARM CortexA78CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-312: IP revisions support

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexA78CT

This model has the following Iris instances:

Table 3-313: ARM CortexA78CT Iris instances

InstanceName	ComponentName
ARM CortexA78CT	Cluster_ARM_Cortex-A78
ARM CortexA78CT.AMU	PVBusLogger

ARMCortexA78CT.ext_bus.mapper	PVBusMapper
ARMCortexA78CT.gic_cpuif_decoder_cluster	GCv3CPUInterfaceDecoder

ARMCortexA78CT contains the following CADI targets:

- ARM_Cortex-A78
- Cluster_ARM_Cortex-A78
- PVCache
- TlbCadi

About ARMCortexA78CT

The model supports the following features:

- DynamIQ (DSU) system registers.
- Per-core L2 cache.
- A P-Channel for the cluster and for each core.
- Optional peripheral port.
- L3 cache partition.
- Per-core clock.
- BROADCASTPERSIST pin.

The model does not support the following features:

- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, or nPMBIRQ signals.
- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.
 - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.

- Debug power management signals `DBGPWRDUP` and `DBGIRSTREQ` are not implemented, but `DBGPWRUPREQ` and `DBGNOPWRDWN` are implemented.
- Cache stashing capability.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.

The per-core parameters are preceded by `cpun.`, where `n` identifies the core (0-3).

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA78CT

Table 3-315: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AENDMP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTARTMP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[4]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
<code>cfgte[4]</code>	Signal	Slave	This signal provides default exception handling state.
<code>clk_in</code>	ClockSignal	Slave	The clock signal connected to the <code>clk_in</code> port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
<code>clusterid</code>	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
<code>clusterpmuirq</code>	Signal	Master	DynamlQ pmu irq
<code>CNTHPIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTHVIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPNSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>CNTPSIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>cntvalueb</code>	CounterInterface	Slave	Interface to SoC level counter module.
<code>CNTVIRQ[4]</code>	Signal	Master	Timer signals to SOC.
<code>commirq[4]</code>	Signal	Master	Interrupt signal from debug communications channel.

Name	Protocol	Type	Description
core_clk_in[4]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
cpuporeset[4]	Signal	Slave	CPU power on reset. Initializes all the processor logic, including debug logic.
cryptodisable[4]	Signal	Slave	Disable cryptography extensions after reset.
cti[4]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[4]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[4]	Signal	Master	No power-down request.
dbgpwrupreq[4]	Signal	Master	Debug power up request.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[4]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s[4]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[4]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
niden	Signal	Slave	External debug interface.
pchannel_cluster	PChannel	Slave	PChannel for cluster.
pchannel_core[4]	PChannel	Slave	PChannels for cores
pmbirq[4]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[4]	Signal	Master	Interrupt signal from performance monitoring unit.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[4]	Signal	Slave	Per core RAM Error Interrupt.
reset[4]	Signal	Slave	Raising this signal will put the core into reset mode.
rvbaraddr[4]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[4]	Signal	Slave	Per core System Error physical pins.

Name	Protocol	Type	Description
spiden	Signal	Slave	External debug interface.
spniden	Signal	Slave	External debug interface.
sporeset	Signal	Slave	A single cluster-wide power on reset signal for all resettable registers in DynamIQ.
ticks[4]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq[4]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[4]	Signal	Slave	Virtualised FIQ.
vinithi[4]	Signal	Slave	This signal controls of the location of the exception vectors at reset.
virq[4]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[4]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A78CT

BROADCASTATOMIC

Type

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.VINITHI**Type**

bool

Default value

0x0

Reset value of SCTLR.V.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_coherent_icache**Type**

bool

Default value

0x0

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_peripheral_port**Type**

bool

Default value

0x0

If true, additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

`l3cache-hit_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x100000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type
bool

Default value
0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat-dcache-cmos-to-pou-as-nop

Type
int

Default value
0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.33 ARMCortexA510CT

ARMCortexA510CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-316: IP revisions support

Revision	Quality level
r0p0	Full support
r1p3	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Changes in 11.27.17

ARMCortexA510CT contains the following CADI targets:

- ARM_Cortex-A510
- Cluster_ARM_Cortex-A510
- PVCache
- TlbCadi

About ARMCortexA510CT

The model supports the following features:

- DynamIQ Shared Unit-110 (DSU-110) system registers.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- PChannel for the cluster and for each core.
- BROADCASTPERSIST pin.
- Optional peripheral port.
- L3Cache partition.
- Per-core clock.
- Utility bus.
- Revision R1 is the default configuration, with 32-bit support at EL0. R1 supports both configurations of EL0, with or without A32 support. For 64-bit only mode, set parameter `max_32bit_el=-1`.
- To configure revision R0, set parameter `revision_number=0`.

Support for the following features is planned for a future release:

- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (the Arm TLM2 extensions) bus protocols.
- BROADCASTCACHEMAINTPOU pin.
- COREINSTRRET, COREINSTRRUN, and `nPMBIRQ` signals.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
 - Automatic CPU retention mode.

- Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- Error correction or detection features.
- Self-test features (MBIST).
- Snoop filtering.
- Latency configuration.
- Cache stashing capability.

This model supports the Arm®v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA510CT

Table 3-320: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[12]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.

Name	Protocol	Type	Description
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[12]	Signal	Master	Timer signals to SOC
CNTHVIRQ[12]	Signal	Master	Timer signals to SOC.
CNTHVSIHQ[12]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[12]	Signal	Master	Timer signals to SOC.
CNTPSIHQ[12]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[12]	Signal	Master	Timer signals to SOC.
commirq[12]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[12]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[12]	PChannel	Master	Core PCSM signals
core_powerdown_out[12]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[12]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[12]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[12]	Signal	Slave	Disable cryptography extensions after reset.
cti[12]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[12]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[12]	Signal	Master	No power-down request.
dbgpwrupreq[12]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.

Name	Protocol	Type	Description
fiq[12]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[12]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[12]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[12]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[12]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[12]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[12]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[12]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[12]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[12]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[12]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[12]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[12]	Signal	Slave	Virtualised FIQ.
virq[12]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).

Name	Protocol	Type	Description
vsei[12]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A510CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU's which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

`cpi_div`**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

`cpuX.CRYPTODISABLE`**Type**

bool

Default value

0x0

Disable cryptographic features.

`cpuX.RVBARADDR`**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`enable_simulation_performance_optimizations`**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_peripheral_port

Type

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

`icache-size`

Type

int

Default value

0x10000

L1 I-Cache size in bytes.

`icache-state_modelled`

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size

Type

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

max_32bit_el**Type**

int

Default value

0x0

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when revision_number = 0.

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes

Type

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

patch_level

Type

int

Default value

0x3

Patch level of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Revision field in MIDR/MIDR_EL1. Corresponds to the patch number Y in rXpY.

ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

ras_pfg_clock_mhz**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

revision_number**Type**

int

Default value

0x1

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions

are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.34 ARMCortexA510CT_CortexA710CT

ARMCortexA510CT_CortexA710CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-321: IP revisions support

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA510CT_CortexA710CT

This model has the following Iris instances:

Table 3-322: ARMCortexA510CT_CortexA710CT Iris instances

InstanceName	ComponentName
ARMCortexA510CT_CortexA710CT	Cluster_ARM_Cortex510_CortexA710_Heterogeneous
ARMCortexA510CT_CortexA710CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA710CT.AMU.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.DAP	PVBusLogger
ARMCortexA510CT_CortexA710CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.DSU	DSU
ARMCortexA510CT_CortexA710CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA710CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.PPU_core0	PPUv1
ARMCortexA510CT_CortexA710CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.PPU_core1	PPUv1
ARMCortexA510CT_CortexA710CT.DSU.PPU_core1.busslave	PVBusSlave

InstanceName	ComponentName
ARMCortexA510CT_CortexA710CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.shared_cache	PVCache
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.upstream[0]	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.upstream[1]	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.upstream[2]	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.upstream[3]	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.upstream[4]	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.upstream[5]	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.utility_slave[0]	PVBusSlave

ARMCortexA510CT_CortexA710CT contains the following CADI targets:

- ARM_Cortex-A510
- ARM_Cortex-A710
- Cluster_ARM_Cortex510_CortexA710_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A510
- Subcluster_ARM_Cortex-A710
- TlbCadi

About ARMCortexA510CT_CortexA710CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-11 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-11 (ARMCortexA710CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>`[0-10] for cores in `subcluster0`.
- `<port_name>`[11-21] for cores in `subcluster1`.

All instances in the Master cross trigger matrix port array `cti[22]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu10` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu10` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [ARMCortexA510CT](#).
- [ARMCortexA710CT](#).

Ports for ARMCortexA510CT_CortexA710CT

Table 3-324: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>ASTART0MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART1MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART2MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>ASTART3MP</code>	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
<code>broadcastatomic</code>	Signal	Slave	CHI defined pins.
<code>broadcastcachemaint</code>	Signal	Slave	ACE defined pins.
<code>broadcastouter</code>	Signal	Slave	ACE defined pins.
<code>broadcastpersist</code>	Signal	Slave	CHI defined pins.
<code>cfgend[22]</code>	Signal	Slave	This signal is for EE bit initialisation.
<code>cfgsdisable</code>	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.

Name	Protocol	Type	Description
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[22]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[22]	Signal	Master	Timer signals to SOC
CNTHVIRQ[22]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[22]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[22]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[22]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[22]	Signal	Master	Timer signals to SOC.
commirq[22]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[22]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[22]	PChannel	Master	Core PCSM signals
core_powerdown_out[22]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[22]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[22]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[22]	Signal	Slave	Disable cryptography extensions after reset.
cti[22]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[22]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[22]	Signal	Master	No power-down request.
dbgprupreq[22]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.

Name	Protocol	Type	Description
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[22]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[22]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[22]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[22]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[22]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[22]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[22]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[22]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[22]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[22]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[22]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[22]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[22]	Signal	Slave	Virtualised FIQ.
virq[22]	Signal	Slave	Virtualised IRQ.

Name	Protocol	Type	Description
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[22]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM Cortex A510CT_Cortex A710CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT

Type

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER

Type

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST

Type

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID

Type

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled

Type

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamlQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x0

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size

Type

int

Default value

0x0

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pchannel_treat_simreset_as_poreset**Type**

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end**Type**

int

Default value

0x0

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

periph_address_start**Type**

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

subcluster0.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster0.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster0.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster0.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster0.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster0.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster0.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster0.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-maintenance_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

subcluster0.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster0.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster0.max_32bit_el**Type**

int

Default value

0x0

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when `revision_number = 0`.

subcluster0.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.ras_pfg_clock_mhz**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

subcluster0.revision_number**Type**

int

Default value

0x1

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster1.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.max_code_cache_mb`**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`subcluster1.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.ete.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

subcluster1.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster1.ete.PIDR_REVAND**Type**

int

Default value

0x1

TRCPIDR REVAND value.

subcluster1.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster1.ete.REVISION**Type**

int

Default value

0x2

TRCIDR1 revision value.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.etc.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

subcluster1.ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

subcluster1.ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

subcluster1.ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

subcluster1.ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

subcluster1.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster1.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster1.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster1.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster1.memory_tagging_support_level**Type**

int

Default value

0x2

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.35 ARMCortexA510CT_CortexA710CT_CortexX2CT

ARMCortexA510CT_CortexA710CT_CortexX2CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-325: IP revisions support

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support
CortexX2 r2p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA510CT_CortexA710CT_CortexX2CT

This model has the following Iris instances:

Table 3-326: ARMCortexA510CT_CortexA710CT_CortexX2CT Iris instances

InstanceName	ComponentName
ARMCortexA510CT_CortexA710CT_CortexX2CT	Cluster_ARM_CortexA510_CortexA710_CortexX2_Heterogeneous

ARMCortexA510CT_CortexA710CT_CortexX2CT contains the following CADI targets:

- ARM_Cortex-A510
- ARM_Cortex-A710
- ARM_Cortex-X2

- Cluster_ARM_CortexA510_CortexA710_CortexX2_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A510
- Subcluster_ARM_Cortex-A710
- Subcluster_ARM_Cortex-X2
- TlbCadi

About ARMCortexA510CT_CortexA710CT_CortexX2CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-10 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-10 (ARMCortexA710CT).

subcluster2.NUM_CORES

Possible values are 1-10 (ARMCortexX2CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port_name>[0-9] for cores in subcluster0.
- <port_name>[10-19] for cores in subcluster1.
- <port_name>[20-29] for cores in subcluster2.

All instances in the Master cross trigger matrix port array, `cti[30]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu9` identify cores in subcluster0.
- `subcluster1.cpu0` to `subcluster1.cpu9` identify cores in subcluster1.
- `subcluster2.cpu0` to `subcluster2.cpu9` identify cores in subcluster2.

For information about the cores in this model, see:

- [ARMCortexA510CT](#).
- [ARMCortexA710CT](#).
- [ARMCortexX2CT](#).

Ports for ARMCortexA510CT_CortexA710CT_CortexX2CT

Table 3-328: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[30]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsn_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[30]	Signal	Master	Timer signals to SOC
CNTHVIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[30]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[30]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[30]	Signal	Master	Timer signals to SOC.

Name	Protocol	Type	Description
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[30]	Signal	Master	Timer signals to SOC.
commirq[30]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[30]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsmpchannel[30]	PChannel	Master	Core PCSM signals
core_powerdown_out[30]	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
coreerrirq[30]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[30]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[30]	Signal	Slave	Disable cryptography extensions after reset.
cti[30]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[30]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[30]	Signal	Master	No power-down request.
dbgpwrupreq[30]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[30]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s[30]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[30]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[30]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[30]	Signal	Master	PPU core interrupt.

Name	Protocol	Type	Description
ppu_core_wakerequest[30]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[30]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[30]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[30]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[30]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[30]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[30]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[30]	Signal	Slave	Virtualised FIQ.
virq[30]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[30]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA510CT_CortexA710CT_CortexX2CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMPO input signal).

AEND1_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x0

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x0

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes

Type

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive (corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

subcluster0.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-size`

Type

int

Default value

0x10000

L1 D-Cache size in bytes.

`subcluster0.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster0.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster0.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster0.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster0.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRTA value for a forcibly traced exception.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster0.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster0.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster0.max_32bit_el**Type**

int

Default value

0x0

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when `revision_number` = 0.

`subcluster0.memory_tagging_support_level`**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

`subcluster0.ptw_latency`**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

`subcluster0.ras_pfg_clock_mhz`**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

`subcluster0.revision_number`**Type**

int

Default value

0x1

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`subcluster1.cpuX.l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

subcluster1.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.etc.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

subcluster1.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster1.ete.PIDR_REVAND**Type**

int

Default value

0x1

TRCPIDR REVAND value.

subcluster1.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster1.ete.REVISION**Type**

int

Default value

0x2

TRCIDR1 revision value.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster1.ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

subcluster1.ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

subcluster1.ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

subcluster1.ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

subcluster1.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

subcluster1.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

subcluster1.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

subcluster1.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster1.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster1.memory_tagging_support_level**Type**

int

Default value

0x2

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

subcluster2.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster2.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster2.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster2.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster2.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster2.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster2.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster2.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster2.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster2.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster2.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster2.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster2.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster2.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster2.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster2.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster2.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster2.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster2.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster2.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster2.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster2.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster2.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster2.ete.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

subcluster2.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster2.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster2.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster2.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster2.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster2.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster2.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster2.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster2.ete.REVISION**Type**

int

Default value

0x2

TRCIDR1 revision value.

subcluster2.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster2.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster2.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster2.ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

subcluster2.ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

subcluster2.ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

subcluster2.ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

subcluster2.ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster2.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster2.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster2.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

subcluster2.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster2.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster2.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster2.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster2.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster2.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster2.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster2.memory_tagging_support_level**Type**

int

Default value

0x2

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

subcluster2.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.tlbi_stall_enabled

Type

bool

Default value

0x0

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster2.treat-dcache-cmos-to-pou-as-nop

Type

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

subcluster2.walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.36 ARMCortexA510CT_CortexA710CT_CortexX3CT

ARMCortexA510CT_CortexA710CT_CortexX3CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-329: IP revisions support

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support

Revision	Quality level
CortexX3 r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA510CT_CortexA710CT_CortexX3CT

This model has the following Iris instances:

Table 3-330: ARMCortexA510CT_CortexA710CT_CortexX3CT Iris instances

ARMCortexA510CT_CortexA710CT_CortexX3CT contains the following CADI targets:

- ARM_Cortex-A510
- ARM_Cortex-A710
- ARM_Cortex-X3
- Cluster_ARM_CortexA510_CortexA710_CortexX3_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A510
- Subcluster_ARM_Cortex-A710
- Subcluster_ARM_Cortex-X3
- TlbCadi

About ARMCortexA510CT_CortexA710CT_CortexX3CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-10 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-10 (ARMCortexA710CT).

subcluster2.NUM_CORES

Possible values are 1-10 (ARMCortexX3CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-9]` for cores in `subcluster0`.
- `<port_name>[10-19]` for cores in `subcluster1`.
- `<port_name>[20-29]` for cores in `subcluster2`.

All instances in the Master cross trigger matrix port array, `cti[30]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu9` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu9` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu9` identify cores in `subcluster2`.

For information about the cores in this model, see:

- [ARMCortexA510CT](#).
- [ARMCortexA710CT](#).
- [ARMCortexX3CT](#).

Ports for ARMCortexA510CT_CortexA710CT_CortexX3CT

Table 3-332: Ports

Name	Protocol	Type	Description
<code>acp_s</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[30]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmpchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[30]	Signal	Master	Timer signals to SOC
CNTHVIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[30]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[30]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[30]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[30]	Signal	Master	Timer signals to SOC.
commirq[30]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[30]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.

Name	Protocol	Type	Description
core_pcsmpchannel[30]	PChannel	Master	Core PCSM signals
core_powerdown_out[30]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[30]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[30]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[30]	Signal	Slave	Disable cryptography extensions after reset.
cti[30]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[30]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[30]	Signal	Master	No power-down request.
dbgpwrupreq[30]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[30]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[30]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[30]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[30]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[30]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[30]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[30]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.

Name	Protocol	Type	Description
pvbush_m0	PVBus	Master	The core will generate bus requests on this port.
pvbush_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[30]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[30]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[30]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[30]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[30]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[30]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[30]	Signal	Slave	Virtualised FIQ.
virq[30]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[30]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA510CT_CortexA710CT_CortexX3CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x1

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x1

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_acp**Type**

bool

Default value

0x0

If true, Accelerator Coherency Port is configured.

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x0

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x0

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes

Type

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pchannel_treat_simreset_as_poreset

Type

bool

Default value

0x0

Register core as ON state to cluster with simulation reset.

periph_address_end

Type

int

Default value

0x0

End address for peripheral port address range exclusive (corresponds to AENDMP input signal).

periph_address_start

Type

int

Default value

0x0

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

subcluster0.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-size`

Type

int

Default value

0x10000

L1 D-Cache size in bytes.

`subcluster0.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster0.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster0.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster0.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster0.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRTA value for a forcibly traced exception.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

subcluster0.has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster0.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster0.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster0.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster0.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster0.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster0.max_32bit_el**Type**

int

Default value

0x0

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when `revision_number = 0`.

`subcluster0.memory_tagging_support_level`**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

`subcluster0.ptw_latency`**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

`subcluster0.ras_pfg_clock_mhz`**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

`subcluster0.revision_number`**Type**

int

Default value

0x1

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

subcluster0.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is

set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`subcluster1.cpuX.l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-snoop_issue_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

subcluster1.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.etc.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

subcluster1.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster1.ete.PIDR_REVAND**Type**

int

Default value

0x1

TRCPIDR REVAND value.

subcluster1.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster1.ete.REVISION**Type**

int

Default value

0x2

TRCIDR1 revision value.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster1.ext_abort_device_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE read external aborts.

subcluster1.ext_abort_device_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRE write external aborts.

subcluster1.ext_abort_so_read_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE read external aborts.

subcluster1.ext_abort_so_write_is_sync**Type**

bool

Default value

0x0

Synchronous reporting of device-nGnRnE write external aborts.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

subcluster1.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster1.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster1.icache-read_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster1.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster1.memory_tagging_support_level**Type**

int

Default value

0x2

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).

subcluster1.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat-dcache-cmos-to-pou-as-nop**Type**

int

Default value

0x0

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster2.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster2.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster2.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster2.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster2.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster2.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster2.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster2.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster2.cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

subcluster2.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

subcluster2.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

subcluster2.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster2.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster2.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster2.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster2.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster2.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster2.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster2.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster2.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster2.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster2.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster2.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster2.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster2.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster2.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster2.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster2.dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster2.dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`subcluster2.dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster2.dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster2.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster2.error_record_feature_register**Type**

string

Default value

```
"[{\"ED\":0x2,\"IMPDEF_3_2\":0x0,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0,\"Visibility\":\"Cluster\"},{\"ED\":0x2,\"IMPDEF_3_2\":0x0,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0}],"
```

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

subcluster2.ete.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

subcluster2.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster2.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster2.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster2.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster2.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster2.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster2.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster2.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster2.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster2.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster2.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster2.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster2.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster2.ext_abort_normal_noncacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of normal noncacheable-read external aborts.

subcluster2.ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster2.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster2.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster2.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

subcluster2.has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3). Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster2.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster2.has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

subcluster2.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster2.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster2.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster2.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster2.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster2.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

subcluster2.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster2.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster2.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster2.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster2.pseudo_fault_generation_feature_register**Type**

string

Default value

```
"[{\"OF\":true, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1,
\"CI\":true, \"ER\":false, \"PN\":true, \"AV\":false, \"MV\":true, \"SYN\":true, \"R\":true},{\"OF
\":false, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1, \"CI
\":false, \"ER\":false, \"PN\":false, \"AV\":false, \"MV\":false, \"SYN\":false, \"R\":true}]]"
```

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_psuedo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

subcluster2.ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.stage12_tlb_size

Type

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster2.tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.tlbi_stall_enabled

Type

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster2.trace_physical_registers_when_host_virtualisation_enabled

Type
int

Default value
0x1

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers.

subcluster2.treat_PAC_as_NOP

Type
bool

Default value
0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster2.walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.37 ARMCortexA510CT_CortexA715CT_CortexX3CT

ARMCortexA510CT_CortexA715CT_CortexX3CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-333: IP revisions support

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA715 r1p2	Full support
CortexX3 r0p0	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM CortexA510CT_CortexA715CT_CortexX3CT

This model has the following Iris instances:

Table 3-334: ARM CortexA510CT_CortexA715CT_CortexX3CT Iris instances

InstanceName	ComponentName
ARM CortexA510CT_CortexA715CT_CortexX3CT	Cluster_ARM_CortexA510_CortexA715_CortexX3_Heterogeneous

ARMCortexA510CT_CortexA715CT_CortexX3CT contains the following CADI targets:

- ARM_Cortex-A510
- ARM_Cortex-A715
- ARM_Cortex-X3
- Cluster_ARM_CortexA510_CortexA715_CortexX3_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A510
- Subcluster_ARM_Cortex-A715
- Subcluster_ARM_Cortex-X3
- TlbCadi

About ARMCortexA510CT_CortexA715CT_CortexX3CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-10 (ARMCortexA510CT).

subcluster1.NUM_CORES

Possible values are 1-10 (ARMCortexA715CT).

subcluster2.NUM_CORES

Possible values are 1-10 (ARMCortexX3CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port_name>[0-9] for cores in subcluster0.
- <port_name>[10-19] for cores in subcluster1.
- <port_name>[20-29] for cores in subcluster2.

All instances in the Master cross trigger matrix port array, cti[30] must be connected, regardless of the NUM_CORES value used.

Core-specific parameters have the following prefixes:

- subcluster0.cpu0 to subcluster0.cpu9 identify cores in subcluster0.
- subcluster1.cpu0 to subcluster1.cpu9 identify cores in subcluster1.
- subcluster2.cpu0 to subcluster2.cpu9 identify cores in subcluster2.

For information about the cores in this model, see:

- [ARMCortexA510CT](#).
- [ARMCortexA715CT](#).
- [ARMCortexX3CT](#).

Ports for ARMCortexA510CT_CortexA715CT_CortexX3CT

Table 3-336: Ports

Name	Protocol	Type	Description
acp_s	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[30]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[30]	Signal	Master	Timer signals to SOC
CNTHVIRQ[30]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[30]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[30]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[30]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[30]	Signal	Master	Timer signals to SOC.
commirq[30]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[30]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[30]	PChannel	Master	Core PCSM signals
core_powerdown_out[30]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info

Name	Protocol	Type	Description
coreerrirq[30]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[30]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[30]	Signal	Slave	Disable cryptography extensions after reset.
cti[30]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[30]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[30]	Signal	Master	No power-down request.
dbgpwrupreq[30]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[30]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[30]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[30]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[30]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[30]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[30]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[30]	Signal	Slave	PPU Core wake request signals.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[30]	Signal	Slave	Per core RAM Error Interrupt.

Name	Protocol	Type	Description
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[30]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[30]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[30]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[30]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[30]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[30]	Signal	Slave	Virtualised FIQ.
virq[30]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[30]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA510CT_CortexA715CT_CortexX3CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

default_opmode**Type**

int

Default value

0x4

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

diagnostics**Type**

bool

Default value

0x0

Enable DynamIQ diagnostic messages.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences

seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_peripheral_port

Type

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled

Type

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam

Type

bool

Default value

0x0

L3 Cache has MPAM support.

l3cache-hit_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

l3cache-miss_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

l3cache-read_access_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

l3cache-read_latency

Type

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

l3cache-size

Type

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes

Type

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

subcluster0.CPUCFR

Type

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES

Type

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

subcluster0.cpi_div

Type

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter `trace_special_hlt_imm16`.

`subcluster0.cpuX.l2cache-hit_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-maintenance_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-miss_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-read_access_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-read_bus_width_in_bytes`

Type

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-size**Type**

int

Default value

0x80000

L2 Cache size in bytes.

subcluster0.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.dcache-size**Type**

int

Default value

0x10000

L1 D-Cache size in bytes.

subcluster0.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster0.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster0.dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster0.etc.CLAIMTAGS`**Type**

int

Default value

0x4

Number of claim tags.

`subcluster0.etc.MAX_INST_PER_Q`**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

`subcluster0.etc.NumberOfRSPairs`**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster0.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster0.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster0.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster0.has_coherent_icache

Type

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

subcluster0.has_dot_product

Type

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

subcluster0.has_ete

Type

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster0.icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster0.icache-maintenance_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`subcluster0.icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

`subcluster0.icache-read_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster0.icache-size**Type**

int

Default value

0x10000

L1 I-Cache size in bytes.

subcluster0.max_32bit_el**Type**

int

Default value

0x0

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when `revision_number = 0`.

subcluster0.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster0.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.ras_pfg_clock_mhz**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

subcluster0.revision_number

Type

int

Default value

0x1

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster0.tlbi_stall_enabled

Type

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster0.treat_PAC_as_NOP

Type

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster0.walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster1.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster1.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster1.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster1.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster1.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster1.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster1.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster1.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster1.cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

subcluster1.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-size`**Type**

int

Default value

0x80000

L2 Cache size in bytes.

`subcluster1.cpuX.l2cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster1.cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster1.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster1.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster1.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster1.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster1.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster1.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster1.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster1.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster1.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster1.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster1.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster1.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster1.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster1.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster1.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster1.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster1.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster1.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster1.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster1.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster1.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

subcluster1.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster1.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster1.error_record_feature_register**Type**

string

Default value

```
"[{\"ED\":0x2,\"IMPDEF_3_2\":0x1,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x2,\"TS\":0x0,\"Visibility\": \"Cluster \",{\"ED\":0x2,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0}],"
```

RAS feature register values. An array of JSON objects. The JSON schema for the array is: `[{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]`. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

subcluster1.ete.CLAIMTAGS

Type

int

Default value

0x4

Number of claim tags.

subcluster1.ete.MAX_INST_PER_Q

Type

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster1.ete.NumberOfRSPairs

Type

int

Default value

0x8

Number of resource selector pairs.

subcluster1.ete.PIDR_CMOD

Type

int

Default value

0x0

TRCPIDR CMOD value.

subcluster1.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster1.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster1.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster1.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster1.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster1.ete.REVISION**Type**

int

Default value

0x1

TRCIDR1 revision value.

subcluster1.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster1.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster1.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster1.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster1.ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster1.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster1.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster1.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

subcluster1.has_enhanced_pan

Type

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster1.has_ete

Type

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster1.has_large_va

Type

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

subcluster1.has_statistical_profiling

Type

bool

Default value

0x0

Whether Statistical Based Profiling is implemented (FEAT_SPE).

subcluster1.icache-hit_latency

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-maintenance_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-miss_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-prefetch_enabled`**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`subcluster1.icache-read_access_latency`**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

subcluster1.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster1.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster1.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster1.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster1.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster1.pseudo_fault_generation_feature_register

Type

string

Default value

```
"[{\"OF\":true, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1,
\"CI\":true, \"ER\":false, \"PN\":true, \"AV\":false, \"MV\":true, \"SYN\":true, \"R\":true},{\"OF
\":false, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1, \"CI
\":false, \"ER\":false, \"PN\":false, \"AV\":false, \"MV\":false, \"SYN\":false, \"R\":true}]]"
```

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

subcluster1.ptw_latency

Type

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.stage12_tlb_size

Type

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster1.tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster1.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster1.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster1.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster2.NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

subcluster2.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster2.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster2.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster2.cpuX.CFGTE**Type**

bool

Default value

0x0

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

subcluster2.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster2.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster2.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster2.cpuX.force-fpsid**Type**

bool

Default value

0x1

Override the FPSID value.

subcluster2.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster2.cpuX.l2cache-size**Type**

int

Default value

0x100000

L2 Cache size in bytes.

subcluster2.cpuX.l2cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`subcluster2.cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`subcluster2.cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`subcluster2.cpuX.l2cache-write_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`subcluster2.cpuX.max_code_cache_mb`**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster2.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster2.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster2.cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster2.cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

subcluster2.cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

subcluster2.cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster2.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster2.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster2.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster2.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster2.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster2.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster2.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster2.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster2.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster2.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster2.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster2.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster2.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster2.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

subcluster2.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

subcluster2.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster2.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster2.error_record_feature_register**Type**

string

Default value

```
"[{\"ED\":0x2,\"IMPDEF_3_2\":0x0,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0,\"Visibility\":\"Cluster\"},{\"ED\":0x2,\"IMPDEF_3_2\":0x0,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0}],"
```

RAS feature register values. An array of JSON objects. The JSON schema for the array is: `[{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]`. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

subcluster2.etc.CLAIMTAGS**Type**

int

Default value

0x20

Number of claim tags.

subcluster2.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster2.ete.NumberOfRSPairs**Type**

int

Default value

0x8

Number of resource selector pairs.

subcluster2.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster2.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster2.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster2.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster2.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster2.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster2.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster2.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster2.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster2.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster2.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster2.ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

subcluster2.ext_abort_normal_noncacheable_read_is_sync**Type**

bool

Default value

0x1

Synchronous reporting of normal noncacheable-read external aborts.

subcluster2.ext_abort_so_write_ras_type**Type**

int

Default value

0x2

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

subcluster2.force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

subcluster2.force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

subcluster2.has_coherent_icache**Type**

bool

Default value

0x1

Whether icache invalidation to the point of unification is required for instruction to data coherence.
true - Invalidate operations not required.

subcluster2.has_enhanced_pan**Type**

int

Default value

0x2

Implements Armv8.7 Enhanced PAN feature (FEAT_PAN3) Possible values of this parameter are: - 1, feature is implemented if ARMv8.7 is enabled. - 2, feature is implemented.

subcluster2.has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

subcluster2.has_large_va**Type**

int

Default value

0x0

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT_LVA). Possible values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

subcluster2.icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

subcluster2.icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

subcluster2.icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

subcluster2.icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

subcluster2.icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

subcluster2.icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

subcluster2.icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

subcluster2.instruction_tlb_size**Type**

int

Default value

0x0

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

subcluster2.memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

subcluster2.pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

subcluster2.pseudo_fault_generation_feature_register**Type**

string

Default value

```
"[{\"OF\":true, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1,
  \"CI\":true, \"ER\":false, \"PN\":true, \"AV\":false, \"MV\":true, \"SYN\":true, \"R\":true},{\"OF
  \":false, \"UC\":true, \"UEU\":false, \"UER\":false, \"UEO\":false, \"DE\":0x1, \"CE\":0x1, \"CI
  \":false, \"ER\":false, \"PN\":false, \"AV\":false, \"MV\":false, \"SYN\":false, \"R\":true}]"
```

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other_pseudo-fault_generating_features_register_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT_SUPPORTED) and true(FEATURE_CONTROLLABLE), where CE can have 0(NOT_SUPPORTED), 1(NONSPECIFIC_CE_SUPPORTED) and 3(TRANSIENT_OR_PERSISTENT_CE_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has_ras_fault_injection is true.

subcluster2.ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.stage12_tlb_size**Type**

int

Default value

0x80

Number of stage1+2 tlb entries.

subcluster2.tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

subcluster2.tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

subcluster2.trace_physical_registers_when_host_virtualisation_enabled**Type**

int

Default value

0x1

When host virtualisation is enabled, trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR_EL1 as ELR/SPSR_EL2, 2=Trace all redirected registers as physical registers.

subcluster2.treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

subcluster2.walk_cache_latency**Type**

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.38 ARM Cortex A520 AECT

ARM Cortex A520 AECT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-337: IP revisions support

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA520AECT

This model has the following Iris instances:

Table 3-338: ARMCortexA520AECT Iris instances

InstanceName	ComponentName
ARMCortexA520AECT	Cluster_ARM_Cortex-A520AE
ARMCortexA520AECT.AMU	PVBusLogger
ARMCortexA520AECT.AMU.mapper	PVBusMapper
ARMCortexA520AECT.DAP	PVBusLogger
ARMCortexA520AECT.DAP.mapper	PVBusMapper
ARMCortexA520AECT.DSU	DSU
ARMCortexA520AECT.DSU.PPU_cluster	PPUv1
ARMCortexA520AECT.DSU.PPU_cluster.busslave	PVBusSlave

ARMCortexA520AECT.RAS.mapper	PVBusMapper
ARMCortexA520AECT.cpu0	ARM_Cortex-A520AE
ARMCortexA520AECT.cpu0.UTLB	TLB
ARMCortexA520AECT.cpu0.l1dcache	PVCache
ARMCortexA520AECT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l1licache	PVCache

InstanceName	ComponentName
ARMCortexA520AECT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l2cache	PVCache
ARMCortexA520AECT.cpu0.l2cache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l2cache.upstream[1]	PVBusSlave
ARMCortexA520AECT.ext_bus	PVBusLogger
ARMCortexA520AECT.ext_bus.mapper	PVBusMapper
ARMCortexA520AECT.gic_cpuif_decoder_cluster	GlCv3CPUInterfaceDecoder

ARMCortexA520AECT contains the following CADI targets:

- ARM_Cortex-A520AE
- Cluster_ARM_Cortex-A520AE
- PVCache
- TlbCadi

AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

Ports for ARMCortexA520AECT

Table 3-340: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).

Name	Protocol	Type	Description
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[14]	PChannel	Master	Core PCSM signals
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency

Name	Protocol	Type	Description
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgpwrupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.

Name	Protocol	Type	Description
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA520AECT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

cluster_split_lock_config**Type**

int

Default value

0x1

Default SPLIT/LOCKED config. The valid values are: 1 - Only LOCKED mode support, 4 - Only SPLIT mode support, 5 - SPLIT or MIXED mode support. Valid only when enable_ae_features is true.

core_cache_protection**Type**

int

Default value

0x1

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

core_complex_mapping**Type**

string

Default value

```
"{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1":
{ "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4,
5], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache
": {"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists
":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":
"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"} }"
```

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" :{"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

`cpi_mul`**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

`cpuX.CFGEND`**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

`cpuX.CRYPTODISABLE`**Type**

bool

Default value

0x0

Disable cryptographic features.

`cpuX.RVBARADDR`**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

`cpuX.enable_trace_special_hlt_imm16`**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

cpuX.l2cache-read_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

cpuX.l2cache-size

Type

int

Default value

0x80000

L2 Cache size in bytes.

cpuX.l2cache-snoop_data_transfer_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

cpuX.l2cache-snoop_issue_latency

Type

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-ways

Type

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write_latency is set. This is only used when dcache-state_modelled=true.

dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

enable_lock_step**Type**

bool

Default value

0x0

Whether the core is configured in Dual Core Lock Step mode (FEAT_DCLS).

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_actlr2**Type**

bool

Default value

0x1

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_impdef_transient_fault_protection**Type**

bool

Default value

0x1

Support the Transient Fault Protection (TFP) flop parity errors through RAS registers (FEAT_TFP).

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state_modelled=true.

icache-maintenance_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state_modelled=true.

icache-miss_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state_modelled=true.

icache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when icache-state_modelled=true.

icache-read_access_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state_modelled=true.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state_modelled=true.

icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether l-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory_tagging_support_level

Type

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier

Type

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_acp

Type

int

Default value

0x0

Number of ACP ports.

num_nodes

Type

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

ras_extra_configurations**Type**

string

Default value

```
"[ { \"Index\": 1, \"ERXMISCO_mask\": 0xFFFFc0003fc3, \"ERXMISC1_mask\":  
0x03F870003FF30f07, \"ERXPFGCTL_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISCO_mask  
\": 0xFFFFe007ffc0, \"ERXMISCO_reset\": 0x2, \"ERXSTATUS_IERR_mask\": 0x300 ,  
\"ERXMISC1_mask\": 0x0FF8700ffff31f0f, \"ERXPFGCTL_reset\": 0x1000 } ]"
```

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCn masks - these are 64 bit masks covering the 64 bit registers ERXMISCn_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}].

ras_pfg_clock_mhz**Type**

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

reported_patch_level**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

reported_revision_number**Type**

int

Default value

0xffffffffffffffff

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

tlb_latency**Type**

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled**Type**

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP**Type**

bool

Default value

0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions

are NOP. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAAuth traps.

walk_cache_latency

Type

int

Default value

0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.39 ARM Cortex A520CT

ARM Cortex A520CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-341: IP revisions support

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARM Cortex A520CT

This model has the following Iris instances:

Table 3-342: ARM Cortex A520CT Iris instances

InstanceName	ComponentName
ARM Cortex A520CT	Cluster_ARM_Cortex-A520
ARM Cortex A520CT.AMU	PVBusLogger
ARM Cortex A520CT.AMU.mapper	PVBusMapper

ARMCortexA520CT contains the following CADI targets:

- ARM_Cortex-A520
- Cluster_ARM_Cortex-A520
- PVCache
- TlbCadi

About ARMCortexA520CT

The model supports the following features:

- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- Internal PPU support is present.
- A P-Channel for the cluster and for each core.
- BROADCASTPERSIST pin.
- Optional peripheral port.

- Memory-mapped register access to MPAM.
- Per-core clock.
- Utility bus.

Support for the following features is planned for a future release:

- DSU-120 system features are not fully implemented.
- Transporting architectural metadata tags over TLM2 (OSCI) and AMBA-PV (TLM2 extensions from Arm) bus protocols.
- Core-Complex.
- BROADCASTCACHEMAINTPOU pin
- COREINSTRRET and COREINSTRRUN signals.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not supported but signals are implemented.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
- Automatic CPU retention mode.
- Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Cache stashing capability.

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

Ports for ARMCortexA520CT

Table 3-344: Ports

Name	Protocol	Type	Description
acp_s[2]	PVBus	Slave	AXI ACP slave port.
AEND0MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
AEND3MP	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[14]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[14]	Signal	Master	Timer signals to SOC
CNTHVIRQ[14]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[14]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[14]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[14]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[14]	Signal	Master	Timer signals to SOC.
commirq[14]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[14]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[14]	PChannel	Master	Core PCSM signals

Name	Protocol	Type	Description
core_powerdown_out[14]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info
coreerrirq[14]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[14]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[14]	Signal	Slave	Disable cryptography extensions after reset.
cti[14]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[14]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[14]	Signal	Master	No power-down request.
dbgpwrupreq[14]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[14]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[14]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[14]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmuirq[14]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[14]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[14]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.

Name	Protocol	Type	Description
rei[14]	Signal	Slave	Per core RAM Error Interrupt.
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[14]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[14]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[14]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[14]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[14]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[14]	Signal	Slave	Virtualised FIQ.
virq[14]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[14]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARMCortexA520CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

NUM_CORES**Type**

int

Default value

0x1

Number of cores per cluster.

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_cache_protection**Type**

int

Default value

0x1

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

core_complex_mapping**Type**

string

Default value

```
"{"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1":
{ "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4,
5], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache
" :{"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists
":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":
"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"}}}"
```

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" :{"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>, "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

cpuX.l2cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

cpuX.l2cache-read_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-size`**Type**

int

Default value

0x80000

L2 Cache size in bytes.

`cpuX.l2cache-snoop_data_transfer_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-snoop_issue_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`cpuX.l2cache-ways`**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

`cpuX.l2cache-write_access_latency`**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

cpuX.semihosting-T32_HLT**Type**

int

Default value

0x3c

T32 HLT number for semihosting calls.

cpuX.semihosting-Thumb_SVC**Type**

int

Default value

0xab

T32 SVC number for semihosting calls.

cpuX.semihosting-cmd_line**Type**

string

Default value

""

Command line available to semihosting calls.

cpuX.semihosting-cwd**Type**

string

Default value

""

Base directory for semihosting file access.

cpuX.semihosting-enable**Type**

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead

of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`dcache-read_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`dcache-size`

Type

int

Default value

0x8000

L1 D-Cache size in bytes.

`dcache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`dcache-state_modelled`

Type

bool

Default value

0x0

Set whether D-cache has stateful implementation.

`dcache-write_access_latency`

Type

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

`dcache-write_latency`**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

`enable_simulation_performance_optimizations`**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

`ete.CLAIMTAGS`**Type**

int

Default value

0x4

Number of claim tags.

`ete.MAX_INST_PER_Q`**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

ete.TRCSRSTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCSRSTA value for a forcibly traced exception.

force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0

Force MTE tag accesses to RAZ/WI and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

force_zero_PSTATE_PAN**Type**

bool

Default value

0x0

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

force_zero_mpam_partid_and_pmg**Type**

int

Default value

0x0

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO_EL1, MPAM1_EL1, MPAM2_EL2, MPAM3_EL3, MPAMHCR_EL2.

has_actlr2**Type**

bool

Default value

0x1

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR_EL1[63:32].

has_dot_product**Type**

int

Default value

0x2

Possible values of this parameter are: - 1, feature not implemented. - 2, feature is implemented.

has_ete**Type**

bool

Default value

0x0

If true, implements the Embedded Trace Extension (FEAT_ETE). This option is discarded if ete plugin is explicitly loaded (--plugin or -P).

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-hit_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

`icache-maintenance_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

`icache-miss_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

`icache-prefetch_enabled`

Type

bool

Default value

0x0

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

`icache-read_access_latency`

Type

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

icache-read_latency**Type**

int

Default value

0x0

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

icache-size**Type**

int

Default value

0x8000

L1 I-Cache size in bytes.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x1

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`l3cache-size`

Type

int

Default value

0x80000

L3 Cache size in bytes.

`l3cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

`l3cache-snoop_issue_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

`l3cache-ways`

Type

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

`l3cache-write_access_latency`

Type

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

memory_tagging_support_level**Type**

int

Default value

0x3

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT_MTE).2, implemented (FEAT_MTE2).3, implemented with asymmetric handling of exceptions (FEAT_MTE3).

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use (n * accumulator value) to calculate the mpmm

threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_acp**Type**

int

Default value

0x0

Number of ACP ports.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

pmu-num_counters**Type**

int

Default value

0x6

Number of PMU counters implemented.

ptw_latency**Type**

int

Default value

0x0

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

ras_extra_configurations**Type**

string

Default value

```
"[ { \"Index\": 1, \"ERXMISCO_mask\": 0xFFFFc0003fc3, \"ERXMISC1_mask\":  
0x03F870003FF30f07, \"ERXPFGCTL_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISCO_mask
```

```
\": 0xFFFFe007ffc0, \"ERXMISC0_reset\": 0x2, \"ERXSTATUS_IERR_mask\": 0x300 ,
\"ERXMISC1_mask\": 0x0FF8700FFFF31f0f, \"ERXPFGCTL_reset\": 0x1000 } ]"
```

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN_EL1. E.g. [{"Index": 0, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXMISC1_mask": 0x0, "ERXMISC1_reset": 0x0, "ERXMISC2_mask": 0x0, "ERXMISC2_reset": 0x0, "ERXMISC3_mask": 0x0, "ERXMISC3_reset": 0x0, "ERXCTLR_EL1_mask": 0x0, "ERXCTLR_EL1_reset": 0x0}, {"Index": 1, "ERXMISCO_mask": 0x0, "ERXMISCO_reset": 0x0, "ERXSTATUS_IERR_mask": 0x300}].

ras_pfg_clock_mhz

Type

int

Default value

0xc

RAS Pseudo-Fault generation clock rate in MHz.

revision_number

Type

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

tlb_latency

Type

int

Default value

0x0

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

tlbi_stall_enabled

Type

bool

Default value

0x0

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

treat_PAC_as_NOP

Type
bool

Default value
0x0

Non-architecture parameter. Treat Pointer Authentication as NOP. When the parameter is true behaviour of FEAT_PAuth instructions changes as following PAC* and AUT* and XPAC* instructions are NOP. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT_PAuth traps.

walk_cache_latency

Type
int

Default value
0x0

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

3.5.40 ARMCortexA520CT_CortexA720CT

ARMCortexA520CT_CortexA720CT CPU component. This model is written in C++.

This model supports the following revisions of the IP at the given quality levels:

Table 3-345: IP revisions support

Revision	Quality level
CortexA520 r0p1	Full support
CortexA720 r0p1	Full support

For an explanation of the quality levels, see [1.3 Quality level definitions](#) on page 23.

Iris and MTI instances for ARMCortexA520CT_CortexA720CT

This model has the following Iris instances:

Table 3-346: ARMCortexA520CT_CortexA720CT Iris instances

InstanceName	ComponentName
ARMCortexA520CT_CortexA720CT	Cluster_ARM_CortexA520_CortexA720_Heterogeneous
ARMCortexA520CT_CortexA720CT.AMU	PVBusLogger
ARMCortexA520CT_CortexA720CT.AMU.mapper	PVBusMapper

InstanceName	ComponentName
ARMCortexA520CT_CortexA720CT.DAP	PVBusLogger
ARMCortexA520CT_CortexA720CT.DAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT.DSU	DSU
ARMCortexA520CT_CortexA720CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT_CortexA720CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.PPU_core0	PPUv1
ARMCortexA520CT_CortexA720CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.PPU_core1	PPUv1
ARMCortexA520CT_CortexA720CT.DSU.PPU_core1.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520CT_CortexA720CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.shared_cache	PVCache
ARMCortexA520CT_CortexA720CT.DSU.shared_cache.upstream[0]	PVBusSlave

ARMCortexA520CT_CortexA720CT contains the following CADI targets:

- ARM_Cortex-A520
- ARM_Cortex-A720
- Cluster_ARM_CortexA520_CortexA720_Heterogeneous
- PVCache
- Subcluster_ARM_Cortex-A520

- Subcluster_ARM_Cortex-A720
- TlbCadi

About ARMCortexA520CT_CortexA720CT

The number of cores in each subcluster is configurable using the following parameters:

subcluster0.NUM_CORES

Possible values are 1-13 (ARMCortexA520CT).

subcluster1.NUM_CORES

Possible values are 1-13 (ARMCortexA720CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port_name>[0-12] for cores in subcluster0.
- <port_name>[13-25] for cores in subcluster1.

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in subcluster0.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in subcluster1.

For information about the cores in this model, see:

- [ARMCortexA520CT](#).
- [ARMCortexA720CT](#).

Ports for ARMCortexA520CT_CortexA720CT

Table 3-348: Ports

Name	Protocol	Type	Description
<code>acp_s[2]</code>	PVBus	Slave	AXI ACP slave port.
<code>AEND0MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND1MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND2MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).
<code>AEND3MP</code>	Value_64	Slave	Port to obtain end address of valid peripheral address range (exclusive).

Name	Protocol	Type	Description
ASTART0MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	Value_64	Slave	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	Signal	Slave	CHI defined pins.
broadcastcachemaint	Signal	Slave	ACE defined pins.
broadcastouter	Signal	Slave	ACE defined pins.
broadcastpersist	Signal	Slave	CHI defined pins.
cfgend[26]	Signal	Slave	This signal is for EE bit initialisation.
cfgsdisable	Signal	Slave	This signal disables write access to some secure Interrupt Controller registers.
clk_in	ClockSignal	Slave	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	PChannel	Master	Cluster PCSM signal
cluster_powerdown_out	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
clusterid	Value	Slave	The port reads the value in CPU ID register field, bits[11:8] of the MPIDR.
clusterpmuirq	Signal	Master	DynamlQ pmu irq
CNTHPIRQ[26]	Signal	Master	Timer signals to SOC.
CNTHPSIRQ[26]	Signal	Master	Timer signals to SOC
CNTHVIRQ[26]	Signal	Master	Timer signals to SOC.
CNTHVSIRQ[26]	Signal	Master	Timer signals to SOC
CNTPNSIRQ[26]	Signal	Master	Timer signals to SOC.
CNTPSIRQ[26]	Signal	Master	Timer signals to SOC.
cntvalueb	CounterInterface	Slave	Interface to SoC level counter module.
CNTVIRQ[26]	Signal	Master	Timer signals to SOC.
commirq[26]	Signal	Master	Interrupt signal from debug communications channel.
core_clk_in[26]	ClockSignal	Slave	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel[26]	PChannel	Master	Core PCSM signals
core_powerdown_out[26]	Signal	Master	DEPRECATED - An output from PPU that informs thermal controller of the core power info

Name	Protocol	Type	Description
coreerrirq[26]	Signal	Master	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq[26]	Signal	Master	Fault indicator for a detected 1 or 2 bit ECC error
cryptodisable[26]	Signal	Slave	Disable cryptography extensions after reset.
cti[26]	v8EmbeddedCrossTrigger_controlprotocol	Master	Cross trigger matrix port.
ctidbgirq[26]	Signal	Master	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	Signal	Slave	External debug interface.
dbgnopwrdown[26]	Signal	Master	No power-down request.
dbgpwrupreq[26]	Signal	Master	Debug power up request.
defaultMP	Signal	Slave	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	PVBus	Slave	External debug interface.
event	Signal	Peer	This peer port of event input (and output) is for wakeup from WFE.
fiq[26]	Signal	Slave	This signal drives the CPUs fast-interrupt handling.
gicreset	Signal	Master	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s[26]	GICv3Comms	Slave	GICv3 AXI-stream port.
irq[26]	Signal	Slave	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	PVBus	Slave	External debug interface.
pmbirq[26]	Signal	Master	Interrupt signal from the statistical profiling unit.
pmuirq[26]	Signal	Master	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	Signal	Master	PPU cluster interrupt.
ppu_cluster_wakerequest	Signal	Slave	PPU cluster wake request signal.
ppu_core_irq[26]	Signal	Master	PPU core interrupt.
ppu_core_wakerequest[26]	Signal	Slave	PPU core wake request signal.
presetdbg	Signal	Slave	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	PVBus	Master	The core will generate bus requests on this port.
pvbus_periph_m	PVBus	Master	The core can generate peripheral bus request on this port.
rei[26]	Signal	Slave	Per core RAM Error Interrupt.

Name	Protocol	Type	Description
reset	Signal	Slave	Reset signal to cluster.
rvbaraddr[26]	Value_64	Slave	Reset vector base address.
sci_m	SystemCoherencyInterface	Master	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei[26]	Signal	Slave	Per core System Error physical pins.
spiden	Signal	Slave	External debug interface.
ticks[26]	InstructionCount	Master	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq[26]	Signal	Master	Interrupt signal from the trace buffer unit.
utility_bus_s	PVBus	Slave	Utility bus slave
vcpumntirq[26]	Signal	Master	Interrupt signal for virtual CPU maintenance IRQ.
vfiq[26]	Signal	Slave	Virtualised FIQ.
virq[26]	Signal	Slave	Virtualised IRQ.
virtio_s	PVBus	Slave	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei[26]	Signal	Slave	Per core virtual System Error physical pins.

Parameters for ARM CortexA520CT_CortexA720CT

AEND0_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

AEND1_DEFAULT

Type

int

Default value

0x0

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

AEND2_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

AEND3_DEFAULT**Type**

int

Default value

0x0

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

ASTART0_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

ASTART1_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

ASTART2_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

ASTART3_DEFAULT**Type**

int

Default value

0x0

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

BROADCASTATOMIC**Type**

bool

Default value

0x1

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

BROADCASTCACHEMAINT**Type**

bool

Default value

0x0

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

BROADCASTOUTER**Type**

bool

Default value

0x0

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

BROADCASTPERSIST**Type**

bool

Default value

0x1

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

CLUSTER_ID**Type**

int

Default value

0x0

Processor cluster ID value.

CMO_broadcast_when_cache_state_modelling_disabled**Type**

int

Default value

0x1

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. Changing this value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain CMOs even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required .

DBGROMADDR**Type**

int

Default value

0x0

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

DBGROMADDRV**Type**

bool

Default value

0x0

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

GICDISABLE**Type**

bool

Default value

0x1

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

bus_type**Type**

int

Default value

0x0

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

core_complex_mapping**Type**

string

Default value

```
"{"complex0": { "cores": [0, 1], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex1":
{ "cores": [2, 3], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex2": { "cores": [4,
5], "l2-cache" : {"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache
" : {"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" : {"exists
":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" : {"exists":1, "size":
"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" : {"exists":1, "size":"16MB"} }"
```

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [0, 1], "l2-cache" : {"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

core_power_on_by_default**Type**

bool

Default value

0x0

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

dcache-state_modelled**Type**

bool

Default value

0x0

Set whether D-cache has stateful implementation.

enable_simulation_performance_optimizations**Type**

bool

Default value

0x1

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12_tlb_size parameter to 1024).

has_peripheral_port**Type**

bool

Default value

0x0

If true, an additional AXI peripheral port is configured.

icache-state_modelled**Type**

bool

Default value

0x0

Set whether I-cache has stateful implementation.

l3cache-has_mpam**Type**

bool

Default value

0x0

L3 Cache has MPAM support.

l3cache-hit_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

l3cache-maintenance_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

l3cache-miss_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

l3cache-read_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

l3cache-read_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

l3cache-read_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

l3cache-size**Type**

int

Default value

0x80000

L3 Cache size in bytes.

l3cache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state_modelled=true.

l3cache-snoop_issue_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

l3cache-ways**Type**

int

Default value

0x10

L3 Cache number of ways (sets are implicit from size).

l3cache-write_access_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write_latency is set. This is only used when dcache-state_modelled=true.

l3cache-write_bus_width_in_bytes**Type**

int

Default value

0x10

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

l3cache-write_latency**Type**

int

Default value

0x0

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

mpmm_accumulator_multiplier**Type**

int

Default value

0x1

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. A value of n means the accumulator will use $(n * \text{accumulator value})$ to calculate the mpmm threshold (MPMM). This is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

num_nodes**Type**

int

Default value

0x1

Number of transport nodes. Zero implies direct-connect configuration.

revision_number**Type**

int

Default value

0x0

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR_EL1. Corresponds to the revision number X in rXpY.

subcluster0.CPUCFR**Type**

int

Default value

0x0

Value of CPU Configuration Register.

subcluster0.NUM_CORES**Type**

int

Default value

0x1

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

subcluster0.core_cache_protection**Type**

int

Default value

0x1

core_cache_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

subcluster0.cpi_div**Type**

int

Default value

0x1

Divider for calculating CPI (Cycles Per Instruction).

subcluster0.cpi_mul**Type**

int

Default value

0x1

Multiplier for calculating CPI (Cycles Per Instruction).

subcluster0.cpuX.CFGEND**Type**

bool

Default value

0x0

Endianness configuration at reset. 0, little endian. 1, big endian.

subcluster0.cpuX.CRYPTODISABLE**Type**

bool

Default value

0x0

Disable cryptographic features.

subcluster0.cpuX.RVBARADDR**Type**

int

Default value

0x0

Value of RVBAR_ELx register.

subcluster0.cpuX.enable_trace_special_hlt_imm16**Type**

bool

Default value

0x0

Enable usage of parameter trace_special_hlt_imm16.

subcluster0.cpuX.l2cache-hit_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-maintenance_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-miss_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-read_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-read_bus_width_in_bytes`

Type

int

Default value

0x10

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

`subcluster0.cpuX.l2cache-read_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

`subcluster0.cpuX.l2cache-size`

Type

int

Default value

0x80000

L2 Cache size in bytes.

`subcluster0.cpuX.l2cache-snoop_data_transfer_latency`

Type

int

Default value

0x0

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster0.cpuX.l2cache-snoop_issue_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-ways**Type**

int

Default value

0x8

L2 Cache number of ways (sets are implicit from size).

subcluster0.cpuX.l2cache-write_access_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write_latency is set. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.l2cache-write_bus_width_in_bytes**Type**

int

Default value

0x20

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

subcluster0.cpuX.l2cache-write_latency**Type**

int

Default value

0x0

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write_access_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state_modelled=true.

subcluster0.cpuX.max_code_cache_mb**Type**

int

Default value

0x100

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

subcluster0.cpuX.min_sync_level**Type**

int

Default value

0x0

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

subcluster0.cpuX.semihosting-A32_HLT**Type**

int

Default value

0xf000

A32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-A64_HLT**Type**

int

Default value

0xf000

A64 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-ARM_SVC**Type**

int

Default value

0x123456

A32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-T32_HLT

Type

int

Default value

0x3c

T32 HLT number for semihosting calls.

subcluster0.cpuX.semihosting-Thumb_SVC

Type

int

Default value

0xab

T32 SVC number for semihosting calls.

subcluster0.cpuX.semihosting-cmd_line

Type

string

Default value

""

Command line available to semihosting calls.

subcluster0.cpuX.semihosting-cwd

Type

string

Default value

""

Base directory for semihosting file access.

subcluster0.cpuX.semihosting-enable

Type

bool

Default value

0x1

Enable semihosting SVC/HLT traps.

subcluster0.cpuX.semihosting-heap_base**Type**

int

Default value

0x0

Virtual address of heap base.

subcluster0.cpuX.semihosting-heap_limit**Type**

int

Default value

0xf000000

Virtual address of top of heap.

subcluster0.cpuX.semihosting-stack_base**Type**

int

Default value

0x10000000

Virtual address of base of descending stack.

subcluster0.cpuX.semihosting-stack_limit**Type**

int

Default value

0xf000000

Virtual address of stack limit.

subcluster0.cpuX.trace_special_hlt_imm16**Type**

int

Default value

0xf000

For this HLT number, IF enable_trace_special_hlt_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

subcluster0.cpuX.vfp-enable_at_reset**Type**

bool

Default value

0x0

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

subcluster0.cpuX.vfp-present**Type**

bool

Default value

0x1

Set whether the model has VFP support.

subcluster0.dcache-hit_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state_modelled=true.

subcluster0.dcache-maintenance_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state_modelled=true.

subcluster0.dcache-miss_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state_modelled=true.

subcluster0.dcache-prefetch_enabled**Type**

bool

Default value

0x0

Enable simulation of data cache prefetching. This is only used when dcache-state_modelled=true.

subcluster0.dcache-read_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read_bus_width_in_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state_modelled=true.

subcluster0.dcache-read_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read_access_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state_modelled=true.

subcluster0.dcache-size**Type**

int

Default value

0x8000

L1 D-Cache size in bytes.

subcluster0.dcache-snoop_data_transfer_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

subcluster0.dcache-write_access_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

subcluster0.dcache-write_latency**Type**

int

Default value

0x0

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

subcluster0.ete.CLAIMTAGS**Type**

int

Default value

0x4

Number of claim tags.

subcluster0.ete.MAX_INST_PER_Q**Type**

int

Default value

0x1

Maximum limit for the number of instructions implied by a Q element.

subcluster0.ete.PIDR_CM0D**Type**

int

Default value

0x0

TRCPIDR CM0D value.

subcluster0.ete.PIDR_REVAND**Type**

int

Default value

0x0

TRCPIDR REVAND value.

subcluster0.ete.PIDR_REVISION**Type**

int

Default value

0x0

TRCPIDR REVISION value.

subcluster0.ete.Q_CADENCE**Type**

int

Default value

0x1

Number of instruction blocks traced between two Q elements.

subcluster0.ete.RES0_STATEFUL**Type**

bool

Default value

0x0

Whether RES0 bits are stateful or RAZ/WI.

subcluster0.ete.RETSTACK**Type**

int

Default value

0x3

Return stack depth.

subcluster0.ete.REVISION**Type**

int

Default value

0x0

TRCIDR1 revision value.

subcluster0.ete.SIM_OVERFLOW_GRANULARITY**Type**

int

Default value

0x64

Number of instruction blocks in each granule, for simulated overflow.

subcluster0.ete.SIM_OVERFLOW_PERCENTAGE**Type**

int

Default value

0x0

Percentage of instruction blocks lost in each granule, for simulated overflow.

subcluster0.ete.SOURCE_ADDRESS**Type**

bool

Default value

0x0

Allow generation of source address elements.

subcluster0.ete.TRACE_OUTPUT**Type**

string

Default value

""

File to which to write trace byte stream.

subcluster0.ete.TRCRSRTA_FORCED_EXCEP**Type**

bool

Default value

0x0

TRCRSR.TA value for a forcibly traced exception.

subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks**Type**

bool

Default value

0x0
