A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster0.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster0.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster0.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster0.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster0.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster0.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster0.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster0.dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster0.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x10000

**subcluster0.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster0.ete.ETE\_REVISION**

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: uint8\_t

Default value: 1

**subcluster0.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster0.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster0.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

#### **subcluster0.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

#### **subcluster0.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

#### **subcluster0.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **subcluster0.ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: 1

#### **subcluster0.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 1

#### **subcluster0.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

#### **subcluster0.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

#### **`subcluster0.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: N/A

#### **`subcluster0.ete.TRCRSRTA_FORCED_EXCEP`**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

#### **`subcluster0.ete.TSMARK`**

Whether timestamp markers are supported.

Type: `bool`

Default value: `true`

#### **`subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

#### **`subcluster0.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **`subcluster0.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: 0

### **`subcluster0.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster0.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster0.has_enhanced_pan`**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **`subcluster0.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

### **`subcluster0.has_large_va`**

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT\_LVA). values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

#### **subcluster0.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

#### **subcluster0.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

#### **`subcluster0.instruction_tlb_size`**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

#### **`subcluster0.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

#### **`subcluster0.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: `3`

#### **`subcluster0.pmu-num_counters`**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: `6`

#### **`subcluster0.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.stage12_tlb_size`**

Number of stage1+2 tlb entries. Valid values are 0 or  $\geq 4$ .

Type: `uint32_t`

Default value: `0x80`

### **`subcluster0.tlb_latency`**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.tlbi_stall_enabled`**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

### **`subcluster0.treat_PAC_as_NOP`**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

### **`subcluster0.walk_cache_latency`**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.CPUCFR`**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: 0x1

**subcluster1.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: uint8\_t

Default value: 1

**subcluster1.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster1.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster1.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu0.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu0.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu0.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-ways`**

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: `8`

#### **`subcluster1.cpu0.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster1.cpu0.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu0.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu0.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu0.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu0.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu0.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu0.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu0.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu0.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu0.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu1.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster1.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu10.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu10.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu10.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster1.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu10.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu10.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu10.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu10.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu10.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu10.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu10.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu11.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu11.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu11.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu11.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu11.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu11.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster1.cpu11.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu11.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu11.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu11.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu11.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu11.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu11.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu11.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu11.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu11.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu11.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu11.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu11.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu11.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu11.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu11.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu11.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu12.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu12.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu12.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu12.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu12.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**subcluster1.cpu12.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu12.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu12.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu12.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu12.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster1.cpu12.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu12.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu12.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu12.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu12.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu12.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu12.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu12.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu12.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu12.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu12.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu12.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu12.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu12.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu12.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu12.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu12.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu12.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x80000

#### **subcluster1.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

#### **subcluster1.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster1.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

### **subcluster1.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

### **subcluster1.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

### **subcluster1.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

### **subcluster1.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu3.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu3.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu3.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu3.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu3.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu3.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu3.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster1.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu4.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu4.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu4.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu4.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster1.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster1.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu5.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu5.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster1.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster1.cpu6.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu6.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu6.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: `8`

**subcluster1.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster1.cpu6.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster1.cpu6.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster1.cpu6.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster1.cpu6.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster1.cpu6.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**`subcluster1.cpu6.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**`subcluster1.cpu6.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu6.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu6.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu7.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu7.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu7.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster1.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu8.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster1.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu8.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster1.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-prefetch_enabled`**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster1.dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-read_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-size`**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

### **`subcluster1.dcache-snoop_data_transfer_latency`**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-write_access_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.ecv\_support\_level**

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT\_ECV).

Type: uint8\_t

Default value: 2

**subcluster1.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster1.ete.ETE\_REVISION**

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: uint8\_t

Default value: 1

**subcluster1.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster1.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.Q_CADENCE`**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

#### **`subcluster1.ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **`subcluster1.ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: 3

#### **`subcluster1.ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

#### **`subcluster1.ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

#### **`subcluster1.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

#### **`subcluster1.ete.TRCRSRTA_FORCED_EXCEP`**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

#### **`subcluster1.ext_abort_so_write_ras_type`**

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: `2`

#### **`subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

#### **`subcluster1.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

#### **`subcluster1.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

#### **`subcluster1.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

### **`subcluster1.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster1.has_enhanced_pan`**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **`subcluster1.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

### **`subcluster1.has_mt_pmu_disable_feature`**

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT\_MTPMU). 0: FEAT\_MTPMU is disabled, 1: FEAT\_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT\_MTPMU is cherry-picked, 0xF: The feature is disabled and is represented by value 0xF in ID\_AA64DFR0\_EL1.MTPMU.

Type: `uint8_t`

Default value: 0

### **`subcluster1.has_statistical_profiling`**

Whether Statistical Based Profiling is implemented (FEAT\_SPE).

Type: `bool`

Default value: `true`

### **`subcluster1.has_v8_7_spe_inverted_filtering`**

Where FEAT\_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: `false`

### **subcluster1.has\_v8\_7\_spe\_previous\_branch\_target**

Where FEAT\_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT\_SPE\_PBT).

Type: `bool`

Default value: `false`

### **subcluster1.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **subcluster1.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and

intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.icache-read_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

#### **`subcluster1.instruction_tlb_size`**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

#### **`subcluster1.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

#### **`subcluster1.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: `3`

**subcluster1.mpam\_has\_altsp**

DEPRECATED: MPAMIDR\_EL1.HAS\_ALTSP is required when FEAT\_RME is implemented.

Type: `bool`

Default value: `false`

**subcluster1.mpamidr\_has\_force\_ns**

Whether MPAMIDR\_EL1.HAS\_FORCE\_NS bit is set or clear. values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

**subcluster1.mpamidr\_has\_sdeflt**

Whether MPAMIDR\_EL1.HAS\_SDEFLT bit is set or clear. values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

**subcluster1.mpamidr\_has\_tidr**

Whether MPAMIDR\_EL1.HAS\_TIDR bit is set or clear. values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 1

**subcluster1.pmu-num\_counters**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 31

**subcluster1.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

**subcluster1.stage12\_tlb\_size**

Number of stage1+2 tlb entries. Valid values are 0 or  $\geq 4$ .

Type: `uint32_t`

Default value: `0x80`

**subcluster1.tcr\_txsz\_undersize\_should\_fault**

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: `bool`

Default value: `false`

**subcluster1.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

**subcluster1.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

**subcluster1.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.39 ARMC1UltraCT

Defined in `LISA/ARMC1UltraCT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Preliminary support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `has_delayed_dbgreg`
- `has_delayed_sysreg`
- `mpam_has_altsp`
- `num_acp`

### About ARMC1UltraCT

The following example platforms are available:

- `FVP_Base_C1-Ultra`
- `EVS_Dhrystone_C1-Ultrax1`
- `SVP_Base_C1-Ultrax1`

The following functionality is supported in this release:

- C1-SME2 is supported with the following limitations:
  - The arbitration and assignment logic is not supported.
  - RAS error handling is supported in the first CME only.
  - The C1-SME2 auxiliary AMU counters are not supported.
  - It is assumed that C1-SME2 units are operating in dynamic mode, with a minimum power mode of OFF. Accompanying PPU registers may be read or written to, but they do not determine the behavior of the CME. The PPU interrupt signal for the C1-SME2 is also not modeled or exposed at this time.
- Pilatus DSU support for C1-SME2.
- L2Cache is supported at the per-core level only.
- BROADCASTPERSIST pin is implemented.
- Optional peripheral port is supported.
- L3Cache partition is supported.
- Per-core clock is supported.

## Limitations

The following features are not yet supported, and will be added in a future release:

- BROADCASTCACHEMAINTPOU pin is not implemented.
- COREINSTRET signals are not implemented.
- MEM\_RET power mode is not supported.

The following features are not implemented:

- DynamIQ features that are negligible to the programmers' view simulation will not be implemented in the Fast Model.
- 256-bit wide output transactions will not be supported.
- Error correction/detection features will not be supported.
- Self-test features (MBIST) will not be supported.
- Latency configuration will not be supported.
- Snoop filtering will not be supported.
- Cache stashing capability will not be supported.

## Iris and MTI instances for ARMC1UltraCT

This model has the following Iris instances:

Name	Instance type
ARMC1UltraCT	Cluster_ARM_C1-Ultra
ARMC1UltraCT.AMU	PVBusLogger
ARMC1UltraCT.AMU.mapper	PVBusMapper
ARMC1UltraCT.DAP	PVBusLogger
ARMC1UltraCT.DAP.mapper	PVBusMapper
ARMC1UltraCT.DSU	C1-DSU
ARMC1UltraCT.DSU.PPU_cluster	PPUv1
ARMC1UltraCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1UltraCT.DSU.PPU_core0	PPUv1
ARMC1UltraCT.DSU.PPU_core0.busslave	PVBusSlave
ARMC1UltraCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1UltraCT.DSU.mpam_busslave	PVBusSlave
ARMC1UltraCT.DSU.shared_cache	PVCache
ARMC1UltraCT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMC1UltraCT.DSU.shared_cache.upstream[Y] (where Y = 0–4)	PVBusSlave
ARMC1UltraCT.DSU.utility_slave[0]	PVBusSlave
ARMC1UltraCT.MMAP	PVBusLogger
ARMC1UltraCT.MMAP.mapper	PVBusMapper
ARMC1UltraCT.RAS	PVBusLogger
ARMC1UltraCT.RAS.mapper	PVBusMapper

Name	Instance type
ARMC1UltraCT.cpu0	ARM_C1-Ultra
ARMC1UltraCT.cpu0.UTLB	TLB
ARMC1UltraCT.cpu0.debug_rom	debug_rom
ARMC1UltraCT.cpu0.dtlb	TLB
ARMC1UltraCT.cpu0.l1dcache	PVCache
ARMC1UltraCT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMC1UltraCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMC1UltraCT.cpu0.l1licache	PVCache
ARMC1UltraCT.cpu0.l1licache.downstream[0].pvbusmaster	PVBusMaster
ARMC1UltraCT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMC1UltraCT.cpu0.l2cache	PVCache
ARMC1UltraCT.cpu0.l2cache.downstream[0].pvbusmaster	PVBusMaster
ARMC1UltraCT.cpu0.l2cache.upstream[U] (where U = 0-1)	PVBusSlave
ARMC1UltraCT.ext_bus	PVBusLogger
ARMC1UltraCT.ext_bus.mapper	PVBusMapper
ARMC1UltraCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMC1UltraCT.global_debug_rom	debug_rom
ARMC1UltraCT.secondary_debug_rom	debug_rom
ARMC1UltraCT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMC1UltraCT.AMU	PVBusLogger
ARMC1UltraCT.AMU.mapper	PVBusMapper
ARMC1UltraCT.DAP	PVBusLogger
ARMC1UltraCT.DAP.mapper	PVBusMapper
ARMC1UltraCT.DSU	C1-DSU
ARMC1UltraCT.DSU.PPU_cluster	PPUv1
ARMC1UltraCT.DSU.PPU_cluster.busslave	PVBusSlave
ARMC1UltraCT.DSU.PPU_core0	PPUv1
ARMC1UltraCT.DSU.PPU_core0.busslave	PVBusSlave
ARMC1UltraCT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMC1UltraCT.DSU.mpam_busslave	PVBusSlave
ARMC1UltraCT.DSU.shared_cache	PVCache
ARMC1UltraCT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMC1UltraCT.DSU.shared_cache.upstream[Y] (where Y = 0-4)	PVBusSlave
ARMC1UltraCT.DSU.utility_slave[0]	PVBusSlave
ARMC1UltraCT.MMAP	PVBusLogger
ARMC1UltraCT.MMAP.mapper	PVBusMapper
ARMC1UltraCT.RAS	PVBusLogger

Name	Component type
ARMC1UltraCT.RAS.mapper	PVBusMapper
ARMC1UltraCT.cpu0	ARM_C1-Ultra
ARMC1UltraCT.cpu0.UTLB	TLB
ARMC1UltraCT.cpu0.l1dcache	PVCache
ARMC1UltraCT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMC1UltraCT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMC1UltraCT.cpu0.l1licache	PVCache
ARMC1UltraCT.cpu0.l1licache.downstream[0].pvbusmaster	PVBusMaster
ARMC1UltraCT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMC1UltraCT.cpu0.l2cache	PVCache
ARMC1UltraCT.cpu0.l2cache.downstream[0].pvbusmaster	PVBusMaster
ARMC1UltraCT.cpu0.l2cache.upstream[U] (where U = 0-1)	PVBusSlave
ARMC1UltraCT.ext_bus	PVBusLogger
ARMC1UltraCT.ext_bus.mapper	PVBusMapper
ARMC1UltraCT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

## Ports for ARMC1UltraCT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.

Port	Direction	Protocol	Description
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
cme_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cmeerriq	master	Signal	RAS cme err irq
cmefaultirq	master	Signal	RAS cme fault irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.

Port	Direction	Protocol	Description
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_cme_irq	master	Signal	PPU CME interrupt
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus subordinate

Port	Direction	Protocol	Description
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARMC1UltraCT

### **cpuX.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **cpuX.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **cpuX.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **cpuX.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **cpuX.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**cpuX.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **cpuX.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **cpuX.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **cpuX.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **cpuX.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **cpuX.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **cpuX.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**cpuX.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**cpuX.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**cpuX.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**cpuX.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**cpuX.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**cpuX.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**cpuX.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**cpuX.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**cpuX.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**cpuX.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**cpuX.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**cpuX.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`cpuX.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`cpuX.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`AEND0_DEFAULT`**

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMPO input signal).

Type: `uint64_t`

Default value: `0x0`

### **`AEND1_DEFAULT`**

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

### **`AEND2_DEFAULT`**

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

### **`AEND3_DEFAULT`**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The `broadcastpersist` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the MPIDR\_EL1 register and is evaluated based on the MPIDR\_EL1 layout. If MPIDR\_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR\_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain events even when cache state modelling is disabled. Possible values are:- 0 = All CMOs are broadcast if architecturally required- 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: `1`

### **CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: 0x1

#### **DSU.cme.CMECFR**

Value of CMECFR\_EL1 fields (ECC, CHI) for all CMEs.

Type: `string`

Default value: `{"ECC": 0, "CHI": 0}`

#### **DSU.cme.mpmmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. value of `n` means the accumulator will use (`n * accumulator value`) to calculate the mpmm threshold (MPMM). is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

#### **DSU.cme.power\_on\_by\_default**

If true, CME PPU's will initialize in Dynamic mode out of reset, enabling the CME to power itself on/off automatically as it is used.

Type: `bool`

Default value: `true`

#### **GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

#### **NUM\_CMES**

Defines how many CMEs are associated with each cluster. This parameter must be in sync with SVE.ScalableVectorExtension SME configuration.

Type: `uint8_t`

Default value: 0

#### **NUM\_CORES**

Number of cores per cluster.

Type: `uint8_t`

Default value: 1

### **bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

### **core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPU which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

### **cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 0x1

### **cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 0x1

### **dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: `bool`

Default value: `false`

**dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

**dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

### **dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **default\_opmode**

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

### **diagnostics**

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: `false`

### **ecv\_support\_level**

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT\_ECV).

Type: `uint8_t`

Default value: 2

### **enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12\_tlb\_size parameter to 1024).

Type: `bool`

Default value: `true`

### **ete.CLAIMTAGS**

Number of claim tags.

Type: `uint8_t`

Default value: 4

### **ete.ETE\_REVISION**

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: `uint8_t`

Default value: 1

### **ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

### **ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

### **ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

**ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

**ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

**ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: `3`

**ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

**ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: `0`

**ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

**ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**ext\_abort\_so\_write\_ras\_type**

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

**force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: 0

**has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**has\_enhanced\_pan**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

**has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

**has\_mt\_pmu\_disable\_feature**

Implements Multi-threading PMU disable extension from ARMv8.6 (FEAT\_MTPMU). 0: FEAT\_MTPMU is disabled, 1: FEAT\_MTPMU is enabled if ARMv8.6 is implemented, 2: FEAT\_MTPMU is cherry-picked, 0xF: The feature is disabled and is represented by value 0xF in ID\_AA64DFR0\_EL1.MTPMU.

Type: `uint8_t`

Default value: 0

**has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

**has\_statistical\_profiling**

Whether Statistical Based Profiling is implemented (FEAT\_SPE).

Type: `bool`

Default value: `true`

**has\_v8\_7\_spe\_inverted\_filtering**

Where FEAT\_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: `false`

**has\_v8\_7\_spe\_previous\_branch\_target**

Where FEAT\_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT\_SPE\_PBT).

Type: `bool`

Default value: `false`

**icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

**icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

**instruction\_tlb\_size**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

**invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

### **l3cache-mpamf.max\_partid\_ns**

Maximum value of non-secure PARTID supported for DSU L3Cache. Options are 7 or 63.

Type: `uint8_t`

Default value: 63

### **l3cache-size**

L3 Cache size in bytes.

Type: `uint32_t`

Default value: 0x100000

### **log2\_trace\_buffer\_alignment**

Log2 of trace buffer alignment constraint for output buffer (0->1B ... 11->2Kib).

Type: `uint8_t`

Default value: 6

### **memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

### **mpam\_has\_altsp**

DEPRECATED: MPAMIDR\_EL1.HAS\_ALTSP is required when FEAT\_RME is implemented.

Type: `bool`

Default value: `false`

### **mpamidr\_has\_force\_ns**

Whether MPAMIDR\_EL1.HAS\_FORCE\_NS bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

**mpamidr\_has\_sdeflt**

Whether MPAMIDR\_EL1.HAS\_SDEFLT bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: uint8\_t

Default value: 1

**mpamidr\_has\_tidr**

Whether MPAMIDR\_EL1.HAS\_TIDR bit is set or clearvalues of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: uint8\_t

Default value: 1

**mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: uint8\_t

Default value: 1

**num\_acp**

Number of ACP ports.

Type: uint8\_t

Default value: 0

**num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: uint8\_t

Default value: 1

**pmu-num\_counters**

Number of PMU counters implemented.

Type: uint8\_t

Default value: 31

**ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

**stage12\_tlb\_size**

Number of stage1+2 tlb entries. Valid values are 0 or  $\geq 4$ .

Type: `uint32_t`

Default value: `0x80`

**tcr\_txsz\_undersize\_should\_fault**

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: `bool`

Default value: `false`

**tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

**tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

**treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

**walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.40 ARMCortexA320CT

Defined in `LISA/ARMCortexA320CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

Model quality level changes:

From	To
Preliminary support	Full support

### About ARMCortexA320CT

The number of cores currently supported is 1,2,4. The following example platforms are available:

- FVP\_Base\_Cortex-A320
- EVS\_Dhrystone\_Cortex-A320x1
- SVP\_Base\_Cortex-A320x1

### Limitations

The following features are not yet supported, and will be added in a future release:

- No support for Core-Complex yet.
- BROADCASTCACHEMAINTPOU pin is not implemented.
- COREINSTRRET signals are not implemented.
- MEM\_RET power mode is not supported.

The following features are not supported in this or future releases:

- DynamIQ features that are negligible to the programmers view simulation.
- 256-bit wide output transactions.
- Error correction/detection features.

- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Cache stashing capability.

## Iris and MTI instances for ARM Cortex-A320CT

This model has the following Iris instances:

Name	Instance type
ARM Cortex-A320CT	Cluster_ARM_Cortex-A320
ARM Cortex-A320CT.AMU	PVBusLogger
ARM Cortex-A320CT.AMU.mapper	PVBusMapper
ARM Cortex-A320CT.DAP	PVBusLogger
ARM Cortex-A320CT.DAP.mapper	PVBusMapper
ARM Cortex-A320CT.DSU	DSU-120
ARM Cortex-A320CT.DSU.PPU_cluster	PPUv1
ARM Cortex-A320CT.DSU.PPU_cluster.busslave	PVBusSlave
ARM Cortex-A320CT.DSU.PPU_core0	PPUv1
ARM Cortex-A320CT.DSU.PPU_core0.busslave	PVBusSlave
ARM Cortex-A320CT.DSU.mpam_busslave	PVBusSlave
ARM Cortex-A320CT.DSU.shared_cache	PVCache
ARM Cortex-A320CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARM Cortex-A320CT.DSU.shared_cache.upstream[Y] (where Y = 0-4)	PVBusSlave
ARM Cortex-A320CT.DSU.utility_slave[0]	PVBusSlave
ARM Cortex-A320CT.MMAP	PVBusLogger
ARM Cortex-A320CT.MMAP.mapper	PVBusMapper
ARM Cortex-A320CT.RAS	PVBusLogger
ARM Cortex-A320CT.RAS.mapper	PVBusMapper
ARM Cortex-A320CT.cpu0	ARM_Cortex-A320
ARM Cortex-A320CT.cpu0.UTLB	TLB
ARM Cortex-A320CT.cpu0.debug_rom	debug_rom
ARM Cortex-A320CT.cpu0.dtlb	TLB
ARM Cortex-A320CT.cpu0.l1dcache	PVCache
ARM Cortex-A320CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARM Cortex-A320CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARM Cortex-A320CT.cpu0.l1licache	PVCache
ARM Cortex-A320CT.cpu0.l1licache.downstream[0].pvbusmaster	PVBusMaster
ARM Cortex-A320CT.cpu0.l1licache.upstream[0]	PVBusSlave
ARM Cortex-A320CT.ext_bus	PVBusLogger
ARM Cortex-A320CT.ext_bus.mapper	PVBusMapper
ARM Cortex-A320CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

Name	Instance type
ARMCortexA320CT.global_debug_rom	debug_rom
ARMCortexA320CT.l2_cache	PVCache
ARMCortexA320CT.l2_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA320CT.l2_cache.upstream[Z] (where Z = 0-16)	PVBusSlave
ARMCortexA320CT.secondary_debug_rom	debug_rom
ARMCortexA320CT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMCortexA320CT.AMU	PVBusLogger
ARMCortexA320CT.AMU.mapper	PVBusMapper
ARMCortexA320CT.DAP	PVBusLogger
ARMCortexA320CT.DAP.mapper	PVBusMapper
ARMCortexA320CT.DSU	DSU-120
ARMCortexA320CT.DSU.PPU_cluster	PPUv1
ARMCortexA320CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA320CT.DSU.PPU_core0	PPUv1
ARMCortexA320CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA320CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA320CT.DSU.shared_cache	PVCache
ARMCortexA320CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA320CT.DSU.shared_cache.upstream[Y] (where Y = 0-4)	PVBusSlave
ARMCortexA320CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA320CT.MMAP	PVBusLogger
ARMCortexA320CT.MMAP.mapper	PVBusMapper
ARMCortexA320CT.RAS	PVBusLogger
ARMCortexA320CT.RAS.mapper	PVBusMapper
ARMCortexA320CT.cpu0	ARM_Cortex-A320
ARMCortexA320CT.cpu0.UTLB	TLB
ARMCortexA320CT.cpu0.l1dcache	PVCache
ARMCortexA320CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA320CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA320CT.cpu0.l1icache	PVCache
ARMCortexA320CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA320CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA320CT.ext_bus	PVBusLogger
ARMCortexA320CT.ext_bus.mapper	PVBusMapper
ARMCortexA320CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA320CT.l2_cache	PVCache
ARMCortexA320CT.l2_cache.downstream[0].pvbusmaster	PVBusMaster

Name	Component type
ARMCortexA320CT.12_cache.upstream[Z] (where Z = 0-16)	PVBusSlave

## Ports for ARMCortexA320CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP subordinate port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.

Port	Direction	Protocol	Description
clusterpmuirq	master	Signal	DynamlQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
complex_pcs_m_pchannel	master	PChannel	Complex PCSM signals
complexerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
complexfaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main manager interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.

Port	Direction	Protocol	Description
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus subordinate
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARM Cortex A320CT

### cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: `false`

**cpuX.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**cpuX.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**cpuX.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**cpuX.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

**cpuX.min\_sync\_level**

Force minimum `syncLevel` (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

**cpuX.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**cpuX.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`cpuX.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

### **`cpuX.semihosting-T32_HLT`**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

### **`cpuX.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

### **`cpuX.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

### **`cpuX.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

### **`cpuX.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`cpuX.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`cpuX.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`cpuX.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`cpuX.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`cpuX.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`cpuX.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`cpuX.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**AEND0\_DEFAULT**

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

**AEND1\_DEFAULT**

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

**AEND2\_DEFAULT**

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

**AEND3\_DEFAULT**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

**ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

**ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

**ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

**ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

**BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

**BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: `false`

**BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: `false`

**BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: `true`

**CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the MPIDR\_EL1 register and is evaluated based on the MPIDR\_EL1 layout. If MPIDR\_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR\_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

**CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: `1`

**CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x80000`

**DBGROMADDR**

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

**DBGROMADDRV**

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: `false`

**GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

**NUM\_CORES**

Number of cores per cluster.

Type: `uint8_t`

Default value: `1`

**bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: `0`

**core\_cache\_protection**

`core_cache_protection` can change `ERR0FR`, `ERR0PFGF` and `ERR0PFGCTL` fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: `1`

**core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

**cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

**dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

**dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

**dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12\_tlb\_size parameter to 1024).

Type: bool

Default value: true

### **ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

### **ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

### **ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

### **ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

### **ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

**ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

**ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: `3`

**ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: `0`

**ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

**ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: `0`

**ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

**ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

**has\_actlr2**

If true ACTLR2 exists and ACTLR2(NS) is aliased to ACTLR\_EL1[63:32].

Type: `bool`

Default value: `true`

**has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**has\_dot\_product**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

**has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

**has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

**icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

**icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

**invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

**l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

### **mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

### **pmu-num\_counters**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

### **ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **ras\_extra\_configurations**

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR\_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN\_EL1. E.g. [{"Index": 0, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXMISC1\_mask": 0x0, "ERXMISC1\_reset": 0x0, "ERXMISC2\_mask": 0x0, "ERXMISC2\_reset": 0x0, "ERXMISC3\_mask": 0x0, "ERXMISC3\_reset": 0x0, "ERXCTLR\_EL1\_mask": 0x0, "ERXCTLR\_EL1\_reset": 0x0}, {"Index": 1, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXSTATUS\_IERR\_mask": 0x300}].

Type: `string`

Default value: "[ { \"Index\": 0, \"ERXMISC0\_mask\": 0xFFFFFC0003FCF, \"ERXMISC1\_mask\": 0x03F87000FFF30F07, \"ERXPGCTL\_reset\": 0x1000}, { \"Index\": 1, \"ERXMISC0\_mask\": 0xFFFFE007FFCF, \"ERXMISC0\_reset\": 0x2, \"ERXSTATUS\_IERR\_mask\": 0x300, \"ERXMISC1\_mask\": 0x0FF8700FFFF31F0F, \"ERXPGCTL\_reset\": 0x1000} ]"

### **ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

### **revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 0

### **store\_excl\_fail\_tag\_check\_action**

Behavior of tag check by core when a store exclusive fails. 0, Tag check ignored, 1, Tag check done if exclusive fails by global monitor.

Type: `uint8_t`

Default value: 0

### **tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

### **treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions

are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAAuth traps.

Type: `bool`

Default value: `false`

### **walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.41 ARMCortexA32CT

Defined in `LISA/ARMCortexA32CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `has_delayed_dbgreg`
- `has_delayed_sysreg`

### About ARMCortexA32CT

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for the Arm(R) Cortex(R)-A32 processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a `PVBusDecoder` to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.
- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.

This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter. - ECC and parity schemes are hardware-specific so are not supported.

## Iris and MTI instances for ARM CortexA32CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA32CT	Cluster_ARM_Cortex-A32
ARMCortexA32CT.AMU	PVBusLogger
ARMCortexA32CT.AMU.mapper	PVBusMapper
ARMCortexA32CT.DAP	PVBusLogger
ARMCortexA32CT.DAP.mapper	PVBusMapper
ARMCortexA32CT.DSU	DSU
ARMCortexA32CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA32CT.MMAP	PVBusLogger
ARMCortexA32CT.MMAP.mapper	PVBusMapper
ARMCortexA32CT.RAS	PVBusLogger
ARMCortexA32CT.RAS.mapper	PVBusMapper
ARMCortexA32CT.acp_mapper	PVBusMapper
ARMCortexA32CT.cpu0	ARM_Cortex-A32
ARMCortexA32CT.cpu0.SZTLB (where Z = 1-2)	TLB
ARMCortexA32CT.cpu0.UTLB	TLB
ARMCortexA32CT.cpu0.dtlb	TLB
ARMCortexA32CT.cpu0.l1dcache	PVCache
ARMCortexA32CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA32CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA32CT.cpu0.l1icache	PVCache
ARMCortexA32CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA32CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA32CT.ext_bus	PVBusLogger
ARMCortexA32CT.ext_bus.mapper	PVBusMapper
ARMCortexA32CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA32CT.global_debug_rom	debug_rom

Name	Instance type
ARMCortexA32CT.l2_cache	PVCache
ARMCortexA32CT.l2_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA32CT.l2_cache.upstream[Z] (where Z = 0-16)	PVBusSlave
ARMCortexA32CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Name	Component type
ARMCortexA32CT.AMU	PVBusLogger
ARMCortexA32CT.AMU.mapper	PVBusMapper
ARMCortexA32CT.DAP	PVBusLogger
ARMCortexA32CT.DAP.mapper	PVBusMapper
ARMCortexA32CT.DSU	DSU
ARMCortexA32CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA32CT.MMAP	PVBusLogger
ARMCortexA32CT.MMAP.mapper	PVBusMapper
ARMCortexA32CT.RAS	PVBusLogger
ARMCortexA32CT.RAS.mapper	PVBusMapper
ARMCortexA32CT.acp_mapper	PVBusMapper
ARMCortexA32CT.cpu0	ARM_Cortex-A32
ARMCortexA32CT.cpu0.SZTLB (where Z = 1-2)	TLB
ARMCortexA32CT.cpu0.UTLB	TLB
ARMCortexA32CT.cpu0.l1dcache	PVCache
ARMCortexA32CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA32CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA32CT.cpu0.l1icache	PVCache
ARMCortexA32CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA32CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA32CT.ext_bus	PVBusLogger
ARMCortexA32CT.ext_bus.mapper	PVBusMapper
ARMCortexA32CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA32CT.l2_cache	PVCache
ARMCortexA32CT.l2_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA32CT.l2_cache.upstream[Z] (where Z = 0-16)	PVBusSlave
ARMCortexA32CT.l2_flusher	AsyncCacheFlushUnit

## Ports for ARMCortexA32CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastinner	slave	Signal	ACE defined pins.

Port	Direction	Protocol	Description
broadcastouter	slave	Signal	ACE defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
cfgte	slave	Signal	This signal provides default exception handling state.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.
clrexmonack	master	Signal	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	slave	Signal	Signals the clearing of an external global exclusive monitor
clusterid	slave	Value	The port sets the value of the affinity levels 1 and 2; bits [23:16] and [15:8] of the MPIDR.
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
commrx	master	Signal	Receive portion of Data Transfer Register full.
commtx	master	Signal	Transmit portion of Data Transfer Register empty.
cp15sdisable2	slave	Signal	-
cp15sdisable	slave	Signal	This signal disables write access to some system control processor registers.
cpuporeset	slave	Signal	CPU power on reset.
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross trigger matrix port.
dbgack	master	Signal	External debug interface.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Processor powerup request.
dev_debug_s	slave	PVBus	External debug interface.
edbgrq	slave	Signal	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
l2flushdone	master	Signal	Flush of L2 memory system complete.
l2flushreq	slave	Signal	Request flush of L2 memory system.

Port	Direction	Protocol	Description
l2reset	slave	Signal	Level2 reset.
memorymapped_debug_s	slave	PVBus	External debug interface.
niden	slave	Signal	External debug interface.
periphbase	slave	Value_64	This port sets the base address of private peripheral region.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
presetdbg	slave	Signal	Debug reset.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
rei	slave	Signal	Per core RAM Error Interrupt
reset	slave	Signal	Reset.
romaddr	slave	Value_64	Debug ROM base address.
romaddrv	slave	Signal	Debug ROM base address valid.
sei	slave	Signal	Per core System Error physical pins.
smpen	master	Signal	This signals AMP or SMP mode for each core.
spiden	slave	Signal	External debug interface.
spniden	slave	Signal	External debug interface.
standbywfe	master	Signal	This signal indicates if a core is in WFE state.
standbywfi	master	Signal	This signal indicates if a core is in WFI state
standbywfi12	master	Signal	This signal indicated all cores and L2 are idles and in low power state.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
vinithi	slave	Signal	This signal controls of the location of the exception vectors at reset.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARM Cortex A32CT

### cpuX.CFGEND

Type: `bool`

Default value: `false`

### cpuX.CFGTE

Type: `bool`

Default value: `false`

**cpuX.CP15SDISABLE**Type: `bool`Default value: `false`**cpuX.CP15SDISABLE2**Type: `bool`Default value: `false`**cpuX.CRYPTODISABLE**Type: `bool`Default value: `false`**cpuX.VINITHI**Type: `bool`Default value: `false`**cpuX.enable\_trace\_special\_hlt\_imm16**Enable usage of parameter `trace_special_hlt_imm16`.Type: `bool`Default value: `false`**cpuX.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint64_t`

Default value: 256

**cpuX.min\_sync\_level**force minimum `syncLevel` (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).Type: `uint32_t`

Default value: 0

**cpuX.semihosting-A32\_HLT**Type: `uint32_t`

Default value: 0xF000

**cpuX.semihosting-ARM\_SVC**

Type: uint32\_t

Default value: 0x123456

**cpuX.semihosting-T32\_HLT**

Type: uint32\_t

Default value: 0x3c

**cpuX.semihosting-Thumb\_SVC**

Type: uint32\_t

Default value: 0xAB

**cpuX.semihosting-cmd\_line**

Type: string

Default value: ""

**cpuX.semihosting-cwd**

Type: string

Default value: ""

**cpuX.semihosting-enable**

Type: bool

Default value: true

**cpuX.semihosting-heap\_base**

Type: uint32\_t

Default value: 0x0

**cpuX.semihosting-heap\_limit**

Type: uint32\_t

Default value: 0x0F000000

**cpuX.semihosting-stack\_base**

Type: uint32\_t

Default value: 0x10000000

**cpuX.semihosting-stack\_limit**Type: `uint32_t`Default value: `0x0F000000`**cpuX.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`Default value: `0xf000`**cpuX.vfp-enable\_at\_reset**Type: `bool`Default value: `false`**BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The `broadcastcachemaint` signal will override this value if used.

Type: `bool`Default value: `true`**BROADCASTINNER**

Enable broadcasting of Inner Shareable transactions. The `broadcastinner` signal will override this value if used.

Type: `bool`Default value: `true`**BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`Default value: `true`**CLUSTER\_ID**Type: `uint32_t`Default value: `0`

**DBGROMADDR**

Type: uint64\_t

Default value: 0x22000000

**DBGROMADDRV**

Type: bool

Default value: true

**GICDISABLE**

Type: bool

Default value: true

**NUM\_CORES**

Number of cores in cluster.

Type: uint8\_t

Default value: 1

**PERIPHBASE**

Type: uint64\_t

Default value: 0x13080000

**bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: uint32\_t

Default value: 0

**cpi\_div**

divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 1

**cpi\_mul**

multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 1

**dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

**dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

**dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

**dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (based on the size of `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

**dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

**dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: 0x8000

**dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**dcache-state\_modelled**

Type: `bool`

Default value: `false`

**dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (based on the size of `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**icache-hit\_latency**

L1 I-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

### **icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **icache-miss\_latency**

L1 I-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

### **icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (based on the size of `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

### **`icache-state_modelled`**

Type: `bool`

Default value: `false`

### **`l2cache-hit_latency`**

L2 Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: `0`

### **`l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

### **`l2cache-miss_latency`**

L2 Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: `0`

### **`l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access (based on the size of `l2cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

### **`l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access (based on the size of `l2cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: `0`

**tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint32\_t

Default value: 0

## 3.42 ARMCortexA34CT

Defined in `LISA/ARMCortexA34CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `has_delayed_dbgreg`
- `has_delayed_sysreg`

### About ARMCortexA34CT

The model has the following features:

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for this processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBUSDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.

- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems.
- This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.
- ECC and parity schemes are hardware-specific so are not supported.

## Iris and MTI instances for ARMCortexA34CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA34CT	Cluster_ARM_Cortex-A34
ARMCortexA34CT.AMU	PVBusLogger
ARMCortexA34CT.AMU.mapper	PVBusMapper
ARMCortexA34CT.DAP	PVBusLogger
ARMCortexA34CT.DAP.mapper	PVBusMapper
ARMCortexA34CT.DSU	DSU
ARMCortexA34CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA34CT.MMAP	PVBusLogger
ARMCortexA34CT.MMAP.mapper	PVBusMapper
ARMCortexA34CT.RAS	PVBusLogger
ARMCortexA34CT.RAS.mapper	PVBusMapper
ARMCortexA34CT.acp_mapper	PVBusMapper
ARMCortexA34CT.cpu0	ARM_Cortex-A34
ARMCortexA34CT.cpu0.UTLB	TLB
ARMCortexA34CT.cpu0.dtlb	TLB
ARMCortexA34CT.cpu0.l1dcache	PVCache
ARMCortexA34CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA34CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA34CT.cpu0.l1icache	PVCache
ARMCortexA34CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA34CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA34CT.ext_bus	PVBusLogger
ARMCortexA34CT.ext_bus.mapper	PVBusMapper
ARMCortexA34CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA34CT.global_debug_rom	debug_rom
ARMCortexA34CT.l2_cache	PVCache
ARMCortexA34CT.l2_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA34CT.l2_cache.upstream[Z] (where Z = 0-16)	PVBusSlave
ARMCortexA34CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Name	Component type
ARMCortexA34CT.AMU	PVBusLogger
ARMCortexA34CT.AMU.mapper	PVBusMapper
ARMCortexA34CT.DAP	PVBusLogger
ARMCortexA34CT.DAP.mapper	PVBusMapper
ARMCortexA34CT.DSU	DSU
ARMCortexA34CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA34CT.MMAP	PVBusLogger
ARMCortexA34CT.MMAP.mapper	PVBusMapper
ARMCortexA34CT.RAS	PVBusLogger
ARMCortexA34CT.RAS.mapper	PVBusMapper
ARMCortexA34CT.acp_mapper	PVBusMapper
ARMCortexA34CT.cpu0	ARM_Cortex-A34
ARMCortexA34CT.cpu0.UTLB	TLB
ARMCortexA34CT.cpu0.l1dcache	PVCache
ARMCortexA34CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA34CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA34CT.cpu0.l1icache	PVCache
ARMCortexA34CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA34CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA34CT.ext_bus	PVBusLogger
ARMCortexA34CT.ext_bus.mapper	PVBusMapper
ARMCortexA34CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA34CT.l2_cache	PVCache
ARMCortexA34CT.l2_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA34CT.l2_cache.upstream[Z] (where Z = 0-16)	PVBusSlave
ARMCortexA34CT.l2_flusher	AsyncCacheFlushUnit

## Ports for ARMCortexA34CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastinner	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
cfgte	slave	Signal	This signal provides default exception handling state.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.

Port	Direction	Protocol	Description
clrexmonack	master	Signal	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	slave	Signal	Signals the clearing of an external global exclusive monitor
clusterid	slave	Value	The port sets the value of the affinity levels 1 and 2; bits [23:16] and [15:8] of the MPIDR.
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
commrq	master	Signal	Receive portion of Data Transfer Register full.
commtx	master	Signal	Transmit portion of Data Transfer Register empty.
cp15sdisable	slave	Signal	This signal disables write access to some system control processor registers.
cpuporeset	slave	Signal	Power on reset. Initializes all the processor logic, including debug logic.
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgack	master	Signal	External debug interface.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Processor powerup request.
dev_debug_s	slave	PVBus	External debug interface.
edbgrq	slave	Signal	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
l2flushdone	master	Signal	Flush of L2 memory system complete.
l2flushreq	slave	Signal	Request flush of L2 memory system.
l2reset	slave	Signal	This signal resets the shared L2 memory system, interrupt controller and timer logic.
memorymapped_debug_s	slave	PVBus	External debug interface.
niden	slave	Signal	External debug interface.
periphbase	slave	Value_64	This port sets the base address of private peripheral region.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.

Port	Direction	Protocol	Description
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Raising this signal will put the core into reset mode.
romaddr	slave	Value_64	Debug ROM base address.
romaddrv	slave	Signal	Debug ROM base address valid.
rvbaraddr	slave	Value_64	Reset vector base address.
sei	slave	Signal	Per core virtual System Error physical pins.
smpen	master	Signal	This signals AMP or SMP mode for each core.
spiden	slave	Signal	External debug interface.
spniden	slave	Signal	External debug interface.
standbywfe	master	Signal	This signal indicates if a core is in WFE state.
standbywfi	master	Signal	This signal indicates if a core is in WFI state.
standbywfil2	master	Signal	Indicate that all the individual processors and the L2 memory system are in a WFI state.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
vinithi	slave	Signal	This signal controls of the location of the exception vectors at reset.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARM CortexA34CT

### **cpuX.CFGEND**

Type: `bool`

Default value: `false`

### **cpuX.CFGTE**

Type: `bool`

Default value: `false`

### **cpuX.CP15SDISABLE**

Type: `bool`

Default value: `false`

**cpuX.CRYPTODISABLE**

Type: `bool`

Default value: `false`

**cpuX.RVBARADDR**

Type: `uint64_t`

Default value: `0`

**cpuX.VINITHI**

Type: `bool`

Default value: `false`

**cpuX.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**cpuX.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint64_t`

Default value: `256`

**cpuX.min\_sync\_level**

force minimum `syncLevel` (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint32_t`

Default value: `0`

**cpuX.semihosting-A32\_HLT**

Type: `uint32_t`

Default value: `0xF000`

**cpuX.semihosting-A64\_HLT**

Type: `uint32_t`

Default value: 0xF000

**cpuX.semihosting-ARM\_SVC**

Type: uint32\_t

Default value: 0x123456

**cpuX.semihosting-T32\_HLT**

Type: uint32\_t

Default value: 0x3c

**cpuX.semihosting-Thumb\_SVC**

Type: uint32\_t

Default value: 0xAB

**cpuX.semihosting-cmd\_line**

Type: string

Default value: ""

**cpuX.semihosting-cwd**

Type: string

Default value: ""

**cpuX.semihosting-enable**

Type: bool

Default value: true

**cpuX.semihosting-heap\_base**

Type: uint32\_t

Default value: 0x0

**cpuX.semihosting-heap\_limit**

Type: uint32\_t

Default value: 0x0F000000

**cpuX.semihosting-stack\_base**

Type: uint32\_t

Default value: 0x10000000

**cpuX.semihosting-stack\_limit**Type: `uint32_t`Default value: `0x0F000000`**cpuX.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`Default value: `0xf000`**cpuX.vfp-enable\_at\_reset**Type: `bool`Default value: `false`**BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The `broadcastcachemaint` signal will override this value if used.

Type: `bool`Default value: `true`**BROADCASTINNER**

Enable broadcasting of Inner Shareable transactions. The `broadcastinner` signal will override this value if used.

Type: `bool`Default value: `true`**BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`Default value: `true`**CLUSTER\_ID**Type: `uint32_t`Default value: `0`

**DBGROMADDR**

Type: uint64\_t

Default value: 0x22000000

**DBGROMADDRV**

Type: bool

Default value: true

**GICDISABLE**

Type: bool

Default value: true

**NUM\_CORES**

Number of cores in cluster.

Type: uint8\_t

Default value: 1

**PERIPHBASE**

Type: uint64\_t

Default value: 0x13080000

**bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: uint32\_t

Default value: 0

**cpi\_div**

divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 1

**cpi\_mul**

multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 1

**dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

**dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

**dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

**dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (based on the size of `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

**dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

**dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: 0x8000

**dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**dcache-state\_modelled**

Type: `bool`

Default value: `false`

**dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (based on the size of `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**icache-hit\_latency**

L1 I-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

### **icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **icache-miss\_latency**

L1 I-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

### **icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (based on the size of `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

### **`icache-state_modelled`**

Type: `bool`

Default value: `false`

### **`l2cache-hit_latency`**

L2 Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: `0`

### **`l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

### **`l2cache-miss_latency`**

L2 Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: `0`

### **`l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access (based on the size of `l2cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

### **`l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access (based on the size of `l2cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0`

**ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: `0`

**tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint32\_t

Default value: 0

## 3.43 ARMCortexA35CT

Defined in `LISA/ARMCortexA35CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `has_delayed_dbgreg`
- `has_delayed_sysreg`

### About ARMCortexA35CT

The model has the following features:

- If either L1 cache is stateful, then the L2 cache is stateful. This is controlled by the `dcache-state_modelled` and `icache-state_modelled` parameters.
- The cache latency parameters are only effective when you enable cache-state modeling.
- Timing annotation for transactions downstream of the cache and TLB models propagates through the models.
- Although Neon support is optional for this processor, this model does not implement the `ase-present` parameter. Therefore, it is not possible to configure the model to not support Neon.
- This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).
- The `semihosting-cwd` parameter sets the current working directory that is used for semihosting. The host operating system limits the maximum path length. The `semihosting-cwd` parameter does not provide any security. Software running on the model can access files outside this directory using relative paths containing `..` or using absolute paths.
- The system designer decides whether a debug APB ties the external debug view with other system views. In the model, use a PVBUSDecoder to direct traffic to the correct port, `dev_debug_s` or `memorymapped_debug_s`.

- The `vfp-enable_at_reset` option is model-specific and has no hardware equivalent. Arm recommends that it is only used in test systems and tied off to false in production systems. This model has a variable number of cores per cluster, specified using the `NUM_CORES` parameter.
- ECC and parity schemes are hardware-specific so are not supported.

### Iris and MTI instances for ARM Cortex A35CT

This model has the following Iris instances:

Name	Instance type
ARM Cortex A35CT	Cluster_ARM_Cortex-A35
ARM Cortex A35CT.AMU	PVBusLogger
ARM Cortex A35CT.AMU.mapper	PVBusMapper
ARM Cortex A35CT.DAP	PVBusLogger
ARM Cortex A35CT.DAP.mapper	PVBusMapper
ARM Cortex A35CT.DSU	DSU
ARM Cortex A35CT.DSU.mpam_busslave	PVBusSlave
ARM Cortex A35CT.MMAP	PVBusLogger
ARM Cortex A35CT.MMAP.mapper	PVBusMapper
ARM Cortex A35CT.RAS	PVBusLogger
ARM Cortex A35CT.RAS.mapper	PVBusMapper
ARM Cortex A35CT.acp_mapper	PVBusMapper
ARM Cortex A35CT.cpu0	ARM_Cortex-A35
ARM Cortex A35CT.cpu0.UTLB	TLB
ARM Cortex A35CT.cpu0.dtlb	TLB
ARM Cortex A35CT.cpu0.l1dcache	PVCache
ARM Cortex A35CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARM Cortex A35CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARM Cortex A35CT.cpu0.l1icache	PVCache
ARM Cortex A35CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARM Cortex A35CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARM Cortex A35CT.ext_bus	PVBusLogger
ARM Cortex A35CT.ext_bus.mapper	PVBusMapper
ARM Cortex A35CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARM Cortex A35CT.global_debug_rom	debug_rom
ARM Cortex A35CT.l2_cache	PVCache
ARM Cortex A35CT.l2_cache.downstream[0].pvbusmaster	PVBusMaster
ARM Cortex A35CT.l2_cache.upstream[Z] (where Z = 0-16)	PVBusSlave
ARM Cortex A35CT.l2_flusher	AsyncCacheFlushUnit

This model has the following MTI trace components:

Name	Component type
ARM Cortex A35CT.AMU	PVBusLogger

Name	Component type
ARMCortexA35CT.AMU.mapper	PVBusMapper
ARMCortexA35CT.DAP	PVBusLogger
ARMCortexA35CT.DAP.mapper	PVBusMapper
ARMCortexA35CT.DSU	DSU
ARMCortexA35CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA35CT.MMAP	PVBusLogger
ARMCortexA35CT.MMAP.mapper	PVBusMapper
ARMCortexA35CT.RAS	PVBusLogger
ARMCortexA35CT.RAS.mapper	PVBusMapper
ARMCortexA35CT.acp_mapper	PVBusMapper
ARMCortexA35CT.cpu0	ARM_Cortex-A35
ARMCortexA35CT.cpu0.UTLB	TLB
ARMCortexA35CT.cpu0.l1dcache	PVCache
ARMCortexA35CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA35CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA35CT.cpu0.l1icache	PVCache
ARMCortexA35CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA35CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA35CT.ext_bus	PVBusLogger
ARMCortexA35CT.ext_bus.mapper	PVBusMapper
ARMCortexA35CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA35CT.l2_cache	PVCache
ARMCortexA35CT.l2_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA35CT.l2_cache.upstream[Z] (where Z = 0-16)	PVBusSlave
ARMCortexA35CT.l2_flusher	AsyncCacheFlushUnit

## Ports for ARMCortexA35CT

Port	Direction	Protocol	Description
aa64naa32	slave	Signal	Register width after reset.
acp_s	slave	PVBus	AXI ACP slave port.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastinner	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
cfgte	slave	Signal	This signal provides default exception handling state.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the core executes instructions.

Port	Direction	Protocol	Description
clrexmonack	master	Signal	Acknowledge handshake signal for the clrexmonreq signal
clrexmonreq	slave	Signal	Signals the clearing of an external global exclusive monitor
clusterid	slave	Value	The port sets the value of the affinity levels 1 and 2; bits [23:16] and [15:8] of the MPIDR.
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
commr	master	Signal	Receive portion of Data Transfer Register full.
commt	master	Signal	Transmit portion of Data Transfer Register empty.
cp15sdisable2	slave	Signal	This signal disables write access to some system control processor registers.
cp15sdisable	slave	Signal	This signal disables write access to some system control processor registers.
cpuporeset	slave	Signal	CPU power on reset.
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross trigger matrix port.
dbgack	master	Signal	External debug interface.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Processor powerup request.
dev_debug_s	slave	PVBus	External debug interface.
edbgrq	slave	Signal	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
l2flushdone	master	Signal	Flush of L2 memory system complete.
l2flushreq	slave	Signal	Request flush of L2 memory system.
l2reset	slave	Signal	Level2 reset.
memorymapped_debug_s	slave	PVBus	External debug interface.
niden	slave	Signal	External debug interface.
periphbase	slave	Value_64	This port sets the base address of private peripheral region.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
presetdbg	slave	Signal	Debug reset.

Port	Direction	Protocol	Description
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
rei	slave	Signal	Per core RAM Error Interrupt
reset	slave	Signal	Reset.
romaddr	slave	Value_64	Debug ROM base address.
romaddrv	slave	Signal	Debug ROM base address valid.
rvbaraddr	slave	Value_64	Reset vector base address.
sei	slave	Signal	Per core System Error physical pins.
smpen	master	Signal	This signals AMP or SMP mode for each core.
spiden	slave	Signal	External debug interface.
spniden	slave	Signal	External debug interface.
standbywfe	master	Signal	This signal indicates if a core is in WFE state.
standbywfi	master	Signal	This signal indicates if a core is in WFI state
standbywfil2	master	Signal	This signal indicated all cores and L2 are idles and in low power state.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
vinithi	slave	Signal	This signal controls of the location of the exception vectors at reset.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARMCortexA35CT

### **cpuX.AA64nAA32**

Type: `bool`

Default value: `true`

### **cpuX.CFGEND**

Type: `bool`

Default value: `false`

### **cpuX.CFGTE**

Type: `bool`

Default value: `false`

**cpuX.CP15SDISABLE**

Type: bool

Default value: false

**cpuX.CP15SDISABLE2**

Type: bool

Default value: false

**cpuX.CRYPTODISABLE**

Type: bool

Default value: false

**cpuX.RVBARADDR**

Type: uint64\_t

Default value: 0

**cpuX.VINITI**

Type: bool

Default value: false

**cpuX.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**cpuX.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint64\_t

Default value: 256

**cpuX.min\_sync\_level**

force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint32\_t

Default value: 0

**cpuX.semihosting-A32\_HLT**

Type: uint32\_t

Default value: 0xF000

**cpuX.semihosting-A64\_HLT**

Type: uint32\_t

Default value: 0xF000

**cpuX.semihosting-ARM\_SVC**

Type: uint32\_t

Default value: 0x123456

**cpuX.semihosting-T32\_HLT**

Type: uint32\_t

Default value: 0x3c

**cpuX.semihosting-Thumb\_SVC**

Type: uint32\_t

Default value: 0xAB

**cpuX.semihosting-cmd\_line**

Type: string

Default value: ""

**cpuX.semihosting-cwd**

Type: string

Default value: ""

**cpuX.semihosting-enable**

Type: bool

Default value: true

**cpuX.semihosting-heap\_base**

Type: uint32\_t

Default value: 0x0

**cpuX.semihosting-heap\_limit**

Type: uint32\_t

Default value: 0x0F000000

**cpuX.semihosting-stack\_base**

Type: uint32\_t

Default value: 0x10000000

**cpuX.semihosting-stack\_limit**

Type: uint32\_t

Default value: 0x0F000000

**cpuX.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**cpuX.vfp-enable\_at\_reset**

Type: bool

Default value: false

**cpuX.vfp-present**

Set whether the model has VFP support.

Type: bool

Default value: true

**BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: bool

Default value: true

**BROADCASTINNER**

Enable broadcasting of Inner Shareable transactions. The broadcastinner signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

Type: `uint32_t`

Default value: 0

### **DBGROMADDR**

Type: `uint64_t`

Default value: `0x0`

### **DBGROMADDRV**

Type: `bool`

Default value: `true`

### **GICDISABLE**

Type: `bool`

Default value: `true`

### **NUM\_CORES**

Number of cores in cluster.

Type: `uint8_t`

Default value: 1

### **PERIPHBASE**

Type: `uint64_t`

Default value: `0x13080000`

### **bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint32_t`

Default value: 0

### **`cpi_div`**

divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 1

### **`cpi_mul`**

multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 1

### **`dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

### **`dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **`dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

### **`dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (based on the size of `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: 0x8000

### **dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **dcache-state\_modelled**

Type: `bool`

Default value: `false`

### **dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (based on the size of `dcache-write_bus_width_in_bytes`. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

**has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**icache-hit\_latency**

L1 I-Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

**icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

**icache-miss\_latency**

L1 I-Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

**icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (based on the size of `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will

be used instead of per-byte even if `icache-read_latency` is set. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **`icache-read_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **`icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

### **`icache-state_modelled`**

Type: `bool`

Default value: `false`

### **`l2cache-hit_latency`**

L2 Cache timing annotation latency for hit.

Type: `uint64_t`

Default value: 0

### **`l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **`l2cache-miss_latency`**

L2 Cache timing annotation latency for miss.

Type: `uint64_t`

Default value: 0

**l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access (based on the size of l2cache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0

**l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0

**l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0

**l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0

**l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access (based on the size of l2cache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0

### **l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0

### **ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: 0

### **tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint32_t`

Default value: 0

## 3.44 ARMCortexA510CT

Defined in `LISA/ARMCortexA510CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support
r1p3	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `has_delayed_dbgreg`
- `has_delayed_sysreg`
- `num_acp`

### About ARMCortexA510CT

The model supports the following features:

- DynamIQ Shared Unit-110 (DSU-110) system registers.
- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- PChannel for the cluster and for each core.
- `BROADCASTPERSIST` pin.
- Optional peripheral port.
- L3Cache partition.
- Per-core clock.
- Utility bus.
- Revision R1 is the default configuration, with 32-bit support at EL0. R1 supports both configurations of EL0, with or without A32 support. For 64-bit only mode, set parameter `max_32bit_el=-1`.
- To configure revision R0, set parameter `revision_number=0`.

Support for the following features is planned for a future release:

- `BROADCASTCACHEMAINTPOU` pin.
- `COREINSTRET`, `COREINSTRUN`, and `nPMBIRQ` signals.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
  - Automatic CPU retention mode.
  - Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- Error correction or detection features.
- Self-test features (MBIST).
- Snoop filtering.
- Latency configuration.
- Cache stashing capability.

This model supports the Arm(R)v8-A Cryptographic Extensions, which requires the crypto plug-in (`crypto.dll` or `crypto.so`) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

## Iris and MTI instances for ARM Cortex A510CT

This model has the following Iris instances:

Name	Instance type
ARM Cortex A510CT	Cluster_ARM_Cortex-A510
ARM Cortex A510CT.AMU	PVBusLogger

Name	Instance type
ARMCortexA510CT.AMU.mapper	PVBusMapper
ARMCortexA510CT.DAP	PVBusLogger
ARMCortexA510CT.DAP.mapper	PVBusMapper
ARMCortexA510CT.DSU	DSU-110
ARMCortexA510CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT.DSU.PPU_core0	PPUv1
ARMCortexA510CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA510CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA510CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT.DSU.shared_cache	PVCache
ARMCortexA510CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT.DSU.shared_cache.upstream[Y] (where Y = 0-3)	PVBusSlave
ARMCortexA510CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT.MMAP	PVBusLogger
ARMCortexA510CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT.RAS	PVBusLogger
ARMCortexA510CT.RAS.mapper	PVBusMapper
ARMCortexA510CT.cpu0	ARM_Cortex-A510
ARMCortexA510CT.cpu0.UTLB	TLB
ARMCortexA510CT.cpu0.debug_rom	debug_rom
ARMCortexA510CT.cpu0.dtlb	TLB
ARMCortexA510CT.cpu0.l1dcache	PVCache
ARMCortexA510CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA510CT.cpu0.l1icache	PVCache
ARMCortexA510CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA510CT.cpu0.l2cache	PVCache
ARMCortexA510CT.cpu0.l2cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT.cpu0.l2cache.upstream[U] (where U = 0-1)	PVBusSlave
ARMCortexA510CT.ext_bus	PVBusLogger
ARMCortexA510CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA510CT.global_debug_rom	debug_rom
ARMCortexA510CT.secondary_debug_rom	debug_rom
ARMCortexA510CT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMCortexA510CT.AMU	PVBusLogger
ARMCortexA510CT.AMU.mapper	PVBusMapper
ARMCortexA510CT.DAP	PVBusLogger
ARMCortexA510CT.DAP.mapper	PVBusMapper
ARMCortexA510CT.DSU	DSU-110
ARMCortexA510CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT.DSU.PPU_core0	PPUv1
ARMCortexA510CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA510CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA510CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT.DSU.shared_cache	PVCache
ARMCortexA510CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT.DSU.shared_cache.upstream[Y] (where Y = 0-3)	PVBusSlave
ARMCortexA510CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT.MMAP	PVBusLogger
ARMCortexA510CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT.RAS	PVBusLogger
ARMCortexA510CT.RAS.mapper	PVBusMapper
ARMCortexA510CT.cpu0	ARM_Cortex-A510
ARMCortexA510CT.cpu0.UTLB	TLB
ARMCortexA510CT.cpu0.l1dcache	PVCache
ARMCortexA510CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA510CT.cpu0.l1icache	PVCache
ARMCortexA510CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA510CT.cpu0.l2cache	PVCache
ARMCortexA510CT.cpu0.l2cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT.cpu0.l2cache.upstream[U] (where U = 0-1)	PVBusSlave
ARMCortexA510CT.ext_bus	PVBusLogger
ARMCortexA510CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

## Ports for ARMCortexA510CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AENDOMP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).

Port	Direction	Protocol	Description
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmpchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.

Port	Direction	Protocol	Description
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsn_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgprupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU Core wake request signals.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.

Port	Direction	Protocol	Description
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARM Cortex A510CT

### cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### cpuX.CRYPTODISABLE

Disable cryptographic features.

Type: `bool`

Default value: `false`

### cpuX.RVBARADDR

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**cpuX.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**cpuX.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**cpuX.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**cpuX.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**cpuX.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**cpuX.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

**cpuX.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**cpuX.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**cpuX.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**cpuX.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**cpuX.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**cpuX.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**cpuX.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**cpuX.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

### **`cpuX.semihosting-T32_HLT`**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

### **`cpuX.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

### **`cpuX.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

### **`cpuX.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

### **`cpuX.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`cpuX.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`cpuX.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf0000000`

### **`cpuX.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`cpuX.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf0000000`

### **`cpuX.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`cpuX.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`cpuX.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`AEND0_DEFAULT`**

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMPO input signal).

Type: `uint64_t`

Default value: 0x0

#### **AEND1\_DEFAULT**

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: uint64\_t

Default value: 0x0

#### **AEND2\_DEFAULT**

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: uint64\_t

Default value: 0x0

#### **AEND3\_DEFAULT**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: uint64\_t

Default value: 0x0

#### **ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: uint64\_t

Default value: 0x0

#### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: uint64\_t

Default value: 0x0

#### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: uint64\_t

Default value: `0x0`

### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the MPIDR\_EL1 register and is evaluated based on the MPIDR\_EL1 layout. If MPIDR\_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR\_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1.

This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: `1`

### **CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

### **GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

### **NUM\_CORES**

Number of cores per cluster.

Type: `uint8_t`

Default value: `1`

### **bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: `0`

**core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

**cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: `bool`

Default value: `false`

**dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

**dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **`dcache-write_access_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`dcache-write_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`enable_simulation_performance_optimizations`**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

### **`ete.CLAIMTAGS`**

Number of claim tags.

Type: `uint8_t`

Default value: 4

### **`ete.MAX_INST_PER_Q`**

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

### **`ete.NumberOfRSPairs`**

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

#### **ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

#### **ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

#### **ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

#### **ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

#### **ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: 3

#### **ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

### **`ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

### **`ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

### **`ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

### **`ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: N/A

### **`ete.TRCSRSTA_FORCED_EXCEP`**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

### **`force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

**has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**has\_dot\_product**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: `2`

**has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

**has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

**icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: 0x10000

### **icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

### **l3cache-has\_mpam**

L3 Cache has MPAM support.

Type: `bool`

Default value: `true`

### **l3cache-hit\_latency**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**l3cache-maintenance\_latency**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-size**

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-snoop_issue_latency`**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-ways`**

L3 Cache number of ways (sets are implicit from size).

Type: `uint16_t`

Default value: `16`

### **`l3cache-write_access_latency`**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-write_latency`**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`max_32bit_el`**

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when `revision_number = 0`.

Type: `int8_t`

Default value: `0`

**memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

**mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

**num\_acp**

Number of ACP ports.

Type: `uint8_t`

Default value: 0

**num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

**patch\_level**

Patch level of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Revision field in MIDR/MIDR\_EL1. Corresponds to the patch number Y in rXpY.

Type: `uint8_t`

Default value: 3

**ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

### **revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 1

### **tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

### **treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

### **walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

## 3.45 ARMCortexA510CT\_CortexA710CT

Defined in LISA/ARMCortexA510CT\_CortexA710CT.lisa.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- num\_acp
- subcluster0.has\_delayed\_dbgreg
- subcluster0.has\_delayed\_sysreg
- subcluster1.has\_delayed\_dbgreg
- subcluster1.has\_delayed\_sysreg

### About ARMCortexA510CT\_CortexA710CT

The number of cores in each subcluster is configurable using the following parameters:

#### **subcluster0.NUM\_CORES**

Possible values are 1-11 (ARMCortexA510CT).

#### **subcluster1.NUM\_CORES**

Possible values are 1-11 (ARMCortexA710CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port\_name>[0-10] for cores in subcluster0.
- <port\_name>[11-21] for cores in subcluster1.

All instances in the Master cross trigger matrix port array `cti[22]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu10` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu10` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [ARMCortexA510CT](#).
- [ARMCortexA710CT](#).

## Iris and MTI instances for ARMCortexA510CT\_CortexA710CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA510CT_CortexA710CT	Cluster_ARM_Cortex510_CortexA710_Heterogeneous
ARMCortexA510CT_CortexA710CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA710CT.AMU.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.DAP	PVBusLogger
ARMCortexA510CT_CortexA710CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.DSU	DSU-110
ARMCortexA510CT_CortexA710CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA710CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.PPU_coreZ (where Z = 0-1)	PPUv1
ARMCortexA510CT_CortexA710CT.DSU.PPU_coreZ.busslave (where Z = 0-1)	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.shared_cache	PVCache
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.upstream[Z] (where Z = 0-5)	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT_CortexA710CT.MMAP	PVBusLogger
ARMCortexA510CT_CortexA710CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.RAS	PVBusLogger
ARMCortexA510CT_CortexA710CT.RAS.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.cpuZ.debug_rom (where Z = 0-1)	debug_rom
ARMCortexA510CT_CortexA710CT.ext_bus	PVBusLogger
ARMCortexA510CT_CortexA710CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA510CT_CortexA710CT.global_debug_rom	debug_rom
ARMCortexA510CT_CortexA710CT.secondary_debug_rom	debug_rom
ARMCortexA510CT_CortexA710CT.subcluster0	Subcluster_ARM_Cortex-A510
ARMCortexA510CT_CortexA710CT.subcluster0.cpu0	ARM_Cortex-A510

Name	Instance type
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.UTLB (where Z = 0-1)	TLB
ARMCortexA510CT_CortexA710CT.subclusterZ.cpuU.dtlb (where Z = 0-1; U = 0-1)	TLB
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1dcache (where Z = 0-1)	PVCache
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1dcache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1dcache.upstream[0] (where Z = 0-1)	PVBusSlave
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1icache (where Z = 0-1)	PVCache
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1icache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1icache.upstream[0] (where Z = 0-1)	PVBusSlave
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l2cache (where Z = 0-1)	PVCache
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l2cache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l2cache.upstream[W] (where Z = 0-1; W = 0-1)	PVBusSlave
ARMCortexA510CT_CortexA710CT.subclusterZ.sve (where Z = 0-1)	ScalableVectorExtension
ARMCortexA510CT_CortexA710CT.subcluster1	Subcluster_ARM_Cortex-A710
ARMCortexA510CT_CortexA710CT.subcluster1.cpu0	ARM_Cortex-A710

This model has the following MTI trace components:

Name	Component type
ARMCortexA510CT_CortexA710CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA710CT.AMU.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.DAP	PVBusLogger
ARMCortexA510CT_CortexA710CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.DSU	DSU-110
ARMCortexA510CT_CortexA710CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA710CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.PPU_coreZ (where Z = 0-1)	PPUv1
ARMCortexA510CT_CortexA710CT.DSU.PPU_coreZ.busslave (where Z = 0-1)	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.shared_cache	PVCache
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT_CortexA710CT.DSU.shared_cache.upstream[Z] (where Z = 0-5)	PVBusSlave
ARMCortexA510CT_CortexA710CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT_CortexA710CT.MMAP	PVBusLogger

Name	Component type
ARMCortexA510CT_CortexA710CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.RAS	PVBusLogger
ARMCortexA510CT_CortexA710CT.RAS.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.ext_bus	PVBusLogger
ARMCortexA510CT_CortexA710CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT.gic_cpuif_decoder_cluster	GlCv3CPUInterfaceDecoder
ARMCortexA510CT_CortexA710CT.subcluster0.cpu0	ARM_Cortex-A510
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.UTLB (where Z = 0-1)	TLB
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1dcache (where Z = 0-1)	PVCache
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1dcache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1dcache.upstream[0] (where Z = 0-1)	PVBusSlave
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1icache (where Z = 0-1)	PVCache
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1icache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l1icache.upstream[0] (where Z = 0-1)	PVBusSlave
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l2cache (where Z = 0-1)	PVCache
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l2cache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA510CT_CortexA710CT.subclusterZ.cpu0.l2cache.upstream[W] (where Z = 0-1; W = 0-1)	PVBusSlave
ARMCortexA510CT_CortexA710CT.subcluster1.cpu0	ARM_Cortex-A710

### Ports for ARMCortexA510CT\_CortexA710CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).

Port	Direction	Protocol	Description
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error

Port	Direction	Protocol	Description
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU Core wake request signals.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.

Port	Direction	Protocol	Description
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARMCortexA510CT\_CortexA710CT

### **AEND0\_DEFAULT**

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: uint64\_t

Default value: 0x0

### **AEND1\_DEFAULT**

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: uint64\_t

Default value: 0x0

### **AEND2\_DEFAULT**

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: uint64\_t

Default value: 0x0

### **AEND3\_DEFAULT**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: uint64\_t

Default value: 0x0

**ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

**ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

**ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

**ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

**BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

**BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: `true`

**BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: `true`

**BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: `true`

**CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the MPIDR\_EL1 register and is evaluated based on the MPIDR\_EL1 layout. If MPIDR\_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR\_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

**CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: `1`

**GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

**core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

**dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

**default\_opmode**

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

**diagnostics**

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: `false`

**enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

**has\_acp**

If true, Accelerator Coherency Port is configured.

Type: `bool`

Default value: `false`

**has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

**icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

**l3cache-has\_mpam**

L3 Cache has MPAM support.

Type: `bool`

Default value: `false`

**l3cache-hit\_latency**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-maintenance\_latency**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-size**

L3 Cache size in bytes.

Type: uint32\_t

Default value: 0x0

**l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-write\_access\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used

instead of per-byte even if l3cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-write\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: uint8\_t

Default value: 1

### **num\_acp**

Number of ACP ports.

Type: uint8\_t

Default value: 0

### **num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: uint8\_t

Default value: 1

### **periph\_address\_end**

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type: uint64\_t

Default value: 0x0

**periph\_address\_start**

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type: `uint64_t`

Default value: `0x0`

**subcluster0.CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: `uint8_t`

Default value: `1`

**subcluster0.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster0.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster0.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster0.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu0.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu1.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu1.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu10.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu10.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu10.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu10.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu10.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu10.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu10.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu10.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu10.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu10.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu10.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu10.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu10.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu10.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu10.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu10.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu10.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu2.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu2.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu2.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu2.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **subcluster0.cpu3.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **subcluster0.cpu3.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **subcluster0.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **subcluster0.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu3.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu3.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu4.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu4.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu4.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu4.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu4.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu4.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu4.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu4.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu4.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

#### **`subcluster0.cpu4.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster0.cpu4.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu4.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu6.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster0.cpu7.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster0.cpu7.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster0.cpu7.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster0.cpu7.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu7.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu7.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster0.cpu7.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu7.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu7.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu7.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu8.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **subcluster0.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **subcluster0.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **subcluster0.cpu9.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu9.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **subcluster0.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu9.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-prefetch_enabled`**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster0.dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-read_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-size`**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

### **`subcluster0.dcache-snoop_data_transfer_latency`**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-write_access_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster0.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster0.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster0.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.ete.Q_CADENCE`**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

#### **`subcluster0.ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **`subcluster0.ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: 3

#### **`subcluster0.ete.REVISION`**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

#### **`subcluster0.ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

### **subcluster0.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

### **subcluster0.ete.TRCSRSTA\_FORCED\_EXCEP**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

### **subcluster0.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

### **subcluster0.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **subcluster0.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **subcluster0.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence.  
true - Invalidate operations not required.

Type: `bool`

Default value: `true`

#### **`subcluster0.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

#### **`subcluster0.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

#### **`subcluster0.has_dot_product`**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

#### **`subcluster0.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

#### **`subcluster0.icache-hit_latency`**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.icache-maintenance_latency`**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster0.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

**subcluster0.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.max_32bit_el`**

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when `revision_number` = 0.

Type: `int8_t`

Default value: 0

#### **`subcluster0.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

#### **`subcluster0.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

#### **`subcluster0.ras_pfg_clock_mhz`**

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

#### **`subcluster0.revision_number`**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 1

#### **`subcluster0.tlb_latency`**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

#### **subcluster0.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

#### **subcluster0.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: bool

Default value: false

#### **subcluster0.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: uint8\_t

Default value: 1

#### **subcluster1.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

#### **subcluster1.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster1.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu1.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster1.cpu1.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu1.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu1.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu1.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu1.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu1.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu1.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu1.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

### **subcluster1.cpu10.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **subcluster1.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu10.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu10.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu10.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu10.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu10.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu10.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu10.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu2.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster1.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: `true`

#### **`subcluster1.cpu2.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu2.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu2.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

#### **`subcluster1.cpu2.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu2.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu3.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu4.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu4.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster1.cpu4.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster1.cpu4.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster1.cpu4.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster1.cpu4.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster1.cpu4.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster1.cpu4.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster1.cpu4.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

#### **`subcluster1.cpu4.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu4.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu4.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

### **subcluster1.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **subcluster1.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu5.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu6.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster1.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: `true`

### **`subcluster1.cpu6.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu6.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu6.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu6.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu7.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu8.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu8.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu8.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster1.cpu8.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster1.cpu8.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster1.cpu8.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster1.cpu8.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster1.cpu8.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster1.cpu8.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster1.cpu8.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu8.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu8.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu8.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu9.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**subcluster1.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster1.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-prefetch_enabled`**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster1.dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and

intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.dcache-read_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.dcache-size`**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

#### **`subcluster1.dcache-snoop_data_transfer_latency`**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.dcache-write_access_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.dcache-write_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 32

**subcluster1.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster1.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 1

**subcluster1.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: bool

Default value: false

**subcluster1.ete.RETSTACK**

Return stack depth.

Type: uint8\_t

Default value: 3

**subcluster1.ete.REVISION**

TRCIDR1 revision value.

Type: uint8\_t

Default value: 2

**subcluster1.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: uint32\_t

Default value: 0x64

**subcluster1.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: uint8\_t

Default value: 0

**subcluster1.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: bool

Default value: false

**subcluster1.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: string

Default value: `N/A`

**subcluster1.ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**subcluster1.ext\_abort\_device\_read\_is\_sync**

Synchronous reporting of device-nGnRE read external aborts.

Type: `bool`

Default value: `false`

**subcluster1.ext\_abort\_device\_write\_is\_sync**

Synchronous reporting of device-nGnRE write external aborts.

Type: `bool`

Default value: `false`

**subcluster1.ext\_abort\_so\_read\_is\_sync**

Synchronous reporting of device-nGnRnE read external aborts.

Type: `bool`

Default value: `false`

**subcluster1.ext\_abort\_so\_write\_is\_sync**

Synchronous reporting of device-nGnRnE write external aborts.

Type: `bool`

Default value: `false`

**subcluster1.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**subcluster1.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**subcluster1.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

**subcluster1.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence. `true` - Invalidate operations not required.

Type: `bool`

Default value: `true`

**subcluster1.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**subcluster1.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**subcluster1.has\_ete**

If `true`, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

**subcluster1.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

**subcluster1.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

#### **`subcluster1.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

#### **`subcluster1.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).

Type: `uint8_t`

Default value: `2`

#### **`subcluster1.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.tlb_latency`**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.tlbi_stall_enabled`**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

### **`subcluster1.treat-dcache-cmos-to-pou-as-nop`**

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

Type: `uint8_t`

Default value: 0

### **`subcluster1.walk_cache_latency`**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.46 ARMCortexA510CT\_CortexA710CT\_CortexX2CT

Defined in `LISA/ARMCortexA510CT_CortexA710CT_CortexX2CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support
CortexX2 r2p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `num_acp`
- `subcluster0.has_delayed_dbgreg`
- `subcluster0.has_delayed_sysreg`
- `subcluster1.has_delayed_dbgreg`
- `subcluster1.has_delayed_sysreg`
- `subcluster2.has_delayed_dbgreg`
- `subcluster2.has_delayed_sysreg`

## About ARMCortexA510CT\_CortexA710CT\_CortexX2CT

The number of cores in each subcluster is configurable using the following parameters:

### **subcluster0.NUM\_CORES**

Possible values are 1-10 (ARMCortexA510CT).

### **subcluster1.NUM\_CORES**

Possible values are 1-10 (ARMCortexA710CT).

### **subcluster2.NUM\_CORES**

Possible values are 1-10 (ARMCortexX2CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port\_name>[0-9] for cores in subcluster0.
- <port\_name>[10-19] for cores in subcluster1.
- <port\_name>[20-29] for cores in subcluster2.

#### Note

All instances in the Master cross trigger matrix port array, `cti[30]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu9` identify cores in subcluster0.
- `subcluster1.cpu0` to `subcluster1.cpu9` identify cores in subcluster1.
- `subcluster2.cpu0` to `subcluster2.cpu9` identify cores in subcluster2.

For information about the cores in this model, see:

- [ARMCortexA510CT](#).
- [ARMCortexA710CT](#).
- [ARMCortexX2CT](#).

## Iris and MTI instances for ARMCortexA510CT\_CortexA710CT\_CortexX2CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA510CT_CortexA710CT_CortexX2CT	<a href="#">Cluster_ARM_CortexA510_CortexA710_CortexX2_Heterogeneous</a>
ARMCortexA510CT_CortexA710CT_CortexX2CT.AMU	<a href="#">PVBUSLogger</a>
ARMCortexA510CT_CortexA710CT_CortexX2CT.AMU.mapper	<a href="#">PVBUSMapper</a>
ARMCortexA510CT_CortexA710CT_CortexX2CT.DAP	<a href="#">PVBUSLogger</a>

Name	Instance type
ARMCortexA510CT_CortexA710CT_CortexX2CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU	DSU-110
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.PPU_coreU (where $U = 0-2$ )	PPUv1
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.PPU_coreU.busslave (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.shared_cache	PVCache
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.shared_cache.upstream[U] (where $U = 0-7$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.MMAP	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX2CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX2CT.RAS	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX2CT.RAS.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX2CT.cpuU.debug_rom (where $U = 0-2$ )	debug_rom
ARMCortexA510CT_CortexA710CT_CortexX2CT.ext_bus	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX2CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX2CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA510CT_CortexA710CT_CortexX2CT.global_debug_rom	debug_rom
ARMCortexA510CT_CortexA710CT_CortexX2CT.secondary_debug_rom	debug_rom
ARMCortexA510CT_CortexA710CT_CortexX2CT.subcluster0	Subcluster_ARM_Cortex-A510
ARMCortexA510CT_CortexA710CT_CortexX2CT.subcluster0.cpu0	ARM_Cortex-A510
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.UTLB (where $U = 0-2$ )	TLB
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpuV.dtlb (where $U = 0-2$ ; $V = 0-2$ )	TLB

Name	Instance type
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1dcache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1dcache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1dcache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1icache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1icache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1icache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l2cache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l2cache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l2cache.upstream[A] (where $U = 0-2$ ; $A = 0-1$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.sve (where $U = 0-2$ )	ScalableVectorExtension
ARMCortexA510CT_CortexA710CT_CortexX2CT.subcluster1	Subcluster_ARM_Cortex-A710
ARMCortexA510CT_CortexA710CT_CortexX2CT.subcluster1.cpu0	ARM_Cortex-A710
ARMCortexA510CT_CortexA710CT_CortexX2CT.subcluster2	Subcluster_ARM_Cortex-X2
ARMCortexA510CT_CortexA710CT_CortexX2CT.subcluster2.cpu0	ARM_Cortex-X2

This model has the following MTI trace components:

Name	Component type
ARMCortexA510CT_CortexA710CT_CortexX2CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX2CT.AMU.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX2CT.DAP	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX2CT.DAP.mapper	PVBusMapper

ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1dcache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1dcache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1dcache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1icache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1icache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l1icache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l2cache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l2cache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX2CT.subclusterU.cpu0.l2cache.upstream[A] (where $U = 0-2$ ; $A = 0-1$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX2CT.subcluster1.cpu0	ARM_Cortex-A710
ARMCortexA510CT_CortexA710CT_CortexX2CT.subcluster2.cpu0	ARM_Cortex-X2

### Ports for ARMCortexA510CT\_CortexA710CT\_CortexX2CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).

Port	Direction	Protocol	Description
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmp_channel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.

Port	Direction	Protocol	Description
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsn_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgprupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU Core wake request signals.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.

Port	Direction	Protocol	Description
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARM CortexA510CT\_CortexA710CT\_CortexX2CT

### AEND0\_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: uint64\_t

Default value: 0x0

### AEND1\_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: uint64\_t

Default value: 0x0

### AEND2\_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: uint64\_t

Default value: 0x0

### **AEND3\_DEFAULT**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: uint64\_t

Default value: 0x0

### **ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: uint64\_t

Default value: 0x0

### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: uint64\_t

Default value: 0x0

### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: uint64\_t

Default value: 0x0

### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: uint64\_t

Default value: 0x0

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: bool

Default value: `true`

### **BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The `broadcastcachemaint` signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The `broadcastpersist` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the `MPIDR_EL1` register and is evaluated based on the `MPIDR_EL1` layout. If `MPIDR_EL1` supports 16-bit cluster affinity levels, bits [15:8] map to `IDRAFF3`, while bits [7:0] map to `IDRAFF2`. If `MPIDR_EL1` supports 24-bit cluster affinity levels, the bits [23:16] map to `IDRAFF3`, bits [15:8] map to `IDRAFF2`, and bits [7:0] map to `IDRAFF1`. This configuration also updates all relevant component `DEVAFF` registers and is used to set the `ManagerID64` of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain events even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

### **GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

### **core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

### **dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **default\_opmode**

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

### **diagnostics**

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: `false`

### **enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

**has\_acp**

If true, Accelerator Coherency Port is configured.

Type: `bool`

Default value: `false`

**has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

**icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

**l3cache-has\_mpam**

L3 Cache has MPAM support.

Type: `bool`

Default value: `false`

**l3cache-hit\_latency**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-maintenance\_latency**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-size**

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x0`

**l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-write_access_latency`**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-write_latency`**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`mpmm_accumulator_multiplier`**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. value of `n` means the accumulator will use (`n * accumulator value`) to calculate the mpmm threshold (MPMM). is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: `1`

### **`num_acp`**

Number of ACP ports.

Type: `uint8_t`

Default value: `0`

### **`num_nodes`**

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: `1`

**periph\_address\_end**

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type: uint64\_t

Default value: 0x0

**periph\_address\_start**

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type: uint64\_t

Default value: 0x0

**subcluster0.CPUCFR**

Value of CPU Configuration Register.

Type: uint64\_t

Default value: 0x0

**subcluster0.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: uint8\_t

Default value: 1

**subcluster0.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster0.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster0.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: `false`

**subcluster0.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu0.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **subcluster0.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu0.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

### **subcluster0.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

### **subcluster0.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu1.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

**subcluster0.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x80000

**subcluster0.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu1.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu1.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu1.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu1.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu1.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu1.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu1.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster0.cpu1.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu1.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**subcluster0.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

#### **subcluster0.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster0.cpu3.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster0.cpu3.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu3.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu3.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu4.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu4.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu4.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu4.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu4.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu4.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu4.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu4.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu4.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

#### **`subcluster0.cpu4.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster0.cpu4.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu4.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu6.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu7.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu7.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu7.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu7.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu7.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu7.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu7.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu7.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu7.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu7.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu7.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu8.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu9.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-prefetch_enabled`**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster0.dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-read_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-size`**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

### **`subcluster0.dcache-snoop_data_transfer_latency`**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-write_access_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster0.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster0.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster0.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

### **`subcluster0.ete.Q_CADENCE`**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

### **`subcluster0.ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

### **`subcluster0.ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: 3

### **`subcluster0.ete.REVISION`**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

### **`subcluster0.ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

### **`subcluster0.ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

### **`subcluster0.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

### **`subcluster0.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

### **`subcluster0.ete.TRCSRSTA_FORCED_EXCEP`**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

### **`subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

### **`subcluster0.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **`subcluster0.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **`subcluster0.has_coherent_icache`**

Whether icache invalidation to the point of unification is required for instruction to data coherence.  
true - Invalidate operations not required.

Type: `bool`

Default value: `true`

#### **`subcluster0.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

#### **`subcluster0.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

#### **`subcluster0.has_dot_product`**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

#### **`subcluster0.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

#### **`subcluster0.icache-hit_latency`**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.icache-maintenance_latency`**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster0.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

**subcluster0.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.max_32bit_el`**

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when `revision_number` = 0.

Type: `int8_t`

Default value: 0

#### **`subcluster0.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

#### **`subcluster0.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

#### **`subcluster0.ras_pfg_clock_mhz`**

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

#### **`subcluster0.revision_number`**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 1

#### **`subcluster0.tlb_latency`**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

#### **subcluster0.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

#### **subcluster0.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: bool

Default value: false

#### **subcluster0.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: uint8\_t

Default value: 1

#### **subcluster1.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

#### **subcluster1.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster1.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu1.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster1.cpu1.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu1.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu1.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu1.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu1.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu1.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu1.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu1.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster1.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: `true`

### **`subcluster1.cpu3.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu3.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu3.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu3.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu3.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu5.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu5.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu5.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu5.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu5.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu5.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster1.cpu5.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu5.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu5.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu5.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu5.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu5.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu5.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu5.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu5.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster1.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: `true`

### **`subcluster1.cpu7.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu7.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu7.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu7.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu7.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu9.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster1.cpu9.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu9.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu9.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu9.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu9.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu9.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu9.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu9.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster1.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster1.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

### **subcluster1.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be

used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.dcache-write_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.ete.CLAIMTAGS`**

Number of claim tags.

Type: `uint8_t`

Default value: 32

#### **`subcluster1.ete.MAX_INST_PER_Q`**

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

#### **`subcluster1.ete.NumberOfRSPairs`**

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

#### **`subcluster1.ete.PIDR_CM0D`**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.PIDR_REVAND`**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 1

**subcluster1.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

**subcluster1.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

**subcluster1.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

**subcluster1.ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: 3

**subcluster1.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 2

**subcluster1.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

**subcluster1.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

**subcluster1.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: bool

Default value: false

**subcluster1.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: string

Default value: N/A

**subcluster1.ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: bool

Default value: false

**subcluster1.ext\_abort\_device\_read\_is\_sync**

Synchronous reporting of device-nGnRE read external aborts.

Type: bool

Default value: false

**subcluster1.ext\_abort\_device\_write\_is\_sync**

Synchronous reporting of device-nGnRE write external aborts.

Type: bool

Default value: false

**subcluster1.ext\_abort\_so\_read\_is\_sync**

Synchronous reporting of device-nGnRnE read external aborts.

Type: bool

Default value: false

**subcluster1.ext\_abort\_so\_write\_is\_sync**

Synchronous reporting of device-nGnRnE write external aborts.

Type: bool

Default value: `false`

### **subcluster1.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

### **subcluster1.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **subcluster1.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **subcluster1.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

Type: `bool`

Default value: `true`

### **subcluster1.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

### **subcluster1.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

### **subcluster1.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

### **subcluster1.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **subcluster1.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-read_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

### **`subcluster1.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

### **`subcluster1.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).

Type: `uint8_t`

Default value: `2`

### **`subcluster1.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.tlb_latency`**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

**subcluster1.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

**subcluster1.treat-dcache-cmos-to-pou-as-nop**

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

Type: uint8\_t

Default value: 0

**subcluster1.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

**subcluster2.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: uint8\_t

Default value: 1

**subcluster2.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster2.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster2.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster2.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster2.cpu1.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster2.cpu1.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster2.cpu1.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster2.cpu1.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster2.cpu1.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu1.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu1.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster2.cpu1.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu1.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster2.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **subcluster2.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster2.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster2.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster2.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster2.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: `true`

### **`subcluster2.cpu3.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu3.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster2.cpu3.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu3.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu3.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster2.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

#### **subcluster2.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

#### **subcluster2.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

#### **subcluster2.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu5.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu5.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **subcluster2.cpu5.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **subcluster2.cpu5.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **subcluster2.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster2.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster2.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster2.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster2.cpu5.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster2.cpu5.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster2.cpu5.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster2.cpu5.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster2.cpu5.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu5.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu5.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster2.cpu5.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu5.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu5.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster2.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **subcluster2.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster2.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster2.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster2.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

#### **subcluster2.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

#### **subcluster2.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster2.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster2.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: `true`

### **`subcluster2.cpu7.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu7.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster2.cpu7.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu7.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster2.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu9.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster2.cpu9.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster2.cpu9.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster2.cpu9.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster2.cpu9.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster2.cpu9.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu9.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

### **`subcluster2.cpu9.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

### **`subcluster2.cpu9.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster2.cpu9.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu9.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster2.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster2.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.etc.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 32

**subcluster2.etc.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster2.etc.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster2.etc.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster2.etc.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster2.etc.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

### **`subcluster2.ete.Q_CADENCE`**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

### **`subcluster2.ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

### **`subcluster2.ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: 3

### **`subcluster2.ete.REVISION`**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 2

### **`subcluster2.ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

### **`subcluster2.ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

### **`subcluster2.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

### **`subcluster2.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

### **`subcluster2.ete.TRCSRSTA_FORCED_EXCEP`**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

### **`subcluster2.ext_abort_device_read_is_sync`**

Synchronous reporting of device-nGnRE read external aborts.

Type: `bool`

Default value: `false`

### **`subcluster2.ext_abort_device_write_is_sync`**

Synchronous reporting of device-nGnRE write external aborts.

Type: `bool`

Default value: `false`

### **`subcluster2.ext_abort_so_read_is_sync`**

Synchronous reporting of device-nGnRnE read external aborts.

Type: `bool`

Default value: `false`

### **`subcluster2.ext_abort_so_write_is_sync`**

Synchronous reporting of device-nGnRnE write external aborts.

Type: `bool`

Default value: `false`

**subcluster2.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**subcluster2.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**subcluster2.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

**subcluster2.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

Type: `bool`

Default value: `true`

**subcluster2.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**subcluster2.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**subcluster2.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

**subcluster2.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster2.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

### **subcluster2.memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented. 1, instructions and registers only are implemented (FEAT\_MTE). 2, implemented (FEAT\_MTE2).

Type: `uint8_t`

Default value: 2

### **subcluster2.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

### **`subcluster2.treat-dcache-cmos-to-pou-as-nop`**

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

Type: `uint8_t`

Default value: 0

### **`subcluster2.walk_cache_latency`**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.47 ARMCortexA510CT\_CortexA710CT\_CortexX3CT

Defined in `LISA/ARMCortexA510CT_CortexA710CT_CortexX3CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA710 r2p0	Full support
CortexX3 r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `num_acp`
- `subcluster0.has_delayed_dbgreg`
- `subcluster0.has_delayed_sysreg`
- `subcluster1.has_delayed_dbgreg`
- `subcluster1.has_delayed_sysreg`
- `subcluster2.has_delayed_dbgreg`
- `subcluster2.has_delayed_sysreg`

## About ARMCortexA510CT\_CortexA710CT\_CortexX3CT

The number of cores in each subcluster is configurable using the following parameters:

### **subcluster0.NUM\_CORES**

Possible values are 1-10 (ARMCortexA510CT).

### **subcluster1.NUM\_CORES**

Possible values are 1-10 (ARMCortexA710CT).

### **subcluster2.NUM\_CORES**

Possible values are 1-10 (ARMCortexX3CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port\_name>[0-9] for cores in subcluster0.
- <port\_name>[10-19] for cores in subcluster1.
- <port\_name>[20-29] for cores in subcluster2.

#### Note

All instances in the Master cross trigger matrix port array, `cti[30]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu9` identify cores in subcluster0.
- `subcluster1.cpu0` to `subcluster1.cpu9` identify cores in subcluster1.
- `subcluster2.cpu0` to `subcluster2.cpu9` identify cores in subcluster2.

For information about the cores in this model, see:

- [ARMCortexA510CT](#).
- [ARMCortexA710CT](#).
- [ARMCortexX3CT](#).

## Iris and MTI instances for ARMCortexA510CT\_CortexA710CT\_CortexX3CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA510CT_CortexA710CT_CortexX3CT	<a href="#">Cluster_ARM_CortexA510_CortexA710_CortexX3_Heterogeneous</a>
ARMCortexA510CT_CortexA710CT_CortexX3CT.AMU	<a href="#">PVBusLogger</a>
ARMCortexA510CT_CortexA710CT_CortexX3CT.AMU.mapper	<a href="#">PVBusMapper</a>
ARMCortexA510CT_CortexA710CT_CortexX3CT.DAP	<a href="#">PVBusLogger</a>

Name	Instance type
ARMCortexA510CT_CortexA710CT_CortexX3CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU	DSU-110
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.PPU_coreU (where $U = 0-2$ )	PPUv1
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.PPU_coreU.busslave (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.shared_cache	PVCache
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.shared_cache.upstream[U] (where $U = 0-7$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.MMAP	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX3CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.RAS	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX3CT.RAS.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.cpuU.debug_rom (where $U = 0-2$ )	debug_rom
ARMCortexA510CT_CortexA710CT_CortexX3CT.ext_bus	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX3CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA510CT_CortexA710CT_CortexX3CT.global_debug_rom	debug_rom
ARMCortexA510CT_CortexA710CT_CortexX3CT.secondary_debug_rom	debug_rom
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster0	Subcluster_ARM_Cortex-A510
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster0.cpu0	ARM_Cortex-A510
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.UTLB (where $U = 0-2$ )	TLB
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpuV.dtlb (where $U = 0-2$ ; $V = 0-2$ )	TLB

Name	Instance type
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1dcache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1dcache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1dcache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1icache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1icache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1icache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l2cache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l2cache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l2cache.upstream[A] (where $U = 0-2$ ; $A = 0-1$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.sve (where $U = 0-2$ )	ScalableVectorExtension
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster1	Subcluster_ARM_Cortex-A710
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster1.cpu0	ARM_Cortex-A710
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster2	Subcluster_ARM_Cortex-X3
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster2.cpu0	ARM_Cortex-X3

This model has the following MTI trace components:

Name	Component type
ARMCortexA510CT_CortexA710CT_CortexX3CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX3CT.AMU.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.DAP	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX3CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU	DSU-110
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.PPU_coreU (where $U = 0-2$ )	PPUv1

Name	Component type
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.PPU_coreU.busslave (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.shared_cache	PVCache
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.shared_cache.upstream[U] (where $U = 0-7$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.MMAP	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX3CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.RAS	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX3CT.RAS.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.ext_bus	PVBusLogger
ARMCortexA510CT_CortexA710CT_CortexX3CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT_CortexA710CT_CortexX3CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster0.cpu0	ARM_Cortex-A510
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.UTLB (where $U = 0-2$ )	TLB
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1dcache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1dcache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1dcache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1icache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1icache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l1icache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l2cache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l2cache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA710CT_CortexX3CT.subclusterU.cpu0.l2cache.upstream[A] (where $U = 0-2$ ; $A = 0-1$ )	PVBusSlave
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster1.cpu0	ARM_Cortex-A710
ARMCortexA510CT_CortexA710CT_CortexX3CT.subcluster2.cpu0	ARM_Cortex-X3

### Ports for ARMCortexA510CT\_CortexA710CT\_CortexX3CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).

Port	Direction	Protocol	Description
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsmp_channel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.

Port	Direction	Protocol	Description
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsn_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgprupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPUs that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU Core wake request signals.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.

Port	Direction	Protocol	Description
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARMCortexA510CT\_CortexA710CT\_CortexX3CT

### AEND0\_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: uint64\_t

Default value: 0x0

### AEND1\_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: uint64\_t

Default value: 0x0

### AEND2\_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

### **AEND3\_DEFAULT**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The `broadcastcachemaint` signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The `broadcastpersist` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the `MPIDR_EL1` register and is evaluated based on the `MPIDR_EL1` layout. If `MPIDR_EL1` supports 16-bit cluster affinity levels, bits [15:8] map to `IDRAFF3`, while bits [7:0] map to `IDRAFF2`. If `MPIDR_EL1` supports 24-bit cluster affinity levels, the bits [23:16] map to `IDRAFF3`, bits [15:8] map to `IDRAFF2`, and bits [7:0] map to `IDRAFF1`. This configuration also updates all relevant component `DEVAFF` registers and is used to set the `ManagerID64` of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

### **GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

### **core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

### **dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **default\_opmode**

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

### **diagnostics**

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: `false`

### **enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

### **has\_acp**

If true, Accelerator Coherency Port is configured.

Type: `bool`

Default value: `false`

### **has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

### **icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **l3cache-has\_mpam**

L3 Cache has MPAM support.

Type: `bool`

Default value: `false`

### **l3cache-hit\_latency**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-maintenance\_latency**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-size**

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x0`

**l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-write_access_latency`**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-write_latency`**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`mpmm_accumulator_multiplier`**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of `n` means the accumulator will use (`n * accumulator value`) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: `1`

### **`num_acp`**

Number of ACP ports.

Type: `uint8_t`

Default value: `0`

### **`num_nodes`**

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: `1`

**periph\_address\_end**

End address for peripheral port address range exclusive(corresponds to AENDMP input signal).

Type: uint64\_t

Default value: 0x0

**periph\_address\_start**

Start address for peripheral port address range inclusive(corresponds to ASTARTMP input signal).

Type: uint64\_t

Default value: 0x0

**subcluster0.CPUCFR**

Value of CPU Configuration Register.

Type: uint64\_t

Default value: 0x0

**subcluster0.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: uint8\_t

Default value: 1

**subcluster0.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster0.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster0.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: `false`

#### **`subcluster0.cpu0.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu0.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu0.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu0.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu0.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu0.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **subcluster0.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu0.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

### **subcluster0.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

### **subcluster0.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu1.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

**subcluster0.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x80000

**subcluster0.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu1.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu1.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu1.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu1.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu1.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu1.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu1.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster0.cpu1.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu1.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**subcluster0.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

### **subcluster0.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **subcluster0.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **subcluster0.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster0.cpu3.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster0.cpu3.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu3.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu3.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu4.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu4.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu4.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu4.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu4.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu4.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu4.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu4.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

#### **`subcluster0.cpu4.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster0.cpu4.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu4.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **subcluster0.cpu6.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **subcluster0.cpu6.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **subcluster0.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **subcluster0.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster0.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster0.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu6.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster0.cpu7.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster0.cpu7.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster0.cpu7.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster0.cpu7.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu7.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu7.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster0.cpu7.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu7.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu7.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu7.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu8.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **subcluster0.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **subcluster0.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **subcluster0.cpu9.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu9.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **subcluster0.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu9.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-prefetch_enabled`**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster0.dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-read_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-size`**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

### **`subcluster0.dcache-snoop_data_transfer_latency`**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-write_access_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster0.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster0.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster0.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.ete.Q_CADENCE`**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

#### **`subcluster0.ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **`subcluster0.ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: 3

#### **`subcluster0.ete.REVISION`**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

#### **`subcluster0.ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

### **`subcluster0.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

### **`subcluster0.ete.TRCSRSTA_FORCED_EXCEP`**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

### **`subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

### **`subcluster0.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **`subcluster0.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **`subcluster0.has_coherent_icache`**

Whether icache invalidation to the point of unification is required for instruction to data coherence.  
true - Invalidate operations not required.

Type: `bool`

Default value: `true`

#### **`subcluster0.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

#### **`subcluster0.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

#### **`subcluster0.has_dot_product`**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

#### **`subcluster0.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

#### **`subcluster0.icache-hit_latency`**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.icache-maintenance_latency`**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster0.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

**subcluster0.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

### **subcluster0.max\_32bit\_el**

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: EL0 supports A32. This parameter is ignored in Rev0 i.e. when `revision_number` = 0.

Type: `int8_t`

Default value: 0

### **subcluster0.memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

### **subcluster0.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **subcluster0.ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

### **subcluster0.revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 1

### **subcluster0.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

#### **subcluster0.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

#### **subcluster0.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: bool

Default value: false

#### **subcluster0.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: uint8\_t

Default value: 1

#### **subcluster1.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

#### **subcluster1.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster1.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu1.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster1.cpu1.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster1.cpu1.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster1.cpu1.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster1.cpu1.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster1.cpu1.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster1.cpu1.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster1.cpu1.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu1.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu1.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster1.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: `true`

### **`subcluster1.cpu3.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu3.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu3.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu3.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu3.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu5.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu5.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster1.cpu5.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu5.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu5.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu5.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu5.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu5.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu5.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu5.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu5.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster1.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: `true`

#### **`subcluster1.cpu7.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu7.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu7.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

#### **`subcluster1.cpu7.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu7.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu9.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster1.cpu9.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu9.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu9.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu9.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu9.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu9.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu9.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu9.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster1.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster1.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

### **subcluster1.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be

used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.dcache-write_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.ete.CLAIMTAGS`**

Number of claim tags.

Type: `uint8_t`

Default value: 32

#### **`subcluster1.ete.MAX_INST_PER_Q`**

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

#### **`subcluster1.ete.NumberOfRSPairs`**

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

#### **`subcluster1.ete.PIDR_CM0D`**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.PIDR_REVAND`**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 1

**subcluster1.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

**subcluster1.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

**subcluster1.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

**subcluster1.ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: 3

**subcluster1.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 2

**subcluster1.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

**subcluster1.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

**subcluster1.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: bool

Default value: false

**subcluster1.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: string

Default value: N/A

**subcluster1.ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: bool

Default value: false

**subcluster1.ext\_abort\_device\_read\_is\_sync**

Synchronous reporting of device-nGnRE read external aborts.

Type: bool

Default value: false

**subcluster1.ext\_abort\_device\_write\_is\_sync**

Synchronous reporting of device-nGnRE write external aborts.

Type: bool

Default value: false

**subcluster1.ext\_abort\_so\_read\_is\_sync**

Synchronous reporting of device-nGnRnE read external aborts.

Type: bool

Default value: false

**subcluster1.ext\_abort\_so\_write\_is\_sync**

Synchronous reporting of device-nGnRnE write external aborts.

Type: bool

Default value: `false`

#### **subcluster1.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

#### **subcluster1.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

#### **subcluster1.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

#### **subcluster1.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence.  
true - Invalidate operations not required.

Type: `bool`

Default value: `true`

#### **subcluster1.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

#### **subcluster1.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

### **`subcluster1.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

### **`subcluster1.icache-hit_latency`**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-maintenance_latency`**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-miss_latency`**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-prefetch_enabled`**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster1.icache-read_access_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-read_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

### **`subcluster1.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

### **`subcluster1.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).

Type: `uint8_t`

Default value: `2`

### **`subcluster1.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.tlb_latency`**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

**subcluster1.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

**subcluster1.treat-dcache-cmos-to-pou-as-nop**

Whether dcache invalidation to the point of unification is required for instruction to data coherence. 0 - Invalidate ops required, 1 - Invalidate ops not required and cannot generate faults, 2 - Invalidate ops not required but can generate faults.

Type: uint8\_t

Default value: 0

**subcluster1.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

**subcluster2.CPUCFR**

Value of CPU Configuration Register.

Type: uint64\_t

Default value: 0x0

**subcluster2.NUM\_CORES**

Number of cores per cluster.

Type: uint8\_t

Default value: 1

**subcluster2.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**subcluster2.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster2.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu0.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu0.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster2.cpu0.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu0.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu0.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu0.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu0.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

#### **`subcluster2.cpu0.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

**`subcluster2.cpu0.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**`subcluster2.cpu0.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**`subcluster2.cpu0.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**`subcluster2.cpu0.semihosting-T32_HLT`**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster2.cpu0.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster2.cpu0.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster2.cpu0.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

### **`subcluster2.cpu0.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu0.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu0.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster2.cpu0.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu0.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu1.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu1.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster2.cpu1.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu1.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu1.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu1.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

#### **subcluster2.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

#### **subcluster2.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

#### **subcluster2.cpu1.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

#### **subcluster2.cpu2.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

#### **subcluster2.cpu2.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

#### **subcluster2.cpu2.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster2.cpu2.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu2.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster2.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu2.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu2.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster2.cpu2.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster2.cpu2.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu2.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu2.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster2.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu3.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu3.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu3.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu3.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

### **`subcluster2.cpu3.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster2.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster2.cpu4.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu4.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu4.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu4.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

#### **subcluster2.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

#### **subcluster2.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster2.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu5.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu5.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu5.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu5.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu5.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu5.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu5.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster2.cpu5.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu5.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu5.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu5.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster2.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster2.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster2.cpu6.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster2.cpu6.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster2.cpu6.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster2.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu6.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster2.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu6.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu6.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster2.cpu6.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster2.cpu6.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu6.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu6.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster2.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu6.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu6.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu7.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu7.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu7.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu7.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu7.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

### **`subcluster2.cpu7.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster2.cpu8.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu8.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu8.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu8.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu8.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu8.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x100000

**subcluster2.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster2.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster2.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu9.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu9.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu9.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu9.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu9.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster2.cpu9.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu9.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu9.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu9.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

#### **subcluster2.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

#### **subcluster2.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

#### **subcluster2.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

#### **subcluster2.dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster2.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

### **subcluster2.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be

used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster2.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster2.error\_record\_feature\_register**

RAS feature register values. An array of JSON objects. The JSON schema for the array is: `[{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values]`. Where ED,UI,FI,CE and UE have valid values between `0x0 - 0x3`. CFI and DUI have valid values `0x0, 0x2` and `0x3`. CEC has valid values `0x0,0x2` or `0x4`. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values `0x0` or `0x1`. CI and TS has valid values of `0x0, 0x1` and `0x2`. Visibility has valid values "Core" or "Cluster".

Type: `string`

Default value: `"[{\"ED\":0x2,\"IMPDEF_3_2\":0x0,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0,\"Visibility\":\"Cluster\"},{\"ED\":0x2,\"IMPDEF_3_2\":0x0,\"UI\":0x2,\"FI\":0x2,\"UE\":0x1,\"CFI\":0x2,\"CEC\":0x2,\"RP\":0x1,\"DUI\":0x0,\"CEO\":0x0,\"INJ\":0x1,\"CI\":0x0,\"TS\":0x0}]]"`

### **subcluster2.ete.CLAIMTAGS**

Number of claim tags.

Type: `uint8_t`

Default value: `32`

### **subcluster2.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

**subcluster2.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: `uint8_t`

Default value: 8

**subcluster2.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

**subcluster2.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

**subcluster2.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

**subcluster2.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

**subcluster2.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

**subcluster2.ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: 3

**subcluster2.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

**subcluster2.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

**subcluster2.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

**subcluster2.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**subcluster2.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: N/A

**subcluster2.ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**subcluster2.ext\_abort\_normal\_noncacheable\_read\_is\_sync**

Synchronous reporting of normal noncacheable-read external aborts.

Type: `bool`

Default value: `true`

**subcluster2.ext\_abort\_so\_write\_ras\_type**

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO , 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

**subcluster2.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**subcluster2.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**subcluster2.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: 0

**subcluster2.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

Type: `bool`

Default value: `true`

**subcluster2.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster2.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster2.has_enhanced_pan`**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **`subcluster2.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

### **`subcluster2.has_large_va`**

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT\_LVA). values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

### **`subcluster2.icache-hit_latency`**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **`subcluster2.icache-maintenance_latency`**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster2.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.icache-size**

L1 I-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

### **subcluster2.instruction\_tlb\_size**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: uint32\_t

Default value: 0x0

### **subcluster2.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: uint8\_t

Default value: 0

### **subcluster2.memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: uint8\_t

Default value: 3

### **subcluster2.pmu-num\_counters**

Number of PMU counters implemented.

Type: uint8\_t

Default value: 6

### **subcluster2.pseudo\_fault\_generation\_feature\_register**

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other\_psuedo-fault\_generating\_features\_register\_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT\_SUPPORTED) and true(FEATURE\_CONTROLLABLE), where CE can have 0(NOT\_SUPPORTED), 1(NONSPECIFIC\_CE\_SUPPORTED) and 3(TRANSIENT\_OR\_PERSISTENT\_CE\_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has\_ras\_fault\_injection is true.

Type: string

Default value: "[{"OF":true, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1, "CE":0x1, "CI":true, "ER":false, "PN":true, "AV":false, "MV":true, "SYN":true, "R":true}, {"OF":false, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1, "CE":0x1, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":true}]"

**subcluster2.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.stage12\_tlb\_size**

Number of stage1+2 tlb entries. Valid values are 0 or  $\geq 4$ .

Type: `uint32_t`

Default value: `0x80`

**subcluster2.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

**subcluster2.trace\_physical\_registers\_when\_host\_virtualisation\_enabled**

Trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR\_EL1 as ELR/SPSR\_EL2, 2=Trace all redirected registers as physical registers affecting all features inc. the host virtualised registers).

Type: `uint8_t`

Default value: `1`

**subcluster2.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

**subcluster2.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

## 3.48 ARMCortexA510CT\_CortexA715CT\_CortexX3CT

Defined in LISA/ARMCortexA510CT\_CortexA715CT\_CortexX3CT.lisa.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA510 r0p0	Full support
CortexA510 r1p3	Full support
CortexA715 r1p2	Full support
CortexX3 r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- num\_acp
- subcluster0.has\_delayed\_dbgreg
- subcluster0.has\_delayed\_sysreg

- subcluster2.has\_delayed\_sysreg

### About ARMCortexA510CT\_CortexA715CT\_CortexX3CT

The number of cores in each subcluster is configurable using the following parameters:

**subcluster0.NUM\_CORES**

Possible values are 1-10 (ARMCortexA510CT).

**subcluster1.NUM\_CORES**

Possible values are 1-10 (ARMCortexA715CT).

**subcluster2.NUM\_CORES**

Possible values are 1-10 (ARMCortexX3CT).

The total number of cores in the cluster cannot exceed 12.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-9]` for cores in `subcluster0`.
- `<port_name>[10-19]` for cores in `subcluster1`.
- `<port_name>[20-29]` for cores in `subcluster2`.

Note

All instances in the Master cross trigger matrix port array, `cti[30]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu9` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu9` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu9` identify cores in `subcluster2`.

For information about the cores in this model, see:

- [ARMCortexA510CT](#).
- [ARMCortexA715CT](#).
- [ARMCortexX3CT](#).

## Iris and MTI instances for ARMCortexA510CT\_CortexA715CT\_CortexX3CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA510CT_CortexA715CT_CortexX3CT	Cluster_ARM_CortexA510_CortexA715_CortexX3_Heterogeneous
ARMCortexA510CT_CortexA715CT_CortexX3CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.AMU.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.DAP	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU	DSU-110
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_coreU (where $U = 0-2$ )	PPUv1
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_coreU.busslave (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.l3_flusher	AsyncCacheFlushUnit

Name	Instance type
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.shared_cache	PVCache
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.shared_cache.upstream[U] (where $U = 0-7$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.MMAP	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.RAS	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.RAS.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.cpuU.debug_rom (where $U = 0-2$ )	debug_rom
ARMCortexA510CT_CortexA715CT_CortexX3CT.ext_bus	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.gic_cpuif_decoder_cluster	GLCv3CPUInterfaceDecoder
ARMCortexA510CT_CortexA715CT_CortexX3CT.global_debug_rom	debug_rom
ARMCortexA510CT_CortexA715CT_CortexX3CT.secondary_debug_rom	debug_rom
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster0	Subcluster_ARM_Cortex-A510
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster0.cpu0	ARM_Cortex-A510
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.UTLB (where $U = 0-2$ )	TLB
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpuV.dtlb (where $U = 0-2$ ; $V = 0-2$ )	TLB
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1dcache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1dcache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1dcache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1licache (where $U = 0-2$ )	PVCache

Name	Instance type
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1icache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1icache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l2cache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l2cache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l2cache.upstream[A] (where $U = 0-2$ ; $A = 0-1$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.sve (where $U = 0-2$ )	ScalableVectorExtension
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster1	Subcluster_ARM_Cortex-A715
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster1.cpu0	ARM_Cortex-A715
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster2	Subcluster_ARM_Cortex-X3
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster2.cpu0	ARM_Cortex-X3

This model has the following MTI trace components:

Name	Component type
ARMCortexA510CT_CortexA715CT_CortexX3CT.AMU	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.AMU.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.DAP	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.DAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU	DSU-110
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_cluster	PPUv1
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_coreU (where $U = 0-2$ )	PPUv1
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.PPU_coreU.busslave (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.shared_cache	PVCache
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.shared_cache.upstream[U] (where $U = 0-7$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.DSU.utility_slave[0]	PVBusSlave

Name	Component type
ARMCortexA510CT_CortexA715CT_CortexX3CT.MMAP	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.MMAP.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.RAS	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.RAS.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.ext_bus	PVBusLogger
ARMCortexA510CT_CortexA715CT_CortexX3CT.ext_bus.mapper	PVBusMapper
ARMCortexA510CT_CortexA715CT_CortexX3CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster0.cpu0	ARM_Cortex-A510
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.UTLB (where $U = 0-2$ )	TLB
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1dcache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1dcache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1dcache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1icache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1icache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l1icache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l2cache (where $U = 0-2$ )	PVCache
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l2cache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA510CT_CortexA715CT_CortexX3CT.subclusterU.cpu0.l2cache.upstream[A] (where $U = 0-2$ ; $A = 0-1$ )	PVBusSlave
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster1.cpu0	ARM_Cortex-A715
ARMCortexA510CT_CortexA715CT_CortexX3CT.subcluster2.cpu0	ARM_Cortex-X3

### Ports for ARMCortexA510CT\_CortexA715CT\_CortexX3CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).

Port	Direction	Protocol	Description
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.

Port	Direction	Protocol	Description
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgppwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU Core wake request signals.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.

Port	Direction	Protocol	Description
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARM CortexA510CT\_CortexA715CT\_CortexX3CT

### AEND0\_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: uint64\_t

Default value: 0x0

### AEND1\_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: uint64\_t

Default value: 0x0

### AEND2\_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: uint64\_t

Default value: 0x0

### AEND3\_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: uint64\_t

Default value: 0x0

#### **ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: 0x0

#### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: 0x0

#### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: 0x0

#### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: 0x0

#### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

#### **BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The `broadcastpersist` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the MPIDR\_EL1 register and is evaluated based on the MPIDR\_EL1 layout. If MPIDR\_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR\_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: `1`

### **GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

### **bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

### **core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

### **dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **default\_opmode**

Operating mode of DynamIQ coming out of reset. 0: SFONLY ON, 1: 1/4 CACHE ON, 2: 1/2 CACHE ON, 3: 3/4 CACHE ON, 4: FULL CACHE ON.

Type: `uint8_t`

Default value: 4

### **diagnostics**

Enable DynamIQ diagnostic messages.

Type: `bool`

Default value: `false`

### **enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

### **has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

### **icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **l3cache-has\_mpam**

L3 Cache has MPAM support.

Type: `bool`

Default value: `false`

### **l3cache-hit\_latency**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-maintenance\_latency**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-size**

L3 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-ways**

L3 Cache number of ways (sets are implicit from size).

Type: uint16\_t

Default value: 16

### **l3cache-write\_access\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-write\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: uint8\_t

Default value: 1

### **num\_acp**

Number of ACP ports.

Type: uint8\_t

Default value: 0

### **num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: uint8\_t

Default value: 1

### **subcluster0.CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.NUM_CORES`**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 12.

Type: `uint8_t`

Default value: `1`

### **`subcluster0.cpi_div`**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

### **`subcluster0.cpi_mul`**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

### **`subcluster0.cpu0.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**subcluster0.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster0.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: `8`

**subcluster0.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**`subcluster0.cpu0.semihosting-T32_HLT`**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**`subcluster0.cpu0.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**`subcluster0.cpu0.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**`subcluster0.cpu0.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**`subcluster0.cpu0.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu0.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu0.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf0000000`

### **`subcluster0.cpu0.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x100000000`

### **`subcluster0.cpu0.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf0000000`

### **`subcluster0.cpu0.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu0.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu1.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster0.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **subcluster0.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu1.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

### **subcluster0.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

### **subcluster0.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu2.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

**subcluster0.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x80000

**subcluster0.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu2.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu2.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu2.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu2.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu2.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu2.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu2.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu2.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: 0x0

### **subcluster0.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

### **subcluster0.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu3.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

### **subcluster0.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **subcluster0.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **subcluster0.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster0.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster0.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu4.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu5.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster0.cpu5.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster0.cpu5.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster0.cpu5.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster0.cpu5.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu5.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu5.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster0.cpu5.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu5.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu5.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu5.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu6.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu6.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **subcluster0.cpu7.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **subcluster0.cpu7.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **subcluster0.cpu7.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu7.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **subcluster0.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu8.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu8.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu8.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu8.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu8.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu8.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu8.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu8.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu8.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu8.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu8.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu8.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu8.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu9.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster0.cpu9.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

#### **subcluster0.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-prefetch_enabled`**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster0.dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x10000`

**subcluster0.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.etc.CLAIMTAGS**

Number of claim tags.

Type: `uint8_t`

Default value: 4

**subcluster0.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster0.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster0.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: uint16\_t

Default value: 0x1

**subcluster0.ete.RES0\_STATEFUL**

Whether RES0 bits are stateful or RAZ/WI.

Type: bool

Default value: `false`

**subcluster0.ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: 3

**subcluster0.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

**subcluster0.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

**subcluster0.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

**subcluster0.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**subcluster0.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

**subcluster0.ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

### **subcluster0.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

### **subcluster0.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **subcluster0.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **subcluster0.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence.  
true - Invalidate operations not required.

Type: `bool`

Default value: `true`

### **subcluster0.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

### **subcluster0.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **subcluster0.has\_dot\_product**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **subcluster0.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

### **subcluster0.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster0.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster0.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster0.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster0.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.icache-size**

L1 I-Cache size in bytes.

Type: uint32\_t

Default value: 0x10000

**subcluster0.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: uint8\_t

Default value: 0

**subcluster0.max\_32bit\_el**

Maximum exception level supporting AArch32 modes. -1: No Support for A32 at any EL, 0: ELO supports A32. This parameter is ignored in Rev0 i.e. when revision\_number = 0.

Type: int8\_t

Default value: 0

**subcluster0.memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

**subcluster0.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

**subcluster0.ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

**subcluster0.revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 1

**subcluster0.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

**subcluster0.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

**subcluster0.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

**subcluster0.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.NUM\_CORES**

Number of cores per cluster.

Type: `uint8_t`

Default value: `1`

**subcluster1.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster1.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster1.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu0.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu1.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu1.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu2.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu2.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu2.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu2.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu2.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu2.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu2.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu3.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu3.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu3.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu3.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu3.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu4.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu4.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x80000

**subcluster1.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster1.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu6.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu6.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu6.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu6.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu6.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster1.cpu7.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu7.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu7.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu7.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu7.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu7.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu7.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu7.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu7.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu7.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu8.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu9.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu9.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster1.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster1.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

**subcluster1.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.error\_record\_feature\_register**

RAS feature register values. An array of JSON objects. The JSON schema for the array is:

```
[{"ED":0x0, "IMPDEF_3_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other_feature_register_values].
```

Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

Type: string

Default value: "[{"ED":0x2, "IMPDEF\_3\_2":0x1, "UI":0x2, "FI":0x2, "UE":0x1, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x0, "INJ":0x1, "CI":0x2, "TS":0x0, "Visibility":"Cluster"}, {"ED":0x2, "UI":0x2, "FI":0x2, "UE":0x1, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x0, "INJ":0x1, "CI":0x0, "TS":0x0}]",

**subcluster1.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster1.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster1.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: bool

Default value: false

**subcluster1.ete.RETSTACK**

Return stack depth.

Type: uint8\_t

Default value: 3

**subcluster1.ete.REVISION**

TRCIDR1 revision value.

Type: uint8\_t

Default value: 1

**subcluster1.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

**subcluster1.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: `0`

**subcluster1.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**subcluster1.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

**subcluster1.ete.TRCSRSTA\_FORCED\_EXCEP**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**subcluster1.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**subcluster1.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**subcluster1.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

**subcluster1.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence. `true` - Invalidate operations not required.

Type: `bool`

Default value: `true`

**subcluster1.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**subcluster1.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**subcluster1.has\_enhanced\_pan**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: `2`

**subcluster1.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

**subcluster1.has\_large\_va**

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT\_LVA). values of this parameter are: - 0, feature is not enabled. - 1, feature is implemented if ARMv8.2 is enabled. - 2, feature is implemented.

Type: `uint8_t`

Default value: 0

**subcluster1.has\_statistical\_profiling**

Whether Statistical Based Profiling is implemented (FEAT\_SPE).

Type: `bool`

Default value: `false`

**subcluster1.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

**subcluster1.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.icache-size**

L1 I-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

**subcluster1.instruction\_tlb\_size**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: uint32\_t

Default value: 0x0

**subcluster1.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: uint8\_t

Default value: 0

### **subcluster1.memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: uint8\_t

Default value: 3

### **subcluster1.pmu-num\_counters**

Number of PMU counters implemented.

Type: uint8\_t

Default value: 6

### **subcluster1.pseudo\_fault\_generation\_feature\_register**

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: [{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false, "CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other\_psuedo-fault\_generating\_features\_register\_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT\_SUPPORTED) and true(FEATURE\_CONTROLLABLE), where CE can have 0(NOT\_SUPPORTED), 1(NONSPECIFIC\_CE\_SUPPORTED) and 3(TRANSIENT\_OR\_PERSISTENT\_CE\_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has\_ras\_fault\_injection is true.

Type: string

Default value: "[{"OF":true, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1, "CE":0x1, "CI":true, "ER":false, "PN":true, "AV":false, "MV":true, "SYN":true, "R":true}, {"OF":false, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1, "CE":0x1, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":true}]"

### **subcluster1.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

### **subcluster1.stage12\_tlb\_size**

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: uint32\_t

Default value: 0x80

### **subcluster1.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

### **subcluster1.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

### **subcluster1.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: bool

Default value: false

### **subcluster1.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

### **subcluster2.CPUCFR**

Value of CPU Configuration Register.

Type: uint64\_t

Default value: 0x0

### **subcluster2.NUM\_CORES**

Number of cores per cluster.

Type: uint8\_t

Default value: 1

**subcluster2.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster2.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster2.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu0.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu0.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu0.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

### **`subcluster2.cpu0.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster2.cpu0.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster2.cpu0.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu0.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu0.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

### **`subcluster2.cpu0.semihosting-T32_HLT`**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

### **`subcluster2.cpu0.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

### **`subcluster2.cpu0.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**`subcluster2.cpu0.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**`subcluster2.cpu0.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster2.cpu0.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster2.cpu0.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster2.cpu0.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**`subcluster2.cpu0.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster2.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster2.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster2.cpu1.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster2.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster2.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu1.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster2.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu1.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster2.cpu1.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster2.cpu1.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu1.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu1.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu1.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu2.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu2.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu2.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu2.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu2.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu2.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu2.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu2.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu2.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

### **`subcluster2.cpu2.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster2.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster2.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

#### **subcluster2.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

#### **subcluster2.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster2.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster2.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu4.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu4.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu4.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu4.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu4.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu4.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu4.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu4.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster2.cpu4.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu4.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu4.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu4.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

#### **subcluster2.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

#### **subcluster2.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

#### **subcluster2.cpu4.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

#### **subcluster2.cpu5.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

#### **subcluster2.cpu5.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

#### **subcluster2.cpu5.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster2.cpu5.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu5.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster2.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster2.cpu5.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster2.cpu5.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu5.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu5.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster2.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu6.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu6.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu6.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu6.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu6.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu6.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu6.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu6.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

### **`subcluster2.cpu6.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu6.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster2.cpu6.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster2.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x100000

**subcluster2.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster2.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster2.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu8.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu8.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu8.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu8.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu8.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu8.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster2.cpu8.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu8.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu8.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu8.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

#### **subcluster2.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

#### **subcluster2.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

#### **subcluster2.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

#### **subcluster2.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

#### **subcluster2.cpu9.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

#### **subcluster2.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster2.cpu9.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu9.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster2.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster2.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu9.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster2.cpu9.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster2.cpu9.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu9.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu9.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: bool

Default value: false

**subcluster2.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

### **subcluster2.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.error\_record\_feature\_register**

RAS feature register values. An array of JSON objects. The JSON schema for the array is: [{"ED":0x0, "IMPDEF\_3\_2":0x0, "UI":0x0, "FI":0x0, "UE":0x0, "CFI":0x0, "CEC":0x0, "RP":0x0, "DUI":0x0, "CEO":0x0, "CI":0x0, "TS":0x0, "INJ":0x0, "FRX":0x0, "UC":0x0, "UEU":0x0, "UER":0x0, "UEO":0x0, "DE":0x0, "CE":0x0, "Visibility":"Core"},other\_feature\_register\_values]. Where ED,UI,FI,CE and UE have valid values between 0x0 - 0x3. CFI and DUI have valid values 0x0, 0x2 and 0x3. CEC has valid values 0x0,0x2 or 0x4. RP,CEO,INJ,FRX,UC,UEU,UER,UEO,DE has valid values 0x0 or 0x1. CI and TS has valid values of 0x0, 0x1 and 0x2. Visibility has valid values "Core" or "Cluster".

Type: string

Default value: "[{"ED":0x2, "IMPDEF\_3\_2":0x0, "UI":0x2, "FI":0x2, "UE":0x1, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x0, "INJ":0x1, "CI":0x0, "TS":0x0, "Visibility":"Cluster"}, {"ED":0x2, "IMPDEF\_3\_2":0x0, "UI":0x2, "FI":0x2, "UE":0x1, "CFI":0x2, "CEC":0x2, "RP":0x1, "DUI":0x0, "CEO":0x0, "INJ":0x1, "CI":0x0, "TS":0x0}]",

**subcluster2.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 32

**subcluster2.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster2.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster2.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster2.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster2.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**subcluster2.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: uint16\_t

Default value: 0x1

**subcluster2.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

**subcluster2.ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: `3`

**subcluster2.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: `0`

**subcluster2.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

**subcluster2.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: `0`

**subcluster2.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**subcluster2.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

**subcluster2.ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**subcluster2.ext\_abort\_normal\_noncacheable\_read\_is\_sync**

Synchronous reporting of normal noncacheable-read external aborts.

Type: `bool`

Default value: `true`

**subcluster2.ext\_abort\_so\_write\_ras\_type**

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

**subcluster2.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**subcluster2.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**subcluster2.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: 0

**subcluster2.has\_coherent\_icache**

Whether icache invalidation to the point of unification is required for instruction to data coherence.  
true - Invalidate operations not required.

Type: `bool`

Default value: `true`

**subcluster2.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**subcluster2.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**subcluster2.has\_enhanced\_pan**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

**subcluster2.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

**subcluster2.has\_large\_va**

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT\_LVA). values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

**subcluster2.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

**subcluster2.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

#### **`subcluster2.instruction_tlb_size`**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

#### **`subcluster2.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

#### **`subcluster2.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: `3`

#### **`subcluster2.pmu-num_counters`**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: `6`

#### **`subcluster2.pseudo_fault_generation_feature_register`**

ARMv8.4 Standard Pseudo-fault generation feature register values. JSON schema for the parameter value is: `[{"OF":false, "UC":false, "UEU":false, "UER":false, "UEO":false, "DE":false,`

"CE":0x0, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":false, "NA":false}, other\_psuedo-fault\_generating\_features\_register\_values]. Where OF, UC, UEU, UER, UEO, DE, CI, ER, PN, AV, MV, SYN, and R have valid false(NOT\_SUPPORTED) and true(FEATURE\_CONTROLLABLE), where CE can have 0(NOT\_SUPPORTED), 1(NONSPECIFIC\_CE\_SUPPORTED) and 3(TRANSIENT\_OR\_PERSISTENT\_CE\_SUPPORTED) and NA can have false(component fakes detection on next access) or true(component fakes detection spontaneously). Effective only when ERXFR's INJ field allows it or has\_ras\_fault\_injection is true.

Type: string

Default value: "[{"OF":true, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1, "CE":0x1, "CI":true, "ER":false, "PN":true, "AV":false, "MV":true, "SYN":true, "R":true}, {"OF":false, "UC":true, "UEU":false, "UER":false, "UEO":false, "DE":0x1, "CE":0x1, "CI":false, "ER":false, "PN":false, "AV":false, "MV":false, "SYN":false, "R":true}]"

### **subcluster2.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

### **subcluster2.stage12\_tlb\_size**

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: uint32\_t

Default value: 0x80

### **subcluster2.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

### **subcluster2.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

**subcluster2.trace\_physical\_registers\_when\_host\_virtualisation\_enabled**

Trace sysreg accesses to physical register accessed (0=disabled, 1=Trace only ELR/SPSR\_EL1 as ELR/SPSR\_EL2, 2=Trace all redirected registers as physical registers affecting all features inc. the host virtualised registers.

Type: `uint8_t`

Default value: 1

**subcluster2.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

**subcluster2.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.49 ARMCortexA520AECT

Defined in `LISA/ARMCortexA520AECT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `has_delayed_dbgreg`
- `has_delayed_sysreg`

### AE-specific features implemented

The only AE-specific features implemented in the model are Split-Lock and Lock-Step, with the following limitations:

- The implementation of Split-Lock and Lock-Step in the model is simply a halving of the number of cores available.
- Lock-step is implemented by a parameter that can be true or false for the entire execution only, rather than by a signal that can be enabled during execution.

As the model does not implement true Split-Lock functionality, the ports and parameters are contiguous. For example, for a 4-core CPU with Split-Lock enabled, `cpu0` and `cpu1` identify the available cores and associated ports, not `cpu0` and `cpu2`.

- Hybrid mode is not modeled in the DSU.

## Iris and MTI instances for ARMCortexA520AECT

This model has the following Iris instances:

Name	Instance type
ARMCortexA520AECT	Cluster_ARM_Cortex-A520AE
ARMCortexA520AECT.AMU	PVBusLogger
ARMCortexA520AECT.AMU.mapper	PVBusMapper
ARMCortexA520AECT.DAP	PVBusLogger
ARMCortexA520AECT.DAP.mapper	PVBusMapper
ARMCortexA520AECT.DSU	DSU-120
ARMCortexA520AECT.DSU.PPU_cluster	PPUv1
ARMCortexA520AECT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520AECT.DSU.PPU_core0	PPUv1
ARMCortexA520AECT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA520AECT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520AECT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520AECT.DSU.shared_cache	PVCache
ARMCortexA520AECT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520AECT.DSU.shared_cache.upstream[Y] (where Y = 0-4)	PVBusSlave
ARMCortexA520AECT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA520AECT.MMAP	PVBusLogger
ARMCortexA520AECT.MMAP.mapper	PVBusMapper
ARMCortexA520AECT.RAS	PVBusLogger
ARMCortexA520AECT.RAS.mapper	PVBusMapper
ARMCortexA520AECT.cpu0	ARM_Cortex-A520AE
ARMCortexA520AECT.cpu0.UTLB	TLB
ARMCortexA520AECT.cpu0.debug_rom	debug_rom
ARMCortexA520AECT.cpu0.dtlb	TLB
ARMCortexA520AECT.cpu0.l1dcache	PVCache
ARMCortexA520AECT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520AECT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l1icache	PVCache
ARMCortexA520AECT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster

Name	Instance type
ARMCortexA520AECT.cpu0.l1licache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l2cache	PVCache
ARMCortexA520AECT.cpu0.l2cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520AECT.cpu0.l2cache.upstream[U] (where U = 0-1)	PVBusSlave
ARMCortexA520AECT.ext_bus	PVBusLogger
ARMCortexA520AECT.ext_bus.mapper	PVBusMapper
ARMCortexA520AECT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA520AECT.global_debug_rom	debug_rom
ARMCortexA520AECT.secondary_debug_rom	debug_rom
ARMCortexA520AECT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMCortexA520AECT.AMU	PVBusLogger
ARMCortexA520AECT.AMU.mapper	PVBusMapper
ARMCortexA520AECT.DAP	PVBusLogger
ARMCortexA520AECT.DAP.mapper	PVBusMapper
ARMCortexA520AECT.DSU	DSU-120
ARMCortexA520AECT.DSU.PPU_cluster	PPUv1
ARMCortexA520AECT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520AECT.DSU.PPU_core0	PPUv1
ARMCortexA520AECT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA520AECT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520AECT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520AECT.DSU.shared_cache	PVCache
ARMCortexA520AECT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520AECT.DSU.shared_cache.upstream[Y] (where Y = 0-4)	PVBusSlave
ARMCortexA520AECT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA520AECT.MMAP	PVBusLogger
ARMCortexA520AECT.MMAP.mapper	PVBusMapper
ARMCortexA520AECT.RAS	PVBusLogger
ARMCortexA520AECT.RAS.mapper	PVBusMapper
ARMCortexA520AECT.cpu0	ARM_Cortex-A520AE
ARMCortexA520AECT.cpu0.UTLB	TLB
ARMCortexA520AECT.cpu0.l1dcache	PVCache
ARMCortexA520AECT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520AECT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA520AECT.cpu0.l1licache	PVCache
ARMCortexA520AECT.cpu0.l1licache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520AECT.cpu0.l1licache.upstream[0]	PVBusSlave

Name	Component type
ARMCortexA520AECT.cpu0.l2cache	PVCache
ARMCortexA520AECT.cpu0.l2cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520AECT.cpu0.l2cache.upstream[U] (where U = 0-1)	PVBusSlave
ARMCortexA520AECT.ext_bus	PVBusLogger
ARMCortexA520AECT.ext_bus.mapper	PVBusMapper
ARMCortexA520AECT.gic_cpuif_decoder_cluster	GIcV3CPUInterfaceDecoder

## Ports for ARMCortexA520AECT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state

Port	Direction	Protocol	Description
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsn_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgprupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.

Port	Direction	Protocol	Description
gicreset	master	Signal	An output from PPU's that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARMCortexA520AECT

### cpuX.CFGEND

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`cpuX.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`cpuX.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`cpuX.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`cpuX.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`cpuX.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`cpuX.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**cpuX.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**cpuX.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**cpuX.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **cpuX.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **cpuX.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **cpuX.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

### **cpuX.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **cpuX.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

### **cpuX.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**cpuX.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**cpuX.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**cpuX.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**cpuX.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**cpuX.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**cpuX.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**cpuX.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**cpuX.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**cpuX.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**cpuX.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**cpuX.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**cpuX.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**cpuX.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**cpuX.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`cpuX.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`AEND0_DEFAULT`**

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

### **`AEND1_DEFAULT`**

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

### **`AEND2_DEFAULT`**

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

### **`AEND3_DEFAULT`**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **`ASTART0_DEFAULT`**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTCACHEMAIN**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The `broadcastpersist` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the `MPIDR_EL1` register and is evaluated based on the `MPIDR_EL1` layout. If `MPIDR_EL1` supports 16-bit cluster affinity levels, bits [15:8] map to `IDRAFF3`, while bits [7:0] map to `IDRAFF2`. If `MPIDR_EL1` supports 24-bit cluster affinity levels, the bits [23:16] map to `IDRAFF3`, bits [15:8] map to `IDRAFF2`, and bits [7:0] map to `IDRAFF1`. This configuration also updates all relevant component `DEVAFF` registers and is used to set the `ManagerID64` of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain events even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: `1`

### **CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

### **DBGROMADDR**

Initialization value of `DBGDRAR` register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: 0x0

**DBGROMADDRV**

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: bool

Default value: false

**GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: bool

Default value: true

**NUM\_CORES**

Number of cores per cluster.

Type: uint8\_t

Default value: 1

**bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: uint8\_t

Default value: 0

**cluster\_split\_lock\_config**

Default SPLIT/LOCKED config. Directly maps to values of CLUSTERSLCFR. The valid values are: 1 - Only LOCKED configuration support 4 - Only SPLIT configuration support, 5 - Mixed Configuration support. Modes are not software visible, and not modeled. Valid only when enable\_ae\_features is true.

Type: uint8\_t

Default value: 1

**core\_cache\_protection**

core\_cache\_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1: Not implemented (by default), 0: Disabled, 1: Enabled.

Type: int8\_t

Default value: 1

**core\_complex\_mapping**

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [ 0, 1 ], "l2-cache" : {"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core\_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core\_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: string

Default value: "{ \"complex0\": { \"cores\": [0, 1], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex1\": { \"cores\": [2, 3], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex2\": { \"cores\": [4, 5], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex3\": { \"cores\": [6, 7], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex4\": { \"cores\": [8, 9], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex5\": { \"cores\": [10, 11], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex6\": { \"cores\": [12, 13], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } } }

**core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: bool

Default value: false

**cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

**dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: 0x8000

### **dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **enable\_lock\_step**

Whether the core is configured in Dual Core Lock Step mode (FEAT\_DCLS).

Type: `bool`

Default value: `false`

### **enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

### **`ete.CLAIMTAGS`**

Number of claim tags.

Type: `uint8_t`

Default value: 4

### **`ete.MAX_INST_PER_Q`**

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

### **`ete.PIDR_CM0D`**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

### **`ete.PIDR_REVAND`**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

### **`ete.PIDR_REVISION`**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

### **`ete.Q_CADENCE`**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

### **`ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **`ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: 3

#### **`ete.REVISION`**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

#### **`ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

#### **`ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

#### **`ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

#### **`ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

#### **`ete.TRCSRSTA_FORCED_EXCEP`**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

### **`force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

### **`force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **`force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **`has_actlr2`**

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR\_EL1[63:32].

Type: `bool`

Default value: `true`

### **`has_coherent_icache`**

Whether icache invalidation to the point of unification is required for instruction to data coherence. true - Invalidate operations not required.

Type: `bool`

Default value: `false`

### **`has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

### **has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **has\_dot\_product**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

### **has\_impdef\_transient\_fault\_protection**

Support the Transient Fault Protection (TFP) flop parity errors through RAS registers (FEAT\_TFP).

Type: `bool`

Default value: `true`

### **has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

### **icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

### **`icache-state_modelled`**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **`invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

### **`l3cache-has_mpam`**

L3 Cache has MPAM support.

Type: `bool`

Default value: `true`

### **`l3cache-hit_latency`**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-maintenance_latency`**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-miss_latency`**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-read\_bus\_width\_in\_bytes**

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

### **l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-size**

L3 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-ways**

L3 Cache number of ways (sets are implicit from size).

Type: `uint16_t`

Default value: `16`

### **l3cache-write\_access\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-write\_bus\_width\_in\_bytes**

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

### **l3cache-write\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: `3`

**mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: uint8\_t

Default value: 1

**num\_acp**

Number of ACP ports.

Type: uint8\_t

Default value: 0

**num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: uint8\_t

Default value: 1

**pmu-num\_counters**

Number of PMU counters implemented.

Type: uint8\_t

Default value: 6

**ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

**ras\_extra\_configurations**

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR\_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN\_EL1. E.g. [{"Index": 0, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXMISC1\_mask": 0x0, "ERXMISC1\_reset": 0x0, "ERXMISC2\_mask": 0x0, "ERXMISC2\_reset": 0x0, "ERXMISC3\_mask": 0x0, "ERXMISC3\_reset": 0x0, "ERXCTLR\_EL1\_mask": 0x0,

"ERXCTLR\_EL1\_reset": 0x0, {"Index": 1, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXSTATUS\_IERR\_mask": 0x300}}].

Type: string

Default value: "[ { \"Index\": 1, \"ERXMISCO\_mask\": 0xFFFFc0003fc3, \"ERXMISC1\_mask\": 0x03F870003FF30f07, \"ERXPPFGCTL\_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISCO\_mask\": 0xFFFFe007ffc0, \"ERXMISCO\_reset\": 0x2, \"ERXSTATUS\_IERR\_mask\": 0x300 , \"ERXMISC1\_mask\": 0x0FF8700ffff31f0f, \"ERXPPFGCTL\_reset\": 0x1000 } ]"

### **ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: uint8\_t

Default value: 12

### **reported\_patch\_level**

Purely cosmetic patch level value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type: int8\_t

Default value: -1

### **reported\_revision\_number**

Purely cosmetic revision number value to be displayed from the ID registers. This value will not necessarily align with the model behaviour. The default value (-1) will see this parameter ignored.

Type: int8\_t

Default value: -1

### **tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

### **tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

**treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

**walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.50 ARMCortexA520CT

Defined in `LISA/ARMCortexA520CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
r0p1	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `has_delayed_dbgreg`
- `has_delayed_sysreg`

### About ARMCortexA520CT

The model supports the following features:

- L2 cache is supported at the per-core level only and there is no implementation of Core-Complex with shared L2 cache yet.
- Internal PPU support is present.
- A P-Channel for the cluster and for each core.
- `BROADCASTPERSIST` pin.
- Optional peripheral port.
- Memory-mapped register access to MPAM.

- Per-core clock.
- Utility bus.

Support for the following features is planned for a future release:

- DSU-120 system features are not fully implemented.
- Core-Complex.
- BROADCASTCACHEMAINTPOU pin
- COREINSTRRET and COREINSTRRUN signals.
- Each thread has its own L1Cache and L2Cache instead of a common cache that is shared by all threads of the core.
- Per-thread parameters are not supported but signals are implemented.

The following features will not be implemented:

- DynamIQ features that are irrelevant to the programmers' view simulation, for example:
- Automatic CPU retention mode.
- Level-3 Cache RAM retention.
- 256-bit wide output transactions.
- ECC and parity schemes are hardware-specific so are not supported.
- Self-test features (MBIST).
- Latency configuration.
- Snoop filtering.
- Cache stashing capability.

This model supports the Armv8-A Cryptographic Extensions, which requires the crypto plug-in (crypto.dll or crypto.so) to be loaded. The crypto plug-in is available for download from the [Arm Developer website](#).

## Iris and MTI instances for ARM CortexA520CT

This model has the following Iris instances:

Name	Instance type
ARM CortexA520CT	Cluster_ARM_Cortex-A520
ARM CortexA520CT.AMU	PVBusLogger
ARM CortexA520CT.AMU.mapper	PVBusMapper
ARM CortexA520CT.DAP	PVBusLogger
ARM CortexA520CT.DAP.mapper	PVBusMapper
ARM CortexA520CT.DSU	DSU-120
ARM CortexA520CT.DSU.PPU_cluster	PPUv1
ARM CortexA520CT.DSU.PPU_cluster.busslave	PVBusSlave
ARM CortexA520CT.DSU.PPU_core0	PPUv1

Name	Instance type
ARMCortexA520CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA520CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520CT.DSU.shared_cache	PVCache
ARMCortexA520CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT.DSU.shared_cache.upstream[Y] (where Y = 0–4)	PVBusSlave
ARMCortexA520CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA520CT.MMAP	PVBusLogger
ARMCortexA520CT.MMAP.mapper	PVBusMapper
ARMCortexA520CT.RAS	PVBusLogger
ARMCortexA520CT.RAS.mapper	PVBusMapper
ARMCortexA520CT.cpu0	ARM_Cortex-A520
ARMCortexA520CT.cpu0.UTLB	TLB
ARMCortexA520CT.cpu0.debug_rom	debug_rom
ARMCortexA520CT.cpu0.dtlb	TLB
ARMCortexA520CT.cpu0.l1dcache	PVCache
ARMCortexA520CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA520CT.cpu0.l1icache	PVCache
ARMCortexA520CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA520CT.cpu0.l2cache	PVCache
ARMCortexA520CT.cpu0.l2cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT.cpu0.l2cache.upstream[U] (where U = 0–1)	PVBusSlave
ARMCortexA520CT.ext_bus	PVBusLogger
ARMCortexA520CT.ext_bus.mapper	PVBusMapper
ARMCortexA520CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA520CT.global_debug_rom	debug_rom
ARMCortexA520CT.secondary_debug_rom	debug_rom
ARMCortexA520CT.sve	ScalableVectorExtension

This model has the following MTI trace components:

Name	Component type
ARMCortexA520CT.AMU	PVBusLogger
ARMCortexA520CT.AMU.mapper	PVBusMapper
ARMCortexA520CT.DAP	PVBusLogger
ARMCortexA520CT.DAP.mapper	PVBusMapper
ARMCortexA520CT.DSU	DSU-120
ARMCortexA520CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT.DSU.PPU_cluster.busslave	PVBusSlave

Name	Component type
ARMCortexA520CT.DSU.PPU_core0	PPUv1
ARMCortexA520CT.DSU.PPU_core0.busslave	PVBusSlave
ARMCortexA520CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520CT.DSU.shared_cache	PVCache
ARMCortexA520CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT.DSU.shared_cache.upstream[Y] (where Y = 0-4)	PVBusSlave
ARMCortexA520CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA520CT.MMAP	PVBusLogger
ARMCortexA520CT.MMAP.mapper	PVBusMapper
ARMCortexA520CT.RAS	PVBusLogger
ARMCortexA520CT.RAS.mapper	PVBusMapper
ARMCortexA520CT.cpu0	ARM_Cortex-A520
ARMCortexA520CT.cpu0.UTLB	TLB
ARMCortexA520CT.cpu0.l1dcache	PVCache
ARMCortexA520CT.cpu0.l1dcache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT.cpu0.l1dcache.upstream[0]	PVBusSlave
ARMCortexA520CT.cpu0.l1icache	PVCache
ARMCortexA520CT.cpu0.l1icache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT.cpu0.l1icache.upstream[0]	PVBusSlave
ARMCortexA520CT.cpu0.l2cache	PVCache
ARMCortexA520CT.cpu0.l2cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT.cpu0.l2cache.upstream[U] (where U = 0-1)	PVBusSlave
ARMCortexA520CT.ext_bus	PVBusLogger
ARMCortexA520CT.ext_bus.mapper	PVBusMapper
ARMCortexA520CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder

## Ports for ARMCortexA520CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).

Port	Direction	Protocol	Description
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamlQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info

Port	Direction	Protocol	Description
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.

Port	Direction	Protocol	Description
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARMCortexA520CT

### **cpuX.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **cpuX.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **cpuX.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **cpuX.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**cpuX.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**cpuX.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**cpuX.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**cpuX.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**cpuX.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**cpuX.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**cpuX.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**cpuX.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**cpuX.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**cpuX.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**cpuX.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`cpuX.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`cpuX.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`cpuX.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`cpuX.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`cpuX.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`cpuX.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`cpuX.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`cpuX.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`cpuX.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`cpuX.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`cpuX.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`AEND0_DEFAULT`**

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

### **`AEND1_DEFAULT`**

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: 0x0

#### **AEND2\_DEFAULT**

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: uint64\_t

Default value: 0x0

#### **AEND3\_DEFAULT**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: uint64\_t

Default value: 0x0

#### **ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: uint64\_t

Default value: 0x0

#### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: uint64\_t

Default value: 0x0

#### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: uint64\_t

Default value: 0x0

#### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: uint64\_t

Default value: `0x0`

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The `broadcastatomic` signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The `broadcastcachemaint` signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The `broadcastpersist` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the `MPIDR_EL1` register and is evaluated based on the `MPIDR_EL1` layout. If `MPIDR_EL1` supports 16-bit cluster affinity levels, bits [15:8] map to `IDRAFF3`, while bits [7:0] map to `IDRAFF2`. If `MPIDR_EL1` supports 24-bit cluster affinity levels, the bits [23:16] map to `IDRAFF3`, bits [15:8] map to `IDRAFF2`, and bits [7:0] map to `IDRAFF1`. This configuration also updates all relevant component `DEVAFF` registers and is used to set the `ManagerID64` of the core.

Type: `uint32_t`

Default value: `0x0`

**CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

**CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: 0x0

**DBGROMADDR**

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: 0x0

**DBGROMADDRV**

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: `false`

**GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

**NUM\_CORES**

Number of cores per cluster.

Type: `uint8_t`

Default value: 1

**bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: uint8\_t

Default value: 0

**core\_cache\_protection**

core\_cache\_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: int8\_t

Default value: 1

**core\_complex\_mapping**

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [ 0, 1 ], "l2-cache" : {"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core\_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core\_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: string

Default value: "{ \"complex0\": { \"cores\": [0, 1], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex1\": { \"cores\": [2, 3], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex2\": { \"cores\": [4, 5], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex3\": { \"cores\": [6, 7], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex4\": { \"cores\": [8, 9], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex5\": { \"cores\": [10, 11], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex6\": { \"cores\": [12, 13], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } } }

**core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: bool

Default value: false

**cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

**cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

**dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

**dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

**dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of stage12\_tlb\_size parameter to 1024).

Type: bool

Default value: true

### **ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

### **ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

### **ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

### **ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

### **ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

**ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

**ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: `3`

**ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: `0`

**ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

**ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: `0`

**ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

**ete.TRCSRSTA\_FORCED\_EXCEP**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

**has\_actlr2**

If true ACTLR2 exists and ACTLR2(NS) is aliased to ACTLR\_EL1[63:32].

Type: `bool`

Default value: `true`

**has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

**has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

**has\_dot\_product**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

**has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

**has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

**icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`icache-miss_latency`**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`icache-prefetch_enabled`**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`icache-read_access_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`icache-read_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

**icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

**invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

**l3cache-has\_mpam**

L3 Cache has MPAM support.

Type: `bool`

Default value: `true`

**l3cache-hit\_latency**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-maintenance\_latency**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-read\_bus\_width\_in\_bytes**

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-size**

L3 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-ways**

L3 Cache number of ways (sets are implicit from size).

Type: `uint16_t`

Default value: 16

### **l3cache-write\_access\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **l3cache-write\_bus\_width\_in\_bytes**

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: 0x10

### **l3cache-write\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

### **mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums

in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

### **num\_acp**

Number of ACP ports.

Type: `uint8_t`

Default value: 0

### **num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

### **pmu-num\_counters**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

### **ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **ras\_extra\_configurations**

Miscellaneous configurations for error records. An array of JSON objects. Note for `ERXCTLR_EL1` register it only allows to define the mask value for the `IMPDEF` fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for `ERXMISCN` masks - these are 64 bit masks covering the 64 bit registers `ERXMISCN_EL1`. E.g. [{"Index": 0, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXMISC1\_mask": 0x0, "ERXMISC1\_reset": 0x0, "ERXMISC2\_mask": 0x0, "ERXMISC2\_reset": 0x0, "ERXMISC3\_mask": 0x0, "ERXMISC3\_reset": 0x0, "ERXCTLR\_EL1\_mask": 0x0, "ERXCTLR\_EL1\_reset": 0x0}, {"Index": 1, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXSTATUS\_IERR\_mask": 0x300}].

Type: `string`

Default value: "[ { \"Index\": 1, \"ERXMISC0\_mask\": 0xFFFFc0003fc3, \"ERXMISC1\_mask\": 0x03F870003FF30f07, \"ERXPGCTL\_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISC0\_mask\": 0xFFFFe007ffc0, \"ERXMISC0\_reset\": 0x2, \"ERXSTATUS\_IERR\_mask\": 0x300 , \"ERXMISC1\_mask\": 0x0FF8700ffff31f0f, \"ERXPGCTL\_reset\": 0x1000 } ]"

### **ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: `uint8_t`

Default value: 12

### **revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 0

### **tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

### **treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

### **walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

## 3.51 ARMCortexA520CT\_CortexA720CT

Defined in LISA/ARMCortexA520CT\_CortexA720CT.lisa.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA520 r0p1	Full support
CortexA720 r0p1	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- num\_acp
- subcluster0.has\_delayed\_dbgreg
- subcluster0.has\_delayed\_sysreg
- subcluster1.has\_delayed\_dbgreg
- subcluster1.has\_delayed\_sysreg

### About ARMCortexA520CT\_CortexA720CT

The number of cores in each subcluster is configurable using the following parameters:

#### **subcluster0.NUM\_CORES**

Possible values are 1-13 (ARMCortexA520CT).

#### **subcluster1.NUM\_CORES**

Possible values are 1-13 (ARMCortexA720CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port\_name>[0-12] for cores in subcluster0.
- <port\_name>[13-25] for cores in subcluster1.

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [ARMCortexA520CT](#).
- [ARMCortexA720CT](#).

### Iris and MTI instances for ARMCortexA520CT\_CortexA720CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA520CT_CortexA720CT	Cluster_ARM_CortexA520_CortexA720_Heterogeneous
ARMCortexA520CT_CortexA720CT.AMU	PVBusLogger
ARMCortexA520CT_CortexA720CT.AMU.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT.DAP	PVBusLogger
ARMCortexA520CT_CortexA720CT.DAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT.DSU	DSU-120
ARMCortexA520CT_CortexA720CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT_CortexA720CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.PPU_coreZ (where Z = 0-1)	PPUv1
ARMCortexA520CT_CortexA720CT.DSU.PPU_coreZ.busslave (where Z = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520CT_CortexA720CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.shared_cache	PVCache
ARMCortexA520CT_CortexA720CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT_CortexA720CT.DSU.shared_cache.upstream[Z] (where Z = 0-6)	PVBusSlave
ARMCortexA520CT_CortexA720CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA520CT_CortexA720CT.MMAP	PVBusLogger
ARMCortexA520CT_CortexA720CT.MMAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT.RAS	PVBusLogger
ARMCortexA520CT_CortexA720CT.RAS.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT.cpuZ.debug_rom (where Z = 0-1)	debug_rom
ARMCortexA520CT_CortexA720CT.ext_bus	PVBusLogger

Name	Instance type
ARMCortexA520CT_CortexA720CT.ext_bus.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA520CT_CortexA720CT.global_debug_rom	debug_rom
ARMCortexA520CT_CortexA720CT.secondary_debug_rom	debug_rom
ARMCortexA520CT_CortexA720CT.subcluster0	Subcluster_ARM_Cortex-A520

### Ports for ARMCortexA520CT\_CortexA720CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).

Port	Direction	Protocol	Description
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcsn_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIRQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIRQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.

Port	Direction	Protocol	Description
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsn_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPU that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.

Port	Direction	Protocol	Description
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARM CortexA520CT\_CortexA720CT

### AEND0\_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: uint64\_t

Default value: 0x0

### AEND1\_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: uint64\_t

Default value: 0x0

### AEND2\_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: uint64\_t

Default value: 0x0

### **AEND3\_DEFAULT**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: uint64\_t

Default value: 0x0

### **ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: uint64\_t

Default value: 0x0

### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: uint64\_t

Default value: 0x0

### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: uint64\_t

Default value: 0x0

### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: uint64\_t

Default value: 0x0

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: bool

Default value: `true`

### **BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The `broadcastcachemaint` signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The `broadcastouter` signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The `broadcastpersist` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the `MPIDR_EL1` register and is evaluated based on the `MPIDR_EL1` layout. If `MPIDR_EL1` supports 16-bit cluster affinity levels, bits [15:8] map to `IDRAFF3`, while bits [7:0] map to `IDRAFF2`. If `MPIDR_EL1` supports 24-bit cluster affinity levels, the bits [23:16] map to `IDRAFF3`, bits [15:8] map to `IDRAFF2`, and bits [7:0] map to `IDRAFF1`. This configuration also updates all relevant component `DEVAFF` registers and is used to set the `ManagerID64` of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain events even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: 1

### **DBGROMADDR**

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

### **DBGROMADDRV**

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: `false`

### **GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

### **bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

### **core\_complex\_mapping**

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [ 0, 1 ], "l2-cache" : {"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core\_list>, "l2-cache" : {"exists":1, "size":16MB}}} where <core\_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: `string`

Default value: "{ \"complex0\": { \"cores\": [0, 1], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex1\": { \"cores\": [2, 3], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex2\": { \"cores\": [4, 5], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex3\": { \"cores\": [6, 7], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex4\": { \"cores\": [8, 9], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex5\": { \"cores\": [10, 11], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } }, \"complex6\": { \"cores\": [12, 13], \"l2-cache\" : { \"exists\":1, \"size\": \"16MB\" } } }

**core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

**dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

**enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

**has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

**icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

**l3cache-has\_mpam**

L3 Cache has MPAM support.

Type: `bool`

Default value: `false`

**l3cache-hit\_latency**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-maintenance\_latency**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_bus\_width\_in\_bytes**

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-size**

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-ways**

L3 Cache number of ways (sets are implicit from size).

Type: `uint16_t`

Default value: `16`

### **l3cache-write\_access\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-write\_bus\_width\_in\_bytes**

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: 0x10

### **l3cache-write\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantum in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: uint8\_t

Default value: 1

### **num\_acp**

Number of ACP ports.

Type: uint8\_t

Default value: 0

### **num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: uint8\_t

Default value: 1

### **revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: uint8\_t

Default value: 0

### **subcluster0.CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.NUM_CORES`**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: `1`

### **`subcluster0.core_cache_protection`**

`core_cache_protection` can change `ERROFR`, `ERROPFGF` and `ERROPFGCTL` fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: `1`

### **`subcluster0.cpi_div`**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

### **`subcluster0.cpi_mul`**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

### **`subcluster0.cpu0.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu1.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu1.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu1.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu10.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu10.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu10.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu10.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu10.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu10.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu10.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **subcluster0.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu10.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **subcluster0.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.cpu10.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu10.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu10.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu10.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu10.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu10.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu10.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu10.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu10.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu10.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu10.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu10.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu11.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu11.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu11.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu11.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu11.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu11.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu11.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu11.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu11.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu11.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu11.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu11.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu11.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu11.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu11.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu11.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu11.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu11.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu11.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu11.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu11.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu11.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu11.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu11.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu12.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu12.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu12.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu12.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu12.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu12.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu12.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu12.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu12.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu12.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu12.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu12.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu12.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu12.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu12.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu12.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu12.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu12.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu12.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu12.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu12.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu12.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu12.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu12.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu12.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu12.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu12.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu2.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu2.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster0.cpu2.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster0.cpu2.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster0.cpu2.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster0.cpu2.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu2.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu2.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster0.cpu2.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu2.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu2.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu3.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu3.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu3.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu4.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster0.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster0.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu4.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster0.cpu5.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster0.cpu5.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster0.cpu5.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster0.cpu5.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu5.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu5.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster0.cpu5.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu5.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu5.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu5.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu6.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu7.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu7.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu8.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu8.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu8.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu8.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster0.cpu8.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster0.cpu8.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster0.cpu8.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster0.cpu8.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu8.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu8.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster0.cpu8.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu8.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu8.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu8.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu9.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu9.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu9.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-prefetch_enabled`**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster0.dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-size**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

**subcluster0.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.etc.CLAIMTAGS**

Number of claim tags.

Type: `uint8_t`

Default value: 4

**subcluster0.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

**subcluster0.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

**subcluster0.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

**subcluster0.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

**subcluster0.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

**subcluster0.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

**subcluster0.ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: 3

**subcluster0.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

**subcluster0.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

**subcluster0.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

**subcluster0.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**subcluster0.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: N/A

**subcluster0.ete.TRCSRSTA\_FORCED\_EXCEP**

TRCSRSTA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**subcluster0.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/

GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

#### **`subcluster0.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

#### **`subcluster0.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

#### **`subcluster0.has_actlr2`**

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR\_EL1[63:32].

Type: `bool`

Default value: `true`

#### **`subcluster0.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

#### **`subcluster0.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

#### **`subcluster0.has_dot_product`**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **`subcluster0.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

### **`subcluster0.icache-hit_latency`**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.icache-maintenance_latency`**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.icache-miss_latency`**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.icache-prefetch_enabled`**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster0.icache-read_access_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and

intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.icache-read_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

#### **`subcluster0.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

#### **`subcluster0.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: `3`

#### **`subcluster0.pmu-num_counters`**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: `6`

**subcluster0.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

**subcluster0.ras\_extra\_configurations**

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR\_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCn masks - these are 64 bit masks covering the 64 bit registers ERXMISCn\_EL1. E.g. [{"Index": 0, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXMISC1\_mask": 0x0, "ERXMISC1\_reset": 0x0, "ERXMISC2\_mask": 0x0, "ERXMISC2\_reset": 0x0, "ERXMISC3\_mask": 0x0, "ERXMISC3\_reset": 0x0, "ERXCTLR\_EL1\_mask": 0x0, "ERXCTLR\_EL1\_reset": 0x0}, {"Index": 1, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXSTATUS\_IERR\_mask": 0x300}].

Type: string

Default value: "[ { \"Index\": 1, \"ERXMISCO\_mask\": 0xFFFFc0003fc3, \"ERXMISC1\_mask\": 0x03F870003FF30f07, \"ERXPGCTL\_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISCO\_mask\": 0xFFFFe007ffc0, \"ERXMISCO\_reset\": 0x2, \"ERXSTATUS\_IERR\_mask\": 0x300 , \"ERXMISC1\_mask\": 0x0FF8700ffff31f0f, \"ERXPGCTL\_reset\": 0x1000 } ]"

**subcluster0.ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: uint8\_t

Default value: 12

**subcluster0.revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: uint8\_t

Default value: 0

**subcluster0.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

**subcluster0.tlbi\_stall\_enabled**

If true, tlbi invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

**subcluster0.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

**subcluster0.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: `1`

**subcluster1.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster1.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster1.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu0.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu0.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

#### **`subcluster1.cpu0.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

#### **`subcluster1.cpu0.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

#### **`subcluster1.cpu0.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

#### **`subcluster1.cpu0.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

#### **`subcluster1.cpu0.semihosting-T32_HLT`**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

#### **`subcluster1.cpu0.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

#### **`subcluster1.cpu0.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

#### **`subcluster1.cpu0.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

### **`subcluster1.cpu0.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu0.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu0.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu0.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu0.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu1.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu1.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu1.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu1.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu1.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu1.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster1.cpu10.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu10.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu10.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu10.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu10.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu10.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu10.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu10.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu10.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu10.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu10.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu10.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu10.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu10.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu10.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu10.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu11.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu11.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu11.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu11.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu11.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu11.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu11.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu11.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu11.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu11.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu11.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu11.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu11.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu11.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu11.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu11.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu11.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu11.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu11.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu11.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu11.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu11.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu11.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu11.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu11.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu11.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu12.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu12.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu12.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu12.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu12.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu12.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu12.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu12.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu12.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu12.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu12.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu12.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster1.cpu12.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu12.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu12.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu12.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu12.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu12.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu12.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu12.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu12.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu12.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu12.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu2.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu2.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu2.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu2.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu2.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu2.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu2.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu2.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu2.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster1.cpu3.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu3.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu3.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu3.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu3.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu3.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu3.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu4.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu5.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu6.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu6.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu6.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu6.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu6.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster1.cpu7.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu7.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu7.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu7.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu7.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu7.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu7.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu7.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu7.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu7.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu8.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster1.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster1.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

**subcluster1.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster1.ete.ETE\_REVISION**

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: uint8\_t

Default value: 1

**subcluster1.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster1.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.PIDR_REVISION`**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.Q_CADENCE`**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

#### **`subcluster1.ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **`subcluster1.ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: 3

#### **`subcluster1.ete.REVISION`**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

#### **`subcluster1.ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

#### **`subcluster1.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: N/A

#### **`subcluster1.ete.TRCRSRTA_FORCED_EXCEP`**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

#### **`subcluster1.ete.TSMARK`**

Whether timestamp markers are supported.

Type: `bool`

Default value: `true`

#### **`subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

#### **`subcluster1.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **`subcluster1.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **`subcluster1.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster1.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster1.has_enhanced_pan`**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: `2`

### **`subcluster1.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

### **`subcluster1.has_large_va`**

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT\_LVA). values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

### **subcluster1.has\_statistical\_profiling**

Whether Statistical Based Profiling is implemented (FEAT\_SPE).

Type: bool

Default value: false

### **subcluster1.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster1.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-read_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

### **`subcluster1.instruction_tlb_size`**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

### **`subcluster1.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

### **`subcluster1.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: `3`

### **`subcluster1.pmu-num_counters`**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

### **`subcluster1.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **`subcluster1.stage12_tlb_size`**

Number of stage1+2 tlb entries. Valid values are 0 or  $\geq 4$ .

Type: `uint32_t`

Default value: 0x80

### **`subcluster1.tlb_latency`**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **`subcluster1.tlbi_stall_enabled`**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

### **`subcluster1.treat_PAC_as_NOP`**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

### **`subcluster1.walk_cache_latency`**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

## 3.52 ARMCortexA520CT\_CortexA720CT\_CortexX4CT

Defined in LISA/ARMCortexA520CT\_CortexA720CT\_CortexX4CT.lisa.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA520 r0p1	Full support
CortexA720 r0p1	Full support
CortexX4 r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- num\_acp
- subcluster0.has\_delayed\_dbgreg
- subcluster0.has\_delayed\_sysreg
- subcluster1.has\_delayed\_dbgreg
- subcluster1.has\_delayed\_sysreg
- subcluster2.has\_delayed\_dbgreg
- subcluster2.has\_delayed\_sysreg

### About ARMCortexA520CT\_CortexA720CT\_CortexX4CT

The number of cores in each subcluster is configurable using the following parameters:

#### **subcluster0.NUM\_CORES**

Possible values are 1-12 (ARMCortexA520CT).

#### **subcluster1.NUM\_CORES**

Possible values are 1-12 (ARMCortexA720CT).

#### **subcluster2.NUM\_CORES**

Possible values are 1-12 (ARMCortexX4CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port\_name>[0-11] for cores in subcluster0.
- <port\_name>[12-23] for cores in subcluster1.

- `<port_name>[24-35]` for cores in `subcluster2`.

**Note**

All instances in the Master cross trigger matrix port array, `cti[36]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu11` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu11` identify cores in `subcluster1`.
- `subcluster2.cpu0` to `subcluster2.cpu11` identify cores in `subcluster2`.

For information about the cores in this model, see:

- [ARMCortexA520CT](#).
- [ARMCortexA720CT](#).
- [ARMCortexX4CT](#).

## Iris and MTI instances for ARMCortexA520CT\_CortexA720CT\_CortexX4CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA520CT_CortexA720CT_CortexX4CT	Cluster_ARM_CortexA520_CortexA720_CortexX4_Heterogeneous
ARMCortexA520CT_CortexA720CT_CortexX4CT.AMU	PVBusLogger
ARMCortexA520CT_CortexA720CT_CortexX4CT.AMU.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT_CortexX4CT.DAP	PVBusLogger
ARMCortexA520CT_CortexA720CT_CortexX4CT.DAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU	DSU-120
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_coreU (where $U = 0-2$ )	PPUv1
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.PPU_coreU.busslave (where $U = 0-2$ )	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.shared_cache	PVCache

Name	Instance type
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.shared_cache.upstream[U] (where $U = 0-8$ )	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.MMAP	PVBusLogger
ARMCortexA520CT_CortexA720CT_CortexX4CT.MMAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT_CortexX4CT.RAS	PVBusLogger
ARMCortexA520CT_CortexA720CT_CortexX4CT.RAS.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT_CortexX4CT.cpuU.debug_rom (where $U = 0-2$ )	debug_rom
ARMCortexA520CT_CortexA720CT_CortexX4CT.ext_bus	PVBusLogger
ARMCortexA520CT_CortexA720CT_CortexX4CT.ext_bus.mapper	PVBusMapper
ARMCortexA520CT_CortexA720CT_CortexX4CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA520CT_CortexA720CT_CortexX4CT.global_debug_rom	debug_rom
ARMCortexA520CT_CortexA720CT_CortexX4CT.secondary_debug_rom	debug_rom
ARMCortexA520CT_CortexA720CT_CortexX4CT.subcluster0	Subcluster_ARM_Cortex-A520
ARMCortexA520CT_CortexA720CT_CortexX4CT.subcluster0.cpu0	ARM_Cortex-A520

ARMCortexA520CT_CortexA720CT_CortexX4CT.subclusterU.cpu0.l1icache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA520CT_CortexA720CT_CortexX4CT.subclusterU.cpu0.l1icache.upstream[0] (where $U = 0-2$ )	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.subclusterU.cpu0.l2cache (where $U = 0-2$ )	PVCache
ARMCortexA520CT_CortexA720CT_CortexX4CT.subclusterU.cpu0.l2cache.downstream[0].pvbusmaster (where $U = 0-2$ )	PVBusMaster
ARMCortexA520CT_CortexA720CT_CortexX4CT.subclusterU.cpu0.l2cache.upstream[A] (where $U = 0-2$ ; $A = 0-1$ )	PVBusSlave
ARMCortexA520CT_CortexA720CT_CortexX4CT.subcluster1.cpu0	ARM_Cortex-A720
ARMCortexA520CT_CortexA720CT_CortexX4CT.subcluster2.cpu0	ARM_Cortex-X4

### Ports for ARMCortexA520CT\_CortexA720CT\_CortexX4CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.

Port	Direction	Protocol	Description
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcs_m_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.

Port	Direction	Protocol	Description
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgpwrupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.
gicreset	master	Signal	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave

Port	Direction	Protocol	Description
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARM CortexA520CT\_CortexA720CT\_CortexX4CT

### AEND0\_DEFAULT

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: uint64\_t

Default value: 0x0

### AEND1\_DEFAULT

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: uint64\_t

Default value: 0x0

### AEND2\_DEFAULT

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: uint64\_t

Default value: 0x0

### AEND3\_DEFAULT

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: uint64\_t

Default value: 0x0

### ASTART0\_DEFAULT

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTCACHEMAIN**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The `broadcastpersist` signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the `MPIDR_EL1` register and is evaluated based on the `MPIDR_EL1` layout. If `MPIDR_EL1` supports 16-bit cluster affinity levels, bits [15:8] map to `IDRAFF3`, while bits [7:0] map to `IDRAFF2`. If `MPIDR_EL1` supports 24-bit cluster affinity levels, the bits [23:16] map to `IDRAFF3`, bits [15:8] map to `IDRAFF2`, and bits [7:0] map to `IDRAFF1`. This configuration also updates all relevant component `DEVAFF` registers and is used to set the `ManagerID64` of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: `1`

### **DBGROMADDR**

Initialization value of `DBGDRAR` register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

### **DBGROMADDRV**

If true, set bits[1:0] of the CP15 `DBGDRAR` to indicate that the address is valid.

Type: `bool`

Default value: `false`

### **GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

### **bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

### **core\_complex\_mapping**

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [ 0, 1 ], "l2-cache" :{"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core\_list>], "l2-cache" : {"exists":1, "size":16MB}}} where <core\_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: `string`

Default value: {"complex0": { "cores": [0, 1], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex1": { "cores": [2, 3], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex2": { "cores": [4, 5], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" :{"exists":1, "size":"16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" :{"exists":1, "size":"16MB"}} }

### **core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

### **dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **`enable_simulation_performance_optimizations`**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

### **`has_peripheral_port`**

If `true`, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

### **`icache-state_modelled`**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **`l3cache-has_mpam`**

L3 Cache has MPAM support.

Type: `bool`

Default value: `true`

### **`l3cache-hit_latency`**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`l3cache-maintenance_latency`**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size `l3cache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_bus\_width\_in\_bytes**

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l3cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-size**

L3 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-ways**

L3 Cache number of ways (sets are implicit from size).

Type: uint16\_t

Default value: 16

### **l3cache-write\_access\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size l3cache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-write\_bus\_width\_in\_bytes**

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

### **l3cache-write\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. l3cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator.value of n means the accumulator will use (n \* accumulator value) to calculate the mpmm threshold (MPMM).is provided as a fast model workaround to handle cases where execution of quantums

in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

### **num\_acp**

Number of ACP ports.

Type: `uint8_t`

Default value: 0

### **num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

### **revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 0

### **subcluster0.CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: 0x0

### **subcluster0.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

### **subcluster0.core\_cache\_protection**

`core_cache_protection` can change `ERROFR`, `ERROPFGF` and `ERROPFGCTL` fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

### **`subcluster0.cpi_div`**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 0x1

### **`subcluster0.cpi_mul`**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 0x1

### **`subcluster0.cpu0.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: 0x0

### **`subcluster0.cpu0.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu0.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu0.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu0.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu0.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu0.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu0.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu0.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu0.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu0.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu0.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu1.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu1.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu1.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu10.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu10.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu10.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu10.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu10.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu10.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu10.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu10.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu10.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu10.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu10.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu10.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu10.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu10.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu10.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu10.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu10.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu10.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu10.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu11.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu11.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu11.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu11.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu11.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu11.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu11.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu11.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu11.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu11.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu11.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu11.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu11.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu11.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu11.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu11.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu11.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu11.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**`subcluster0.cpu11.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster0.cpu11.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster0.cpu11.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster0.cpu11.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu11.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu11.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster0.cpu11.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu11.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu11.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu11.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu11.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu3.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu3.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu3.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu4.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu4.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu4.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu4.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu4.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu4.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu4.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu4.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu4.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu4.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu4.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu4.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu5.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu5.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu6.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu7.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu7.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu7.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu7.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu7.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu7.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu7.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu7.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu7.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu7.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu7.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu8.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu9.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu9.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-miss_latency`**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-prefetch_enabled`**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **`subcluster0.dcache-read_access_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size `dcache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-read_latency`**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. `dcache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-size`**

L1 D-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

### **`subcluster0.dcache-snoop_data_transfer_latency`**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-write_access_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster0.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster0.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

#### **`subcluster0.ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **`subcluster0.ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: `3`

#### **`subcluster0.ete.REVISION`**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: `0`

#### **`subcluster0.ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

#### **`subcluster0.ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: `0`

#### **`subcluster0.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

#### **`subcluster0.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

#### **`subcluster0.ete.TRCRSRTA_FORCED_EXCEP`**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

#### **`subcluster0.force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

#### **`subcluster0.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

#### **`subcluster0.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

#### **`subcluster0.has_actlr2`**

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR\_EL1[63:32].

Type: `bool`

Default value: `true`

#### **`subcluster0.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

### **subcluster0.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **subcluster0.has\_dot\_product**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **subcluster0.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

### **subcluster0.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster0.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster0.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster0.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster0.icache-size**

L1 I-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

### **subcluster0.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: uint8\_t

Default value: 0

**subcluster0.memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: uint8\_t

Default value: 3

**subcluster0.pmu-num\_counters**

Number of PMU counters implemented.

Type: uint8\_t

Default value: 6

**subcluster0.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

**subcluster0.ras\_extra\_configurations**

Miscellaneous configurations for error records. An array of JSON objects. Note for ERXCTLR\_EL1 register it only allows to define the mask value for the IMPDEF fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for ERXMISCN masks - these are 64 bit masks covering the 64 bit registers ERXMISCN\_EL1. E.g. [{"Index": 0, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXMISC1\_mask": 0x0, "ERXMISC1\_reset": 0x0, "ERXMISC2\_mask": 0x0, "ERXMISC2\_reset": 0x0, "ERXMISC3\_mask": 0x0, "ERXMISC3\_reset": 0x0, "ERXCTLR\_EL1\_mask": 0x0, "ERXCTLR\_EL1\_reset": 0x0}, {"Index": 1, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXSTATUS\_IERR\_mask": 0x300}].

Type: string

Default value: "[ { \"Index\": 1, \"ERXMISCO\_mask\": 0xFFFFc0003fc3, \"ERXMISC1\_mask\": 0x03F870003FF30f07, \"ERXPFGCTL\_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISCO\_mask\": 0xFFFFFe007ffc0, \"ERXMISCO\_reset\": 0x2, \"ERXSTATUS\_IERR\_mask\": 0x300 , \"ERXMISC1\_mask\": 0x0FF8700ffff31f0f, \"ERXPFGCTL\_reset\": 0x1000 } ]"

**subcluster0.ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: uint8\_t

Default value: 12

**subcluster0.revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 0

**subcluster0.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

**subcluster0.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

**subcluster0.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAAuth traps.

Type: `bool`

Default value: `false`

**subcluster0.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

**subcluster1.CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: 0x0

**subcluster1.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

**subcluster1.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 0x1

**subcluster1.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 0x1

**subcluster1.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**subcluster1.cpu0.force-fpsid**

Override the FPSID value.

Type: bool

Default value: true

**subcluster1.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu0.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu0.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu0.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu0.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu0.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu0.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu0.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

### **`subcluster1.cpu0.semihosting-T32_HLT`**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf0000000`

**subcluster1.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu1.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu1.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu10.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu10.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu10.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu10.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu10.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu10.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu10.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu10.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu10.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu10.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu11.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu11.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu11.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu11.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu11.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster1.cpu11.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu11.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu11.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu11.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu11.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu11.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu11.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu11.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu11.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu11.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu11.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu11.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu11.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu11.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu11.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu11.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu11.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu11.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu11.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu11.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu2.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster1.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster1.cpu2.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster1.cpu2.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster1.cpu2.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu2.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster1.cpu2.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster1.cpu2.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu2.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu2.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu3.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu3.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu3.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu3.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu3.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu4.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu5.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu5.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster1.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu6.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu6.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu6.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu6.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster1.cpu6.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu6.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu6.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster1.cpu7.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu7.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu7.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu7.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu7.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu7.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu7.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu7.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu7.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu7.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster1.cpu8.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu9.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster1.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster1.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster1.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

**subcluster1.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster1.ete.ETE\_REVISION**

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: uint8\_t

Default value: 1

**subcluster1.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster1.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

#### **subcluster1.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: `uint8_t`

Default value: 0

#### **subcluster1.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: 0x1

#### **subcluster1.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **subcluster1.ete.RETSTACK**

Return stack depth.

Type: `uint8_t`

Default value: 3

#### **subcluster1.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

#### **subcluster1.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

#### **subcluster1.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

#### **`subcluster1.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

#### **`subcluster1.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: N/A

#### **`subcluster1.ete.TRCRSRTA_FORCED_EXCEP`**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

#### **`subcluster1.ete.TSMARK`**

Whether timestamp markers are supported.

Type: `bool`

Default value: `true`

#### **`subcluster1.force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

#### **`subcluster1.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **`subcluster1.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **`subcluster1.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster1.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **`subcluster1.has_enhanced_pan`**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: `2`

### **`subcluster1.has_ete`**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (`-plugin` or `-P`).

Type: `bool`

Default value: `false`

### **`subcluster1.has_large_va`**

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT\_LVA). values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 0

### **subcluster1.has\_statistical\_profiling**

Whether Statistical Based Profiling is implemented (FEAT\_SPE).

Type: `bool`

Default value: `false`

### **subcluster1.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **subcluster1.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

### **subcluster1.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.icache-read_latency`**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.icache-size`**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

#### **`subcluster1.instruction_tlb_size`**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: `uint32_t`

Default value: `0x0`

#### **`subcluster1.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

#### **`subcluster1.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: `3`

#### **`subcluster1.pmu-num_counters`**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

### **`subcluster1.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **`subcluster1.stage12_tlb_size`**

Number of stage1+2 tlb entries. Valid values are 0 or  $\geq 4$ .

Type: `uint32_t`

Default value: 0x80

### **`subcluster1.tlb_latency`**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **`subcluster1.tlbi_stall_enabled`**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

### **`subcluster1.treat_PAC_as_NOP`**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

### **`subcluster1.walk_cache_latency`**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

#### **subcluster2.CPUCFR**

Value of CPU Configuration Register.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: uint8\_t

Default value: 1

#### **subcluster2.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

#### **subcluster2.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: uint32\_t

Default value: 0x1

#### **subcluster2.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

#### **subcluster2.cpu0.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

#### **subcluster2.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu0.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu0.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster2.cpu0.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-ways`**

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: `8`

### **`subcluster2.cpu0.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu0.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster2.cpu0.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster2.cpu0.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu0.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu0.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu1.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

#### **`subcluster2.cpu1.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu1.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

**subcluster2.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: 0x100

**subcluster2.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

**subcluster2.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster2.cpu1.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster2.cpu10.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu10.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu10.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu10.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.cpu10.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu10.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu10.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu10.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu10.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu10.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu10.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster2.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu10.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster2.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster2.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu10.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu10.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu10.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu10.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster2.cpu10.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu10.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu10.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu10.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu10.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu10.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu10.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu11.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu11.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu11.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu11.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu11.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu11.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu11.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu11.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu11.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu11.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu11.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster2.cpu11.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu11.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu11.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster2.cpu11.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu11.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu11.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu11.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu11.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu11.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu11.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu11.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu11.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu11.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu11.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu11.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu11.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu11.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu11.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu11.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster2.cpu11.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu11.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster2.cpu11.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster2.cpu2.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster2.cpu2.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster2.cpu2.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster2.cpu2.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster2.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: `8`

**subcluster2.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster2.cpu2.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster2.cpu2.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster2.cpu2.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster2.cpu2.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster2.cpu2.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu2.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu2.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster2.cpu2.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu2.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu2.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster2.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu3.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu3.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster2.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster2.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu4.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu4.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu4.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu4.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu4.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu4.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster2.cpu4.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster2.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu4.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster2.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu5.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster2.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster2.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster2.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster2.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster2.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster2.cpu5.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu5.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster2.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu6.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster2.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster2.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster2.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster2.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster2.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **subcluster2.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **subcluster2.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **subcluster2.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **subcluster2.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **subcluster2.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **subcluster2.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **subcluster2.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster2.cpu6.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster2.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu6.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster2.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster2.cpu7.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu7.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

### **subcluster2.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

### **subcluster2.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

### **subcluster2.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

### **subcluster2.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

### **subcluster2.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

### **subcluster2.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster2.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster2.cpu8.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu8.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu8.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

### **`subcluster2.cpu8.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster2.cpu8.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: `uint8_t`

Default value: 8

**subcluster2.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: 0x100

**subcluster2.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: 0

**subcluster2.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster2.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster2.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster2.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster2.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster2.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster2.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster2.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster2.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster2.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **subcluster2.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **subcluster2.cpu9.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **subcluster2.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **subcluster2.cpu9.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **subcluster2.cpu9.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **subcluster2.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster2.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster2.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster2.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster2.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster2.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster2.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster2.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster2.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster2.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster2.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster2.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster2.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster2.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster2.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster2.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster2.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster2.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster2.dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster2.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when `dcache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster2.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x10000

**subcluster2.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.ecv\_support\_level**

Implement Enhanced Counter Virtualization feature from ARMv8.6. 0, Not supported. 1, fully supported without CNTPOFF. 2, fully supported with CNTPOFF (FEAT\_ECV).

Type: uint8\_t

Default value: 2

**subcluster2.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster2.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster2.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster2.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster2.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: `uint16_t`

Default value: `0x1`

#### **`subcluster2.ete.RES0_STATEFUL`**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: `bool`

Default value: `false`

#### **`subcluster2.ete.RETSTACK`**

Return stack depth.

Type: `uint8_t`

Default value: `3`

#### **`subcluster2.ete.SIM_OVERFLOW_GRANULARITY`**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: `0x64`

#### **`subcluster2.ete.SIM_OVERFLOW_PERCENTAGE`**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: `0`

#### **`subcluster2.ete.SOURCE_ADDRESS`**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

#### **`subcluster2.ete.TRACE_OUTPUT`**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

#### **`subcluster2.ete.TRCRSRTA_FORCED_EXCEP`**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

### **`subcluster2.ext_abort_so_write_ras_type`**

External Aborts are reported as RAS error type specified in this param. Values: 0 = NONE, 1 = UC, 2 = UEU, 3 = UEO, 4 = UER, 5 = CE.

Type: `uint8_t`

Default value: 2

### **`subcluster2.force_mte_tag_access_razwi_and_ignore_tag_checks`**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

### **`subcluster2.force_zero_PSTATE_PAN`**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **`subcluster2.force_zero_mpam_partid_and_pmg`**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: 0

### **`subcluster2.has_delayed_dbgreg`**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `false`

### **`subcluster2.has_delayed_sysreg`**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **subcluster2.has\_enhanced\_pan**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **subcluster2.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: `bool`

Default value: `false`

### **subcluster2.has\_statistical\_profiling**

Whether Statistical Based Profiling is implemented (FEAT\_SPE).

Type: `bool`

Default value: `true`

### **subcluster2.has\_v8\_7\_spe\_inverted\_filtering**

Where FEAT\_SPEv1p2 is implemented, whether inverted filtering by events is implemented (represented by PMISDR.FnE).

Type: `bool`

Default value: `false`

### **subcluster2.has\_v8\_7\_spe\_previous\_branch\_target**

Where FEAT\_SPEv1p2 is implemented, whether the optional branch target feature is implemented (FEAT\_SPE\_PBT).

Type: `bool`

Default value: `false`

### **subcluster2.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **subcluster2.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster2.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster2.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster2.icache-size**

L1 I-Cache size in bytes.

Type: uint32\_t

Default value: 0x10000

**subcluster2.instruction\_tlb\_size**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: uint32\_t

Default value: 0x0

**subcluster2.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: uint8\_t

Default value: 0

**subcluster2.memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: uint8\_t

Default value: 3

**subcluster2.mpam\_has\_altsp**

DEPRECATED: MPAMIDR\_EL1.HAS\_ALTSP is required when FEAT\_RME is implemented.

Type: bool

Default value: false

**subcluster2.mpamidr\_has\_force\_ns**

Whether MPAMIDR\_EL1.HAS\_FORCE\_NS bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: uint8\_t

Default value: 0

**subcluster2.mpamidr\_has\_sdeflt**

Whether MPAMIDR\_EL1.HAS\_SDEFLT bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: uint8\_t

Default value: 1

**subcluster2.mpamidr\_has\_tidr**

Whether MPAMIDR\_EL1.HAS\_TIDR bit is set or clear.values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.6 is enabled.- 2, feature is implemented.

Type: uint8\_t

Default value: 1

**subcluster2.pmu-num\_counters**

Number of PMU counters implemented.

Type: uint8\_t

Default value: 31

**subcluster2.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

**subcluster2.stage12\_tlb\_size**

Number of stage1+2 tlb entries. Valid values are 0 or >= 4.

Type: uint32\_t

Default value: 0x80

**subcluster2.tcr\_txsz\_undersize\_should\_fault**

If large VA is not supported, Whether undersized TxSZ value should generate translation fault.

Type: bool

Default value: false

**subcluster2.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster2.tlbi_stall_enabled`**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

#### **`subcluster2.treat_PAC_as_NOP`**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Brach, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

#### **`subcluster2.walk_cache_latency`**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.53 ARMCortexA520CT\_CortexA725CT

Defined in `LISA/ARMCortexA520CT_CortexA725CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA520 r0p1	Full support
CortexA725 r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `num_acp`
- `subcluster0.has_delayed_dbgreg`

## About ARMCortexA520CT\_CortexA725CT

The number of cores in each subcluster is configurable using the following parameters:

### **`subcluster0.NUM_CORES`**

Possible values are 1-13 (ARMCortexA520CT).

### **`subcluster1.NUM_CORES`**

Possible values are 1-13 (ARMCortexA725CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- `<port_name>[0-12]` for cores in `subcluster0`.
- `<port_name>[13-25]` for cores in `subcluster1`.

All instances in the Master cross trigger matrix port array, `cti[26]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu12` identify cores in `subcluster0`.
- `subcluster1.cpu0` to `subcluster1.cpu12` identify cores in `subcluster1`.

For information about the cores in this model, see:

- [ARMCortexA520CT](#).
- [ARMCortexA725CT](#).

## Iris and MTI instances for ARMCortexA520CT\_CortexA725CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA520CT_CortexA725CT	Cluster_ARM_Cortex-A520_CortexA725_Heterogeneous
ARMCortexA520CT_CortexA725CT.AMU	PVBusLogger
ARMCortexA520CT_CortexA725CT.AMU.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.DAP	PVBusLogger
ARMCortexA520CT_CortexA725CT.DAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.DSU	DSU-120

Name	Instance type
ARMCortexA520CT_CortexA725CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT_CortexA725CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520CT_CortexA725CT.DSU.PPU_coreZ (where Z = 0-1)	PPUv1
ARMCortexA520CT_CortexA725CT.DSU.PPU_coreZ.busslave (where Z = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA725CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520CT_CortexA725CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520CT_CortexA725CT.DSU.shared_cache	PVCache
ARMCortexA520CT_CortexA725CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT_CortexA725CT.DSU.shared_cache.upstream[Z] (where Z = 0-6)	PVBusSlave
ARMCortexA520CT_CortexA725CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA520CT_CortexA725CT.MMAP	PVBusLogger
ARMCortexA520CT_CortexA725CT.MMAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.RAS	PVBusLogger
ARMCortexA520CT_CortexA725CT.RAS.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.cpuZ.debug_rom (where Z = 0-1)	debug_rom
ARMCortexA520CT_CortexA725CT.ext_bus	PVBusLogger
ARMCortexA520CT_CortexA725CT.ext_bus.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA520CT_CortexA725CT.global_debug_rom	debug_rom
ARMCortexA520CT_CortexA725CT.secondary_debug_rom	debug_rom
ARMCortexA520CT_CortexA725CT.subcluster0	Subcluster_ARM_Cortex-A520
ARMCortexA520CT_CortexA725CT.subcluster0.cpu0	ARM_Cortex-A520
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.UTLB (where Z = 0-1)	TLB
ARMCortexA520CT_CortexA725CT.subclusterZ.cpuU.dtlb (where Z = 0-1; U = 0-1)	TLB
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1dcache (where Z = 0-1)	PVCache
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1dcache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1dcache.upstream[0] (where Z = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1icache (where Z = 0-1)	PVCache
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1icache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1icache.upstream[0] (where Z = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l2cache (where Z = 0-1)	PVCache
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l2cache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l2cache.upstream[W] (where Z = 0-1; W = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA725CT.subclusterZ.sve (where Z = 0-1)	ScalableVectorExtension

Name	Instance type
ARMCortexA520CT_CortexA725CT.subcluster1	Subcluster_ARM_Cortex-A725
ARMCortexA520CT_CortexA725CT.subcluster1.cpu0	ARM_Cortex-A725

This model has the following MTI trace components:

Name	Component type
ARMCortexA520CT_CortexA725CT.AMU	PVBusLogger
ARMCortexA520CT_CortexA725CT.AMU.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.DAP	PVBusLogger
ARMCortexA520CT_CortexA725CT.DAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.DSU	DSU-120
ARMCortexA520CT_CortexA725CT.DSU.PPU_cluster	PPUv1
ARMCortexA520CT_CortexA725CT.DSU.PPU_cluster.busslave	PVBusSlave
ARMCortexA520CT_CortexA725CT.DSU.PPU_coreZ (where Z = 0-1)	PPUv1
ARMCortexA520CT_CortexA725CT.DSU.PPU_coreZ.busslave (where Z = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA725CT.DSU.l3_flusher	AsyncCacheFlushUnit
ARMCortexA520CT_CortexA725CT.DSU.mpam_busslave	PVBusSlave
ARMCortexA520CT_CortexA725CT.DSU.shared_cache	PVCache
ARMCortexA520CT_CortexA725CT.DSU.shared_cache.downstream[0].pvbusmaster	PVBusMaster
ARMCortexA520CT_CortexA725CT.DSU.shared_cache.upstream[Z] (where Z = 0-6)	PVBusSlave
ARMCortexA520CT_CortexA725CT.DSU.utility_slave[0]	PVBusSlave
ARMCortexA520CT_CortexA725CT.MMAP	PVBusLogger
ARMCortexA520CT_CortexA725CT.MMAP.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.RAS	PVBusLogger
ARMCortexA520CT_CortexA725CT.RAS.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.ext_bus	PVBusLogger
ARMCortexA520CT_CortexA725CT.ext_bus.mapper	PVBusMapper
ARMCortexA520CT_CortexA725CT.gic_cpuif_decoder_cluster	GICv3CPUInterfaceDecoder
ARMCortexA520CT_CortexA725CT.subcluster0.cpu0	ARM_Cortex-A520
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.UTLB (where Z = 0-1)	TLB
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1dcache (where Z = 0-1)	PVCache
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1dcache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1dcache.upstream[0] (where Z = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1icache (where Z = 0-1)	PVCache
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1icache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l1icache.upstream[0] (where Z = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l2cache (where Z = 0-1)	PVCache

Name	Component type
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l2cache.downstream[0].pvbusmaster (where Z = 0-1)	PVBusMaster
ARMCortexA520CT_CortexA725CT.subclusterZ.cpu0.l2cache.upstream[W] (where Z = 0-1; W = 0-1)	PVBusSlave
ARMCortexA520CT_CortexA725CT.subcluster1.cpu0	ARM_Cortex-A725

### Ports for ARMCortexA520CT\_CortexA725CT

Port	Direction	Protocol	Description
acp_s	slave	PVBus	AXI ACP slave port.
AEND0MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND1MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND2MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
AEND3MP	slave	Value_64	Port to obtain end address of valid peripheral address range (exclusive).
ASTART0MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART1MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART2MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
ASTART3MP	slave	Value_64	Port to obtain start address of valid peripheral address range (inclusive).
broadcastatomic	slave	Signal	CHI defined pins.
broadcastcachemaint	slave	Signal	ACE defined pins.
broadcastouter	slave	Signal	ACE defined pins.
broadcastpersist	slave	Signal	CHI defined pins.
cfgend	slave	Signal	This signal is for EE bit initialisation.
cfgsdisable	slave	Signal	This signal disables write access to some secure Interrupt Controller registers.
clk_in	slave	ClockSignal	The clock signal connected to the clk_in port is used to determine the rate at which the cluster level components run e.g cluster level timers, caches and pmu.
cluster_pcs_m_pchannel	master	PChannel	Cluster PCSM signal
cluster_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the cluster power info
cluster_ppu_hw_stat	master	Value	Cluster PPU power state

Port	Direction	Protocol	Description
clusterid	slave	Value	The cluster ID maps to the affinity levels of the MPIDR_EL1 register and is evaluated based on the MPIDR_EL1 layout. If MPIDR_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR_EL1 supports 24-bit cluster affinity levels, bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set ManagerID64 of the core.
clusterpmuirq	master	Signal	DynamiQ pmu irq
CNTHPIRQ	master	Signal	Timer signals to SOC.
CNTHPSIRQ	master	Signal	Timer signals to SOC
CNTHVIRQ	master	Signal	Timer signals to SOC.
CNTHVSIQ	master	Signal	Timer signals to SOC
CNTPNSIRQ	master	Signal	Timer signals to SOC.
CNTPSIQ	master	Signal	Timer signals to SOC.
cntvalueb	slave	CounterInterface	Interface to SoC level counter module.
CNTVIRQ	master	Signal	Timer signals to SOC.
commirq	master	Signal	Interrupt signal from debug communications channel.
core_clk_in	slave	ClockSignal	The clock signal connected to the core_clk_in port is used to determine the rate at which each core executes instructions.
core_pcsn_pchannel	master	PChannel	Core PCSM signals
core_powerdown_out	master	Signal	DEPRECATED - An output from PPUs that informs thermal controller of the core power info
core_ppu_hw_stat	master	Value	Notify the power state change inside the PPU.
coreerrirq	master	Signal	Error indicator for an ECC error that causes potential data corruption or loss of coherency
corefaultirq	master	Signal	Fault indicator for a detected 1 or 2 bit ECC error
coreinstrrun	master	Signal	Core Running State
cryptodisable	slave	Signal	Disable cryptography extensions after reset.
cti	master	v8EmbeddedCrossTrigger_controlprotocol	Cross trigger matrix port.
ctidbgirq	master	Signal	Cross Trigger Interface (CTI) interrupt trigger output.
dbgen	slave	Signal	External debug interface.
dbgnopwrdown	master	Signal	No power-down request.
dbgprupreq	master	Signal	Debug power up request.
defaultMP	slave	Signal	If DefaultMP is asserted, all the transactions go to peripheral ports except the configured address ranges. Configured address ranges are sent to main master interface ports.
dev_debug_s	slave	PVBus	External debug interface.
event	peer	Signal	This peer port of event input (and output) is for wakeup from WFE.
fiq	slave	Signal	This signal drives the CPUs fast-interrupt handling.

Port	Direction	Protocol	Description
gicreset	master	Signal	An output from PPU that can be used to reset GICCLK domain components
gicv3_redistributor_s	slave	GICv3Comms	GICv3 AXI-stream port.
irq	slave	Signal	This signal drives the CPUs interrupt handling.
memorymapped_debug_s	slave	PVBus	External debug interface.
pmbirq	master	Signal	Interrupt signal from the statistical profiling unit.
pmuirq	master	Signal	Interrupt signal from performance monitoring unit.
ppu_cluster_irq	master	Signal	PPU cluster interrupt.
ppu_cluster_isolate	master	Signal	PPU Cluster Domain isolation control.
ppu_cluster_wakerequest	slave	Signal	PPU cluster wake request signal.
ppu_core_irq	master	Signal	PPU core interrupt.
ppu_core_isolate	master	Signal	PPU Core Domain isolation control.
ppu_core_wakerequest	slave	Signal	PPU core wake request signal.
presetdbg	slave	Signal	Initialize the shared debug APB, Cross Trigger Interface (CTI), and Cross Trigger Matrix (CTM) logic.
pvbus_m0	master	PVBus	The core will generate bus requests on this port.
pvbus_periph_m	master	PVBus	The core can generate peripheral bus request on this port.
rei	slave	Signal	Per core RAM Error Interrupt.
reset	slave	Signal	Reset signal to cluster.
rvbaraddr	slave	Value_64	Reset vector base address.
sci_m	master	SystemCoherencyInterface	System coherency interface port, which is used to take the whole cluster into/out-of coherency domain
sei	slave	Signal	Per core System Error physical pins.
spiden	slave	Signal	External debug interface.
ticks	master	InstructionCount	This port should be connected to one of the two ticks ports on a 'visualisation' component, in order to display a running instruction count.
trbirq	master	Signal	Interrupt signal from the trace buffer unit.
utility_bus_s	slave	PVBus	Utility bus slave
vcpumntirq	master	Signal	Interrupt signal for virtual CPU maintenance IRQ.
vfiq	slave	Signal	Virtualised FIQ.
virq	slave	Signal	Virtualised IRQ.
virtio_s	slave	PVBus	The virtio coherent port, hooks directly into the L2 system and becomes coherent (assuming attributes are set correctly).
vsei	slave	Signal	Per core virtual System Error physical pins.

## Parameters for ARMCortexA520CT\_CortexA725CT

### **AEND0\_DEFAULT**

Default end address for peripheral port 0 address range exclusive (corresponds to AENDMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

### **AEND1\_DEFAULT**

Default end address for peripheral port 1 address range exclusive (corresponds to AENDMP1 input signal).

Type: `uint64_t`

Default value: `0x0`

### **AEND2\_DEFAULT**

Default end address for peripheral port 2 address range exclusive (corresponds to AENDMP2 input signal).

Type: `uint64_t`

Default value: `0x0`

### **AEND3\_DEFAULT**

Default end address for peripheral port 3 address range exclusive (corresponds to AENDMP3 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART0\_DEFAULT**

Default start address for peripheral port 0 address range inclusive (corresponds to ASTARTMP0 input signal).

Type: `uint64_t`

Default value: `0x0`

### **ASTART1\_DEFAULT**

Default start address for peripheral port 1 address range inclusive (corresponds to ASTARTMP1 input signal).

Type: `uint64_t`

Default value: 0x0

### **ASTART2\_DEFAULT**

Default start address for peripheral port 2 address range inclusive (corresponds to ASTARTMP2 input signal).

Type: `uint64_t`

Default value: 0x0

### **ASTART3\_DEFAULT**

Default start address for peripheral port 3 address range inclusive (corresponds to ASTARTMP3 input signal).

Type: `uint64_t`

Default value: 0x0

### **BROADCASTATOMIC**

Enable broadcasting of atomic operation. The broadcastatomic signal will override this value if used.

Type: `bool`

Default value: `true`

### **BROADCASTCACHEMAINT**

Enable broadcasting of cache maintenance operations to downstream caches. The broadcastcachemaint signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTOUTER**

Enable broadcasting of Outer Shareable transactions. The broadcastouter signal will override this value if used.

Type: `bool`

Default value: `false`

### **BROADCASTPERSIST**

Enable broadcasting of cache clean to the point of persistence operations. The broadcastpersist signal will override this value if used.

Type: `bool`

Default value: `true`

### **CLUSTER\_ID**

The Cluster ID maps to the affinity levels of the MPIDR\_EL1 register and is evaluated based on the MPIDR\_EL1 layout. If MPIDR\_EL1 supports 16-bit cluster affinity levels, bits [15:8] map to IDRAFF3, while bits [7:0] map to IDRAFF2. If MPIDR\_EL1 supports 24-bit cluster affinity levels, the bits [23:16] map to IDRAFF3, bits [15:8] map to IDRAFF2, and bits [7:0] map to IDRAFF1. This configuration also updates all relevant component DEVAFF registers and is used to set the ManagerID64 of the core.

Type: `uint32_t`

Default value: `0x0`

### **CMO\_broadcast\_when\_cache\_state\_modelling\_disabled**

Skip broadcasting some cache maintenance operations (CMOs) when cache state modelling is disabled as a performance optimisation. This value may affect performance of the simulation, but is required if the rest of the system is sensitive to certain events even when cache state modelling is disabled. Possible values are: - 0 = All CMOs are broadcast if architecturally required - 1 = Data cache maintenance to the PoC or PoU are not broadcast when data cache state modelling is disabled. Otherwise all CMOs are broadcast if architecturally required.

Type: `uint8_t`

Default value: `1`

### **DBGROMADDR**

Initialization value of DBGDRAR register. Bits[55:12] of this register specify the ROM table physical address.

Type: `uint64_t`

Default value: `0x0`

### **DBGROMADDRV**

If true, set bits[1:0] of the CP15 DBGDRAR to indicate that the address is valid.

Type: `bool`

Default value: `false`

### **GICDISABLE**

Disable the new style GICv3 CPU interface in each core model. It can be set for the platform not having a GICv3 Interface (GICv3).

Type: `bool`

Default value: `true`

**bus\_type**

Cosmetic change that changes reset value of L2ACTLR register. 0, ACE. 1, CHI. 2, AXI.

Type: `uint8_t`

Default value: 0

**core\_complex\_mapping**

Defines Complex descriptions for platforms that support several Cores per Complex like Cortex-A510. JSON format: {"complex0": { "cores" : [ 0, 1 ], "l2-cache" : {"exists":1, "size":16MB}}, ... , "complexN": { "cores" : [<core\_list>, "l2-cache" : {"exists":1, "size":16MB}}} where <core\_list> is the list of cores in the complexN. Effective only when the parameter value is not empty.

Type: `string`

Default value: {"complex0": { "cores": [0, 1], "l2-cache" : {"exists":1, "size": "16MB"}}, "complex1": { "cores": [2, 3], "l2-cache" : {"exists":1, "size": "16MB"}}, "complex2": { "cores": [4, 5], "l2-cache" : {"exists":1, "size": "16MB"}}, "complex3": { "cores": [6, 7], "l2-cache" : {"exists":1, "size": "16MB"}}, "complex4": { "cores": [8, 9], "l2-cache" : {"exists":1, "size": "16MB"}}, "complex5": { "cores": [10, 11], "l2-cache" : {"exists":1, "size": "16MB"}}, "complex6": { "cores": [12, 13], "l2-cache" : {"exists":1, "size": "16MB"}} }

**core\_power\_on\_by\_default**

If true, The cluster and cores will be powered on for v9 after reset. If this parameter is enabled, the powerdown signal from in-cluster PPUs which is connected to cores and cluster reset signals will be cleared after reset and triggers the power on sequence in PPU.

Type: `bool`

Default value: `false`

**dcache-state\_modelled**

Set whether D-cache has stateful implementation.

Type: `bool`

Default value: `false`

**enable\_simulation\_performance\_optimizations**

With this option enabled, the model will run more quickly, but be less accurate to exact CPU behavior. The model will still be functionally accurate for software, but may increase differences seen between hardware behavior and model behavior for certain workloads (it changes the micro-architectural value of `stage12_tlb_size` parameter to 1024).

Type: `bool`

Default value: `true`

### **has\_peripheral\_port**

If true, an additional AXI peripheral port is configured.

Type: `bool`

Default value: `false`

### **icache-state\_modelled**

Set whether I-cache has stateful implementation.

Type: `bool`

Default value: `false`

### **l3cache-has\_mpam**

L3 Cache has MPAM support.

Type: `bool`

Default value: `true`

### **l3cache-hit\_latency**

L3 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-maintenance\_latency**

L3 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **l3cache-miss\_latency**

L3 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**l3cache-read\_access\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per access (of size l3cache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l3cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-read\_bus\_width\_in\_bytes**

L3 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**l3cache-read\_latency**

L3 Cache timing annotation latency for read accesses given in ticks per byte accessed. l3cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-size**

L3 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**l3cache-snoop\_data\_transfer\_latency**

L3 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**l3cache-snoop\_issue\_latency**

L3 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **l3cache-ways**

L3 Cache number of ways (sets are implicit from size).

Type: `uint16_t`

Default value: 16

### **l3cache-write\_access\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per access (of size `l3cache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l3cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **l3cache-write\_bus\_width\_in\_bytes**

L3 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: 0x10

### **l3cache-write\_latency**

L3 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l3cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

### **mpmm\_accumulator\_multiplier**

Parameter for non-architectural behaviour to provide a multiplier for the MPMM accumulator. value of `n` means the accumulator will use (`n * accumulator value`) to calculate the mpmm threshold (MPMM). is provided as a fast model workaround to handle cases where execution of quantums in SystemC does not result in an expected threshold in MPMM counters being reached at the anticipated time.

Type: `uint8_t`

Default value: 1

### **num\_acp**

Number of ACP ports.

Type: `uint8_t`

Default value: 0

### **num\_nodes**

Number of transport nodes. Zero implies direct-connect configuration.

Type: `uint8_t`

Default value: 1

### **revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: `uint8_t`

Default value: 0

### **subcluster0.CPUCFR**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: 0x0

### **subcluster0.NUM\_CORES**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: 1

### **subcluster0.core\_cache\_protection**

core\_cache\_protection can change ERROFR, ERROPFGF and ERROPFGCTL fields. Possible values are: -1:Not implemented (by default), 0:Disabled, 1:Enabled.

Type: `int8_t`

Default value: 1

### **subcluster0.cpi\_div**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: 0x1

**subcluster0.cpi\_mul**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

**subcluster0.cpu0.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster0.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.l2cache-read_bus_width_in_bytes`**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

### **`subcluster0.cpu0.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu0.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x80000`

**subcluster0.cpu0.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

**subcluster0.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

**subcluster0.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster0.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster0.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster0.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster0.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster0.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**subcluster0.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu1.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**`subcluster0.cpu1.semihosting-T32_HLT`**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**`subcluster0.cpu1.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**`subcluster0.cpu1.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**`subcluster0.cpu1.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**`subcluster0.cpu1.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster0.cpu1.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster0.cpu1.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf0000000`

### **`subcluster0.cpu1.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu1.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf0000000`

### **`subcluster0.cpu1.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu1.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu1.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu10.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster0.cpu10.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu10.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu10.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu10.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu10.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu10.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu10.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu10.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu10.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu10.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

#### **subcluster0.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

#### **subcluster0.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu10.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu10.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu10.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu10.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster0.cpu10.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu10.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu10.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu10.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu10.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu10.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu10.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu11.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu11.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu11.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu11.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu11.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: `uint32_t`

Default value: `0x10`

**subcluster0.cpu11.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu11.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x80000

**subcluster0.cpu11.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu11.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu11.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu11.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu11.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu11.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu11.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu11.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu11.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu11.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu11.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu11.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu11.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu11.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu11.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu11.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu11.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster0.cpu11.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu11.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu11.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu12.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu12.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu12.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu12.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: bool

Default value: false

**subcluster0.cpu12.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

#### **subcluster0.cpu12.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu12.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu12.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu12.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu12.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu12.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu12.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu12.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu12.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu12.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu12.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu12.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu12.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu12.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu12.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu12.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu12.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu12.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu12.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu12.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu12.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu12.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu12.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu12.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster0.cpu2.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster0.cpu2.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu2.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu2.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu2.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: string

Default value: N/A

**subcluster0.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster0.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu2.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu2.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu3.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu3.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu3.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu3.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu3.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu3.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu3.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu3.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu3.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu3.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu3.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu3.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu3.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu4.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu4.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu4.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu4.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu4.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu4.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu4.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu4.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu4.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster0.cpu4.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu5.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu5.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu5.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu5.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu5.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu5.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu5.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu5.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu5.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu5.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu6.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu6.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu6.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu6.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu6.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu6.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

### **`subcluster0.cpu6.semihosting-Thumb_SVC`**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

### **`subcluster0.cpu6.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

### **`subcluster0.cpu6.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

### **`subcluster0.cpu6.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

### **`subcluster0.cpu6.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu6.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu6.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu6.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu6.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu6.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu6.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster0.cpu7.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu7.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu7.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster0.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster0.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster0.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster0.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster0.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster0.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster0.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster0.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster0.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.cpu8.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu8.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.cpu8.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu8.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

**subcluster0.cpu8.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

**subcluster0.cpu8.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu8.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster0.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster0.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster0.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster0.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster0.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster0.cpu8.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu8.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster0.cpu9.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu9.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster0.cpu9.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.cpu9.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster0.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.l2cache-read\_bus\_width\_in\_bytes**

L2 Cache read bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x10

**subcluster0.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x80000

#### **subcluster0.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu9.l2cache-ways**

L2 Cache number of ways (sets are implicit from size).

Type: uint8\_t

Default value: 8

#### **subcluster0.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.cpu9.l2cache-write\_bus\_width\_in\_bytes**

L2 Cache write bus width in bytes used to calculate per-access timing annotations.

Type: uint32\_t

Default value: 0x20

**subcluster0.cpu9.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.cpu9.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster0.cpu9.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster0.cpu9.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster0.cpu9.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster0.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster0.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster0.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster0.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster0.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster0.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster0.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster0.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

### **`subcluster0.cpu9.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

### **`subcluster0.cpu9.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster0.cpu9.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster0.cpu9.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster0.dcache-hit_latency`**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster0.dcache-maintenance_latency`**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster0.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: bool

Default value: false

#### **subcluster0.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster0.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x8000

#### **subcluster0.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-write_access_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size `dcache-write_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `dcache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.dcache-write_latency`**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. `dcache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.ete.CLAIMTAGS`**

Number of claim tags.

Type: `uint8_t`

Default value: 4

#### **`subcluster0.ete.MAX_INST_PER_Q`**

Maximum limit for the number of instructions implied by a Q element.

Type: `uint16_t`

Default value: `0x1`

#### **`subcluster0.ete.PIDR_CM0D`**

TRCPIDR CM0D value.

Type: `uint8_t`

Default value: 0

#### **`subcluster0.ete.PIDR_REVAND`**

TRCPIDR REVAND value.

Type: `uint8_t`

Default value: 0

**subcluster0.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: uint16\_t

Default value: 0x1

**subcluster0.ete.RES0\_STATEFUL**

Whether **RES0** bits are stateful or **RAZ/WI**.

Type: bool

Default value: false

**subcluster0.ete.RETSTACK**

Return stack depth.

Type: uint8\_t

Default value: 3

**subcluster0.ete.REVISION**

TRCIDR1 revision value.

Type: uint8\_t

Default value: 0

**subcluster0.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: uint32\_t

Default value: 0x64

**subcluster0.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: uint8\_t

Default value: 0

**subcluster0.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**subcluster0.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: `N/A`

**subcluster0.ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**subcluster0.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

**subcluster0.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

**subcluster0.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAM0\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: 0

**subcluster0.has\_actlr2**

If true ACLTR2 exists and ACTLR2(NS) is aliased to ACTLR\_EL1[63:32].

Type: bool

Default value: true

**subcluster0.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: bool

Default value: false

**subcluster0.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: bool

Default value: true

**subcluster0.has\_dot\_product**

Possible values of this parameter are:- 1, feature not implemented.- 2, feature is implemented.

Type: uint8\_t

Default value: 2

**subcluster0.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: bool

Default value: false

**subcluster0.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster0.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when `icache-state_modelled=true`.

Type: `bool`

Default value: `false`

**subcluster0.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size `icache-read_bus_width_in_bytes`). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `icache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. `icache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `icache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster0.icache-size**

L1 I-Cache size in bytes.

Type: `uint32_t`

Default value: `0x8000`

#### **`subcluster0.invalidate_code_cache_on_icache_cmo`**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: `0`

#### **`subcluster0.memory_tagging_support_level`**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: `3`

#### **`subcluster0.pmu-num_counters`**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: `6`

#### **`subcluster0.ptw_latency`**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster0.ras_extra_configurations`**

Miscellaneous configurations for error records. An array of JSON objects. Note for `ERXCTLR_EL1` register it only allows to define the mask value for the `IMPDEF` fields, ie bits [63:32] and bit 1, but its reset value applies on all fields. Note for `ERXMISCN` masks - these are 64 bit masks covering the 64 bit registers `ERXMISCN_EL1`. E.g. [{"Index": 0, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXMISC1\_mask": 0x0, "ERXMISC1\_reset": 0x0, "ERXMISC2\_mask": 0x0, "ERXMISC2\_reset": 0x0, "ERXMISC3\_mask": 0x0, "ERXMISC3\_reset": 0x0, "ERXCTLR\_EL1\_mask": 0x0, "ERXCTLR\_EL1\_reset": 0x0}, {"Index": 1, "ERXMISCO\_mask": 0x0, "ERXMISCO\_reset": 0x0, "ERXSTATUS\_IERR\_mask": 0x300}].

Type: `string`

Default value: "[ { \"Index\": 1, \"ERXMISC0\_mask\": 0xFFFFc0003fc3, \"ERXMISC1\_mask\": 0x03F870003FF30f07, \"ERXPGCTL\_reset\": 0x1000 }, { \"Index\": 2, \"ERXMISC0\_mask\": 0xFFFFe007ffc0, \"ERXMISC0\_reset\": 0x2, \"ERXSTATUS\_IERR\_mask\": 0x300 , \"ERXMISC1\_mask\": 0xFF8700ffff31f0f, \"ERXPGCTL\_reset\": 0x1000 } ]"

### **subcluster0.ras\_pfg\_clock\_mhz**

RAS Pseudo-Fault generation clock rate in MHz.

Type: uint8\_t

Default value: 12

### **subcluster0.revision\_number**

Revision number of TRM implemented by the model. Changing the value can change the model behaviour. Visible as the Variant field in MIDR/MIDR\_EL1. Corresponds to the revision number X in rXpY.

Type: uint8\_t

Default value: 0

### **subcluster0.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: uint64\_t

Default value: 0x0

### **subcluster0.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: bool

Default value: false

### **subcluster0.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: bool

Default value: false

### **subcluster0.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.CPUCFR`**

Value of CPU Configuration Register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.NUM_CORES`**

Number of cores in the subcluster. Total number of cores in cluster may not exceed 14.

Type: `uint8_t`

Default value: `1`

### **`subcluster1.cpi_div`**

Divider for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

### **`subcluster1.cpi_mul`**

Multiplier for calculating CPI (Cycles Per Instruction).

Type: `uint32_t`

Default value: `0x1`

### **`subcluster1.cpu0.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu0.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu0.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster1.cpu0.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu0.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu0.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu0.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu0.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu0.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu0.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu0.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu0.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu0.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu0.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu0.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu0.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu0.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu0.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu0.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu1.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu1.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu1.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu1.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

**subcluster1.cpu1.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu1.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu1.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu1.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu1.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu1.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu1.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu1.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu1.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu1.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu1.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu1.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu1.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu1.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu1.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu1.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu1.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu10.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu10.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu10.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu10.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: 0x0

#### **subcluster1.cpu10.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

#### **subcluster1.cpu10.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu10.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu10.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu10.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu10.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu10.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu10.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu10.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu10.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu10.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu10.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu10.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: string

Default value: N/A

**subcluster1.cpu10.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu10.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu10.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu10.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu10.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu10.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu10.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu10.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu11.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu11.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter trace\_special\_hlt\_imm16.

Type: `bool`

Default value: `false`

**subcluster1.cpu11.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu11.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu11.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster1.cpu11.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu11.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu11.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu11.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu11.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu11.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu11.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu11.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**`subcluster1.cpu1.semihosting-cmd_line`**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**`subcluster1.cpu1.semihosting-cwd`**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**`subcluster1.cpu1.semihosting-enable`**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**`subcluster1.cpu1.semihosting-heap_base`**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**`subcluster1.cpu1.semihosting-heap_limit`**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**`subcluster1.cpu1.semihosting-stack_base`**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**`subcluster1.cpu1.semihosting-stack_limit`**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

#### **`subcluster1.cpu11.trace_special_hlt_imm16`**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

#### **`subcluster1.cpu11.vfp-enable_at_reset`**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu11.vfp-present`**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu12.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu12.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu12.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu12.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu12.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu12.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu12.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu12.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu12.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu12.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster1.cpu12.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu12.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu12.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu12.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu12.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu12.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu12.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu12.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu12.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu12.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu12.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu12.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu12.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu12.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu12.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu12.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu12.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu12.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu12.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu12.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu2.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu2.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu2.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu2.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu2.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

### **`subcluster1.cpu2.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu2.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu2.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu2.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu2.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu2.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu2.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu2.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu2.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu2.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu2.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu2.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu2.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu2.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu2.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu2.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu2.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

### **`subcluster1.cpu3.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu3.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu3.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster1.cpu3.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu3.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu3.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu3.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu3.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu3.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu3.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu3.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu3.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu3.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu3.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu3.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu3.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu3.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu3.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu3.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu3.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu3.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu4.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu4.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu4.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu4.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu4.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster1.cpu4.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu4.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu4.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu4.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu4.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu4.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu4.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu4.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu4.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu4.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu4.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu4.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu4.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu4.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu4.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster1.cpu5.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu5.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu5.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu5.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu5.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster1.cpu5.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu5.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu5.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu5.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu5.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu5.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu5.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu5.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu5.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu5.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu5.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu5.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu5.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu5.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu5.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu5.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu5.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu5.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu6.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu6.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu6.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu6.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu6.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

### **`subcluster1.cpu6.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu6.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu6.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu6.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu6.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu6.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu6.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu6.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu6.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: `60`

**subcluster1.cpu6.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: `171`

**subcluster1.cpu6.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu6.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu6.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu6.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu6.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu6.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu6.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu6.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu6.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu6.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

#### **`subcluster1.cpu7.CFGEND`**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.CFGTE`**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.CRYPTODISABLE`**

Disable cryptographic features.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.RVBARADDR`**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu7.enable_trace_special_hlt_imm16`**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

#### **`subcluster1.cpu7.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu7.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu7.l2cache-size**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: 0x100000

#### **subcluster1.cpu7.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu7.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu7.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu7.l2cache-write\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. l2cache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

#### **subcluster1.cpu7.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

#### **subcluster1.cpu7.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu7.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu7.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: 0xf000

**subcluster1.cpu7.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: 0x123456

**subcluster1.cpu7.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu7.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu7.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu7.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu7.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: bool

Default value: true

**subcluster1.cpu7.semihosting-heap\_base**

Virtual address of heap base.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu7.semihosting-heap\_limit**

Virtual address of top of heap.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu7.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: uint64\_t

Default value: 0x10000000

**subcluster1.cpu7.semihosting-stack\_limit**

Virtual address of stack limit.

Type: uint64\_t

Default value: 0xf000000

**subcluster1.cpu7.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu7.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu7.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.cpu8.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.CRYPTODISABLE**

Disable cryptographic features.

Type: `bool`

Default value: `false`

**subcluster1.cpu8.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

### **`subcluster1.cpu8.force-fpsid`**

Override the FPSID value.

Type: `bool`

Default value: `true`

### **`subcluster1.cpu8.l2cache-hit_latency`**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-maintenance_latency`**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-miss_latency`**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_access_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-read_latency` is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu8.l2cache-read_latency`**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. `l2cache-read_access_latency` must be set to 0 for per-byte latencies to be applied. This is in addition to

the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu8.l2cache-size`**

L2 Cache size in bytes.

Type: `uint32_t`

Default value: `0x100000`

#### **`subcluster1.cpu8.l2cache-snoop_data_transfer_latency`**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu8.l2cache-snoop_issue_latency`**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu8.l2cache-write_access_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if `l2cache-write_latency` is set. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

#### **`subcluster1.cpu8.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.max\_code\_cache\_mb**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: uint16\_t

Default value: 0x100

**subcluster1.cpu8.min\_sync\_level**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: uint8\_t

Default value: 0

**subcluster1.cpu8.semihosting-A32\_HLT**

A32 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-A64\_HLT**

A64 HLT number for semihosting calls.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.semihosting-ARM\_SVC**

A32 SVC number for semihosting calls.

Type: uint32\_t

Default value: 0x123456

**subcluster1.cpu8.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: uint8\_t

Default value: 60

**subcluster1.cpu8.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: uint8\_t

Default value: 171

**subcluster1.cpu8.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: `N/A`

**subcluster1.cpu8.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu8.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu8.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu8.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu8.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu8.trace\_special\_hlt\_imm16**

For this HLT number, IF enable\_trace\_special\_hlt\_imm16=true, skip performing usual HLT execution but call MTI trace if registered.

Type: uint16\_t

Default value: 0xf000

**subcluster1.cpu8.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: bool

Default value: false

**subcluster1.cpu8.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: true

**subcluster1.cpu9.CFGEND**

Endianness configuration at reset. 0, little endian. 1, big endian. Big endian is unsupported in the presence of Future Architecture Technologies (FAT).

Type: bool

Default value: false

**subcluster1.cpu9.CFGTE**

Instruction set state when resetting into AArch32. 0, A32. 1, T32.

Type: bool

Default value: false

**subcluster1.cpu9.CRYPTODISABLE**

Disable cryptographic features.

Type: bool

Default value: false

**subcluster1.cpu9.RVBARADDR**

Value of RVBAR\_ELx register.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu9.enable\_trace\_special\_hlt\_imm16**

Enable usage of parameter `trace_special_hlt_imm16`.

Type: `bool`

Default value: `false`

**subcluster1.cpu9.force-fpsid**

Override the FPSID value.

Type: `bool`

Default value: `true`

**subcluster1.cpu9.l2cache-hit\_latency**

L2 Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu9.l2cache-maintenance\_latency**

L2 Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu9.l2cache-miss\_latency**

L2 Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.cpu9.l2cache-read\_access\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-read\_latency**

L2 Cache timing annotation latency for read accesses given in ticks per byte accessed. l2cache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-size**

L2 Cache size in bytes.

Type: uint32\_t

Default value: 0x100000

**subcluster1.cpu9.l2cache-snoop\_data\_transfer\_latency**

L2 Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-snoop\_issue\_latency**

L2 Cache timing annotation latency for snoop accesses issued by this cache in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.cpu9.l2cache-write\_access\_latency**

L2 Cache timing annotation latency for write accesses given in ticks per access. If this parameter is non-zero, per-access latencies will be used instead of per-byte even if l2cache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.l2cache-write_latency`**

L2 Cache timing annotation latency for write accesses given in ticks per byte accessed. `l2cache-write_access_latency` must be set to 0 for per-byte latencies to be applied. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

### **`subcluster1.cpu9.max_code_cache_mb`**

Maximum size of the simulation code cache (MiB). For platforms with more than 2 cores this limit will be scaled down. (e.g 1/8 for 16 or more cores).

Type: `uint16_t`

Default value: `0x100`

### **`subcluster1.cpu9.min_sync_level`**

Force minimum syncLevel (0=off=default, 1=syncState, 2=postInsnIO, 3=postInsnAll).

Type: `uint8_t`

Default value: `0`

### **`subcluster1.cpu9.semihosting-A32_HLT`**

A32 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu9.semihosting-A64_HLT`**

A64 HLT number for semihosting calls.

Type: `uint16_t`

Default value: `0xf000`

### **`subcluster1.cpu9.semihosting-ARM_SVC`**

A32 SVC number for semihosting calls.

Type: `uint32_t`

Default value: `0x123456`

**subcluster1.cpu9.semihosting-T32\_HLT**

T32 HLT number for semihosting calls.

Type: `uint8_t`

Default value: 60

**subcluster1.cpu9.semihosting-Thumb\_SVC**

T32 SVC number for semihosting calls.

Type: `uint8_t`

Default value: 171

**subcluster1.cpu9.semihosting-cmd\_line**

Command line available to semihosting calls.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-cwd**

Base directory for semihosting file access.

Type: `string`

Default value: N/A

**subcluster1.cpu9.semihosting-enable**

Enable semihosting SVC/HLT traps.

Type: `bool`

Default value: `true`

**subcluster1.cpu9.semihosting-heap\_base**

Virtual address of heap base.

Type: `uint64_t`

Default value: 0x0

**subcluster1.cpu9.semihosting-heap\_limit**

Virtual address of top of heap.

Type: `uint64_t`

Default value: 0xf000000

**subcluster1.cpu9.semihosting-stack\_base**

Virtual address of base of descending stack.

Type: `uint64_t`

Default value: `0x10000000`

**subcluster1.cpu9.semihosting-stack\_limit**

Virtual address of stack limit.

Type: `uint64_t`

Default value: `0xf000000`

**subcluster1.cpu9.trace\_special\_hlt\_imm16**

For this HLT number, IF `enable_trace_special_hlt_imm16=true`, skip performing usual HLT execution but call MTI trace if registered.

Type: `uint16_t`

Default value: `0xf000`

**subcluster1.cpu9.vfp-enable\_at\_reset**

Enable VFP in CPACR, CPPWR, NSACR at reset. Warning: Arm recommends going through the implementation's suggested VFP power-up sequence!.

Type: `bool`

Default value: `false`

**subcluster1.cpu9.vfp-present**

Set whether the model has VFP support; always true in the presence of Future Architecture Technologies (FAT).

Type: `bool`

Default value: `true`

**subcluster1.dcache-hit\_latency**

L1 D-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when `dcache-state_modelled=true`.

Type: `uint64_t`

Default value: `0x0`

**subcluster1.dcache-maintenance\_latency**

L1 D-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-miss\_latency**

L1 D-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-prefetch\_enabled**

Enable simulation of data cache prefetching. This is only used when dcache-state\_modelled=true.

Type: bool

Default value: false

**subcluster1.dcache-read\_access\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per access (of size dcache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-read\_latency**

L1 D-Cache timing annotation latency for read accesses given in ticks per byte accessed. dcache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-size**

L1 D-Cache size in bytes.

Type: uint32\_t

Default value: 0x10000

**subcluster1.dcache-snoop\_data\_transfer\_latency**

L1 D-Cache timing annotation latency for received snoop accesses that perform a data transfer given in ticks per byte accessed. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-write\_access\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per access (of size dcache-write\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if dcache-write\_latency is set. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.dcache-write\_latency**

L1 D-Cache timing annotation latency for write accesses given in ticks per byte accessed. dcache-write\_access\_latency must be set to 0 for per-byte latencies to be applied. This is only used when dcache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

**subcluster1.ete.CLAIMTAGS**

Number of claim tags.

Type: uint8\_t

Default value: 4

**subcluster1.ete.ETE\_REVISION**

ETE revision: 0=ETEv1.0, 1=ETEv1.1, 2=ETEv1.2, 3=ETEv1.3.

Type: uint8\_t

Default value: 1

**subcluster1.ete.MAX\_INST\_PER\_Q**

Maximum limit for the number of instructions implied by a Q element.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.NumberOfRSPairs**

Number of resource selector pairs.

Type: uint8\_t

Default value: 8

**subcluster1.ete.PIDR\_CM0D**

TRCPIDR CM0D value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.PIDR\_REVAND**

TRCPIDR REVAND value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.PIDR\_REVISION**

TRCPIDR REVISION value.

Type: uint8\_t

Default value: 0

**subcluster1.ete.Q\_CADENCE**

Number of instruction blocks traced between two Q elements.

Type: uint16\_t

Default value: 0x1

**subcluster1.ete.RES0\_STATEFUL**

Whether RES0 bits are stateful or RAZ/WI.

Type: bool

Default value: false

**subcluster1.ete.RETSTACK**

Return stack depth.

Type: uint8\_t

Default value: 1

**subcluster1.ete.REVISION**

TRCIDR1 revision value.

Type: `uint8_t`

Default value: 0

**subcluster1.ete.SIM\_OVERFLOW\_GRANULARITY**

Number of instruction blocks in each granule, for simulated overflow.

Type: `uint32_t`

Default value: 0x64

**subcluster1.ete.SIM\_OVERFLOW\_PERCENTAGE**

Percentage of instruction blocks lost in each granule, for simulated overflow.

Type: `uint8_t`

Default value: 0

**subcluster1.ete.SOURCE\_ADDRESS**

Allow generation of source address elements.

Type: `bool`

Default value: `false`

**subcluster1.ete.TRACE\_OUTPUT**

File to which to write trace byte stream.

Type: `string`

Default value: N/A

**subcluster1.ete.TRCRSRTA\_FORCED\_EXCEP**

TRCRSR.TA value for a forcibly traced exception.

Type: `bool`

Default value: `false`

**subcluster1.ete.TSMARK**

Whether timestamp markers are supported.

Type: `bool`

Default value: `true`

### **subcluster1.force\_mte\_tag\_access\_razwi\_and\_ignore\_tag\_checks**

Force MTE tag accesses to **RAZ/WI** and also ignore tag checks irrespective of whether memory is tagged or not. This parameter doesn't affect non-load/store tag generation instructions like ADDG/GMI/IRG/SUBG. Please note that setting this parameter to true will also disable MTE tag access and tag check related traces.

Type: `bool`

Default value: `false`

### **subcluster1.force\_zero\_PSTATE\_PAN**

Non-architecture parameter to force PSTATE.PAN to be 0.0: No effect. 1: PSTATE.PAN is always treated as 0. The parameter optimizes the performance of updating PSTATE.PAN.

Type: `bool`

Default value: `false`

### **subcluster1.force\_zero\_mpam\_partid\_and\_pmg**

Non-architecture parameter to force MPAM PARTID, PMG and NS/SP to 0.0: No effect. 1: PARTID and PMG are always treated as 0. The parameter optimizes the performance of updating the registers MPAMO\_EL1, MPAM1\_EL1, MPAM2\_EL2, MPAM3\_EL3, MPAMHCR\_EL2.

Type: `uint8_t`

Default value: `0`

### **subcluster1.has\_delayed\_dbgreg**

Delay the functional effect of external debug register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **subcluster1.has\_delayed\_sysreg**

Delay the functional effect of system register writes until ISB or implicit barrier.

Type: `bool`

Default value: `true`

### **subcluster1.has\_enhanced\_pan**

Implements Armv8.7 Enhanced PAN feature (FEAT\_PAN3) values of this parameter are:- 1, feature is implemented if ARMv8.7 is enabled.- 2, feature is implemented.

Type: `uint8_t`

Default value: 2

### **subcluster1.has\_ete**

If true, implements the Embedded Trace Extension (FEAT\_ETE). This option is discarded if ete plugin is explicitly loaded (-plugin or -P).

Type: bool

Default value: false

### **subcluster1.has\_large\_va**

Implement support for the extended 52-bit virtual addresses from ARMv8.2 (FEAT\_LVA).values of this parameter are:- 0, feature is not enabled.- 1, feature is implemented if ARMv8.2 is enabled.- 2, feature is implemented.

Type: uint8\_t

Default value: 0

### **subcluster1.has\_statistical\_profiling**

Whether Statistical Based Profiling is implemented (FEAT\_SPE).

Type: bool

Default value: false

### **subcluster1.icache-hit\_latency**

L1 I-Cache timing annotation latency for hit. Intended to model the tag-lookup time. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.icache-maintenance\_latency**

L1 I-Cache timing annotation latency for cache maintenance operations given in total ticks. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.icache-miss\_latency**

L1 I-Cache timing annotation latency for miss. Intended to model the time for failed tag-lookup and allocation of intermediate buffers. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.icache-prefetch\_enabled**

Enable simulation of instruction cache prefetching. This is only used when icache-state\_modelled=true.

Type: bool

Default value: false

### **subcluster1.icache-read\_access\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per access (of size icache-read\_bus\_width\_in\_bytes). If this parameter is non-zero, per-access latencies will be used instead of per-byte even if icache-read\_latency is set. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus, this is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.icache-read\_latency**

L1 I-Cache timing annotation latency for read accesses given in ticks per byte accessed. icache-read\_access\_latency must be set to 0 for per-byte latencies to be applied. This is in addition to the hit or miss latency, and intended to correspond to the time taken to transfer across the cache upstream bus. This is only used when icache-state\_modelled=true.

Type: uint64\_t

Default value: 0x0

### **subcluster1.icache-size**

L1 I-Cache size in bytes.

Type: uint32\_t

Default value: 0x10000

### **subcluster1.instruction\_tlb\_size**

Number of stage1+2 itlb entries (or 0 for unified ITLB+DTLB).

Type: uint32\_t

Default value: 0x0

### **subcluster1.invalidate\_code\_cache\_on\_icache\_cmo**

If set, all PEs will invalidate simulation code cache when an I-side CMO is executed in a PE. Note: Enabling this parameter will reduce simulation performance.

Type: `uint8_t`

Default value: 0

### **subcluster1.memory\_tagging\_support\_level**

Specify the memory tagging extension support level: 0, not implemented.1, instructions and registers only are implemented (FEAT\_MTE).2, implemented (FEAT\_MTE2).3, implemented with asymmetric handling of exceptions (FEAT\_MTE3).

Type: `uint8_t`

Default value: 3

### **subcluster1.pmu-num\_counters**

Number of PMU counters implemented.

Type: `uint8_t`

Default value: 6

### **subcluster1.ptw\_latency**

Page table walker latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **subcluster1.stage12\_tlb\_size**

Number of stage1+2 tlb entries. Valid values are 0 or  $\geq 4$ .

Type: `uint32_t`

Default value: 0x80

### **subcluster1.tlb\_latency**

TLB latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: 0x0

### **subcluster1.tlbi\_stall\_enabled**

If true, tlb invalidation broadcast requests will block the requesting PE until all the other PEs flush their TLBs.

Type: `bool`

Default value: `false`

**subcluster1.treat\_PAC\_as\_NOP**

Non-architecture parameter. Treat Pointer Authentication as **NOP**. When the parameter is true behaviour of FEAT\_PAuth instructions changes as following PAC\* and AUT\* and XPAC\* instructions are **NOP**. Branch, load, return with authentication instructions do not check and change signature bits and ignore FEAT\_PAuth traps.

Type: `bool`

Default value: `false`

**subcluster1.walk\_cache\_latency**

Walk cache latency for TA (Timing Annotation), expressed in simulation ticks.

Type: `uint64_t`

Default value: `0x0`

## 3.54 ARMCortexA520CT\_CortexA725CT\_CortexX925CT

Defined in `LISA/ARMCortexA520CT_CortexA725CT_CortexX925CT.lisa`.

This model supports the following revisions of the IP at the given quality levels:

Revision	Quality level
CortexA520 r0p1	Full support
CortexA725 r0p0	Full support
CortexX925 r0p0	Full support

For an explanation of the quality levels, see [Quality level definitions](#).

### Changes in 11.31.15

The following parameters were added:

- `num_acp`
- `subcluster0.has_delayed_dbgreg`
- `subcluster0.has_delayed_sysreg`
- `subcluster1.has_delayed_dbgreg`
- `subcluster1.has_delayed_sysreg`
- `subcluster2.has_delayed_dbgreg`
- `subcluster2.has_delayed_sysreg`

### About ARMCortexA520CT\_CortexA725CT\_CortexX925CT

The number of cores in each subcluster is configurable using the following parameters:

**subcluster0.NUM\_CORES**

Possible values are 1-12 (ARMCortexA520CT).

**subcluster1.NUM\_CORES**

Possible values are 1-12 (ARMCortexA725CT).

**subcluster2.NUM\_CORES**

Possible values are 1-12 (ARMCortexX925CT).

The total number of cores in the cluster cannot exceed 14.

Port arrays are expanded to the width needed for the maximum number of cores in each subcluster. Use the following port array indexes:

- <port\_name>[0-11] for cores in subcluster0.
- <port\_name>[12-23] for cores in subcluster1.
- <port\_name>[24-35] for cores in subcluster2.

**Note**

All instances in the Master cross trigger matrix port array, `cti[36]` must be connected, regardless of the `NUM_CORES` value used.

Core-specific parameters have the following prefixes:

- `subcluster0.cpu0` to `subcluster0.cpu11` identify cores in subcluster0.
- `subcluster1.cpu0` to `subcluster1.cpu11` identify cores in subcluster1.
- `subcluster2.cpu0` to `subcluster2.cpu11` identify cores in subcluster2.

For information about the cores in this model, see:

- [ARMCortexA520CT](#).
- [ARMCortexA725CT](#).

## Iris and MTI instances for ARMCortexA520CT\_CortexA725CT\_CortexX925CT

This model has the following Iris instances:

Name	Instance type
ARMCortexA520CT_CortexA725CT_CortexX925CT	<a href="#">Cluster_ARM_Cortex-A520_CortexA725_CortexX925_Heterogeneous</a>
ARMCortexA520CT_CortexA725CT_CortexX925CT.AMU	<a href="#">PVBUSLogger</a>
ARMCortexA520CT_CortexA725CT_CortexX925CT.AMU.mapper	<a href="#">PVBUSMapper</a>
ARMCortexA520CT_CortexA725CT_CortexX925CT.DAP	<a href="#">PVBUSLogger</a>
ARMCortexA520CT_CortexA725CT_CortexX925CT.DAP.mapper	<a href="#">PVBUSMapper</a>
ARMCortexA520CT_CortexA725CT_CortexX925CT.DSU	<a href="#">DSU-120</a>

Name	Instance type
ARMCortexA520CT_CortexA725CT_CortexX925CT.DSU.PPU_cluster	PPUV1
